# ABBREVIATIONS

The titles of subjects, which are printed first in bold type, have been abbreviated within each article to the initial letter or letters.

ac., acre(s).  
**agric.**, agricultural.  
**ambas.**, ambassador(s).  
**Amer.**, American.  
**anct.**, ancient.  
**ann.**, annual.  
**arron.**, arrondissement.  
**A.-S.**, Anglo-Saxon.  
**A.V.**, Authorised Version.  
**b.**, born.  
**Biog. Dic.**, Biographical Dictionary.  
**bor.**, borough.  
**bp.**, birthplace.  
**Brit.**, British.  
**c.**, about.  
**C.**, Centigrade.  
**cap.**, capital.  
**cent.**, century (7th cent.).  
**chem.**, chemistry.  
**co.**, county.  
**com.**, commune.  
**cub. ft.**, cubic feet.  
**d.**, died.  
**Dan.**, Danish.  
**dept.**, department.  
**dimin.**, diminutive.  
**dist.**, district.  
**div.**, division.  
**E.**, east; eastern.  
**eccles.**, ecclesiastical.  
**ed.**, edition; edited.  
**educ.**, educated.  
**e.g.**, for example.  
**Ency. Brit.**, *Encyclopaedia Britannica*.  
**Eng.**, English.  
**estab.**, established; establishment.  
**fl.**, flourished.  
**Flem.**, Flemish.  
**fort. tn.**, fortified town.  
**Fr.**, French.  
**ft.**, feet.  
**Ger.**, German.  
**Gk.**, Greek.  
**gov.**, government.  
**Heb.**, Hebrew.  
**hist.**, history.  
**horticult.**, horticultural.  
**h.p.**, horse-power.  
**H.Q.**, headquarters.  
**hr(s)**, hour(s).  
**in.**, inch(es).  
**inhab.**, inhabitant(s).  
**is.**, island(s).  
**It.**, Italian.  
**Jap.**, Japanese.  
**jour.**, journal.  
**Lat.**, Latin.

**lat.**, latitude.  
**lb.**, pound(s).  
**l. b.**, left bank.  
**long.**, longitude.  
**m.**, mile(s).  
**manuf.**, manufacture(d).  
**M.E.**, Middle English.  
**min.**, minute(s).  
**Mod. E.**, Modern English.  
**m.p.h.**, miles per hour.  
**mrkt tn.**, market town.  
**MS., MSS.**, manuscript(s).  
**mt. mts.**, mount, mountain(s).  
**N.**, north; northern.  
**N.T.**, New Testament.  
**O.E.**, Old English.  
**O.F.**, Old French.  
**O.T.**, Old Testament.  
**oz.**, ounce(s).  
**par.**, parish.  
**parl.**, parliamentary.  
**pop.**, population.  
**prin.**, principal.  
**prof.**, professor.  
**prov.**, province; provincial.  
**pub.**, published; publication.  
**R., riv.**, river.  
**R.A.F.**,  
**r. b.**, right  
**rep.**, republic.  
**Repi. of Ireland**,  
**R.N.**, Royal Navy.  
**Rom.**, Roman.  
**r.p.m.**, revolutions per minute.  
**R.V.**, Revised Version.  
**S.**, south; southern.  
**sec.**, second(s).  
**sev.**, several.  
**Sp.**, Spanish.  
**sp. gr.**, specific gravity.  
**sq. m.**, square miles.  
**temp.**, temperature.  
**ter.**, territory.  
**tn.**, town.  
**trans.**, translated; translation.  
**trib.**, tributary.  
**U.K.**, United Kingdom.  
**U.N.**, United Nations.  
**univ.**, university.  
**U.N.O.**, United Nations Organisation.  
**urb.**, urban.  
**U.S.A.**, United States of America.  
**vil.**, village.  
**vol.**, volume.  
**W.**, west; western.  
**Wm.**, William.  
**yd(s)**, yard(s).

prin. change has been the democratic one of granting relief in respect of 'earned income' and imposing a supertax on incomes over £2000.

The provisions relating to the rate, collection, and assessment of the I. T. immediately before the changes introduced by the Finance Act of 1909 are of interest. Those relating to administration and incidence have mostly undergone no alteration. There were 5 schedules according to the sources of income. Schedule A formed the charge on the owners of land and houses; B on the benefit arising out of the use or occupation of land, measured by a proportion of the rent or ann. value; C related to income from any public revenue, imperial, colonial, or foreign; D, income from professions, trades, and other occupations, together with all incomes not included in any of the other schedules; and E was a charge on persons employed by the state or engaged in any other office of profit in a public corporation or company. Incomes below a stated figure were totally exempt; real property exempt included public parks and recreation grounds, prisons, public offices, or other crown property, and canals, mines, quarries, etc., from which no income or benefit is derived beyond the general profits of the concern to which they belong. Other exemptions were incomes from property held on trust for charitable purposes in so far as applied to such purposes; and the stock dividends or other income of friendly societies, and of industrial and provident societies (see FRIENDLY SOCIETIES). Incomes not exceeding £700 were allowed an abatement. An abatement for premiums for life assurance was also allowed. The relief to 'earned' income was a reduction of 3d. in the pound upon the rate paid on unearned incomes. The general rate was 1s. in the pound, and 9d. in the case of earned incomes not exceeding £2000. The tax was granted for a year only, but annually renewed. The assessment and collection of the tax were entrusted to local commissioners, known as general or dist. commissioners, appointed by the Land Tax Commissioners out of their own body, and not subject to the control of the gov. Their duties consist in signing and allowing I. T. assessments, and hearing appeals. They also appoint local officers for I. T. purposes. There are also special salaried commissioners appointed by the Crown to make assessments under Schedule C, and, where the taxpayer elects, under Schedule D; also to assess utility companies and dividends out of foreign and colonial stocks, funds, or other revenues. Special commissioners may hear appeals from their own assessments or those of local commissioners. The assessments of the salaries under Schedule E are made by the commissioners for public offices. The duty of a collector is to obtain payment of the I. T. from the persons on whom it is imposed, and for this purpose he is supplied with warrants. Most of these provisions are re-enacted annually, and to ensure collection in due time these

provisions and all enactments relating to I. T. not specifically repealed have full force as soon as the tax is granted in any Finance Act (see Section 18 (2) of the Finance Act, 1907). A Select Committee was appointed in 1906 to inquire into the graduation of the I. T., and recommended an extension of the existing system of abatements, even up to incomes of £1000 or more. They also recommended graduation by a supertax, and a differentiation between earned and unearned incomes, to be limited to incomes not exceeding £3000 a year. Some of these recommendations were adopted in the Finance Act, 1909-10.

The Income Tax Act of 1918 consolidated all legislation extending over some 70 years. The Royal Commission of 1920 made important recommendations on differentiation, graduation, fraud, evasion, and administration which were to some extent implemented in the Finance Acts of 1920-39. An I. T. codification committee was set up in 1936. The Second World War saw important changes, such as the assessment of Excess Rents (Finance Act 1940), the assessment of farmers under Schedule 'D', and the implementation of the Pay-As-You-Earn system for Schedule E taxpayers, by which current tax was deducted from current wages and salaries, in 1943. The standard rate of tax reached 10s. in 1941-2; the surtax on incomes of over £20,000 was 9s. 6d. A unique provision, whereby additional tax attributable to the cut in personal and earned income allowances was to be repaid after the war, known as Post-war Credits, was also introduced. Tax Reserve certificates, introduced in 1941, could be purchased and surrendered in payment of tax. Interest on these certificates is exempt from all taxes. The Income Tax Act, 1945, was passed to implement a gov. promise that the capital cost of new buildings and plant would be allowed against profits, and it completely revised the granting of allowances on wasting assets.

After the war, the standard rate was reduced to 9s., but increased owing to the rearmament programme in 1951-2 to 9s. 6d. Legislation was introduced in 1948 to combat the tax-free expenses allowances which had been the source of large-scale tax avoidance. The Special Contribution imposed by the Finance Act, 1948, was not strictly a tax on income, but surtax principles applied, and in effect it was a tax on investment income though it often had of necessity to be paid from capital. The P.A.Y.E. system, continued after the war, imposed a great deal of the administration and collection of Schedule E tax on employers.

A further codification Act was passed in 1952 and all tax legislation up to that date was embodied in the Income Tax Act, 1952. The Finance Act, 1952, implemented some of the recommendations of the first Tucker Committee on Trading Profits. In the Finance Act, 1954, a new capital allowance, the Investment Allowance, was introduced, but withdrawn in

## Income

1956. The Finance Act, 1956, included provisions for carrying into effect some of the recommendations of the second Tucker Committee with regard to retirement benefits for the self-employed. A Royal Commission on the Taxation of Profits and Income issued its final report in June 1955. Among the recommendations of this and previous interim reports were: a graduated child allowance according to income, increased earned income relief, Schedule D assessments of companies to be based on current year's profits, a flat rate of Profits Tax, Capital Allowances for commercial buildings, revision of Schedule A, and the tightening of the law against tax evasion. A Minority Report included a recommendation for a capital gains tax.

The I. T. year is from 6 April to the following 5 April. The standard rate of I. T. between 1842-3 and 1854-5 was 7d.; in 1855-6, 1s. 2d.; 1856-8, 1s. 4d.; it was then below 1s. until 1900-1, when it rose to 1s.; in 1915-16 it was 3s.; 1916-17 and 1917-18 it rose to 5s., and thereafter was as follows: 1918-19 to 1921-2, 6s.; and ranged between 4s. in 1925-6 and 7s. in 1939-40; 8s. 6d. in 1940-1; 10s. in 1941-1942 to 1944-6; 9s. in 1946-7 to 1950-1; 9s. 6d. in 1951-2 to 1952-3; 9s. in 1953-4 to 1954-5; 8s. 6d. in 1955-6 to 1956-7.

The surtax replaced the supertax, which was levied up to and including the supertax year 1928-9. The surtax is in effect a deferred instalment of I. T. payable on 1 Jan. after the end of the I. T. year. Surtax has been at the following rates since 1951-2: in respect of the first £2000, nil; tax chargeable on every £ of income:

£	£	
2001 to 2500	.	2s. 0d.
2501 to 3000	.	2s. 6d.
3001 to 4000	.	3s. 6d.
4001 to 5000	.	4s. 6d.
5001 to 6000	.	5s. 6d.
6001 to 8000	.	6s. 6d.
8001 to 10,000	.	7s. 6d.
10,001 to 12,000	.	8s. 6d.
12,001 to 15,000	.	9s. 6d.
15,001 and over	.	10s. 0d.

In 1956-7 earned income and personal allowances and reliefs could be claimed by individuals and partnerships against total income before arriving at the taxable income as follows: (1) earned income relief of 2/9ths, subject to a maximum of £450; (2) personal allowance of £240 (£140 single person); (3) child allowance of £100, subject to child's income not exceeding £85 per annum. There are also housekeeper and dependent relative reliefs. Age relief of 2/9ths of all income (subject to limit of £600) can be claimed where the taxpayer (or wife) is 65 or more. There are also reliefs for life assurance premiums, superannuation contributions, and National Insurance. The first £60 of taxable income is taxed at 2s. 3d., the next £150 at 4s. 9d., the next £150 at 6s. 9d., and thereafter at the standard rate of 8s. 6d.

Tax is deducted at standard rate from

## Incorporeal

all dividends and interest of an ann. nature and has to be accounted for by the payer. Maintenance relief can be claimed against the Schedule A assessments if the repairs expenditure exceeds the statutory allowance. Agreements for the avoidance of double tax on income and profits have been concluded with a large number of countries; where no agreement exists a credit is allowed against the U.K. tax. Post-war Credits amounted to £800 million by 1945-6. Credits are repaid to taxpayers over 65. In 1954-5 the repayments were £24 million.

The yield of the I. T. and surtax since before the First World War has been:

Year	Yield (£m.)
1911-12	41
1938-9	336
1945-6	1441
1950-1	1535
1955-6	2082

In other countries of Europe, I. T. forms a ready but unpopular means of raising revenue, and in general the same broad principles are laid down as in England, viz. graduated systems with an initial rebate and allowances for families.

The endeavour to impose an I. T. in the U.S.A. in the past met with fluctuating success. As in England, it began as a war tax when it was imposed by the Federal Gov., which during the Civil war levied a tax of 3 per cent on all incomes over \$800. It was not abrogated till 1872, but when revived in 1895 the courts declared it to be unconstitutional, with the result that the constitution had to be amended. On 25 Feb. 1913, the XVIIth Amendment of the U.S.A. constitution was declared in force: it states that Congress shall have power to levy and collect taxes on incomes from whatever source derived without apportionment among the sev. states and without regard to any census or enumeration. This amendment was ratified by all states except Connecticut, Florida, Pennsylvania, Rhode Is., Utah, and Virginia. See *The Annual Reports of the Commissioners of Inland Revenue* and E. E. Spicer and E. C. Pegler, *Income Tax*, 4 vols. (2nd ed.), 1952.

Incommensurable, see COMMENSURABLE.

**Incorporeal Chattels and Hereditaments.** Incorporeal chattels are the rights or interests incident to personal property, e.g. copyrights, patent rights, annuities, debts, cash at a bank, gov. stocks, debentures of companies. Such property is said to be incorporeal because it has only a notional existence as opposed to corporeal chattels, or those having a physical existence. Incorporeal hereditaments are rights over or in connection with the enjoyment of land, as opposed to the right of immediate or future possession of the land itself, e.g. rights of way, advowsons (right of presentation to a vacant living), rents, commonable rights (see COMMON, RIGHT OF). Formerly the term incorporeal hereditament included future estates or interests in land or the right to the future possession by way of reversion

or remainder (see ESTATE; GRANT); such incorporeal hereditaments were said to 'lie in grant' (by deed) while corporeal lay in livery, i.e. transfer of possession was necessary effectually to pass them to another. As both incorporeal chattels and hereditaments now pass by deed, the distinction between them has no practical importance.

**Increment Value Duty** was introduced by Lloyd George as Chancellor of the Exchequer in the famous budget of 1909. The duty was £1 for every £5 of 'increment value' accruing to land on: (1) Sale or lease (for a period exceeding 14 years). (2) Succession (upon death of the owner). (3) Valuation to be made every fifteenth year in respect of land held by permanent corporations.

Increment value was the amount by which the site value exceeded the original site value.

The commissioners of Inland Revenue were made responsible for valuing all land in the U.K., having regard to (1) site value and (2) total value. 'Site value' was defined as the value of the bare land without buildings, etc. (these latter being included in the total value), and 'original site value' as the value of such land on 30 April 1909. Agric. land was exempt from the duty so long as its value did not exceed the market value for agric. purposes. The duty was a failure. Valuation was a long, costly, and inquisitive process and the return from the tax was small. The duty was abolished in 1920.

**Incubation and incubators** (from Lat. *incubare*, to brood; *incumbere*, to lie on or within). I. is strictly the action of a bird in sitting on her eggs to hatch them, but the term is also used of the development of the germs of disease within the body, and especially in connection with the artificial machines (incubators) employed in hatching eggs artificially, or for similar purposes in bacteriological laboratories. In nature, I. is often the task of the female only, but sometimes the male takes his share, as in the case of ostriches and most passerine and running birds. In other cases, again, the eggs are laid among rotting vegetation, the high temp. thus afforded making brooding unnecessary. The period of I. varies considerably in length, from 3 weeks with ravens and common fowls to 6 or 7 with swans and ostriches, and 2 weeks or less with swallows. The habit of brooding over their young is not infrequently found in other creatures as well as in birds, for example in earwigs, centipedes (*Scolopendra*), and pythons.

Artificial I. was known from the earliest times, and practised among the Chinese and Egyptians by means of huge egg ovens, types of which are in use by primitive people to the present day. Commercial manuf. of incubators began about 1900 and the only machine then made was a hot-water type. This incubator consisted of a double-walled cabinet with insulation or dead air space between the walls. The interior of the incubator was heated with a hot-water tank placed in the

top of the cabinet, and this water was passed from an outside boiler which, in turn, was heated by an oil lamp.

The largest incubator of this type held approximately 300 hen eggs. Regulation of the temp. was obtained by a thermostatic capsule filled with ether or methylated spirit or a mixture of both. This capsule expanded when heated and the action of the expansion was used to work either a damper or slide to control entry of the heat into the machine or to allow excess hot air to escape from the egg compartment. In order to meet the demands of large poultry-keepers who wished to incubate hundreds of eggs at a time, this type of machine was later developed by placing sev. of these compartments in long rows and heating the whole with hot-water pipes running from an anthracite boiler. Each compartment could be operated independently, but the chief disadvantage of this type of machine was the amount of space necessary for easy operation. This, together with the amount of labour involved, gradually led to them becoming obsolete.

A few years after the invention of the hot-water incubator, a new type was developed which proved a great improvement in many ways. This was the hot-air machine. In this type air is heated in a heating compartment and passed through the machine in metal pipes. The heating units can be arranged to work in conjunction with oil lamps, electric heaters, or gas burners. This type of machine usually proved to be more sensitive than the hot-water model and easier to work. These incubators are used extensively by pedigree breeders and all poultry farmers who prefer to hatch their eggs in small units.

With the expansion of the poultry industry and the setting up of large commercial hatcheries, the need arose for large incubators, holding sev. thousands of eggs, that would take up little space and be practically automatic in operation. This need was met by the invention of the Cabinet incubator in the U.S.A. It was later developed and improved in Great Britain, and to-day the Cabinet incubator is a precision-built appliance that is practically foolproof.

Usually it consists of a double-walled chamber built of selected timber and divided into 2 compartments. In the setting compartment the trays are so fitted that they can be tilted by some outside medium. In the hatching compartment they are placed at the same level, as no turning of eggs is necessary after the nineteenth day. These compartments are heated by electric elements or hot-water pipes or a combination of both. The air is circulated by means of a fan which ensures even temp. through the whole of the compartment. This fan can be driven by small electric motors or petrol engines.

The largest Cabinet incubators accommodate up to 50,000 eggs in a space little more than 1000 cub. ft. The temp. and humidity are automatically controlled

## Incubation

and, when required, the eggs can be automatically turned at prescribed intervals. Alarm and safety devices are fitted to ensure freedom from breakdown with consequent loss of eggs. These incubators are now used extensively in all parts of the world.

Artificial I. has the following advantages over the natural process: (1) a much larger number of eggs are able to be successfully

## Incumbent

apparatus for keeping the air moist. There are various forms, some heated by warm water, others by warm air. They are mostly square or rectangular in shape, but some bacteriologists prefer cylindrical forms.

Human incubators have also been designed for rearing children too weak to survive under ordinary conditions. The first was that of Dr Tarnier (1880), used in

Horace W. Stephens, Gloucester

EGG INCUBATOR

1, Substantial depth of packing, preventing loss of heat; 2, pipe which conducts fresh warm air into the interior of incubator; 3, heat radiator and diffuser; 4, canvas top diaphragm over the egg chamber; this diaphragm is removable; 5, capsule regulator for maintaining an even temperature; 6, thick packing, which makes up the sides, back, and front of 'Glovenum' incubator; 7, drawers into which newly hatched chicks fall.

hatched; (2) the chickens are free from vermin; (3) they are free from the danger of being trodden to death by the hen. Gamekeepers use incubators largely for rearing pheasants, and, of course, on large poultry farms they are indispensable. Various forms of foster-mothers, artificially warmed by lamps or hot water, have also been contrived in which the chickens can be successfully reared after they are hatched. In due course they are moved to cold brooders, and finally to poultry houses.

Bacteriological incubators differ from those for birds in that the heating surface generally surrounds all sides of the I. chamber, and there is usually no special

Paris, and an improvement was made in Hearson's, which is used at various hospitals and institutions throughout Great Britain.

See T. Christy, jun., *Hydro-Incubation*; H.M.S.O., *Incubation and Hatchery Practice*, 1952; J. H. Sutcliffe, *Incubators and their Management*; H. H. Stoddard, *The New Egg Farm*. For bacteriological I. see catalogues of Hearson of London; Cambridge Scientific Instrument Co., Cambridge; and P. Lequeux, Paris.

Incumbent (Lat. *incumbo*, I bend or lean), word which is said variously to signify 'diligent residence,' or 'assiduous application to duties.' In eccles. law it includes such rectors, vicars, and perpetual

curates as have been duly instituted in their offices. Every I., or holder of a parochial benefice, has care of the souls in his own par., and it is a spiritual offence for any other clergyman to preach, read prayers, or otherwise officiate in the par. of another I. without authorisation of the diocesan bishop. An I. is *ex officio* chairman of the vestry, and upon him devolves the duty of keeping the local register of marriages, baptisms, and burials. Two I.s may in certain circumstances effect an exchange of livings (see also GLEBE, as to extending poor livings) by deed. An I. may be deprived of his living for illiteracy, minority, simoniacal offences (trafficking in benefices), lack of holy orders, conviction for felony and other crimes, and such spiritual offences as affirming doctrines contrary to the Thirty-nine Articles, heresy, schism, and demanding payment for administering a sacrament. An I. may resign by application to the ordinary, but a resignation is invalid unless assented to by the bishop.

Incunabula is a word derived from the Latin meaning a cradle or bp., but has come to be used in a very specialised sense to signify the earliest books printed from type, and particularly those printed before the year 1500. Since the invention of printing in Europe is generally attributed to Gutenberg, whose first books appeared about half way through the 15th cent., we are limited by definition to a period of about 50 years. The rival claim that printing was invented earlier in the cent. by Laurens Coster of Haarlem is without firm corroboration, since there are no known books in existence bearing his imprint. The first book issued by Gutenberg, probably in collaboration with John Fust, was the *Mazarin* or *42-line Bible*, which was printed in a Gothic type, with initials and ornamental borders illuminated by hand. It is interesting to note that the early printers aimed not at creating a new style suitable to the medium of type, but simulated the finest examples of existing illuminated MSS. Chief among the notable books which came from this press were the *Psalter* of 1457, the first book in the hist. of printing to bear a date, and the *Latin Bible* of 1462.

Printing was first introduced into Italy by 2 Ger. printers, Sweynheym and Pannartz, who set up a press at the monastery of Subiaco in about 1464, and that country rapidly achieved supremacy in the art. Venice became pre-eminently the centre, attracting many printers, among them Da Spira, Jenson, Ratdolt, and, later, Aldus. The It. MSS. of the time to which these printers turned for their models were written in the 'humanistic' script, a refinement of the caroline minuscule. This 'round,' cursive, and easily legible hand became, fortunately for the eyesight of the modern world, the prototype of what are now known as 'roman' type-faces. Germany, the only country not to adopt this design, still uses type-faces based on the Gothic letter, or *lettre de forme*. The length of the eds. of

the earliest books was governed chiefly by the capacity of the type to stand up to the printing press, and numbers averaged about 200-300 copies, rising to about 500 by the end of the cent. The fact that the total number of books printed in Venice alone by the end of the cent. is estimated to have been about 2,000,000 gives some idea of the rapid expansion of printing from its inception. Paper, then a staple product of Italy, was chiefly used for books, though frequently a smaller part of an ed. was printed on vellum. Many eds. were illustrated with woodcuts, some of which were afterwards illuminated by hand. A notable illustrated book was Aldus's *Hyperotomachia Polifili*, which contained over 500 woodcuts. Caxton set up his press at Westminster in 1476, though his first book, *The Histories of Troy*, also the first to be printed in English, was printed at Bruges a year earlier. This was followed by an od. of the *Canterbury Tales*, and in 1481 he issued his first illustrated book, *The Mirror of the World*. Caxton used a formal Gothic type and also 'secretary,' a cursive version of the same face. His achievement lay not so much in the quality of his work, which was not equal to the best It. printing of the time, as in the fact that his prolific output did much to establish a national Eng. language.

The difficulties of establishing classifications of I. spring from the fact that so many early books are not only undated, but also bear no printer's name. Identification is most safely made from the type-face. Haebler's *Typenrepertorium der Wiegendrucke*, 1905, takes this approach. Among earlier bibliographies are Panzer's *Annales Typographici*, Nuremberg, 1793, and Hain's *Repertorium Bibliographicum*, Stuttgart, 1826-38. In more recent times we have Robert Proctor's *Index to the early printed books in the British Museum*, 1898, which has been revised and expanded since the author's death; also the *Gesamtkatalog der Wiegendrucke* (7 vols.), Leipzig, 1925-38, and J. C. T. Oates, *Catalogue of the fifteenth-century printed books in the University Library*, Cambridge, 1954. See E. G. Duff, *Early Printed Books*, 1893. See also BIBLIOGRAPHY; BOOK; MANUSCRIPTS; PRINTING.

**Indecency.** Indecent exposure of the person in public is a common law misdemeanour, punishable by fine or imprisonment or both, whether there be an intention to violate the canons of decency or not. An indecent assault upon any female is punishable by imprisonment not exceeding 2 years, under the Offences against the Person Act, 1861. Sodomy or bestiality is a felony punishable by imprisonment for life. An attempt to commit sodomy is a misdemeanour punishable with imprisonment for 2 years. The Criminal Law Amendment Act, 1885, provides a punishment of not more than 2 years' imprisonment in the case of any male person publicly or privately committing, or being a party to the commission of, any act of gross I. with any

other male person. Scots law is practically similar in all respects. Between 1956 and 1957 this and related questions were considered by a departmental committee under Sir John F. Wolfenden (q.v.).

**'Indefatigable.'** The Brit. battle-cruiser launched in 1911, 12-in. guns, 23 knots. On the outbreak of the First World War she was stationed in the Mediterranean. During the battle of Jutland (q.v.) she was a unit in Adm. Beatty's fleet, but was sunk by the Ger. battle-cruiser *Von der Tann*. There were no survivors. A Brit. fleet aircraft carrier of 23,000 tons, laid down in 1939, now bears the name.

**Indefinite,** in mathematics, was originally used for infinite, but at the present time is generally only to be found in the phrase *I. integral*, to denote the process of integration, without reference to limits.  $\int x^n dx$  and  $\int_0^x x^n dx$  are respectively *I.* and definite integrals.

**Indemnity, contract, express or implied,** to keep a person immune from liability under a contract into which he has entered, or intends to enter. Contracts of fire, marine, and accident insurance (but not life assurance) are instances of such contracts. An *I.* differs from a contract of guarantee or suretyship, because the liability of a guarantor or surety depends upon a third person, the prin. debtor, making default, whereas the person under a liability to indemnify another is bound to do so, irrespective of the default of other persons. A contract of *I.* is not, but a guarantee is, within the Statute of Frauds (see **CONTRACT and FRAUDS, STATUTE OF**), and, therefore, the form of an *I.* is immaterial. Other familiar examples of *I.s* are the implied contracts by principals to indemnify their accredited agents from all liability properly incurred in relation to the agency. This principle in the law of agency also applies as between partners. A contract to indemnify a person against liability for an unlawful act is void. An Act of Indemnity is an Act passed by Parliament to indemnify ministers or M.P.s against liability for penalties incurred for unlawful acts innocently committed in the course of their duties (see **PARLIAMENT**).

**Indenture,** practically synonymous with a deed (q.v.), since the requirement of 'indenting' the edges became unnecessary to the validity of an instrument. An *I.* was an instrument made between two or more persons with distinct interests, as opposed to a deed poll or instrument made by one person or a set of persons having identical interests. Formerly copies of an instrument were always made on the same parchment, or paper, and then cut into as many parts as there were copies, with a wavy or scalloped line, so that the genuineness of any part could at any future time be estab. by merely fitting the edges together. Other formalities having taken the place of 'indenting', the designation of a deed as an *I.* is now mere surplusage.

**Independence, city, cap. of Jackson co., Missouri, U.S.A., 12 m. E. of Kansas City**

in potato, Indian corn, and wheat area. It manufs. farm machinery, furnaces, stoves, cement, and flour. It is the H.Q. of the Reorganised Church of Jesus Christ of Latter Day Saints, and the home of former President Harry S. Truman. Pop. 37,000.

**Independence, American War of, see UNITED STATES OF AMERICA, History.**

**Independence, Declaration of (U.S.A.), see DECLARATION OF INDEPENDENCE (U.S.A.).**

**Independence Day,** commemoration observed in the U.S.A. on 4 July. It is a legal holiday, and is kept up by various celebrations, such as patriotic speeches and meetings. It commemorates the Declaration of Independence on 4 July 1776.

**Independence Hall,** building in Philadelphia where, on 4 July 1776, the Declaration of Independence was adopted by Congress and read to the people. The Continental Congress met there. It is now an historical museum.

**Independent Labour Party (the 'I.L.P.'),** throughout much of its hist. the largest and most influential of Brit. socialist organisations. The I.L.P. was founded at a conference held at Bradford in 1893 over which Keir Hardie (q.v.) presided. He was subsequently its chairman. Other distinguished chairmen have been J. Ramsay MacDonald and Philip Snowden (later Lord Snowden). The fortunes of the I.L.P. were for a long time intimately bound up with those of the Labour Party, but its influence declined sharply from 1930 onwards and it now (1958) has no representatives in Parliament. It represented an extreme left-wing and pacifist section of the Labour movement, and, as such, was opposed to both world wars. From 1926 until his death (1946) James Maxton was the virtual leader of the I.L.P.

**Independent Order of Oddfellows, see ODDFELLOWS.**

**Independent Television Authority,** set up under the Television Act, 1954, to provide, for an initial period of 10 years from the passing of the Act, television broadcasting services additional to those of the B.B.C. for so much of the U.K., the Isle of Man, and the Channel Is. as may from time to time be reasonably practicable. The Television Act lays down that the programmes themselves shall, except in certain defined circumstances, be provided by programme contractors and not by the Authority itself. These companies provide their own programme material, studios, and artistes, but the news is the responsibility of a separate non-profit-making news company. The transmitters are built by and are under the control of the Authority.

Independent television is financed from money paid to the programme contractors by advertisers whose advertisements are shown, but Parliament was determined in passing the Television Act that the advertising element should not be allowed to colour the programmes themselves. Thus, the system brought into being by the Television Act makes impossible the

'sponsoring' of programmes by advertisers as practised in the U.S.A. and elsewhere, whereby a programme is adopted or provided by one or more individual advertisers. The Brit. system is entirely different; the programmes are the sole responsibility of the programme contractors, and the advertisements must be inserted at the beginning or end of the programme items, or at 'natural breaks' within them.

At present the permitted hours of broadcasting for I. T. A. programmes are a maximum of 50 hrs per week with a maximum of 8 hrs on any one day. There is a closed period on Sunday from 6.15 to 7.25 p.m., although religious programmes may be broadcast during that time. In general, the limitations on hours of broadcasting do not apply to religious services and outside broadcasts of events the timing of which is outside the control of the programme companies.

Transmitters are at present operating in the following areas: London, Croydon transmitter, serving a pop. of 11 million; Midlands, Lichfield transmitter, serving a pop. of 5.7 million; N. (W.), Winter Hill transmitter, serving a pop. of 7.21 million; N. (E.), Emley Moor transmitter, serving a pop. of 4.93 million; Central Scotland, Black Hill transmitter, serving a pop. of 3.82 million; S. Wales, St Hilary transmitter, serving a pop. of 3.28 million. A station in the Isle of Wight to serve approximately 2 million people in the S. region was scheduled for the summer of 1958.

Programmes produced by the Authority's programme contractors cover a wide field, and include current affairs programmes, broadcasts of sporting events, drama, variety, serials, westerns, panel games, and prize shows. There are also 3 news bulletins daily, and religious epilogues at the end of each evening's programmes. Examples of programmes which are among the most popular at present are: 'Sunday Night at the London Palladium' (variety from the Palladium); 'Take Your Pick' (audience participation show); 'I Love Lucy' (Amer. family comedy); 'The Army Game' (comedy series); and 'Armchair Theatre.'

**Independents, or Congregationalists, see CONGREGATIONALISM.**

**Inderab, see ANDERAB.**

**Indeterminacy Principle, or uncertainty principle,** was enunciated by Heisenberg in 1927. In simple terms it states that it is impossible to determine exactly and simultaneously the position and momentum of a particle. If  $\Delta p$  is the range of values found for the momentum of the particle and  $\Delta q$  is the range of values in the simultaneous determination of the position of the particle, then the product  $\Delta p \cdot \Delta q$  is of the order of magnitude of  $h$ , Planck's constant,  $= 6.62377 \pm 0.00018 \times 10^{-27}$  erg. sec. A similar relation holds for determinations of the energy ( $E$ ) at a time  $t$ , viz.  $\Delta E \cdot \Delta t$  is of the order of  $h$ . This does not arise from experimental errors; it is a fundamental characteristic of nature, and an essential

postulate of quantum mechanics. *See* QUANTUM THEORY.

**Indeterminate,** in mathematics, used in sev. connections. Simultaneous equations are called I. when an insufficient number of such equations is given. Thus the equation  $5x + 3y = 21$ , where  $x$  and  $y$  are independent unknown quantities, is I., and has an infinite number of solutions. In the differential calculus the name I. is given to such expressions as the limit of  $\frac{a^2 - x^2}{a - x}$  when  $x = a$ , which take the form

$0/0$ , or similar forms, such as  $\frac{\infty}{\infty}$ ,  $0 \times \infty$ , etc., but the values of these forms can be found by algebraical, trigonometrical, and other processes. *See also* DIOPHANTINE EQUATIONS.

**Index,** in mathematics, that number placed after and above a quantity to denote the power to which the quantity is to be raised. Thus  $a^2 = a \times a \times a \times a$ . It follows that  $a^m \times a^n = a^{m+n}$  and, more generally,  $a^m \times a^n = a^{m+n}$ , where  $m$  and  $n$  are positive whole numbers. This is one of the fundamental laws of algebra, and is known as the I. Law. So also  $a^m \div a^n = a^{m-n}$ , and  $(a^m)^n = a^{mn}$ . It has been found convenient to make use also of fractional and negative indices, which at first sight seem unintelligible. To ensure that the I. Law  $a^m \times a^n = a^{m+n}$  shall be true for all values of  $m$  and  $n$ , integral and fractional, positive and negative, we give to such quantities as  $a^{\frac{1}{2}}$  and  $a^{-2}$  those meanings to which the formula leads us. Thus  $a^{\frac{1}{2}} \times a^{\frac{1}{2}} = a^{\frac{1}{2} + \frac{1}{2}} = a^1 = a$ ,  $\therefore a^{\frac{1}{2}} = \sqrt{a}$ , and more generally  $a^{\frac{p}{q}} = \sqrt[q]{a^p}$ , also  $a^0 \times a^4 = a^{0+4} = a^4$ ,  $\therefore a^0 = \frac{a^4}{a^4} = 1$ , and  $a^0 \times a^{-6} = a^{0-6} = a^{-6} = \frac{1}{a^6}$ ,  $\therefore a^{-6} = \frac{1}{a^6}$ , and more generally  $a^{-n} = \frac{1}{a^n}$ .

*See also* LOGARITHM.

**Index Librorum Prohibitorum**, title of a list of books prohibited by the Rom. Church on doctrinal or moral grounds. The origin of eccles. prohibitions dates from very early in the hist. of the Church, and the earliest known instance is the *Notitia Librorum Apocryphorum qui non recipiuntur*, a catalogue of forbidden apocryphal works, issued by Pope Gelasius (494). What may be regarded as the first Rom. Index was pub. by Pope Paul V (1557-9) through the Inquisition at Rome, and was confirmed by Clement VIII in 1595. When the books in the list or catalogue are allowed to be read after correction or alteration, with the approval of the papal authorities, the list is termed *Index Expurgatorius*. Later Pope Sixtus V organised a special congregation, consisting of a prefect, cardinals, consultants, and examiners of books, the proceedings being governed by rules laid down by Pope Benedict XIV in a constitution issued in 1753. All books considered pernicious to Rom. Catholics and all versions of the Bible by unauthorised persons

are placed on the Index by the Congregation of the Holy Office.

Obscene books are forbidden except 'classical authors, ancient or modern . . . on account of the elegance of their diction, which are not to be used for teaching children. The ban still remains on Gibbon's *Decline and Fall*. The works of David Hume, John Stuart Mill, and Oliver Goldsmith (for his hist. of England) are proscribed along with Sterne for his *Sentimental Journey*. Savonarola, Kant, Voltaire, and Croce share the Index pages with Stendhal and D'Annunzio.

The Book of Common Prayer is also banned. Dante, Copernicus, and Galen have been removed.

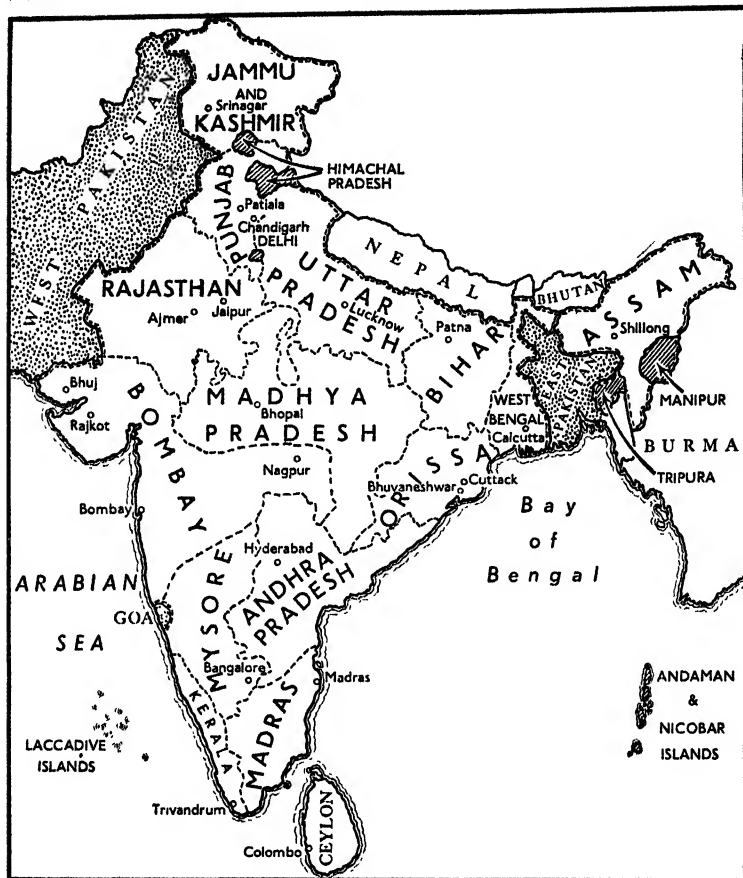

Any living author placed on the Index can earn remission by re-writing his book or cutting out the offending passages. Permissions to read forbidden books are granted to students. See also LITERARY CENSORSHIP.

**Index Number**, see STATISTICS.

**Indexing**, operation of compiling an alphabetical list of statements and allusions contained in files or in a book or series of books or periodicals, together with the page number, folio number, or other reference to where the indexed matter is to be found. An index differs from a 'table of contents' by being a more complete analysis of the contents, and by being arranged in alphabetical order. The term as applied to the l. of books and periodicals has been in use since the 16th cent., and derives from the Lat. word *index* which was used by Cicero and other classical writers in the same sense. Calendar, inventory, and register were alternative terms which have now been superseded. Specialised l., such as that of the contents of a library, is termed cataloguing (q.v.), while an index of the works of a single author, or of works on a given subject, comes under the heading of bibliography (q.v.). There were a number of indexes to books pub. in the 16th cent., among the most notable being that to the 1556 ed. of Polydore Vergil's *Anglica Historia*. Many indexes of the 17th and 18th cents. were intended rather as whimsical enticements to the reader to dip into the contents than as a serious analysis of the subject-matter. The index of the *Spectator*, *Teller*, and *Guardian* (1757) was, however, a model of its kind. During the 19th cent. and after, a number of scientific and informative works have made l. an indispensable aid to the reader, while the growth of periodical writing brought into being a number of cumulative indexes, an early example of which was W. F. Poole's *Index to Periodical Literature*, New York, 1853. A 'general' index contains entries under proper names, place names, and subject-headings. It may, however, be advisable to provide 2 indexes to a single work, one being an index of names and the other an index of subjects. In a subject index the selection of catchwords presents the indexer with a problem which he can only solve by an understanding of his author and by an assessment of what the reader to whom the work

may be unknown would look for. Correct alphabetical order is never so simple a process as it may seem to the inexperienced. It should be carried through either to the end of the initial word or to the end of the initial group of words, that is, to the first mark of punctuation. The first method is called 'nothing before something' and by it one would file New Barnet and New Zealand before Newfoundland. The second method, usually called 'all the way through,' arranges by first New Barnet, then Newfoundland, and then New Zealand, as it does not take account of the space. The first method is adopted by the Brit. Standards Institution and by this encyclopaedia, and the second by the Post Office Directories; but whichever method is used, it should be adhered to throughout the index. Many other obstructions arise, such as Mac, Saint, apostrophe s, and numbers, and the would-be indexer is advised to refer to the Brit. Standard: 1794:1951. Indexes prepared for press may be compiled either on slips or cards. The slip system consists of allotting a slip to each letter of the alphabet or each subdivision of a letter (e.g. Aa-Ak, Al-Aq, Ar-Az). The entries are then made on the appropriate slip. The card system differs from this in that each reference is written on a separate card which bears the appropriate catchword as a heading. The cards may then be sorted into alphabetical order and ed. when all the entries are complete. The invention of the card-index system is attributed to the Abbé Jean Rozior (1734-93), whose *Tables des Mémoires de l'Académie des Sciences* was pub. in 1775. It is the only suitable method for compiling an expansive index of, for example, files to which constant additions are being made. In book-indexing if there are a number of references under one entry, the references should themselves be classified under appropriate sub-headings which may be arranged either alphabetically or in chronological order or in the order in which they appear in the course of the book—the choice being determined by the nature of the work to be indexed. See also CATALOGUES AND CLASSIFICATION. See H. B. Wheatley, *How to make an Index*, 1903; A. L. Clarke, *Manual of Practical Indexing*, 1933; G. V. Carey, *Making an Index*, 1951; R. L. Collison, *Indexes and indexing*, 1953.

**India** (in Hindi known as **Bharat**), rep., member of the Commonwealth, formerly a large portion of Brit. I., together with many Princely States in treaty relations with the Brit. Gov., then since Aug. 1947 an independent dominion, and now since Jan. 1950 a rep. I. is a union of 14 states (including Jammu and Kashmir which is now the subject of dispute with Pakistan before the U.N.), a very large reorganisation of the constituent units having been effected in 1956. This was roughly on a linguistic basis, but geographical, economic, and other practical considerations imposed departures from the linguistic principle in not a few cases. The new states (see map) are Andhra,

STATES AND TERRITORIES OF THE INDIAN UNION ACCORDING TO PROVISIONS OF THE STATES REORGANISATION ACT

Assam, Bihar, Bombay, Kerala, Madhya Pradesh, Madras, Mysore, Orissa, Punjab, Rajasthan, Uttar Pradesh, and W. Bengal (qq.v.). There are also 6 small centrally administered areas, Andaman and Nicobar Is., Delhi, Himachal Pradesh, Laccadive and Admindive Is., Manipur, and Tripura. For all hist. prior to 1947, and for general information, see INDIAN PRINCELY STATES and INDIAN SUB-CONTINENT.

**Area and population.** The area of I. is 1,269,640 sq. m., and the pop. (1951) 356,691,624. It was estimated in 1954 that the pop., including Jammu and

Kashmir (4.3 million) and refugees from Pakistan (8 million), had risen to 376,500,000. Only China has a larger pop. The natural increase is now about 1.5 per cent or 5.5 million annually. The average mean density is 312 per sq. m. Of the total pop., roughly 303 million are Hindu, 35 million Muslim, 8 million Christian, 6 million Sikh, and 1.5 million Jain.

There are too many large cities to list fully. The biggest are Calcutta, including Howrah (2,982,307), Bombay (2,339,720), Madras (1,416,508), Delhi, Old and New (1,191,104), Hyderabad (1,085,722),

Ahmedabad (788,333), Bangalore (778,977), Kanpur (Cawnpore) (705,383), Lucknow (496,861), Poona (480,982), and Nagpur (449,099) (qq.v.).

**Physical features.** The main geographical and climatic features are described under INDIAN SUBCONTINENT. I., as it now is, stretches some 2000 m. from N. to S., from lat. 37° to lat. 8°, and some 1700 m. from W. to E., from long. 66° to long. 97° E. On the NW. border lies Pakistan, and beyond Kashmir the Soviet Union, to the N. and NE. lie China, Tibet, and

regularly accompanied by cyclones which originate in the Bay of Bengal. Cherrapunji in Assam appears to receive the attentions of both, having once (1861) recorded an ann. rainfall of 905 in. Its ann. average is 426 in. The great rvs. of I. are the Ganges, together with the Jumna which joins it at Allahabad, and the Brahmaputra. There are many others of great size and length, such as the Narbada, the Mahanadi, the Tungabhadra, the Krishna, and the Godavari; but the rainfall is so uncertain and so

*The High Commissioner for India*

#### SANCHI STUPA

Nepal, and to the E. Burma. Surrounding the N. borders is the vast mass of the Himalaya Mts, and to the E. the complicated and partly unexplored mt ranges which separate I. from China and Burma. I. is therefore both tropical and sub-tropical, and contains the highest mts in the world, extensive plateau lands crossed by numberless rvs., many of which are dry in the hot season, and a lengthy coastal plain, almost uniformly flat and devoid of cliffs. The total coastline is 3500 m. There is consequently the greatest variety of climatic conditions, great extremes of temp. and rainfall, and both extreme aridity and extreme humidity. There are 2 recognised rainy seasons, that of the SW. monsoon, approximately June-Aug., which is the prin. rain supply for most of I., and that of the NE. monsoon, approximately Oct.-Dec., which benefits mainly the E. areas of the S. peninsula. This monsoon is

concentrated in short periods that the dispersal is very rapid, with the result that without major control works the rvs. do not afford an adequate irrigation supply for the areas through which they pass. Indeed, from the necessity to take into account their maximum flood level and width, they constitute formidable and costly obstacles to road and rail communication. One of the main legacies of Brit. rule in I. is a widespread irrigation system, which by 1947 brought water to some 50,000 sq. m. of land otherwise unwatered. The system is being steadily and zealously expanded by the present Gov. of I. with very large joint irrigation and hydro-electric works.

**Agriculture.** I. remains a predominantly agric. country, though her industrial capacity is now expanding at a great pace. In 1931 it was estimated that nearly one-third of the working pop. was employed directly on the land. The

comparable figure to-day (1958) does not seem to be available, but it is unlikely that there has yet been any startling change, particularly as during the first 5 years of independence circumstances compelled I. to devote strenuous, and strikingly successful, efforts to the increased production of food, largely food-grains. The total area under food-grains in 1953-4 was 261 million ac. The total cultivable area has been estimated as 360 million ac.

Traditionally land revenue has been one of the prin. sources of income for the state (formerly prov.) gov. in I. In consequence there have been exhaustive surveys of both occupied and unoccupied land, and land records of occupation, output, and assessable value are fairly complete. This is particularly true of the areas where the State is the direct landlord—the Ryotwari system—and where the assessable value is periodically revised. In the areas where private landlords make themselves responsible for paying a fixed revenue to the State—the Zamindari system—irrespective of what profit they may themselves derive from the land they hold, the stimulus to maintain up-to-date records is not so great. This latter system is now being gradually abolished in most states.

The prin. crops grown in I. are rice, wheat, sugarcane, pulses and oil-seed, cotton, jute, and tea. In 1953-4 I. produced 66 million tons of food-grains, consisting of 56.1 million tons of cereals and 9.9 million tons of pulses. Rice output was 27.1 million tons, and wheat 7.8 million tons. All these figures constitute records, and while favourable monsoons played a significant part in their achievement, credit must also be given to the great impulse supplied by the first Five-Year Plan, in which approximately one-third of the total expenditure planned was earmarked for schemes of agric. improvement. In 1954-5 I. produced over 1½ million tons of refined sugar and all purchases from abroad ceased. Other significant figures of production worth recording are cotton 4,298,000 bales (1954-5), jute 4,605,000 bales (1952-3), and tea 660,000,000 lb. (estimated 1955-1956).

It must be remembered, however, that in the matter of agric. self-sufficiency I. has two formidable problems in the ann. 5½ million increase in pop. and the uncertainty of climate. Both drought and floods can quickly upset all calculations, and in so vast an area result in human misery on a catastrophic scale. While the precepts of birth control and family planning can only be expected to be inculcated very slowly, and to go hand in hand with an expansion in education, the control of rivs. and irrigation is a matter which can be undertaken immediately. I. consequently has a large number of grand-scale combined irrigation and hydro-electric riv. control projects. The best known are the Damodar Valley, the Bhakra-Nangal, and the Hirakud schemes. Others are the Tungabhadra, Mayurakshi, Bhavani, and Gangapur projects. The

first Five-Year Plan (1951-6) aimed at providing irrigation for an additional 16.94 million ac. In addition, special attention is now being given to the use of fertilisers, the Sindri fertiliser factory being in full production, and to the encouragement of co-operative farming.

*Industry and power.* Industry, in the modern sense, got off to a late and ill-balanced start in I. Cotton and jute mills, also coal-mining, came into existence soon after 1850, and the great iron and steel industry was founded in 1908.

*The High Commissioner for India*  
QUTAB MINAR, DELHI

The two world wars gave industrial enterprise a great stimulus and widened its scope, so that at the end of the Second World War I. ranked as the eighth industrial country in the world. Nevertheless the total industrial output remained very small compared with the size and pop.

In 1948, after partition, the Gov. of I. announced an industrial policy designed to associate private enterprise with official planning. The production of arms and ammunition and of atomic energy, together with all riv. valley projects and the railways, is an outright State monopoly. Coal, iron and steel, aircraft, telephones, telegraphs, wireless, ship-building, and mineral oils are declared to be State responsibilities, but existing private concerns were allowed to continue for not less than 10 years. All other industry is open to private enterprise, but the State has the power to license and,

in cases of mismanagement, to assume control. It also has the authority to assist with finance. In the circumstances of I. these powers were considered necessary if only because of the decision to undertake planned development (see sub-heading below).

At the moment, probably the two most important industries in I. are the textile and tea industries. In 1954, in the cotton spinning and weaving industry, I. had 11½ million spindles and 200,000 looms, with an output of 1560 million lb. of yarn, and nearly 5000 million yds of cloth. In the tea industry there were some 1 million people employed, with a production (estimated 1955-6) of 660 million lb. The jute industry is also of special importance as an earner of foreign exchange, the total output of jute products in 1954-5 having been over 1 million tons with export earnings over £75 million. But it must be recognised that industrially I. is in a transition stage and that any picture of her present industrial capacity is likely to become out of date very rapidly.

Even before partition I. possessed, in the Tata works at Jamshedpur, as fine a steel works as anywhere. Output there has reached (1955) the figure of 1½ million tons. In addition the Gov. of I. have come to agreement with the U.K. and with the U.S.S.R. for the erection of 2 large new plants in the near future. It is planned to produce 4½ million tons of rolled steel. Similarly, though through private enterprise, special encouragement is being given to the cement industry. The output has increased from 1½ million tons (1948) to 4½ million tons (1955). At Chittaranjan the Gov. of I. has estab. a locomotive factory; now in operation, it is expected to produce some 200 locomotives annually. At Vizagapatam the gov. has taken control of the shipyard, and since 1952 has built 15 seagoing ships. The Sindri fertiliser factory, an important link between industry and agriculture, began production in 1951, and in 1955 produced 321,000 tons of ammonium sulphate. The Hindustan cable factory, opened in 1954, produced in 1955-6 some 500 m. of cable. The Hindustan machine tools factory began producing high-speed lathes in 1954. Three oil refineries have been installed with an ann. output of some 4 million tons. Many chemical and pharmaceutical factories have been estab. Coal production has risen from 29.8 million tons in 1948 to 38.2 million tons in 1955. Machine-made paper production has risen to 185,000 tons (1955), and includes newsprint.

The significance of the foregoing very short list from among the many industrial activities in I. lies not so much in the production figures, though some of them are remarkable, as in the indication they give of a completely new development in the life of this country. The same significance attaches to the rapid development of sources of power, and the increasing electrification. Mention has been made

(sub-head *Agriculture*) of the major hydro-electric projects, combining new irrigation with power supplies. The installed capacity of plants generating electricity for all I. has risen from 1363 thousand kw. in 1947 to 2494 thousand kw. in 1954, and the actual generation over the same period from 4073 million kwh. to 7522 million kwh. The increases are large, but it is widely recognised that there remains almost unlimited room for further expansion, particularly in the rural areas.

*Planned development.* No account of independent I. would be complete without a brief reference to the Five-Year Plans. It would not be too much to say that both the economic and the political future of I. are at present in the balance, and that the degree of success achieved in implementing the plans will be a major factor in determining the future.

The First Five-Year Plan for 1951-6 was finally approved in Dec. 1952. It envisaged the expenditure of £1766 million, of which the central gov. would spend £1030 million and the state govts. £736 million. The percentage allocations under major heads were as follows: agriculture and community services 16 per cent, irrigation and power 28 per cent, industries and minerals 7 per cent, transport and communications 24 per cent, social services 23 per cent, miscellaneous 2 per cent. The gap between foreseeable available resources and the total proposed expenditure was £802 million, which was to be covered by internal taxation and borrowing, external contributions and borrowing, and deficit financing. It is too early to estimate the extent to which the targets set out in the plan have been reached. It is claimed that the national income has risen by 18 per cent, the production of food-grains by 17 per cent, and of industry by 60 per cent. Whatever the actual results, the Gov. of I. are clearly confident and have pub. a much more ambitious plan for the second five-year period.

The Second Five-Year Plan envisages the expenditure of £3600 million—twice the amount of the first plan—of which the central gov. should spend £1940 million and the state govts. £1660 million. In allocation there has been a major shift towards industry, as the following figures show: agriculture and community services 12 per cent, irrigation and power 19 per cent, industries and minerals 19 per cent, transport and communications 28 per cent, social services 20 per cent, miscellaneous 2 per cent. In the case of this plan, even taking into account what may be hoped for from taxation, internal and external borrowing, and from deficit financing, there remains an uncovered gap of £300 million.

*Trade.* During the Second World War, owing to the world shortage of all kinds of goods and the dislocation of normal sources of supply and communications, I. experienced a period of large favourable trade balances and built up a sterling balance of some £1200 million. Since the

end of the war, and after independence (1947), the position has entirely changed. The figures for all sea, land, and air-borne merchandise show consistently adverse trade balances from 1950-1 to 1954-5, varying from £18 million (1950-1) to £160 million (1951-2), with a latest figure of £51 million (1954-5). The prin. exports, in money value, are tea, cotton manufs., jute products, hides and skins and leather goods, and oils. The prin. imports, also in money value, are machinery, oil, raw cotton, grain and flour, metals and ores. The changing pattern of trade and the adverse balance are clearly related to the Five-year Plans and I's determination to build up indigenous industry, but not at the cost of agriculture or of increased austerity. I. still retains (1955) a sterling balance of £550 million, and if the great expenditure involved in the Second Five-Year Plan is likely to constitute a severe drain upon all external balances, the risk is a calculated one.

**Education.** Education in I. has since 1921 been under the administrative control of state govs. The central gov. has, however, taken an increasing interest, both through financial subvention and through experiment and example. In 1951 it was estimated that only 16.6 per cent of the pop. were literate, i.e. could read and write in some language. It is therefore not surprising that the constitution requires that by 1961 compulsory education should be provided for all children up to the age of 14. In 1955-6 provision was in fact made for 50 per cent of such children.

There are (1953-4) 239,118 primary schools providing for 21,000,000 children, 25,684 secondary schools providing for 6,400,000 pupils, 467 colleges catering for 511,000 students, and 30 univs. for 41,000 students. The total of all enrolled students, including special and vocational institutions, is 29,536,000. The total expenditure is about £112 million. The contribution by the central gov. is, of necessity, confined mainly to univs. special and vocational training, and to the co-ordination of inquiry and experiment. A particular problem facing all educational institutions in I. is the constitutional requirement that Hindi should be the official language by 1962. In addition to the fact that strong opposition to the change has been voiced, particularly in S. I., the practical problems of providing enough teachers fully versed in Hindi and of producing text-books, especially on scientific and technical subjects, in that language make it probable that a longer period will have to be allowed.

**Communications.** All railways in I. are State-owned, and with a mileage of 34,100 claim to be the largest system in Asia and the fourth largest in the world. Having carried (1953-4) 1220 million passengers and 99 million tons of goods, the claim may well be justified. The train mileage run was 195 million m., and net earnings were over £30 million. The railways are organised in 7 zones, and overall control and administration are in

the hands of the Railway Board in Delhi. A major problem has been one of rehabilitation and replacement after the war and, later, partition. £300 million was allotted for this purpose in the First Five-Year Plan. Capital expenditure of £90 million was provided for 1955-6. Both locomotives and all-steel coaches are now being produced in I. Little electrification has yet been undertaken, the total electrified mileage being only 240. Plans for further suburban electrification around Calcutta and Madras are now in hand.

There were in 1951 97,000 m. of metalled roads and 147,000 m. of unmetalled. For a country of I's size and character, where roads must for many years constitute by far the most used means of communication, these figures are obviously inadequate. In 1947 the central gov. undertook responsibility for constructing and maintaining national highways; all other roads are the responsibility of state govs. National highways at present total about 13,800 m. The First Five-Year Plan provided for the construction of some 6000 m. of new surfaced and 20,000 m. of unsurfaced. The Second Plan provides an even more ambitious programme.

Civil aviation has obviously a great part to play in a country of such great distances, and is rapidly assuming an important role in I's communications system. There are altogether 81 aerodromes under gov. control and operation, of which 3 are international airports—Bombay (Santa Cruz), Calcutta (Dum Dum), and Delhi (Palam). A further 9 aerodromes have been declared customs aerodromes. A further 13 are under construction or contemplated. A Civil Aviation Training Centre has been estab. at Allahabad. There are 12 subsidised flying clubs. All air transport is nationalised and controlled through 2 corporations, Air I. International and Indian Airlines Corporation.

**Defence.** The supreme command of all armed forces in I. is vested in the President. The minister of defence exercises overall control of all the 3 services. Each service is under the command of a Chief-of-Staff.

The Indian Army, with a hist. and tradition of gallantry, determination, and efficiency second to none in the world—a tradition fully maintained—is divided into 3 commands, each under G.O.C.-in-C. of the rank of lieutenant-general. Is now self-sufficient in respect of training. The National Defence Academy was estab. at Khadakvasla near Poona in 1954, and the Staff College has been estab. at Wellington. Both these institutions cater for army, navy, and air force cadets and officers. There are also a number of schools and specialised training centres. There is a Territorial Army, in which applicants are enrolled for 7 years' training, followed by 8 years in the reserve. There is also an Auxiliary Territorial Army, now called the Lok Sahayak Sena, training with which involves no liability for military service.

The Indian Navy is in the process of slow but steady expansion. Its prin. ships at present consist of 2 cruisers, 3 destroyers, 7 frigates, and a number of subsidiary ships, including mine-sweepers. It has 3 bases at Bombay, Cochin, and Vizagapatam. It has a small naval aviation wing.

The Indian Air Force dates back to 1933, and was considerably expanded during the Second World War. It has further expanded since 1947, and now operates under 3 commands, Operational Command at Delhi, Training Command at Bangalore, and Maintenance Command

bank-notes, of holding reserves to maintain monetary stability, and of operating the currency and credit system of the country. It also conducts all gov. banking operations. The State Bank of I. is a commercial bank, providing credit for industry, trade, and commerce.

Both the central gov. and the state govts. collect and spend public money. Audit, which is independent of the executive, examines the accounts of all govts. The prin. sources of central revenues are customs, excises, corporation and income taxes, and estate and succession duties. In the state govts. the prin. receipts come

*The High Commissioner for India*

#### PARLIAMENT BUILDINGS, NEW DELHI

at Cawnpore. There are 2 colleges for flying training at Begumpet and Jodhpur, a college for technical training, and a college for training in ground duties. An auxiliary unit has been estab. at New Delhi.

Attention is now being given to the provision of ordnance and equipment from internal resources. In addition to the utilisation of existing factories, a Defence Production Board has been set up to regulate and co-ordinate research and production.

**Currency and finance.** The monetary unit in I. is the rupee, until recently of 16 annas, but now (1957) of 100 naya paise. There will be coins of the value of 1, 2, 5, 10, 25, and 50 naya paise, and 1 rupee. The sterling value of the rupee is roughly 1s. 6d. A lakh of rupees is 100,000 (roughly £7500) and a crore of rupees, a hundred lakhs, is 10,000,000 (roughly £750,000).

The Reserve Bank of I., estab. in 1935, has the duty of regulating the issue of

from land taxes, sales tax, certain state excises, motor vehicles tax, stamps and registration, and agric. income tax. The central gov. revenue account, which has shown surpluses until 1954-5, shows a deficit for 1955-6 of about £13 million, and the budget for 1956-7 forecast a deficit of about £39 million. A noteworthy feature in the overall monetary position in I. is the increase in small savings from £191 million (1948-9) to £474 million (1956-7 estimated).

**Constitution.** A Constituent Assembly began work in I. in Dec. 1946, before the Indian Independence Act of 1947 was passed and all power transferred from Britain. A Constitution Bill was completed and adopted in Nov. 1949, and the new constitution inaugurated on 26 Jan. 1950.

By the Act, I. is declared a Sovereign Democratic State. It is a Union of States, now by amendment of the original Act numbering 14 (including the ter. of Jammu and Kashmir under dispute with

Pakistan), and 6 centrally administered areas. Five chapters of the Act set out the fundamental rights of citizens and the 'Directive Principles of State Policy.' The latter are not enforceable through action at law, but are declared fundamental in the governance of the country.

All executive authority is vested in the President on the advice of ministers; he is assisted by a Vice-President.

Parliament consists of 2 houses, the Council of States (Rajya Sabha), the upper house, and the House of the People (Lok Sabha), the former consisting of not more than 250 members, and the latter of not more than 500 members.

The executive authority in each state is vested in a Governor, appointed by the President, advised by a council of ministers. In some states there are 2 legislative houses, a Legislative Council, the upper house, and a Legislative Assembly; in others there is 1 only, a Legislative Assembly.

The subjects on which the central and state govts. are competent to legislate are set out in 3 lists—the Union List, the State List, and the Concurrent List. Where there is any repugnancy between Union and State legislation on matters falling within the Concurrent List, the law of the Union prevails.

The constitution can be amended only by means of a bill, passed in both houses of the Union Gov. by a majority of not less than two-thirds of the members of each house present and voting. There have so far been 4 Constitution (Amendment) Acts.

The constitution, which is a document of considerable interest to historians, was framed only after an intensive study of democratic constitutions in many parts of the world, and represents a conscious attempt to embody any features adaptable to Indian circumstances and proved by experience to be salutary and workable. It may well be too early yet to assess whether the somewhat remarkable 'Directive Principles of State Policy' may not give rise to controversial interpretation and practical difficulties; they have not yet done so. It is of interest to note that in a particularly important and practical matter, namely, the allocation of legislative authority between the Union and state govts., the framers of the constitution derived much assistance from the old Government of India Act of 1935.

*History from August 1947.* It is not possible within a period of 10 years to arrive at any strictly historical assessments; nor is it accurate to suggest that hist. can be displayed as starting from a particular date. Nevertheless the division of the Indian subcontinent into two self-governing units in 1947, based as it was on acute political divergences intimately related to the withdrawal of a foreign governing power, makes it necessary to take a view, however inadequate it may be, of the prin. events which, as seen from so close, have marked the evolution of the new, divided, independent I. It is not even possible to determine whether the

evolution has been most significant in the internal or the external sphere; but for the sake of easy reference the two may be treated separately.

Internally, perhaps the most important—or rather most fundamental—factor has been the continuing political predominance of the Congress party. This of itself has assured a continuation, though not without noteworthy modifications, of the basic political ideas, on both internal and external policy, widely preached and disseminated during the last 25 years of Indian nationalist opposition to Brit. rule in I. It has meant that the initial years of the sudden transition from dependence to independence, fraught in many comparable cases with particular danger of instability and violence, have passed with exceptional smoothness and tranquillity. There has been in fact only one recognisable challenge to Congress authority. This came from the Communists who, in 1948, embarked upon a programme of violent resistance to the Congress gov. There were areas, notably in Hyderabad and the bordering Andhra ter., where for a time the local authority of the new Gov. of I. was virtually overridden by Communist gangsters, who collected the local revenue and set about a redistribution of land. At the same time in large towns, such as Calcutta and Kanpur (Cawnpore), public life was rendered irksome and insecure by continuous disruption of public services, such as railways, trains and buses, and public conservancy. There is no doubt that the Communists grossly over-estimated their own popular appeal at the time, and that public anger against them steadily increased; but it is to the lasting credit of the new gov. that they recognised the challenge for what it was, and showed no hesitation in meeting it with the sternest measures; measures which, 2 or 3 years earlier as a nationalist opposition, they would themselves have been the first to condemn. The Communist campaign of violence was quickly and ruthlessly crushed, and the tactic of violence abandoned by the Communist party. It remains a fact that, this episode apart, there has been no organised and united political opposition to the Congress party, and that many Indians themselves deplore the lack of a proper corrective, essential to a lively, democratic parl. form of gov.

It is also remarkable that at the same time as having to deal with the Communist challenge, the new Gov. of I. went steadily and successfully ahead with the integration in the Union of the many and diverse Princely States. While it is certainly true to say that a great majority of these states had, apart from their treaty relations with the Brit. Gov., no valid economic justification for an independent existence, it is also true that, economically and administratively, certain of the larger states could claim favourable comparison with any more democratically controlled unit. The pressure exercised by the Gov. of I. was no doubt considerable, but the fact that with the exception

of Hyderabad (q.v.) and Junagadh—and of course of Kashmir where differences with Pakistan still subsist—the integration was completed with peace and speed is a tribute to the good sense of the former rulers and to the accommodation of the Gov. of I.

It was at just this time too that I. suffered the shock of the assassination of Mahatma Gandhi, on 30 Jan. 1948. While Gandhi's association with the Congress party had always been rather as a mentor than a member, it was his name that represented the nationalist spirit to untold millions in the country, and though he had specifically refused to take any part in the independent gov., his influence remained. It is no small achievement by those who have taken his place that while keeping his memory green they have at the same time estab. a firm hold upon the affections of the great mass of the people and translated his maxims into practical action which might well have surprised Gandhi himself.

The first general elections were held in 1951-2, with some 170 million voters. The Congress party was returned with a sweeping majority at the centre and in nearly all states. By common accord of all foreign observers, the arrangements for and conduct of the elections were of a high standard and genuine impartiality, no mean administrative feat. The second general elections were held in 1957. Once again the Congress party had a great majority at the centre, and in all states except one. In the state of Kerala the Communist party won a bare majority and took office as the new state gov. The extent to which a party so fundamentally opposed to the Congress party and its principles can work in with the Union and other state govts. will be watched with the keenest interest and concern.

The First Five-Year Plan was inaugurated in 1951. This is discussed under the sub-head *Planned Development* above, but must be mentioned here, for it constitutes in a sense the greatest event in the internal hist. of the independent Gov. of I. It will be admitted, or avowed, by most concerned with the plan that it was an act of faith, both in the gov.'s own powers of organisation and administration, and in the people for whose benefit the plan was designed. Though great thought was given to its devising, it remained largely an experiment. Now with the Second Five-Year Plan announced (1956) on a much more ambitious scale, the Gov. of I. is in effect claiming the success of the experiment and the vindication of its faith. That the second plan may have to be in some aspects modified and curtailed for purely financial reasons looks at present (1958) probable; if that should be so, it need do nothing to detract from the remarkable advances so far made, or from the basic confidence of the people of I. in a gov. of their own choosing.

Finally, mention should be made of the revision of state boundaries and the

reduction in the number of states in the Union. From pre-1947 days the Congress party had been advocating such a revision on a language basis, but from an early date after 1947 it became increasingly apparent to them that, desirable as it might be to draw boundaries as nearly as possible on such a basis, the effects must be not only to create awkward minority language problems, but also to disrupt social and economic bonds to a greater extent than had been previously anticipated. The solution has in fact compelled a compromise in 2 important states, Bombay and the Punjab, which remain bi-lingual. It has also been to a large extent responsible for the disturbing political result of a Communist gov. in Kerala state.

In external affairs the development of the new, independent I. has been no less striking, though the impact has been, or at present appears to have been, less specific. It should be remembered that until 1947 the whole conduct of I.'s foreign relations was in the hands of officials who, in the last resort, received definite instructions from the Brit. Gov. in London, and though Indians were members of the so-called foreign service, no Indian politician had practical experience of the conduct of foreign affairs in the way that many of them, in local gov., on committees and so forth, had in the conduct of home affairs. This is not to say that many of them had not made foreign affairs a special study, and none more than the Prime Minister, Jawaharlal Nehru.

Since independence Mr Nehru has been the Minister for External Affairs as well as Prime Minister, and the stamp of his thought has appeared plainly in all manifestations of I.'s foreign policy. There is no doubt that, with the exception (until very recently) of the Communist party, that policy has had the full approval of all political parties and the great mass of the Indian people. It is not surprising that the policy of 'non-alignment' should represent much in the past hist. of the Congress party and of Mr Nehru himself. It represents in international affairs the full essence of nationalism, of independence, of the determination to stand unaided and, if necessary, alone. It also represents the firm, liberal conviction that there is no problem, however thorny, which will not yield to argument, discussion, and negotiation, and that once a solution is found the antagonists can, as Gandhi always urged, become the best of friends. In many instances the stand taken by I. in foreign affairs has appeared puzzling and unrealistic to W. observers; yet throughout there has been a conscious and consistent effort to act in accord with the simple principles described.

It is possible to distinguish certain events which for the present must be regarded as indicative of a conscious external policy. Though deeds are more important, and more significant, than words, it is worth quoting Mr Nehru's first public statement of foreign policy

(Mar. 1949), since it is one he has often repeated: 'We are friendly with all countries. . . . Our main stake in world affairs is peace: to see that there is racial equality and that people who are subjugated should be free.' To this should be added other and repeated statements that while I. had no claim or desire to speak for Asia, or to lead Asia in any political sense, the fact could not be denied that both by tradition and culture, and by historical association and analogy, I. could claim a more intimate understanding of the aspirations of Asian countries than any W. powers, however well intentioned.

The first practical demonstration of this line of thought was the invitation to Asian govs. to attend a conference in Delhi in 1948 to consider in particular the position in Indonesia and the relations between Indonesia and the Dutch Gov. It cannot be said that the conference was particularly successful in suggesting solutions for particular problems, but it can be argued that it prescribed the pattern for much that followed.

Within the next few years I. estab. diplomatic relations with all the prin. world powers, including Russia and China, making it clear at the same time that she would join no bloc, military or political. The aversion from commitments in the international sphere has only increased with time. Yet the attachment to, and membership of, the Commonwealth remains. As Mr Nehru has often explained, this is because membership of the Commonwealth offers practical advantages and imposes no restrictions; it is in no sense a bloc.

I.'s next major adventure in the international field concerned the fighting in Korea. She gave her whole backing to the U.N. intervention, and her representative remains the chairman of the Repatriation Commission in Korea.

In 1952 I. played a leading part in the conference of the so-called Colombo Powers (I., Pakistan, Burma, Ceylon, and Indonesia), at which means were sought to avoid or avert a military conflagration in Indo-China, and in 1954, at the Geneva Conference of Heads of States, the influence and exertions of I. were wholly directed, with success, towards achieving a stoppage of military action there.

It was in the same year (1954) that Mr Nehru, in collaboration with Mr Chou En-lai, Prime Minister of China, committed himself to a formulation of the principles which should govern the relationships between independent states, the 'Panch Shila' or 5 principles:

(a) mutual respect for each other's territorial integrity and sovereignty; (b) non-aggression; (c) non-interference in each other's internal affairs; (d) equality and mutual benefit; (e) peaceful co-existence.

Finally, in 1955, by participation in the Afro-Asian Conference at Bandung, I. committed herself, at least by implication, to a recognition in principle that the desire of African peoples to be free of colonial authority corresponds to an

element in the desire of I. to be independent and free of all commitments.

There are two other problems in I.'s foreign relations which deserve mention. The first is the question of Goa, which remains Portuguese ter. within Indian territorial limits. There is pressure from within I. to absorb this enclave within the Indian Union by force if necessary. While using every other means of pressure open to them, the Gov. of I. have steadfastly refused to contemplate a resort to force, and continue to affirm their faith that common sense and geography will in due course compel a solution in their favour.

The other problem is that of Kashmir. In many respects this is not strictly an external problem since it arises from the partition of I. in 1947. Yet Pakistan, though also a member of the Commonwealth, is as independent as any other country, and it must be recorded with regret that so far there is no sign whatever of agreement between I. and Pakistan in this respect. While it is true that both countries have repeatedly avowed their belief that any resort to force is out of the question, it remains a hard fact that both consider themselves bound to large, defensive measures, the cost of which they can ill afford.

It must be repeated that this brief account of the development of I. as an international power is in no sense a hist. It would be easy to quote instances of I. taking positions both at the U.N., where she exercises no small influence, and elsewhere which might seem either unrealistic and impractical, or difficult to reconcile with the trend suggested. It should be remembered that the years following the Second World War, and the years which followed Indian independence, were in the international field the most crowded, the most complicated, and possibly the most menacing period that hist. has ever seen. That a nation newly independent, lacking international experience and faced with internal tasks of vast magnitude, should at times appear to steer an uncertain course should cause no surprise. A comprehensive bibliography will be found under INDIAN SUBCONTINENT. See also HINDOSTANI LANGUAGE AND LITERATURE; INDIAN ARCHITECTURE; INDIAN ART; INDIAN LANGUAGE; INDIAN LITERATURE.

**India House**, name by which E. India House, demolished in 1861, the H.Q. of the old E. India Co., in Leadenhall Street, was known. Prior to such occupation the company transacted its affairs from 1621 to 1638 in Crosby Hall, Bishopsgate. The modern I. H., which is situated in Aldwych, London, and now houses the prin. offices of the Indian High Commissioner to the U.K., was opened by the King-Emperor and Queen-Empress in July 1930. The new building was the outcome of proposals submitted by Sir Atul Chatterjee (q.v.). Lord Irwin's gov. ultimately accepting the project, and the Legislative Assembly voting the sum of £324,000 for erection and equipment.

See also

The building is essentially Indian in provenance; its purposes are not exclusively official, but are also directed towards providing a London home for India. It is the work of Sir Herbert Baker, who had much to do with the building of New Delhi.

**India Office.** Brit. Gov. dept set up in 1858 to administer the affairs of India. Its political head, the secretary of state for India, was assisted by an under-secretary of state. The I. O. estimates were met from Indian Gov. funds. Prior to 1858 Indian affairs were conducted by the E. India Co., under the supervision of a gov. Board of Control, whose president was responsible for Indian affairs in Parliament. On the transfer of India to the Crown in 1858 the secretary of state was assisted by a consultative council; this council ceased to exist only in 1937 when some of its functions passed to a body of advisers. In 1947, when India and Pakistan assumed dominion status, the I. O. as such ceased to exist, its functions being taken over by the Commonwealth Relations Office. See Sir M. C. C. Seton, *The India Office* (Whitehall Series), 1926.

**Indian Archipelago.** see EAST INDIES.

**Indian Architecture** has a most complicated hist. There are very anc't ruins at Harappā and Mohenjo-daro, c. 3500-2700 BC, also Buddhist shrines of the 3rd cent. BC at Sanchi; the chief surviving buildings elsewhere date from the 3rd cent. BC onwards. Up to the time (c. AD 1775) when the Brit. occupation became effective, they chiefly comprised (i) Buddhist temples; (ii) Hindu and Jain temples and palaces; (iii) Muslim mosques and palaces. The earliest Buddhist temples, e.g. at Karli and Nasik, were hewn out of the solid rock, with rows of massive stone pillars leading up to an apse containing the *chaitya* (shrine). There were also numerous Buddhist *viharas* (monasteries). Hindu temples usually contain a cell for the shrine, crowned by a curvilinear or pyramidal tower (*sikhara* or *vimana*), an entrance porch, a pillared hall (*mandapam*), and a lofty gateway (*gopuram*). After their conquest of India in 1193, the Muslims began to erect their characteristic mosques (see MOSQUE and MUSLIM ARCHITECTURE), more or less in the style that they had adopted in Persia; but fusion with the Hindu tradition resulted in a hybrid style, due partly to the employment of skilled Hindu craftsmen, and eventually produced the famous Mogul or Mughal style of the 16th-17th cents., at Delhi and elsewhere. The chief Muslim buildings in India (which contrast sharply with the shapeless and over-decorated Hindu temples, but are nevertheless often richly ornamented) are the Great Mosques at Delhi, 1198, Ajmir, c. 1200, and Cambay; the Atala Masjid at Jaunpur, 1408; the Moti Masjid at Delhi; the Great Mosques at Jaunpur, 1438, and at Mandu, 1454; and sev. mosques at Ahmadabad, 15th cent. Among the prin. Mogul examples are famous mosques,

tombs, palaces, etc., at Agra, Delhi, Lahore, Fatehpur Sikri, Udaipur, and Bijapur. Most important among them are the tomb of Humayun at Delhi, 1565-9; the fort at Agra, 1566; the palace and the Great Mosque at Fatehpur Sikri; and the Taj Mahal at Agra (1631-53). From the middle of the 17th cent. Mogul architecture declined, India being disturbed by wars. After the Brit. occupation (c. 1775) W. styles of architecture were introduced—first as the 'Greek Revival' (q.v.), then the 'Gothic Revival' favoured by Sir George Gilbert Scott (q.v.), then some praiseworthy attempts to revive the Mogul tradition (see LANCHESTER, H. V.), then the building of the new Delhi (see BAKER, Sir H. and LUTYENS, Sir E.), and finally the planning of a new capital of the Punjab (see FRY, E. M. and 'LE CORBUSIER'). See J. Fergusson and J. Burgess, *The Cave Temples of India*, 1880; J. Fergusson, *History of Indian and Eastern Architecture*, 1910; and E. B. Havell, *Indian Architecture*, 1913.

**Indian Art.** The earliest known art of India is that of the Indus valley culture (q.v.), dating from about 2500 BC and having affinities with the Sumerian art of Mesopotamia. The Indus culture was succeeded after an unknown interval of time by the Aryan culture which again centred in the Indus valley and dates perhaps from 1000 BC or earlier. This age is known from the Vedas, but few buildings or sculptures of the time have survived. The first period from which dates a continuous knowledge of I. A. comes considerably later. During the reigns of Chandragupta Maurya (322-298 BC) and of his grandson Asoka (273-232 BC) (q.v.), in particular, it is known that sculpture and architecture, the arts in which India has made its greatest contribution to the world, flourished. Persian influence had been in existence since about 800 BC, and was particularly evident during the Mauryan period. The commemorative pillars erected by Asoka may have been Persian in origin. Asoka, being a devout Buddhist, also built a number of burial mounds enshrining Buddhist relics. The greatest of these was the great *Stupa* or burial mound at Sanchi in Bhopal. Among smaller works a number of interesting portrait heads in sandstone and groups of figures in terra-cotta have survived. Early I. A. is realistic, sensuous, pantheistic, seldom idealistic. The tradition continued during the post-Mauryan periods—the Sunga and Kanva dynasties from about 200 BC up to AD 20. Literary evidences show that painting was also practised, mainly as mural decoration. Some of the paintings in the famous Ajanta (q.v.) caves in the Deccan belong to this early period. The Ajanta frescoes were painted over a period from 200 BC to the 7th cent. AD. They depict realistic scenes from Buddhist life, and parables from the Buddhist religion, and as compositions are among the great works of art of the world. Long subtle curves, bold and vigorous lines, and uniform thickness

of line are the chief features. Gk infiltration (327 BC-50 BC) gave rise to the Gandhara (Indo-Gk) school of sculpture. Gk and early Christian influences were also felt as a result of the trade carried on in the empire estab. by the Kushan kings, particularly Kanishka (AD 120-162). From this time date the early sculptured figures of Buddha which have become so well recognised a feature of I. A. The Kushan empire was succeeded in N. India by the Gupta dynasty when Chandragupta I came to the throne in

dynasty and its successor, the Chalukya, are remembered for their elaborate temples hewn from the rock.

Some of the glories of Gupta art were revived in N. India during the reign of Harsha. With the death of Harsha in AD 647 the hist. of art in the N. shifts to the kingdom which was founded in Bengal by the Pala dynasty in AD 750 and lasted until the Muslim invasions of the 12th cent. Much intricate and carefully wrought metal work belongs to this period. The sculpture, notably Buddhistic figures in black slate, approximates to metal work and lacks the sensuous modelling of earlier periods. Artists whose names are known through the writings of a Chinese missionary as having belonged to the Pala school of art are Dhiman and his son Vitapala.

During the medieval period, the 600 years from the death of Harsha to the Mohammedan invasions, architecture was the prin. form of art. Much was destroyed by the Muslims. The Rajputs of the 10th and 11th cents. undertook many great building and engineering feats. A medieval Indo-Aryan type of architecture was evolved in N. India, characterised by a curvilinear spire pointed at the top and bulging in the middle. This was unknown in S. India, where the Dravidian pyramid tower prevailed. Delhi was captured by the Muslims in 1193, an event which was commemorated by the founding of a mosque, the earliest Islamic building in India. Indo-Islamic architecture now came into being. The dome and minaret were introduced and combined with the indigenous features of Hindu art. An outstanding monument of this period is the enormous Qutb Minar, a mosque over 200 ft high started at Delhi by the sultan Qutb-ud-din-Aibak and completed in 1332. Among others of the Delhi sultans who were great builders was Feroze Shah Tughlak (1351-88), who with the aid of his architect Malik Ghazi Sabana enriched Delhi and built many new tns. He was also careful to restore earlier monuments. Before India came under the rule of the Mogul emperors, mention must be made of the artistic achievements of the emperors who ruled in Vijayanagar in the Deccan from 1336, the traditional date of the founding of the empire, until 1565 when the city was sacked by Muslim armies from the N. The temples built under the Vijayanagar dynasty show a magnificent and exuberant style, contrasting with the more austere Indo-Islamic style. The arts of painting and sculpture also flourished.

Under the Mogul emperors a blending of Hindu, Islamic, and Persian styles resulted in a flowering of the arts, particularly architecture and sculpture. The beautiful city of Fatehpur Sikri is perhaps the greatest monument to Akbar, who, however, planned his own mausoleum at Sikandra. This with its 4 terraces and white marble superstructure was completed in 1612 during the reign of Jehangir. To his successor Shah Jehan (1627-58)

*Indian State Railways*

'TOILET SCENE': A FRESCO PAINTING  
AT AJANTA

AD 320. The dynasty survived for nearly 300 years, when it was finally overcome by the invasion of the Huns, as a result of which few examples of the art of the period have survived. Enough is known, however, to show the excellence to which the art of sculpture attained, especially in the scenes depicted on the walls of temples. The Gupta period is in fact reckoned as the great age of Indian sculpture. The style is less heavy than that of earlier years and is richly decorative. It was the Gupta artists who evolved the most perfect forms of the Buddhist and Brahmin divinities. Metal casting was carried out with enhanced excellence, a remarkable example being the colossal statue of Buddha from Sultan-ganj of the 5th cent., now in the Birmingham museum. The stability given to the country by the Andhra dynasty, which lasted from 225 BC to the 3rd cent. AD, allowed continuous development. This

are owed some celebrated examples of Mogul architecture—the mausoleum of Jehangir near Lahore, and at Agra the Pearl mosque and the Taj Mahal. The Persian influence predominated over the Hindu and decoration became more elaborate than was to the taste of the earlier Mogul emperors.

Painting received a great impetus through the patronage and connoisseurship of the 3 Mogul emperors, Humayun, Akbar, and Jehangir. Humayun, father of Akbar, spent some years of exile in Persia, and on returning to his throne he brought with him Persian painters who

religious reasons. Rajput painting continued into the 18th and 19th cents. and centred particularly in Jaipur. Later Rajput painting is seen at its best in the Pahari art, named from the hill country of the Punjab where it flourished. It was divided between the schools centred at Jammu and Kangra. Kangra painting is graceful in line and soft in colouring. In the 19th cent. it declined, although portrait painting was encouraged by the Sikh rulers of the Punjab. As the cent. advanced W. influences weakened many of the distinctive features of Indian art, but in the early 20th cent. a movement in recognition of the artistic heritage of India, in which the Tagore family was prominent, brought about a renaissance of the arts: Dr Abanindranath Tagore has given a unique example of successful return to tradition in brilliant paintings. In Bombay a contemporary school of art sought to assimilate European influences, especially French.

The impetus started by Tagore has led to a revival throughout India. Nandal Bose, Asit Haldar, Sarada Ukil, P. K. Chatterji, and D. P. Roy Chowdhury are prominent names in the revival. Another artist who found inspiration in the Ajanta style was the girl Amrita Sher Gil, who *d.* at an early age. More recently artists have been trying to turn from revivalist work to serious work on modern themes. See A. Grünwedel, *Buddhist Art in India*, 1901; E. B. Havell, *Ideals of Indian Art*, 1911; V. Indian Language. To-day the very speech of the people in India and Pakistan has become a matter of bitter communal dispute. Most of the peasants continue to talk the speech of their fathers, but the literate minority and politically conscious town-dwellers and students argue about the rights and wrongs of the 'Hindu-Urdu controversy.' The subcontinent possesses hundreds of languages, dialects, and sub-dialects; but when tribal idiom and local variants have been eliminated, we have some 15 major or literary languages, some alike, and some, especially the Dravidian, very different. But the Hindi-Urdu advocates can rightly claim that so far as the ordinary person, especially in the N., is concerned, the only common language is bazaar Hindustāni (see HINDUSTĀNI LANGUAGE AND LITERATURE)—a pidgin form of mixed High-Hindi and Urdu, which together constitute the same language written in different scripts, and compose the lingua franca of nearly

THE GROTTA TEMPLE OF VISHNU  
KARMAH

One of the many underground temples in India, and probably the most ancient type of temple.

influenced the Hindu school. Painting has had a long tradition in India. Mention has already been made of the Ajanta frescoes. Mural paintings of great merit also survive from the 4th to 6th cent. in the caves of Bagh, nearly 300 m. N. of Ajanta. These apart, however, and except for some MS. illustrations of the medieval schools of painting in Bengal, Nepal, and Gujarat, little survives from the cents. before the Mogul era. Mogul painting is mainly miniature work, but derives from Persia and not from the traditional style of MS. painting. Akbar had a number of painters working for him, many of them Hindu and many whose names are known. Subjects chosen were portraits of men of the time and scenes chronicling events. W. influences were also felt. Gradations of tone, effects of light and shade are features of Mogul painting. In this it is distinguished from the work of the painters of Rajputana, Bundelkhand, and the Himalayan Punjab. Rajput painting derived from the traditional mural art and was devoted to illustrating the stories of legend and religious epic. The colouring is mostly flat. The 2 styles often intermingled but in the best work are distinguishable. Mogul painting declined during the reign of Aurangzeb, who discouraged the arts for

200,000,000 people. This is also the literary language of 100,000,000 people, and the third largest language in the world. Unfortunately this bazaar Hindūstānī is a basic tongue, ill adapted for the expression of ideas more complex than simple direction and marketing. Hence, English still remains the normal language of communication between the better educ. Indians from all parts of the subcontinent in a very similar way to that in which Latin in the Middle Ages was the lingua franca of the nobility and ecclesiastics all over Europe. But just as the Latin of the Middle Ages was far removed from the classical Latin of the schools, so the English of India shows signs of becoming a very different tongue from the English of England to-day. The difference is due to ignorance, historical circumstance, and natural development. There remain, however, a large number of Indians—business and professional men—who use English with the greatest facility, but use words and forms of speech which sound unfamiliar to the contemporary Brit. ear. The speed, and height of pitch, in Indian speech in English are its most constant qualities, and the extreme form is found in Anglo-Indians (Eurasians), who all, to the non-Celtic ear, seem to speak like Welshmen.

Some 225 languages are recorded in linguistic surveys as vernacular in India and Burma. Briefly they may be divided as follows: (1) W. Hindi, with its main dialect, Hindūstānī, in Urdu and Hindi forms; (2) E. Hindi; (3) the central group: (a) Punjabi (including Lahnda or W. Punjabi), (b) Sindhi, (c) Rajasthani, (d) Gujjarati, (e) Kashmiri (main dialect Kашtawari); (4) Pahari, divided into E., W., and Central; (5) the E. group: (a) Bengali, (b) Bihari, (c) Oriya, (d) Assamese; (6) S. India group: (a) Marathi, (b) Saurashtri, (c) Hindūstānī. Apart from these Indo-Aryan languages, there are the Dravidian languages (Tamil, Telugu, Malayalam, and Kanarese) of S. India, and the Kolarian or Munda language spoken in central India. For further details on the languages of India see INDO-EUROPEAN LANGUAGES.

**Indian Literature.** The greater part of the literature dating from 1000 BC is of religious inspiration, and each religious sect possesses its own sacred books. The most important of these are the *Veda* (q.v.) of the Brahmins and the *Tripitaka* of the Buddhists. Then there are also the heroic songs, the fairy-tales, and the myths, together with a vast amount of gnomic poetry which is faultlessly executed. Scientific work in India has never been divorced from literature proper, and verse has been the medium not only for biography and hist., but also for treatises on medicine, architecture, astronomy, philosophy, and law. India's languages belong to at least 3 main linguistic families; and besides the Indo-European languages, of which the Indo-Aryan is the most complicated branch, there are Dravidian and Kolarian languages (see INDO-EUROPEAN LANGUAGES).

The *Veda* is one of the oldest and most important of the literary works belonging to the Indo-European languages. It is not a series of books, like the Heb. Bible, but a great literature which grew during the cents., and for many generations was handed down verbally. The Vedic literature is now separated into 4 classes—*Samhitas* or collections of hymns; *Brahmanas*, prose texts; *Aranyakas*, forest texts; and *Upanishads*, secret doctrines. The *Samhitas* may again be divided into 4 divs., and it is because of these divs. that the Vedic literature is sometimes spoken of as *Vedas* instead of *Veda*. The *Kalpāsūtras*, manuals of ritual, also form a literature closely allied to the *Veda*, but as it is not considered to be of divine revelation it is not included in the Vedic literature proper. The first traces of epic poetry are to be found in the *Veda*, but later a whole heroic literature grew up, sung by the *sūtas* or bards at various festivals. These epics and ballads have been collected into 2 great epic works which are rather complete literatures in themselves than single poems. The first of these, the *Mahābhārata* (q.v.), is the narrative of the battle of Bharatas, and the author is traditionally supposed to be an anct mythical seer, Vyāsa, who is also supposed to have compiled the *Veda* and the heroic poems, *Purānas* (q.v.). The second of the 2 epics, the *Rāmāyana* (q.v.), is probably the work of a poet named Valmiki, who as far as it is known lived in the 3rd cent. BC; but much of the *Rāmāyana* seems to have been added at a later date. There is more unity, however, in the *Rāmāyana* than in the *Mahābhārata*, but which of the two is the older it is difficult to determine, because neither may be in its original form. The *Rāmāyana* may be considered the epic of E. India, and the *Mahābhārata* of W. India. The *Purānas* are 'old narratives,' and their date is uncertain, but they belong to a later Indian religion, Hinduism. There are 18 'Great *Purānas*' and sev. lesser ones. The date of the *Tripitaka*, the religious literature of the Buddhists, seems to be between the 4th and 3rd cents. BC. In later epochs there was a great output of writing on other subjects in Sanskrit and Prakrit, including works on mathematics, astronomy, medicine, grammar, and music, as well as dramatic works which have been acted down the ages to the present time and have been depicted in many Indian films. Indian Mallow, see ABUTILON.

Indian Millet, cereal grass, species of panicum (*P. miliaceum*), widely grown in

Mediterranean countries and the E. Believed to have been the first wild grain to be cultivated. Replaces rice in drier climates, a good bread being made from it. Also serves as cattle fodder; also called Kafir corn.

**Indian Mutiny**, see INDIAN SUBCONTINENT.

**Indian National Congress.** The origin of this Congress may be set down to a suggestion of Lord Dufferin's, and the first meeting was held in 1885 during his viceroyalty, W. C. Bonnerji being the first president. This first meeting was attended by 72 delegates, mostly lawyers, schoolmasters, and journalists. A. O. Hume largely inspired the movement, which was meant to grow into a native parliament. At the first Congress loyalty to England was stressed. The next Congress, a year later, had 440 delegates. The movement was in the beginning essentially Hindu and from the W.-educ. classes; the Muslims had little to do with it, the Muslim League Association being their representative body. In 1916 both bodies combined in a declaration for Indian Home Rule, and from that date it should be regarded as the central nationalist movement in the Indian Subcontinent (q.v.). Under the leadership of Mahatma Gandhi it attracted virtually all the enlightened nationalist minds, from moderate and liberal to extreme left, and became a formidable association. Indeed it can reasonably claim to have laid all the main foundations of Indian independence. It passed through many vicissitudes, and opinions within the Congress were often sharply divided. Nevertheless, it remained the one organisation capable of stimulating mass movements throughout the country, and the readiness of the leaders to risk and suffer imprisonment had a lasting effect on Indian minds. Its only serious and effective challenge came from the Muslim League during the last 10 years or so before independence.

Since independence the Congress has become the major political party in India, and has formed govs. at the centre and in the states. There is no sign yet of any other party strong enough to take over power. See further history sections in INDIA and INDIAN SUBCONTINENT. See Sir H. Lovett, *History of the Indian Nationalist Movement*, 1921; J. T. Gwynn, *Indian Politics*, 1924; B. Patlabhi Sitaramayya, *The History of the Indian National Congress*, 1935; C. F. Andrews and G. Mukerji, *The Rise and Growth of Congress in India*, 1937; Sir R. Coupland, *Indian Politics*, 1936-42, 1943.

**Indian Ocean**, bounded on the N. by Asia (Arabia, Persia, India); on the E. by Indo-China, Sunda Is., Australia, and the meridian of the southernmost point of Tasmania; on the W. by Africa and the meridian of Cape Agulhas; on the S. by the 60th parallel of lat., but the S. boundary is variously given by different authorities. From Cape Agulhas to Tasmania is some 6000 m., and this is the greatest breadth of the I. O. The 2 great bays on either side of the peninsula of

India, the Bay of Bengal on the E. and the Arabian Sea on the W., with its arms the gulfs of Aden and of Oman, belong to the I. O. But the Red Sea and Persian Gulf, which communicate with the said arms by the narrow straits of Bab-el-mandeb and of Ormuz respectively, are separate seas. The Pacific Ocean can be approached from the I. O. by means of the channels between the Sunda Is. and the Timor Sea, whilst the Mediterranean Sea in the NW. communicates with the I. O. by means of the Suez Canal and the Red Sea. There are 2 important straits, Mozambique Channel in the W., separating Africa from Madagascar, and Palk Strait in the E., separating India from Ceylon. The I. O. is dotted about with thousands of is., some of which are of coral formation, as the Maldives, Chagos, and Cocos groups; others, such as the Crozet Is. and St Paul's Is., are volcanic. The chief is. in the W. are Madagascar, Mauritius, Bourbon, the Seychelles, and Socotra, belonging to Africa, whilst the prin. is. in the E. are the Laccadives, Maldives, Ceylon, the Andaman Isles, and Nicobar, belonging to Asia. The prin. large rivs. discharging themselves into this ocean are the Zambesi, Indus, Ganges, Brahmaputra, Irrawadi, Godavari, and Krishna. The bed of the I. O. attains to a depth of about 2000 fathoms in some parts. The mean temp. of the surface water is over 80° F. in all parts N. of 13° S. There are 2 warm currents moving southwards, the Mozambique and Agulhas currents, whilst a colder current in the E., called the W. Australian current, crosses the I. O. moving northwards.

**Indian Shot**, or *Canna indica*, best-known species of its genus, and native of S. and Central America and W. Indies. The plant receives its name from the resemblance of its seeds to shot. The seed yields a beautiful red colour. The root-stocks are very large, spongy, and jointed, and are used in Brazil for poultices in tumours and abscesses.

**Indian Subcontinent.** BOUNDARIES. The subcontinent marches with Persia, Afghanistan, China, Nepal, and Burma. It extends from 8° to 37° N. lat., and from 61° to 97° E. long. The total area is approximately 1,586,979 sq. m., and the total pop. about 433 million.

**THE COUNTRY.** The peninsula juts out southward from the mainland of S. Asia. It is a triangle in form, the huge mt ranges of the Himalayas forming the base of the triangle, while the apex runs far out into the Indian Ocean. On its W. coast it is washed by the waters of the Arabian Sea, whilst on the E. is the Bay of Bengal. The extreme length is about 2000 m., and the breadth, at its widest part, is about 1700 m., but the peninsula tapers down almost to a fine point, its S. extremity being Cape Comorin. The southernmost

point is in the very centre of the tropical region, its lat. being about  $8^{\circ}$ , whilst the most northerly point is found well within the limits of the temperate zone, i.e.  $37^{\circ}$  N. Thus the peninsula experiences extremes of weather. In former days—the days of the great companies—the peninsula was by no means altogether under the sway of the British, for the Dutch, Portuguese, and French had settlements on the coast also. The remains of these settlements may be traced in various towns, and even at the present day Portuguese possessions remain. The chief boundaries are: on the N., the Himalaya Mts, which

The mts soar to a height in places of nearly 30,000 ft. and are continually snow-covered. Nevertheless since time immemorial distinct and well-known trade routes have been known and communications kept up with the countries N. of the Himalayas in spite of the barrier of the mts. The Himalayas form a double boundary to the N. and send out also spurs and offshoots which fill the country between the Ganges and the parent mts themselves. On the W. this offshoot is known by the name of the Suliman Mts; on the NE. it forms the boundary between Burma and India, being known as

JAIN TEMPLES AT CALCUTTA

separate Tibet and China; on the W., the Suliman Mts, which border Afghanistan and Baluchistan; on the S. and SW., the Arabian Sea and the Indian Ocean; on the E., the spurs of the Himalayas, which separate it from Burma, and the Bay of Bengal, an inlet of the Indian Ocean. The geography can be the more easily examined and followed if we divide the whole country up into the 3 natural divs. into which it falls: (1) the mt ranges, i.e. the Himalayas; (2) the riv. plains; (3) the peninsula proper, or the plateau, which goes by the name of the Deccan. (1) *The Himalayas*: This series of mt ranges is the loftiest mt system of the world. The range extends for a distance of 1500 m. round the N. boundary of the subcontinent, and sweeps round in a half bend. The most precipitous face of the mts is the S., forming an almost, but not altogether, impassable boundary. In 2 places the mt range is severed by streams: the Dihang R. in the E. and the Indus in the W.

the Naga Mts. The boundary with Baluchistan is also formed by the offshoots of the Himalayas, but these latter offshoots by no means attain the elevation of the others mentioned. The chief passes of the mountainous div. are the Khyber Pass, the Kurram Pass, the Geinal Pass, and the Bolan Pass. These form the chief means of communication between the peninsula and the NW. See also HIMALAYA MOUNTAINS. (2) *The river plains*: This div. is the richest and most populous part. It extends in a broad belt across practically the widest part of the peninsula running from E. to W. From the beginning of hist. we find this area the continual prey of marauding tribes, who sweep down from the hills to plunder. The importance of the mt system, the Himalayas, may be judged when we see the effect of it on the well-watered plains. The riv. system consists of 3 great rivs.: the Indus, the Ganges, and the Brahmaputra. The Indus rises on the

N. slopes of the Himalayas, sweeps round, and enters at the W. extremity of the range, and waters the Punjab. The Ganges is formed by the amalgamation of the streams which drain the southernmost slopes of the Himalayas, whilst the Brahmaputra rises within easy distance of the Indus in the N. slopes of the Himalayas, flows E. N. of the Himalayas, for some considerable distance, and then breaks through the mts at the extreme E. point of that range. It is therefore to be noticed that the riv. system, of such vast importance to the people, is the drainage of both the N. and the S. slopes of the Himalaya Mts. (3) *The peninsula proper, the southern plateau of India:* Its N. boundary is the Vindhya Mts, a range which stretches for about 800 m. from E. to W., and which has 2 peaks at each extremity. In earlier days this formed a fairly effective barrier between the N. and the S. of the peninsula, since the range varies in height from 3000 to 4000 ft. It has long since, however, been pierced by both road and railway, and communication between N. and S. firmly estab. The 2 sides of this triangular plateau, which has the Vindhya Mts for a base, are formed by the E. Ghats and the W. Ghats. The W. Ghats are on an average higher than the E. The 3 chief rvs. of this dist. are the Godavari, the Krishna, and the Kaveri. These rise in the W. Ghats, but discharge into the Bay of Bengal on the E. coast. The W. Ghats, in fact, form such a strong barrier on the W. coast that the line of mts is unbroken by a riv. gorge. The rvs. which rise in the W. Ghats discharge, as already stated, in the Bay of Bengal, and those which drain the Vindhya Mts into the Gulf of Cambay. Chief amongst the latter may be mentioned the Nerbada and the Tapi. The 3 geographical divs. apply in other respects—in speech, language, race, and characteristics.

**GEOLOGY.** The oldest of these 3 divs. is the peninsula proper. It has been land for many thousands of years; indeed it was already dry when the Himalaya region was covered by the sea, from the Palaeozoic to the Eocene period. This much is proved by the marine deposits of the Himalayas. Whereas the Himalayan region is one of great compression, in which masses of Tertiary rocks of vast thickness are overthrust and folded in the most violent fashion, in the peninsula the oldest rocks consist of gneiss, granite, and crystalline formations and are intersected by bands of transition strata of very ancient but undetermined age. The strata are generally found in an undisturbed state, and are of great antiquity. In great contrast to these regions is the region which separates the 2, and which is known by the name of the Indo-Gangetic plain. This plain is covered with alluvium and sand blown thither by the winds. There is no rise in level between the 2 great rvs. the Indus and the Ganges. The alluvial deposits of the plain have been subjected to frequent examination and prove that there has been a gradual

depression of that region even within comparatively recent times. The chief deposits which are found in the Indo-Gangetic plain are gravel, sand, and clay, together with deposits of peat and forest beds. The Delta deposit has also been subjected to close examination, but its depth at this point cannot be exactly calculated. By boring a depth of some 480 ft was reached, but this was known not even to approximate to the real depth. In one part of the Bay of Bengal, which washes the Delta, the currents have apparently washed away the deposit brought down by the rvs. The depth of

U.N.J.C.E.F.

#### PLOUGHING RECLAIMED SWAMPLAND

the bay here is over 1800 ft, so that, allowing for the fact that the rest of the soundings which are taken in the immediate neighbourhood only give, at most, 10 fathoms, we can deduce that the deposit from the riv. has filled up the bay in that part, and that therefore the alluvial deposit equals the depth of the bay, i.e. about 1800 ft. The alluvial deposit of the plain has been proved by boring to be over 1000 ft in thickness and it appears that the depression of the Indo-Gangetic plain is of recent date, and is probably connected with the elevation of the N. mountainous dist., the Himalayas.

**CLIMATE.** Not unnaturally, in an area which stretches from the tropical regions to well into the temperate zone, many differences will be experienced in the climate. Any extreme of climate, then, either of the tropics or of the temperate zone, will be found. The geographical

characteristics have great influence on climate, especially the huge mt barrier of the N., which prevents any influence of the plateaus of central Asia, and the peninsular point surrounded by the sea in the S. The whole country experiences 3 well-marked and well-defined periods—the cool, the hot, and the rainy seasons. The cool months are experienced during Nov., Dec., Jan., and the early part of Feb. The weather is then at its pleasantest, dry and cool. The hot season which follows belongs, at any rate officially, to Mar. From this time until the middle of June there is a continual rise of temp. which is experienced with greatest severity in the centre and the N. The contrast in temp. during the cool months is between N. and S., but during the hot months the contrast is between the interior and the coast. It is in the interior of Sind and the Punjab that the greatest temps. are experienced during this period. The monsoons or the rainy season usually begin about the middle of June. The rainy season lasts for about 3 months, and during that period rain is generally experienced all over the subcontinent, with the exception of the SE., where temps. fall but rainfall is light. At one place the average rainfall for the year is 426 in. (Cherrapunji). The season which immediately follows the rains is the most unhealthy. Over most of the area rain is virtually finished by Nov., but in the SE. the reflex of the monsoon, turned back from the Himalaya Mts, gives heavy rainfall in Nov. and Dec.

**FAUNA.** The lion, although at one time threatened with extinction, is now carefully preserved. The chief beast of prey is the tiger, which is almost ubiquitous. The man-eating tiger is usually an old animal that has become too enfeebled to be able to catch his ordinary prey, but kills often from sheer desire to destroy, and is a real curse to the country in which he is found. The leopard is found in even greater numbers. The cheetah is another type often confused with the leopard proper. Amongst other wild animals to be found are the bear, boar, wolf, fox, bison, buffalo, elephant, and rhinoceros. Wild goats and wild sheep are found at considerable altitudes in the Himalayas. The domesticated animals are chiefly the cow, ox, and buffalo. The 2 latter are used principally as beasts of burden, the cow being regarded as a sacred animal by the Hindus. Horses are bred, and the breed has been improved by the importation of foreign blood. Donkeys and mules are used very considerably. Sheep and goats are plentiful, as is also the pig, but this latter animal is mainly kept by Christian communities. Monkeys and deer of all kinds abound throughout the country.

The rivers are infested with crocodiles and alligators. Poisonous snakes abound, the most deadly being the cobra *dâ capello* (the hooded cobra) and the krait. Another dangerous reptile is Russell's viper; specimens of this latter are usually carried about by the native showmen,

who cause them to assume a position as if dancing whilst they charm them with music.

The birds are of the tropical varieties. The birds of prey include the vulture, the eagle (many specimens of which are to be found), and falcons of all kinds. Herons and kingfishers abound, and are much sought after on account of their plumage. Waterfowl are particularly numerous, also almost all the game birds found in Europe, e.g. pigeons, partridges, quail, and duck of many kinds. The jungle

METHOD

fowl are supposed to be the ancestors of our domestic fowl. The supply of fish in sea, lake, and riv. is exceedingly abundance, and indeed forms a very great proportion of the food of the poorer classes.

**FLORA.** In an area covering both the tropic and temperate zones the vegetation is naturally varied and plentiful. Rice has always been the staple product in the S. and centre, and wheat in the N. The products of the tropical regions are tobacco, sugarcane, and spices. Tea is grown on the slopes of the E. Himalayas, and has become one of the main products. In Assam the tea plant is found growing wild. Coffee is grown in the S. parts of the peninsula. The chief trees which are found are the mango, orange, banyan, and bamboo. The teak and various other trees useful for timber are produced in the more hilly dists., whilst on the slopes of the Himalayas are found the cedar, fir, and

pine. Since a forestry dept was set up for the forests, which previously had suffered much from wanton destruction, the trees are now more carefully preserved. The most indigenous flower is the water-lily, and European flowers are found in the greatest profusion at the present time. The whole of the vegetation, however, may be regarded as an extension of that found in the prin. dists. which immediately border on the peninsula, i.e. of China, Persia, and Malaysia.

**RELIGION.** The chief religions, with the adherents to each as given by the 1941 census, are as follows: Hindu, 254,930,506 (i.e. 65 per cent of the total pop.); Mohammedan or Muslim, 92,058,096 (i.e. 24 per cent), leaving 11 per cent for the remaining religions, including Christians, 6,316,549; Sikhs, 5,691,447; Jains, 1,449,286; Parsis, 114,890; Jews, 22,480. Besides these there are 25,441,489 persons described as 'Tribes', including persons of the Animist religion; many believe in magic and strive to propitiate impersonal forces. Unspecified communities number 409,877 persons. The most primitive of all these religions is that of the Animist. From the Animist to the Hindu is, however, a great step, the chief characteristics of the Hindu faith being the belief in a large number of gods, in the caste system, and in the cow as a sacred animal. Buddhism, Jainism, and the religion of the Sikhs can be held to be almost offshoots of the original Hindu faith, and, in fact, other beliefs which can be held to differ far more than Buddhism from Hinduism are regarded simply as sects or offshoots of the Hindu faith.

Whereas there are innumerable sects and schisms amongst the believers in the Hindu faith, there are but 2 main sects amongst the Muslims—the Sunnis and the Shias. The Sunnis are greatly in the majority. The original Muslim pop. was found amongst the Mongols and Pathans who invaded the subcontinent as conquering races, and even to the present time it is possible clearly to distinguish the descendants of these conquering races, who were originally Muslim, from the converts of the conquered race who followed the faith of the conquerors, and whose descendants have since become as fervent as the descendants of their previous conquerors.

**HINDU PHILOSOPHY.** The Indian mind, as is evident in Sanskrit literature, is strongly disposed to metaphysical speculation, and this tendency may be seen in the old religious lyrics. In the later age of the hymns the pantheistic idea becomes dominant and finds its outlet in cosmogonic speculation, becoming fully developed in the Brāhmana period. The fundamental conception of this doctrine is expressed in the 2 synonymous terms *brahman*, originally 'power of growth,' then 'prayer' or 'devotional impulse,' and *ātman*, 'breath,' 'self,' 'soul.' The recognition of the essential sameness of the individual souls emanating all alike from the ultimate spiritual essence (*parama-brahman*) involved difficulties for speculative minds, which turned for a

solution of their problems to metempsychosis (*samādra*), speculations which were not approved by the great body of Brahmins engaged in ritualistic practices. The body of treatises propounding the pantheistic doctrine, the Upanishads, were later admitted into the sacred canon as appendages to the ceremonial writing, the Brāhmanas; and they thus form literally 'the end of the Veda,' the *Vedānta*, but their adherents claim this title for their doctrines in a figurative rather than a material sense, as 'the ultimate aim and consummation of the Veda.' It is difficult to determine the time when the so-called *Darsanas* ('demonstrations'), or systems of philosophy, were first formulated; but they certainly developed from the tenets enunciated in the Upanishads. Among the different systems 6 are generally recognised as orthodox and as consistent with the Vedic religion: *Pūrva-mīmāṃsā* and *Uttara-mīmāṃsā* (*Vedānta*); *Sāṅkhya* and *Yoga*; *Nyāya* and *Vaiśeṣika*—each pair being more closely related to each other than to the rest. See further under SANKARA; SĀṆKHYA; SANSKRIT LANGUAGE AND LITERATURE; VEDA AND VEDISM; VEDĀNTA, UTTARA-MĪMĀMSĀ, OR UPAṆISHAD; VIŚHNU; YOGA. For the tenets of the 2 great anti-Brahmanical sects, the Jains and Buddhists, see under BUDDHA AND BUDDHISM AND JAINISM.

**ARMED FORCES.** The partition of India involved a div. of the armed forces between the 2 countries on a territorial basis, and the result was a div. in the proportion of one-third to Pakistan and two-thirds to India. The armed forces of India formerly contained a substantial Brit. element, but India decided to nationalise her armed forces and only a small number of Brit. officers, mostly of the technical and specialist arms, were retained. After partition, regiments and formations of the Indian Army, which for many years had consisted of sub-units comprising men of various castes and creeds, had to be reorganised into regiments containing only representatives of their own dominion. From the end of the Second World War to Aug. 1947 the net reduction in the strength of the Indian and Pakistan armies amounted to 1,648,772 men and women. Of these 32,677 were Brit., Indian, and Pakistani officers, 12,177 were officers and auxiliaries of the WAC (I.), 49,024 were Brit. other ranks serving with Indian and Pakistan armies, and 1,533,570 were Indian and Pakistan ranks, including 64,321 civilians attached to the 2 armies. A total of 8668 army units were disbanded, 61 Indian State Force units returned to the states, and 11 Nepalese contingent units returned to Nepal. The old Indian Army, prior to Aug. 1947, was divided into 3 commands—Northern, Southern, and Eastern. A fourth, Central Command, was raised during the war and disbanded when it was over. Of the Indian divs. which took part in the war 11 were disbanded, leaving 3 infantry divs., 1 armoured div., and 1 airborne div. On 15 Aug. 1947 the army

was divided into the Indian Army and the Pakistan Army. The N. Command was allotted to Pakistan and the S. and E. Commands to India. A new Command, Delhi and E. Punjab Command, was formed soon afterwards. There has also been a considerable expansion of transport services. Other additions to the services were tank transporters, amphibians, and sev. water transport companies. The army of Pakistan comprises 6 armoured corps units, 8½ artillery regiments, and 34 engineer units. Most infantry regiments of the old Indian Army with a Muslim majority were allotted to Pakistan after partition.

The Royal Indian Navy traces its hist. uninterruptedly from the early 17th cent. when the E. India Co.'s Marine was formed. Formerly styled the Royal Indian Marine, the service was reorganised between the 2 world wars on a combatant basis. In 1928 it hoisted the White Ensign for the first time, and in 1934, following the passing of the Indian Naval Discipline Act, was redesignated the Royal Indian Navy. As a result of partition the navy was divided between the 2 dominions. To India went 4 modern sloops, 2 frigates, 1 corvette, 12 mine-sweepers, 4 trawlers, a survey ship, and some auxiliary vessels, with a personnel of 500 officers (of whom about 45 are British) and 5500 ratings. Indianisation of the navy will be completed in 15 years. A large naval estab. is being constructed in Cochin (H.M.I.S. *Venduruthy*) which will include specialist training facilities in gunnery, communications, navigation, torpedo, anti-submarine, electrical, and radar branches. The Pakistan Navy consists of 2 sloops, 2 frigates, 4 mine-sweepers, 2 trawlers, 2 motor mine-sweepers, and some harbour defence launches.

The Royal Indian Air Force had its inception in the recommendations of the Skeene Committee in 1926, and in 1932 the Indian Legislature passed the Indian Air Force Act, the first flight being formed the following year. In 1946 it consisted of 9 fighter and 2 transport squadrons with modern aircraft. On partition 7 fighter squadrons and 1 transport squadron were allotted to India, and 2 fighter squadrons to Pakistan.

*Indian Army (1857-1947).* After the mutiny of 1857, and when the Indian empire was taken over by the Crown, it was decided that the European army in India should be amalgamated with that of the Crown. Formerly, in the days of the E. India Co.'s control, the army was organised on a presidential basis, a staff corps being formed in 1861 for each of the presidencies. This system for a time worked well, but finally the old presidential system of organisation was done away with, and the whole Indian Army was reorganised under the command of a single commander-in-chief. The staff corps became the staff of the Indian Army, and the basis of organisation was one N. and one S. command, together with a separate command for Burma, all under

the control of a commander-in-chief of the Indian Army. Previous to this, and during the gov. of Lord Dufferin, the incident usually known as the Penjdeh scare (over the Russian occupation of that and another place in Afghanistan) took place, and led incidentally to the formation of the Imperial Service Corps. The princes of India volunteered to give pecuniary aid to the gov.; this was at the time rejected, but they were later informed that a proposal to place a certain number of native troops in each state at the disposal of the gov., to be trained, drilled, and officered by Brit. officers, would be welcomed. This was done, and gave rise to the Imperial Service troops, whose value and efficiency were tested and proved. In 1939 the defence forces of India comprised units of the Brit. Regular Army (60,000), the Indian Native Army (140,000), the Indian Army Reserve (35,000), the Indian State forces (about 35,000), the Auxiliary Force (about 24,000), and the Territorial Force (18,000). For police duties and frontier service the regular military was supplemented by frontier militia and local levies. The military forces were organised as the N., S., E., and W. Commands and the Burma Independent Dist., there being a number of dists. and independent brigades in each command. The Field Army was organised in four divs. and five cavalry brigades.

The Brit. Regular Army in India was paid by the Indian Exchequer and was organised in divs. and brigades with the Indian (Native) Army in the proportion of 1 Brit. to 3 Indian battalions. The Artillery Corps at this time was 13,000 strong, organised into 1 field and 6 mt regiments besides various small units—altogether a score of pack batteries and a number of field and garrison artillery batteries, the latter with a proportion of Indian drivers. The tank corps units consisted exclusively of Brit. personnel. The Auxiliary Force was organised in 1920 as a second line to the permanent garrison, and was formed by voluntary enlistment of men of Brit. extraction. The Territorial Force, also organised in 1920, was a militia force, and, like the Territorial Army of Britain, was intended to be a second line replica of the regular army in time of war. The Indian State forces were raised and maintained by the Indian states and trained under the supervision of Brit. officers. In the native army the composition of the regiments was very varied indeed. The troops consisted of men of all races and religions, and these varied naturally with the position of the command. In the ranks of the native army in India were found Pathans, Sikhs, Punjabis, Mahrattas, Hindus, Gurkhas, together with representatives from almost every race to be found in India. The terms of enlistment were general, and although the native troops had not, up to 1939, ordinarily served overseas, nevertheless they enlisted for service within or without the Brit. Empire, and could be taken overseas if necessary. During the First World War, 1,215,000

officers and men of the Indian Army were sent on service overseas from India, the number of Indian troops being 570,000. The total Indian casualties were over 158,000 (deaths, 73,432; wounded, 84,715). Between the world wars some Indian units served in Iraq and at colonial stations, their maintenance being defrayed by the Brit. exchequer. The infantry and cavalry of the old Indian Army were organised into double companies, each commanded by a Brit. officer, together with a Brit. junior officer. The native officers, risaldars in the cavalry and subahdars in the infantry, issued all orders to the native troops. The senior officer was called the risaldar-major, whilst to each half company was usually attached a junior native officer, who was called a jamadar. A reorganisation of the Indian Army was begun in 1921 to meet defects brought to light in the 1914-18 world war. This consisted of grouping regiments for training purposes, and in 1922 the system was carried a stage further by converting the groups into regiments in the case of the Indian infantry and Pioneers. The chief reform, however, was that of 'Indianisation', i.e. having units officered entirely by Indians and without any Brit. cadres. The Indian Territorial Army was also Indianised (see *The Army in India and its Evolution*, 1924, issued under the authority of the Gov. of India). In the Second World War the Indian Army fought in Burma, N. Africa, Italy, and the Middle E., winning over 6000 awards, including 31 V.C.s—an Empire record surpassed only by the army of the U.K. Exclusively recruited on a voluntary basis, the strength of the Indian Army at its peak was 2,250,000, a feature of this expansion being that of the Royal Indian Artillery, which was increased to 84,000 all ranks, and consisted of 12 mt, 11 field, 7 anti-tank, 2 medium, and 20 anti-aircraft regiments. The airborne forces of the Indian Army took part in operations leading to the capture of Rangoon (3 May 1945). The Indian Army's total casualties in the Second World War were 179,935 (killed, 24,338; missing, 11,754; wounded, 64,354; and 79,489 prisoners of war, chiefly on the Burmese front). By 30 Sept. 1946, in the process of demobilisation, over a million men had left the service, the ultimate peace-time strength of which had not been finally determined when the partition of India consequent on independence involved the complete reorganisation of the armed forces of India, and also the disappearance of the old Indian Army.

*Royal Indian Navy.* In 1926 it was decided to establish a Royal Indian Navy (on a combatant basis) the nucleus of which was to be provided by the former Royal India Marine. This navy, at the close of the Second World War, included 6 modern sloops, 3 frigates, 2 corvettes, 16 minesweepers, a survey vessel, and 6 modern trawlers. There were also a number of auxiliary vessels. In 1946 naval strength was reduced by demobilisation to 1000 officers and 10,000 ratings.

It was decided in the same year to purchase 3 cruisers from the R.N. for the Royal Indian Navy.

*Royal Air Force of India.* This had its beginnings in the Indian Air Force Act (1932), the first flight being formed at Karachi in 1933. On 12 Mar. 1945 the king approved the designation of 'Royal' in recognition of the war services of the force. In 1946 it consisted of 9 fighter and 2 transport squadrons with modern aircraft.

*HISTORY.* In an area so vast and so diverse, not unnaturally hist. becomes a matter of some complexity and difficulty, and it is only with the widest movements that this sketch is concerned. It is convenient to begin with the first invasion of the subcontinent by the Aryans, who came from the NW. and who lived for some time on the S. slopes of the Himalayas before they finally entered the great Indo-Gangetic plain and drove back the Dravidian pop. into the peninsula proper to the S. These invaders had a settled system of civilisation and a fixed religious system. They were well acquainted with the various arts, and above all they brought with them the *Rig-Veda*, the Hindu hymnal that estab. the antiquity of their origin (see also RELIGION above and INDIAN ARCHITECTURE; INDIAN ART; INDIAN LANGUAGE; INDIAN LITERATURE). They formed states in the great plain, and they built great tns; the sites of many of these remain down to the present day (e.g. Benares, Aryan Baranesi). Their social system divided them definitely into 4 divs.: the Brahmins, or the priests; the Kshatriyas, or nobles; the Vaisyas, almost the modern middle class; and the Sudras, or serf class, composed principally of non-Aryan peoples who were the slaves of their conquerors. Gradually the civilisation and the religion of these people became corrupted, and about the year 500 bc there lived the great reformer Buddha (q.v.). At the same time occurred the rise of Jainism, a religion which was founded by Vardhamana Mahavira, and has often been regarded as an offshoot of Buddhism. But Buddhism never superseded entirely the older faith of the Hindu, the Brahmanism which had been introduced with the coming of the Aryans, and although for a time Buddhism appeared to have gained the upper hand, ultimately the original religion became the more prominent. It is with the invasion of Alexander the Great (q.v.) that the real hist. of the subcontinent with relation to the outside world may be said to begin. Alexander's campaign was confined, however, to the Punjab and to Sind, and although he made no definite settlement we know that he planted cities and left Gk garrisons behind him. On his death his conquests passed to Seleucus. Chandragupta, Emperor of India E. of the Indus, was contemporary with Seleucus. The 2 emperors made an alliance, and for a time the relations between the Gk and the indigenous kingdoms were well estab.

As records grow more certain and continuous, they tell of periods in which great

Indian dynasties acquired power over a large part of the area. Thus there is the Maurya empire (c. 321-184 BC) with Chandragupta and Asoka as its outstanding rulers, and there is the Gupta empire (c. AD 320-500), the golden age of Hindu culture. But none of these empires extended over the whole subcontinent, and beyond their borders princes and chieftains, powerful and weak, were in constant rivalry and strife. Our knowledge of the system of gov. of Chandragupta is due to the fact that the ambassador to his court by Seleucus, Megasthenes, wrote an account of the court, gov., and institutions. The grandson of this great king was Asoka, the champion of Buddhism. From the inscriptions and rock edicts which Asoka caused to be placed throughout his empire we learn that he ruled practically the whole subcontinent with the exception of the extreme S. of the peninsula. During his reign Buddhism became the predominant religion, but after his death the empire began to decay, and near the beginning of the 2nd cent. BC the Maurya dynasty came to an end. Two other dynasties may be here noticed, the Sunga and the Andhra, but of neither is very much definitely known. The Gk provs. had in the meantime become independent kingdoms under Gk rulers, and in the middle of the 2nd cent. BC the W. Punjab became for a time part of the Parthian empire.

In the middle of the 2nd cent., too, central Asian tribes began to invade. The first of these was known as the Sakas, who estab. themselves W. of Kandahar, and gave to the country the name of Sakastan. Another was the Kushan, and in the 1st cent. AD the chief of this tribe estab. a great kingdom in the NW. The empire of the Kushans does not seem to have come to an end until the beginning of the 4th cent. of the Christian era, when the Gupta dynasty was estab., and almost immediately began to prosper. It was founded by a second Chandragupta, who extended his kingdom along the valley of the Ganges, and was increased by his son, Samudragupta, who conquered all the provs. of the Ganges, and estab. himself in the S. as well. Under Chandragupta II fresh additions were made to the empire, but finally, about the year 480, the Huns from central Asia broke up the empire and estab. themselves in the N. But at the beginning of the 6th cent. the Huns were beaten by a Gupta king. The last indigenous prince was Harsha, who ruled with a strong hand the whole of the N.

After the death of Harsha there follows a confusion of dynasties and kings, whom it is impossible to mention in detail. But gradually in the N. the provs. began to find some shape and form under the gov. of the Rajputs, or members of the ruling families. At the end of the 9th cent. the most important kingdom was that of Panchala, whilst the Pala kings ruled in Bengal, and another important dynasty was that of the Chauran. Until the end of the 3rd cent. the Andhra dynasty ruled

the Deccan, and this was succeeded by that of the Chalukya Rajputs, which lasted until the beginning of the 7th cent., and was then merged in the Chola dynasty. Early in the 8th cent. Arab armies conquered Sind.

The close of the 10th cent. witnessed the beginning of the incursions of the Muslims. The great Muslim empire originated in the setting up of 2 small independent Muslim states in the N. The founders of both these states were originally slaves, and they were bitterly opposed by the Rajputs. In 987 the Sultan Mahmud of Ghazni ascended the throne of the Amir of Sabuktigin, and commenced a holy war against the non-Muslims. In a great number of campaigns he gradually increased his power until it extended practically to the Deccan. Dynasty after dynasty settled themselves at Delhi, and gradually spread into the Deccan itself; amongst the Muslim states formed in the Deccan the more important ones were Golconda and Bijapur. The beginning of the 13th cent. witnessed the incursion of the Mongol chieftain, Genghis Khan. The Mongol hordes, however, although they attained considerable power in the NW., were nevertheless unsuccessful in their attempts to penetrate into the plains, and these attempts were beaten back principally by the Muslims of the N. In 1398 came the great invasion from central Asia of Timur the Lame (usually spoken of as Tamerlane), who swept all opposition before him, and after perpetrating a fearful massacre before Delhi caused himself to be proclaimed Emperor of India. Between 1000 and 1500 a succession of Afghan invaders drove right across the N. Muslim dynasties ruled at Delhi from the Punjab to Bengal; and the new conquerors pushed farther S. than any of their predecessors. Five separate Muslim kingdoms were set up in the Deccan. Only S. of the R. Kaveri was the Hindu pop. saved from the invader. Finally, from 1505 onwards, over the same NW. passes, came the Moguls. At the beginning of the 16th cent., however, appeared the greatest of all the conquerors in the person of Baber. He was a Mongol descended from Taimur and Genghis Khan. In the year 1526 he defeated the army of the Sultan Ibrahim in a battle fought to the N. of Delhi, and was proclaimed Emperor of India. From this time dates the succession of Great Moguls who ruled, at least nominally, from the time of Baber until 1707. For a time Delhi alone remained in the hands of the conqueror, but gradually the whole of the N. was conquered. The greatest of all the Mogul emperors was Akbar the Great (1556-1605), to whom the whole of the subcontinent, with the exception of the very S., owed allegiance. His legal code, the brilliance of his court, and the magnificence of the architecture of his reign are all worthy of note. Akbar was far more liberal in the matter of religion than the contemporary sovereigns of Europe; but for one reason or another multitudes of

Indians, especially in the N., accepted their Muslim conquerors' creed; and so 'beneath the surface of unity the soul of India was divided between 2 faiths or 2 philosophies of life, a gulf which seems to-day almost as deep as when it was first cut so long ago' (Sir R. Coupland). The last of the great Mogul emperors was Aurangzeb, who died in 1707, marking the final break-up of the Mogul empire, on whose ruins the Mahrattas formed an empire which was the greatest and most important in the middle of the 18th cent. On the break-up of the Mogul empire the following practically independent states sprang into existence: those of the Nawab of Oudh, the Nizam of Hyderabad, the Nawab of the Carnatic, and Hyder Ali at Seringapatam. Little by little the provs. of the Mogul empire fell away from their allegiance. The Deccan became independent, Oudh followed suit, Bengal, Behar, and Orissa, though nominally still dependent, became to all intents and purposes independent. A general revolt of the provs. took place, and to make the confusion worse confounded a foreign invader in the person of Nadir Shah, Shah of Persia, appeared in the land. The power of the Mahrattas had increased, and they were now the greatest power. The throne at Delhi was still occupied by descendants of the Mogul dynasty; but they were weaklings and were only nominal kings. The Shah, having plundered Delhi, returned home to Persia, and the land was again free of foreign invaders. Nevertheless it was now but a conglomeration of independent states. The Punjab was annexed in 1761 by the Mahrattas, who were finally defeated by a coalition of Muslim princes who feared the growing power of the Hindus.

*The first European settlements and the power of the British in India.* Europeans had for a long time known of the existence of the trade route via the Red Sea, but the estab. of a Muslim power in Egypt had effectually closed that route to trade, and the result was that it had been necessary to seek some new way of approach. Towards the end of the 15th cent. many attempts were made to 'double the Cape,' and finally the task was accomplished by Vasco da Gama, who arrived by that route at Calicut in 1498. After this the Portuguese made many settlements on the W. coast, the most important of all being Goa. But towards the end of the 16th cent. power in the E. began to pass into the hands of the Dutch. The Portuguese were driven from Ceylon, and the Dutch also estab. themselves firmly in the Malay Peninsula. The next great struggle which ensued was that between the Brit. E. India Co. and the Dutch. The latter were finally driven out altogether. England first appeared to claim a share in the spoils of the E. in 1600, when she obtained a charter for her E. India Co. (q.v.), and her first factory was estab. at Surat in 1608. Trade, and trade alone, was the E. India Co.'s objective; and trade moreover obtained by peaceful enterprise and agreement, not by force. The Company's

first act was to send an envoy to the Mogul emperor at Delhi to secure his permission to establish a trading-post on the coast. The envoy was followed by a full-scale ambas. Sir Thomas Roe (q.v.), whose title to fame is founded on his formulation of the Company's policy, which was not to waste money on military adventures or in acquiring ter. but to 'seek profit at sea and in quiet trade' (P. E. Roberts). In 1639 the site of Madras was bought, and in 1661 Bombay passed as the dowry of the queen of Charles II into the hands of the Company. In 1690, after many failures, a settlement was made on the Hugli, which developed into the city of Calcutta.

The French appeared later than the English. A company with somewhat similar objects to that of the E. India Co. was founded in 1664. Their most important settlement was at Pondicherry, which they retained until 1754. Although, as will be shown, they made a great struggle for political power, they failed very largely because of the lack of interest of the home gov. By the time of the collapse of the Mogul empire the E. India Co. had acquired 3 prin. trading posts—at Madras, Bombay, and Calcutta; and, in order to protect these posts from pirates and from European rivals, forts were built and bodies of Indians known as 'sepoys' enlisted and drilled under Brit. officers. The life struggle for supremacy between the French and the British commenced during the war of the Austrian Succession (1740-8). During this war the French had been the more successful, and had in fact captured Madras. The treaty which ended the war, however, ordered the restoration of all conquests, and so Madras again passed into Brit. hands. With the outbreak of the Seven Years War (1756-63) rivalry between France and England was renewed. A series of succession questions in the Deccan had given both a pretext for joining in the internal quarrels, and now the attention of the Brit. commander, Clive, was called from the Deccan to the N. The succession of Surajah Dowlah to the throne of Bengal had brought about the Black Hole of Calcutta (q.v.), after which Clive came N. to revenge the massacred British. The battle of Plassey (1757) ensued, and with the victory of the Brit. company troops at that battle began the final supremacy of the British in the sub-continent. Three years later, at Wandewash, Sir Eyre Coote finally broke the power of the French in the Deccan.

The throne of Bengal had passed into the hands of the nominee of the Brit. Company, and out of gratitude favour after favour was heaped upon them. But for a time the Brit. company still regarded the victory which they had won as merely a means of definitely establishing a monopoly and *not* an empire. Clive, when he returned from home in 1765, realised that it was possible to build up a great Brit. empire on the ruins of the fallen Mogul empire, but he advised against taking the risk which was necessary.

The Company collected the revenues of Bengal, Bihar, and Orissa, but as the vassals of the nominal emperor at Delhi. Clive during his administration pressed on many reforms which were necessary, but was sadly hampered by the fact that any reform which entailed a diminution of dividend was not popular with the board of directors. Finally, in 1767, he returned to England, and was later bitterly attacked. The House of Commons, however, recorded its appreciation of the services which he had rendered; but worn out by the attacks and by ill health, he committed suicide in 1774. Clive may well be regarded as the founder of Brit. greatness in the subcontinent; he had witnessed the Company become the sovereign of Bengal, Bihar, and Orissa. In the meantime the British had been left with a clear field after the treaty of Paris (1763). The Portuguese, the Dutch, and now the French had all disappeared as rivals to the power of Britain. Henceforth the British could consolidate their power with little fear of interference from any of the European powers. The Brit. power was threatened by Hyder Ali of Mysore, but the victory of Coote at Porto Novo again asserted the power of the British, which had seemed to fall at the end of the first Mysore war.

Between the years 1767 and 1772 the Brit. ideas about governing the country may be regarded as being in a state of flux. The first results of Brit. conquest in the 18th cent. were deplorable, because in Britain both politicians and commercial men had failed to grasp the significance of the conquest. Clive had realised all that was implied in the 'sovereignty' of Bengal, and in a letter to the elder Pitt had suggested that the Brit. Gov. should oust the Company and shoulder the task. It took the Company some time to realise that it was a sovereign power, but finally, in 1772, it appointed Warren Hastings as governor of Bengal. There are points which are debatable in the career of Warren Hastings, but here it is necessary only to mention the events without discussing ethics. Hastings certainly reformed the revenue collecting system, estab. civil and criminal courts, and made large economies. He sold certain ter. to the nawabs of Oudh, but by so doing set up Oudh as a buffer state between the British and the Mahrattas, and later, when he gave the nawabs of Oudh help in the Rohilla war, he did so because he realised that the Rohillas were a real menace to the British. In 1775 Lord North's gov. passed the Regulating Act, which gave the home gov. certain powers over the officials of the E. India Co., and instituted a supreme court of justice and a council of war. Warren Hastings became the first governor-general, but for a time the hostility of his councillors prevented the operation of his schemes. During his period of power hardly any annexations had been made. Some ter. had been gained round Bombay, but on the whole he had been opposed to annexation, otherwise he would probably

have annexed the ter. which he sold to the nawabs of Oudh.

In 1784 Pitt's India Bill was passed. The real power was now in the hands of the Crown, although nominally it still remained with the Company, a state of affairs which existed until 1858. Lord Cornwallis, both Governor-General and Commander-in-Chief, had power of veto to an extent never employed by Warren Hastings. He busied himself at first with internal reform, and estab. a proper system of civil service for the servants of the Company. He was responsible in 1793 for the permanent settlement of Bengal, Bihar, and Orissa; by this the assessment of the revenue was declared perpetual. Legal reform also occupied his attention. The attack by Tipoo Sahib on Travancore, however, necessitated the interference of Cornwallis, and the war ended by the cession of half of Mysore to the Company. The ter. acquired by the Company went to form the beginning of the Presidency of Madras. Cornwallis left in 1793, and was succeeded for a time by Sir John Shore, who, 5 years later, was succeeded by Lord Wellesley, probably the greatest of all the governors-general after Warren Hastings. In 1799 the fourth Mysore war broke out, undertaken by Wellesley with definite aims. It was short and in the course of it Tipoo Sahib was killed. Wellesley was an open advocate of a policy of annexation, and by his system of setting up subsidised princes did much to extend the power of Britain throughout the whole peninsula. In 1803 the second Mahratta war broke out, and Gen. A. Wellesley (brother of the governor-general) won the battle of Assaye against overwhelming odds and practically broke the power of the Mahrattas. Almost at the same time Lake defeated another army and entered Delhi. The troops of Sindia were utterly defeated, and the prince accepted a subsidy from the hands of the British. The aggressive policy of Wellesley, however, led to his recall, and Cornwallis was sent out for a second term. But Wellesley had been instrumental in causing many reforms, in establishing a school for civil servants, and in bringing the finances of the country into a sound condition in spite of the expenses of his numerous campaigns. During the 18th cent. the power of the Sikhs had been increasing continually in the Punjab, and they now, under their leader, Ranjit Singh, put forward claims, that could not for one moment be admitted by the British, to ter. in the Punjab itself. A Brit. army was sent against Ranjit Singh, but no fighting took place, the menace being sufficient. Under Lord Minto's governorship missions were dispatched to Persia and Afghanistan to combat Fr. influence, whilst at the same time attacks were made on the Fr. colonies of Mauritius and Ile de Bourbon, the Dutch colonies in Java also being attacked and captured. The monopoly of the E. India Co. was abolished in 1813, except so far as trade in the China seas was concerned. The period between the departure of Wellesley and the arrival

of the Marquess of Hastings was one of stagnation. Hastings, however, reverted to the policy of his predecessor. During his governorship the Gurkhas were defeated and part of their ter, of Nepal was annexed; and the war against the Pindaris widened into a war with the Mahrattas, much of whose ter. in the neighbourhood of Poona was annexed.

Hastings left in 1825. Brit. supremacy over the native states was finally estab. and the whole peninsula was ruled by the British. But an independent kingdom had been set up in Burma, Afghanistan had developed into a really strong state, and under Ranjit Singh the state of the

Gujarat (1849) delivered the Punjab to the British. In 1852 Lower Burma was annexed during the governor-generalship of Lord Dalhousie and in 1856 Oudh was also annexed. Nagpur and Jhansi also passed into the possession of the British about the same time. Between 1823 and the outbreak of the mutiny many social reforms had taken place under Brit. rule. The country had been developed, education had been encouraged, canals had been developed, the telegraph and railways introduced, a system of cheap postage had also been initiated, and suttee had been abolished. This was a practice of Brahman women by which a widow committed

THE FORT, AGRA

*Canadian Pacific*

Punjab had been unified and strengthened. Almost immediately there were clashes between Britain and these states. The Burmese war resulted in the loss of some ter. to the British. Afghanistan, regarded as an important buffer state between Russia and Brit. India, became for a time the centre of the storm. The Persians, influenced by the Russians, interfered there; the British, to protect their interests, were forced to intervene. They were at first successful, but a later Afghan rising drove them out of Afghanistan, and of the 4000 British who left Kabul only 1 arrived safely at Jellalabad. An expedition was sent to Afghanistan to avenge this disaster; Kabul was stormed, the prisoners released, and the British evacuated the country. In 1843 Sind (Sceinde) was annexed by Sir C. Napier, and the next war broke out on the death of Ranjit Singh, 'the lion of the Punjab.' Two wars were fought with the Sikhs, the first in 1845, the second in 1848-9. The Sikhs of the Punjab were the most formidable enemies the British had yet met in the subcontinent, but the victory at

suicide on her husband's funeral pyre. These reforms had been especially noticeable during the administration of Lord Dalhousie.

*Indian Mutiny.* The Indian Mutiny may be traced to many causes. Inventions such as the telegraph were not understood by the native mind, and railway travelling upset the ideas of caste. Other causes were the distrust of the Brit. policy of annexation, and especially great were the military causes. The Sepoys believed themselves the essential part of the Brit. military power. The campaign in Afghanistan and the late Crimean War had shaken their faith in Brit. power; and a report that the new cartridges were smeared with the fat of the cow and the pig, thus defiling both Hindu and Muslim, supplied the immediate spark. The mutiny broke out on 10 May at Meerut and spread to Delhi. Within 3 weeks the whole Ganges basin was aflame, and at Delhi the representative of the royal line had again been proclaimed Emperor of India. There were less than 40,000 Brit. soldiers to hold in check a pop. of wellnigh

100,000,000. Cawnpore and Lucknow were besieged. But Lawrence held the Punjab in check; a small Brit. force advanced against Delhi. Havelock marched to the relief of Cawnpore with a small force, and Lucknow held out. In Sept. the tide turned at last. Delhi was stormed; Lucknow was relieved by Campbell in Nov., although the city was not finally taken until the following year. In 1858 the mutiny may be said to have ended, although the Central Provs. were not pacified until the following year. The chief results of the mutiny were that the rule of the E. India Co. came to an end; in 1877 Queen Victoria was proclaimed Empress of India, and the governor-general was known henceforward as the viceroy.

*The Indian empire established.* After the mutiny there followed a period of peace broken only by the constant suspicion of Russian intrigue in Afghanistan. This led in 1878 to the second Afghan war. The amir was deposed, and his successor promised to receive a Brit. resident, who was shortly afterwards murdered with his escort. This resulted in the famous march of Roberts from Kabul to Kandahar, and eventually an amir who was favourable to the British was installed. Quetta and the S.E. dists. of Afghanistan were annexed after this.

In 1885 Upper Burma was annexed as a result of the third Burmese war, and the Indian empire was practically completed. The 'Morley-Minto' constitutional reforms may be briefly noticed. These enlarged the legislative councils, accepted the elective principle, and gave Indians a direct share in administration by admitting an Indian member to the executive council in each of the provs. and at the centre. But if Lord Morley, then secretary of state for India, was the leading exponent of the Liberal tradition, he did not intend that these reforms should lead directly or indirectly to the estab. of a parl. system in India. Opinion in England was not then favourable to democratic institutions for a country which was anything but homogeneous. Legislative councils were adopted for each prov., and the electoral system developed in the constitution of the Legislative Council of the viceroy. After his coronation in 1911 George V visited India and held a Coronation Durbar at the beginning of 1912, this being the first visit of a Brit. sovereign to the Indian empire. At the Durbar the king-emperor announced that Delhi would be the new cap. of India.

From the time of the Morley-Minto reforms embodied in the Councils Act of 1909, it is generally true to say that the hist. of the I. S. is a hist. of political conflict between the nationalist politician, notably of course the party called the Indian National Congress, and the Brit. Gov.; it is also the hist. of gradual constitutional development from a Brit. possession to 2 fully independent reps. within the Commonwealth. In addition, as the prospect of independence became more real, it is a hist. of the extension among

Muslims of the fear that, as a minority community, they would be swamped and disregarded by the Hindu majority; hence the ultimate demand for the partition into India and Pakistan.

This is not to suggest that during this period there was not a steady progress and development economically, industrially, and socially. But the rate of such development was constantly under severe criticism by those seeking an independent solution of the country's problems; and indeed, however fast it had been it could never have made development at foreign hands acceptable to the rapidly growing nationalistic sentiment.

The prin. political landmarks in this period were:

(i) The Government of India Act, 1919, which followed the Montagu-Chelmsford Report.

(ii) The Government of India Act, 1935, which followed the Simon Commission Report (1930) and the Round Table Conferences in London of 1931, 1932, and 1933.

(iii) The Indian Independence Act, 1947.

*The Government of India Act, 1919.* The Preamble to the Act embodied in substance a declaration made in 1917 by the Brit. Gov. that their policy was to increase the association of Indians in every branch of the administration and that their ultimate goal was 'responsible government in British India as an integral part of the British Empire.' This statement was regarded at the time in Britain as marking a noteworthy advance in political thinking. Needless to say it was not so regarded in the subcontinent, where the nationalists took particular note of the phrase 'British India,' which excluded the Princely States, and of the words 'an integral part of the British Empire,' a matter upon which in the nationalist view a decision could only be taken by an independent Indian Gov. Briefly, the main provisions of the Act were designed to produce a curious half-way house towards a fully parl. gov. on the Brit. model, and in retrospect it may be that the most significant was the express provision for another full inquiry in not more than 10 years' time.

In the Prov. Gov. the diarchic system was estab. by which certain subjects, e.g. law and order, were 'reserved' to the Governor-in-Council, while other subjects, e.g. education, agriculture, were 'transferred' to ministers appointed by the governor from among the elected members of the Legislative Councils (i.e. prov. parliament). In the selection of individuals as ministers, as also as members of the Governor-Council, the governor was not confined to the majority party, and he had power to certify an Act or a budget or other demand for money which the Legislative Council rejected. In the Central Gov. it was provided that 3 members of the Viceroy's Council of 7 should be Indians, and 2 legislative chambers were estab., the lower the Legislative Assembly, the upper the

Council of State. In both the majority of members were elected and non-official. The viceroy retained over-riding powers similar to those exercisable by prov. governors and was also head of the Chamber of Princes, the relations between whom and the Brit. Gov. were not susceptible of discussion in the legislature.

*The Government of India Act, 1935.* Although the Act of 1919 can be said to have worked with varying degrees of success in different parts of India, it was never acceptable to the Indian National Congress, who used every means at their disposal, including Mahatma Gandhi's perfected technique of civil disobedience, to bring it into disrepute and to render it unworkable. Many of the Congress leaders, including Gandhi and Jawaharlal Nehru, spent periods in prison. In 1928, in anticipation of the coming review, the Simon Commission was appointed and visited India. It was called upon to report 'whether and to what extent it is desirable to establish in British India the principle of responsible government or to extend, modify, or restrict the degree of responsible government now existing.' The commission was boycotted in India by the Congress and certain other organisations. The report was presented in 1930, and considered at 3 round table conferences in London between 1931 and 1933 in an attempt to find the greatest possible measure of agreement. Finally a White Paper was presented to Parliament and exhaustively discussed by a joint committee of both houses. The Act was passed in Aug. 1935.

Apart from a considerable extension of the franchise, which even so embraced only 14 per cent of the pop. of Brit. India, the 2 major features of the Act were autonomy for the prov. govts.—now increased to 11 by the separation of Sind from Bombay and Orissa from Bihar—and a federal gov. at the centre. Emergency and special powers were reserved for the prov. governors and the governor-general. A minor point of interest is that Aden was separated from India and became a crown colony.

Possibly the most remarkable feature, in retrospect, of the 1935 Act is that while it came into force in the provs. in 1937 it never came into force at all in the Central Gov. Thus for 10 years the extraordinary position prevailed that, fundamentally, 2 widely differing constitutions co-existed in India, the 1919 Act at the centre and the 1935 Act in the provs. The prin. reason was that the princes, who at the London conferences had broadly supported the idea of a Federal Central Gov., found that in practice there were objections greater than they had recognised. They were therefore increasingly reluctant to signify their accession, and since the Act provided that Federation should not be complete until half the princes had acceded it was not possible to proceed without that degree of consent. The outbreak of war in 1939 put an immediate stop to the persistent attempts to persuade them, and of course

produced a new constitutional situation in which much of the business of gov. was conducted under emergency powers. Nevertheless it is remarkable, and a tribute to the administration, both in the provs. and at the centre, that while the requirements of finance, industry, and commerce—to mention only a few subjects—necessarily involved close co-ordination between the provs. and the centre, the differences in their constitutional authority did not, by and large, precipitate any major clash.

It was only with grave misgivings, based partly upon a mistrust of the special powers reserved to governors and upon the expected hostility of the permanent civil services, and partly upon doubts whether the new constitution could conscientiously be regarded as a step towards their unchanged goal of complete independence, that the Congress party agreed to take office in those provs. (the majority) where they had a clear electoral mandate. This they did in mid 1937. The assumption and exercise of power considerably modified their views, not of course upon their ultimate objective, but upon the progress that could be made. In a great many ways they displayed an aptitude for gov. surprising in a party which, from its inception, had been marked for opposition. In the larger provs. in particular they began to lay sound foundations for much of the social progress which has since taken place. Nevertheless the judgment of hist. can hardly fail to be that in one vital matter they fell into an error which changed the whole face of the subcontinent. They gravely underestimated—or indeed ignored—the suspicion and mistrust of the Muslim minority of the Hindu majority. There had indeed at various times been theoretical discussion of Muslim areas and partition schemes—all of them anathema to the Indian nationalist thinking in terms of All-India. But it can hardly be denied that it was between 1937 and 1939, owing largely to Hindu Congress failure to satisfy Muslim susceptibilities, that the idea of a Muslim state finally crystallised, and the opportunity to demand it was presented to perhaps the one man with the outstanding authority and ability to do so, Mr Jinnah (q.v.).

*Second World War and 1939–47.* It is no criticism of the martial quality of the Indian fighting services, whose record is second to none (see under INDIA and PAKISTAN), to say that the main problems and preoccupations of India during the Second World War were political. Public opinion at the outbreak of war, and indeed throughout its course, showed sharp divergencies and changes upon the attitude India should adopt. Even Mahatma Gandhi, without at any time receding from his faith in absolute non-violence, found great difficulty in reconciling his political aims with his emotions, and was not the architect of some of the more extreme political demands upon Great Britain. In Oct. 1939 the working

committee, i.e. the central executive, of the Congress issued instructions to all Congress ministers to resign. The instructions were obeyed, though in some cases without enthusiasm. Thereafter, throughout the war, the provs. were under governor's rule, except for those where Muslim League ministries were in power. In 1942 the Jap. participation in the war and the immediate threat to Indian ter., coupled with the general confusion of public thought about the war in India, posed a serious threat to the Brit. Gov. in its conduct of the war. An offer was therefore made, through a visit by Sir Stafford Cripps, of complete self-gov. when the war was over. It was made clear that Indians were to frame their own constitution and that thereafter Indian independence would be complete, even to the extent of leaving the Commonwealth if desired. The offer was rejected for differing reasons by both the Congress and the Muslim League. It seems clear that some Indians at least did not foresee the defeat of the Japanese, and it was Mahatma Gandhi who described the offer as 'a post-dated cheque on a failing bank.' In Aug. 1942 the Congress launched what was virtually an India-wide rebellion against continued Brit. rule. In all the circumstances the ease with which this movement was suppressed is surprising, and may have given some of the Congress leaders food for thought. Thereafter the uneasy stalemate continued until the end of the war.

In 1946, in accordance with their avowed policy, the Brit. Gov. made another attempt to solve the problem of providing self-gov. for India. This took the form of a visit to India of 3 Cabinet ministers, led by Lord Pethick-Lawrence, known as the Cabinet Mission. Once again long and patient negotiations failed to produce a result. Although the mission produced an ingenious, and probably over-complex, scheme for a federal centre, with both groups of provs. and individual provs. adhering, they wholly rejected the Muslim claim for partition. But by this time the position taken by Jinnah, in which he had the full support of the vast majority of Muslims, had hardened to such an extent that no compromise was any longer possible. No scheme which did not include the substance of partition and a separate Muslim state, whatever arrangements might be made for Hindu and Muslim minorities on either side of the border, stood any chance of acceptance. The mission's proposals were rejected out of hand by both the Congress and the Muslim League. It is fair to say, however, that the mission did in fact make a contribution to the final solution. They laid the foundations of the 2 new govts. through Constituent Assemblies, and they set in train the events which culminated in the formation of a gov. at the centre containing ministers representing both the Congress and the Muslim League. The complete failure of the gov. to overcome the violent internal strains between the ministers from

the 2 parties may well have provided the conclusive evidence needed to convince the Brit. Gov. that without partition no solution could be found.

*The end of British rule.* The position of the Brit. Gov. in 1946-7 was by no means happy. Having proclaimed their intention to hand over authority, they found nobody to whom to transfer it; that at least is how the problem appeared in London. With the continuing and increasing tensions between the 2 parties inside the interim central gov. of India, and the consequent serious deterioration of Hindu-Muslim relations throughout the country, it quickly became clear that matters could not be left as they were without risking a major disaster. It is conceivable that Brit. authority could have been maintained by the use of strong military force; it is certain that public opinion in England would have been shocked and dismayed beyond measure at any such move. In Feb. 1947, therefore, the Brit. Gov. took what was perhaps the only action open to them. They announced that authority would be transferred in June 1948, whether any future constitution had been agreed or not, and in Mar. 1947 Lord Mountbatten was sent as viceroy to organise the preparations for the transfer. The shock which this announcement administered to the parties in India was no doubt salutary in imparting a sense of urgency, but it did not, and probably could not, induce any greater readiness to compromise. Lord Mountbatten quickly came to the conclusion that partition was inevitable; also that to wait upon events until June 1948 not only would not increase the chance of compromise but, by reason of rapidly spreading communal antagonism and uncertainty about the future, would soon bring ordered administration to a standstill. He finally persuaded the Congress leaders that however much they might declare their opposition to it in principle, partition in practice offered the only road to independence.

The Brit. Gov. now accepted Lord Mountbatten's views and his estimate that only by acting with extreme urgency could violent upheavals and a collapse of the administration be avoided. In June 1947 the Brit. Gov. announced that the Indian Independence Act would be passed through all stages in the following month. This was in fact done, and on 15 Aug. 1947 India as a unit disappeared and the 2 new dominions of India and Pakistan came into existence. Both were completely self-governing, fully free from any form of control by the Brit. Gov., though the governor-general would continue to represent the Crown, free to frame their own constitutions, and if they so wished to leave the Commonwealth. The Act also abrogated all treaties between the Crown and the Indian states, each state being left to decide whether to accede to India or to Pakistan, or, in theory, to remain independent. Hist. has shown that, as was generally recognised at the time, the latter alternative was in no sense a real one.

*The Indian princes (before the partition of India).* The Indian states numbered 682, of which 327 were relatively of very little consequence and only existed independently as the result of a historical accident. The chiefs on the Afghan frontier were in a different category compared with the princes of India, all being Muslims with a political gravitation towards Kabul, and not to Delhi, and as regards their internal administration they were to all intents and purposes independent. There were only 7 of these border states, varying in importance from that of the Khan of Kalat, with a wild and arid mt country of 75,000 sq. m. in Baluchistan, and a pop. of 308,000, to the small state of Phulera on the Hazara border with an area of 34 sq. m. One of the most important is the new state of Swat, founded in comparatively recent years by a descendant of Alikhund of Swat, on the Peshawar border. Nepal is an independent state and never has been an Indian state. From the mt mass of the Pamirs and Karakoram in the N., where political India impinges on central Asia, to Cape Comorin in the S., a distance of 2000 m., it was possible to travel almost entirely through ter. of the Indian princes without touching Brit. India. From Chitral (which was a Brit. protectorate) one would pass through Gilgit, a dependency of Kashmir; thence the route would lie through small Rajput states in the Himalayas, past Simla to the Sikh state of Patiala in the Punjab plains, a country of prosperous vils. and stalwart fighting men; thence to the desert of Rajputana, home of the blue-blooded Rajputs and memories of anct chivalry; then on to the sphere of the Marathas in Baroda and Indore, secular rivals of the Rajputs. Thence into the great Muslim state of Hyderabad, equal in area to Great Britain, and then to Travancore, with its unrivalled beauty of forest lands and lagoons, and so to Cape Comorin, fabled abode of the goddess Kumari. In all the Indian states covered some two-fifths of the whole of India and contained more than one-fifth of the pop. Their subjects were Brit. protected persons, not Brit. subjects; and they were governed by hereditary rulers under the suzerainty of the Brit. Crown. In the administration of internal affairs the authority of the princes was limited by treaty relationships with the paramount power (Britain) and by usage and suzerance. Brit. Indian law did not prevail nor could the Central Indian Legislature legislate for them. The princes had no relations, however, with foreign powers.

The manner of evolution of this type of autonomous or semi-autonomous kingdom is a problem the solution of which is buried in antiquity. Originating in Hindu political theory, it has certainly been influenced by the Brahminical caste system, which is at least 3000 years old. This scheme of life harmonised best with a gov. in which the ruler administered a small ter. with the assistance of a Durbar or council of ministers, priests, military

feudatories, and representatives of the castes or guilds. This Durbar rule is best illustrated in the more anct Rajput states of central India and the oasis of the great Indian Desert, some of these being tribal in origin. States like the Rajput principalities and some of the older states in the S.—Mysore, Travancore, and Coochin—owed their cents. of existence to the loyal support of their nobles and peasantry. To obtain a clear view of the position of the states in the political fabric of India of to-day, they must be seen in historical perspective. The long-drawn tragedy of invasion, the crash of empires and kingdoms, the bitterness of religious feuds, are reflected in the evolution of India's minor kingdoms' (Sir Wm Barton). Hindu India in the 10th to 11th cents. was fortunate, up to a point, in having found new defenders in the face of terror that was then impending. But for the Rajputs Hinduism would probably have been lost in the surge of Muslim invasion. Unaided, the Brahmins could never have held the people to their faith. But although the Rajput cavalry, in 1191, hurled the Muslims back across the Sutlej, the victory gained only a brief respite. Bengal, Bihar, and Orissa fell before a handful of Afghan horsemen. A new kingdom was estab. (1202), and Mohammedanism prevailed until Clive's victory at Plassey in 1757. For the first four cents. of Muslim rule the chief opponents, the Rajputs, short of man-power, could not for long keep the field. Refusing, however, to admit defeat, they fled to the oasis of Rajputana, into the fastnesses of the central plateau N. of the Vindhya, and to the peninsula of Kathiawar, and there they set up small kingdoms most of which later became fiefs of the great Mogul empire. On the central plateau many of the smaller Rajput barons, however, became feudatories of the Muslim kingdom of Malwa. The resistance of the Rajput rulers preserved the culture, traditions, and religion of the Aryan age.

The Chamber of Princes was estab. in Feb. 1921 as a permanent consultative body on matters affecting the states generally, or both them and Brit. India, or the empire as a whole. In 1947 it consisted of over 100 rulers of states who were members *de jure*, and 12 rulers elected by 127 other states. Arising out of the Montagu-Chelmsford reforms most of the states were in direct relations with the gov. of India. In recent years the policy was pursued of promoting co-operation in such matters as justice, police, and public health. In 1943 an extensive scheme was launched for improving the administrations of hundreds of petty states in W. India by attaching them to large neighbouring states such as Nawanganagar and Baroda. (For later hist. and developments, see INDIA and PAKISTAN.) See also INDIAN PRINCELY STATES.

Indian Summer, season of mild weather on the Atlantic Coast and in the Central States of the U.S.A., usually occurring in Oct. or Nov., but sometimes in Dec. The sky is cloudless, the atmosphere hazy, and the temp. extremely mild. The tendency to extreme dryness causes a number of forest and prairie fires. This summer corresponds to what is known in England as St Luke's Summer, which occurs at the end of Oct. or the beginning of Nov.

Indian Territory, formerly a ter. of the U.S.A., about the size of Ireland. It lay W. of Arkansas, and was separated from Texas by the Red R. This country was

especially reserved for the Indian tribes by the gov. of the U.S.A., and was assigned to them by Act of Congress in 1830. The ter. contained fertile prairies and rich valleys, and was crossed by a broad belt of forest about 40 m. wide called 'Cross Timbers.' The climate was very pleasant and salubrious, and agriculture and cattle-rearing formed the chief occupations. I. T. was occupied by 5 tribes: the Cherokees, the Creeks, the Choctaws, the Chickasaws, and the

soya-beans, wheat, and hay, whilst cattle, milk, and eggs are also produced. The chief mineral products are coal, petroleum, cement, limestone, and sandstone. The production of pig-iron is considerable, and the clay-working industries are important; these yield bricks, tiles, pipes, pottery, etc. Other manufs. include iron, glass, motor vehicles, railroad cars, and woolens. Transport is well provided by the natural facilities of the Ohio R. and by Lake Michigan; while by land there is a

A CONSTRUCTION CREW OF CHOCTAW INDIANS WORKING ON A STATE ROAD NEAR MUSKOGEE, OKLAHOMA

Seminoles. Admitted with the white-settled central ter. to the Union as the State of Oklahoma in 1907.

**Indiana**, N. central state of the U.S.A., known as the 'Hoosier State,' the second to be erected from the old NW. Ter. It covers an area of 36,291 sq. m., 314 of which are water-surface; and its greatest length and breadth are respectively 277 m. and 145 m. It is bounded on the N. by Michigan and Lake Michigan, on the S. by Kentucky, on the E. by Ohio, and on the W. by Illinois. The state lies in the Mississippi valley and in the basin of the Great Lakes, and is well watered by sev. streams, of which the most important is the Wabash. The greater part of the surface is undulating prairie land. The fertility of the soil is largely increased by a system of under-draining. Agriculture is important, 91 per cent of its total area being farms; the chief crops are maize,

total of 6600 m. of railway. Added to this all the lines from the E. to Chicago pass through I., and other connections with E., W., N., and S., which are of great importance to trade. The prin. univs. are Purdue Univ.; Indiana Univ.; De Pauw Univ.; Butler Univ.; and the univ. of Notre Dame. I. is governed by a General Assembly consisting of a Senate of 50 members elected for 4 years and a House of Representatives of 100 members elected for 2 years. The climate is remarkably equable. Pop. 3,930,000. The state is seventh in coal production in the U.S.A. The leading cities are Indianapolis, Fort Wayne, Evansville, and South Bend. See W. H. Smith, *History of Indiana*, 1879; L. Esarey, *A History of Indiana*, 1918; S. S. Visser, *Economic Geography of Indiana*, 1923; Federal Writers' Project, *Indiana: A Guide to the Hoosier State*, 1941.

**Indianapolis**, cap. and the largest city of Indiana, U.S.A., 184 m. by rail SSE. of Chicago and 811 m. W. of New York. It is one of the best built and most attractive inland cities of America. Many of its streets are 100 ft wide and diagonally intersect the 4 main avenues of Massachusetts, Indiana, Virginia, and Kentucky, which radiate from the Central Park, Monument Place. The city is encircled by a railway, connecting the 16 trunk lines, thus facilitating traffic. Among the chief buildings and institutions are the state capitol, co. courthouse, depts of Indiana Univ., and the Arthur Jordan Conservatory of Music. Other cultural institutions and points of interest are the John Herron Art Museum and Art School, the Children's Museum, the State Fair Grounds, and the municipal airport and motor speedway. Industries include meat packing, printing and publishing, drugs and medicines, and automobile and aeroplane parts. I. is the national H.Q. of the Amer. Legion. Pop. 427,200. See L. Burns, *Indianapolis: The Old Town and the New*, 1923.

**Indians of America**, see AMERICAN INDIANS.

**Indicator**, term in chem. to denote a substance used for the detection of minute amounts of materials. Commonly, the word is applied to those bodies that 'indicate' an acid or alkaline reaction. One of the most frequently used I.s is litmus, a substance prepared from certain lichens. This with alkalis gives a blue, and with acids a red coloration, and in most cases the colour-change is sharply defined. In titrating acids and alkalis, care has to be exercised in the choice of I. For example, in the case of carbonates, litmus may not be used (unless the titration be performed so that all the carbon dioxide is expelled, since the latter has a distinct effect upon the I.). Similarly, the I.s prepared synthetically require discretion in their use, e.g. phenolphthalein is an excellent I. for strong acids and bases, but may not be used for the titration of a weak acid by a base, since the end-point is not sharp. Another frequently used I. is methyl orange, which is the sodium salt of an acid, helianthine. This is a sodium salt of an organic acid, which in presence of alkalis is yellow, and in acid solution red. It is, however, necessary that the acid should be 'strong', otherwise no sharp end-point can be obtained. Of other natural I.s may be mentioned cochineal and extracts of red cabbage and other vegetables, but the greater number of the more recent products belong to the benzene series.

Much has been written concerning the 'theory of indicators' with a view to explaining the change of colour that occurs according to the reaction of the solution. The first adequate explanation was offered by Ostwald, who based his views upon the ionic theory of solution (q.v.). According to this view, an acid is a substance which, in aqueous solution, yields free hydrogen ions, and conversely an alkali is one which yields free hydroxyl

ions. Consequently a solution which contains ions of hydrogen and of hydroxyl in equivalent amounts may be regarded as neutral. This condition is realised in the case of pure water, which is only slightly dissociated into its component ions. Further, a 'strong' acid or a 'strong' base is one which in aqueous solution is strongly dissociated. On the other hand, a 'weak' acid or base is one which in solution is not dissociated to any great extent, but remains non-ionised. The assumption made by Ostwald in his theory to account for the behaviour of I.s is that the latter are either weak acids or weak bases, and that the change of colour is due either to the presence of the non-ionised substance or of a coloured ion. In the case of phenolphthalein, it is supposed that we are dealing with a weak and colourless acid. In the terms of the dissociation hypothesis, this is only dissociated to a slight extent, and any increase in the concentration of hydrogen ions, such, for example, as takes place if a strong acid be present, tends to diminish the dissociation. In consequence, there is no colour change. If, however, an alkali such as sodium hydroxide be added, the hydroxyl ions associate or combine with the hydrogen ions of the I., leaving cations of sodium and the anions of the I. The latter, in this case, are supposed to be coloured, and, therefore, the colour change is manifest. Methyl-orange acts as a very weak base, yielding in solution red cations and small numbers of hydroxyl ions (OH<sup>-</sup>); the undissociated substance is yellow. On addition of an acid, the hydrogen ions of the latter combine with hydroxyl ions of the I., and more of the undissociated part of the I. then ionises, so that the red colour of the cations is seen. Addition of alkali, on the other hand, suppresses the ionisation of the I., which therefore shows the yellow colour of the undissociated molecules. In addition to the above theory there has been proposed a so-called chemical explanation depending upon the structural differences existing between the 'lactoid' or colourless form and the 'quinonoid' or coloured form. It has been assumed that all coloured substances possess the quinonoid structure (see QUINONE), and one view of the change of colour of I.s is based upon the change into the quinone type. Phenolphthalein, in the free state, is represented by the formula

its acidic properties being due to the presence of a phenolic (i.e. OH) group. On treatment with alkalis, a change in structure occurs, and the salt is regarded as having the following constitution:

(The double-bonds (a) and (b) present in the molecule are characteristic of the quinonoid structure.) This latter view is in agreement with Hantzsch's theory of pseudo-acids and pseudo-bases, and is not entirely antagonistic to Ostwald's dissociation hypothesis.

A large range of Is. is now available, so that it is usually possible to select a suitable one for indicating any desired concentration of hydrogen ions (see HYDROGEN ION CONCENTRATION). A 'universal indicator' is a mixture of various Is. made up in such a way that it shows a series of colour changes over a large range of hydrogen ion concentration. Universal Is. are extremely useful in applied and technical chem. for the rapid estimation of hydrogen ion concentration.

'External' Is. are substances that are used to determine the end-point of a reaction, but must not be actually introduced into the reacting mixture, since they would either cause undesirable changes or would be obscured by the colour of the solutions concerned. They are usually placed in drops on a white tile, and drops of the reacting mixture are removed from time to time with a glass rod and added to the I. on the tile, when the colour changes may be noted.

'Fluorescence' Is. are substances which indicate variations in hydrogen-ion concentration by changes in the colour or intensity of the fluorescence they emit in daylight or ultra-violet light.

'Adsorption' Is. are used to detect the end-point of precipitation reactions. If silver nitrate solution is added to a solution of sodium chloride in the presence of a suitable dyestuff with a coloured anion, e.g. fluorescein, the precipitate of silver chloride is white until the solution contains a slight excess of silver ions. The silver chloride then takes up the coloured anion from the solution and appears pink, so that the end-point is easily detected. When silver ions are in excess, the silver chloride becomes positively charged, i.e.  $[AgCl]Ag^+$ , and this adsorbs the coloured ion of the fluorescein. Adsorption Is. have been used in the titration of halides, thiocyanates, and cyanides with silver nitrate.

Indicator Diagram, see STEAM ENGINES.

Indiction, term used in chronology (q.v.) to denote a period of 15 years. The meaning of the word originally signified 'the imposition of a tax,' and it was instituted by Constantine the Great, but it gradually crept into the calendar of historians, principally ecclesiastics, to mark time; thus, in the Middle Ages, the dates of charters were expressed in Is. as well as in years of the Christian era. The papal I., which has alone survived, was reckoned as starting 1 Jan. 313.

Indictment, written accusation of crime, triable by a jury, which states the place of trial and the nature and particulars of the offence with which the accused is charged. See CRIMINAL LAW.

Indies, East and West, see EAST INDIES and WEST INDIES.

Indifferentism, philosophical term, denoting the conception that all things in life are of 'indifferent' value, being outside the moral law. I. in this sense originated with the Stoics, who, in common with the Cynics and the Sceptics, held that only virtue and vice possessed absolute value, all qualities other than these two being 'indifferent.' With the Middle Ages, the term came to have a second meaning, especially as it appeared in the teachings of Adolard of Bath. With him I. came to mean the philosophy that life is either particular or universal, moral or immoral, according to the point of view from which it is regarded. Values can, therefore, only be indifferently related to any idea of absolute value. Kant used the term 'indifferent' as meaning extra-moral, but I. has come now to be used simply to denote a negation of all values which in life, it is supposed, cancel each other out, leaving no balance of absolute right or wrong.

Indigestion, see DYSPEPSIA.

Indigirka, riv. in NE. Siberia, rising in the Oymyakon plateau and flowing N. into the E. Siberian Sea. Length 1,100 m.; basin 140,000 sq. m.

Indigo, naturally occurring dye-stuff obtained from various plants. Chief among these are species of *Indigofera* (e.g. *I. sumatrana*, from which the Bengal I. is prepared). I. is also present in the juices of *Isatis tinctoria*, or the woad plant, which was cultivated in England until quite recently for the preparation of a fermentation vat used in I. dyeing. I. occurs in the form of a glucoside, known as *indican*, and this latter, on exposure to the influence of atmospheric oxygen and a ferment present in the leaves of the indigo-bearing plant, is converted into the insoluble blue, *indigotin*, which is the essential principle of I. The preparation of natural I. is carried out as follows: the plant is cut down, steeped in vats for about 12 hrs, and the extract, which is of a greenish colour, separated and run into fresh vats, where it is stirred vigorously, so as to bring the indican into contact with the atmospheric oxygen. Insoluble I. is precipitated as a mud, which is collected, pressed, dried, and cut into cubes. Various components other than indigotin are

DIAGRAM OF THE PROCESS OF MANUFACTURE OF INDIGO

present, the most important being indirubine, or indigo red, indigo green, and indigo brown. The importance of natural I. as a dyestuff has greatly diminished during the last few years owing to the perfection of various synthetic processes for its manuf. The success of these has been in large part due to the work of Adolf von Baeyer, who, by a series of masterly researches, elucidated the constitution of the dye-stuff, and showed that it could be correctly represented by the formula

I. is now manuf. by a process shown in outline in the diagram above. The synthetic product is considerably cheaper than the natural, and has practically entirely replaced it. Sev. thousand tons of indigo are manuf. annually, particularly in Great Britain and the U.S.A. Many other dyes related to I. in composition have also been synthesised and are important dyes. See also DYE.

**Indigo Bird** (*Cyanospiza cyanea*), small bird of the finch family, native of the U.S.A. It is about 5½ in. long, the adult male is of a beautiful blue colour, whilst the female and young are of a bluish-grey. It has a sweet song, something like that of a canary, and frequents open spaces.

**Indirect Rule**, native administration characteristic of the Brit. tradition of colonial rule in the African colonies and also in Brit. Malaya (up to the Federation). The principle is that native institutions are more appropriate agencies of gov. than replicas of European political institutions. I. R. affords to native peoples not only an opportunity for self-development, but the possibility of adjusting themselves with the least avoidable disturbance of their own way of life to the novel conditions which by contact with the white men they now must meet. N. Nigeria is the classical example of I. R. devised by its first Governor, Lord Lugard (q.v.), nearly half a cent. ago. That system persists there to-day in conjunction with a superimposed system of parl. democracy. The typical political unit is the prov., in which the chief executive authority is a Muslim emir. To him a Brit. resident, who is the instrument of higher policy, acts as adviser, and in some cases as father confessor. The relationship is a delicate one and depends much on individual personalities. On the whole it works well in N. Nigeria. Though the principles of I. R. are in accord with Brit. political sentiment, the actual evolution of the system has been more or less fortuitous; and it was the existence in Uganda of a well-developed political organisation in Buganda, and in N. Nigeria of the Muslim emirates, which facilitated the use of native authorities in

a way which could not have been contemplated if experience had been confined, e.g., to the backward societies of S. Nigeria or the weak political units of some parts of Brit. E. Africa. In the latter, however, in Tanganyika, Sir Donald Cameron rendered valuable services in extending the system of I. R. as he himself had helped to develop it in N. Nigeria. Nor, again, does the system owe its origin to any preconceived theory of rule any more than does its opposite, direct rule; for all European govts. have been confronted by the problem of administering large colonial areas with a small European staff mostly ignorant of native custom and language, and in all cases they have been compelled, at least in the earlier days, to make use of chiefs or other available native authorities.

There has been much controversy over the relative merits of I. R. and direct. The most effective means of inducing native opinion to accept salutary innovations is the end sought in the system of I. R., which relies on the appeal to the respect of a people for its own leaders, and its pride in institutions which it can call its own. The system of direct rule, on the other hand, considers rather how best to make quickly effective the decisions of superior authority, and sees its most effective agency in the council system, or in the training of chiefs as subordinate agents of the executive gov. In the Union of S. Africa the form which native administration has taken has been dictated by the conviction that Bantu development must be regarded chiefly in relation to the place which the native must occupy in a society dominated by European institutions—hence the policy of 'segregation.' It is, therefore, understandable that S. Africa should prefer a system of direct administration in native affairs, and should rely on the council system as the best for native areas with organs of local gov. It is also evident that the traditional authority of I. R. would not be suitable for adoption as an agency for managing the large native pops. resident in the urb. centres of the Union of S. Africa, or, indeed, for the de-trialised urb. pops. in, for example, Lagos and Nairobi. In S. Rhodesia the system of direct rule, though it rests in principle on the same basis as in S. Africa, is less developed, notably in the matter of suitable tribunals. Although the liberal provision made for native lands is a prominent feature of S. Rhodesian policy, the colony has not yet evolved a comprehensive scheme for the regulation of native affairs. Kenya colony, on the other hand, has in operation a fully developed system of native administration founded on the creation of dist. councils presided over by an administrative officer, with native courts consisting of *ad hoc* nominated members. The adoption of this system of direct rule is not due to any assumption (as in S. Africa and in the Fr. African colonies) that the welfare of the native lies in his rapid assimilation of the use of 'civilised' institutions; but rather

to the fact that the Kenya Gov. had not sufficient confidence in the traditional authorities to justify their exploitation whether as judicial tribunals or as agencies of local gov. But it is claimed for the Kenya system, not unjustly in the circumstances, that it is the best adapted to a colony where Africans are continually in close contact with Europeans and also that it provides opportunities for educ. Africans to take a part in local gov.

In the Fr. African ter. the adoption of a system of direct rule was deliberate. Whereas Brit. sentiment favours the setting up of institutions which afford a training in the arts of self-gov. besides holding out the prospect of autonomy in the future, this formed no essential part of the Fr. theory of colonial administration. The Fr. goal was not native independence but a progressive association with Fr. methods of administration and with Fr. economic and social institutions. It is natural that, in this scheme of native development, the traditional indigenous institutions should not appear to have the intrinsic value which the scheme of I. R. assigns to them. It is claimed, not without some justification, that this system gives the metropolitan administration a more efficient and more easily controlled agency for development than any other system to be found in operation in Africa, especially as the chiefs are now an educ. class trained at one of the chiefs' schools. Critics, however, of the Fr. system think that it is not to the African's own interests to pass as rapidly as possible from the use of his indigenous institutions and of his own language to a regime of Fr. civilisation and language. They hold, too, that the operation of the system must inevitably prejudice the development of a spirit of responsibility and initiative. In the Belgian Congo the system of native administration is in a state of transition. The gov. is as convinced as the British that a traditional chief can render better service to the administration than one who is appointed (as they are in some of the Brit. E. African colonies); but the Congo Gov. is not yet prepared to give the chief either the same judicial authority or the same position in local gov. as would be assigned to him in Brit. ter. Like the French, the Belgian Gov. have less hesitation than the British in removing their chiefs. Moreover, with the exception of the Ruanda-Urundi, the Belgians have encountered few traditional authorities who have commanded a wide measure of support among their people.

In both Brit. W. and E. Africa the prevailing policy is still that of I. R., but is encountering ever more criticism. The principles of I. R., 'if not necessarily incompatible with the avowed ideal of self-gov. by representative institutions'—the tendency to-day is towards greater African (elected and nominated) representation in the legislative councils—are so far alien to it as to presuppose considerable modifications of native institutions before they can fit into any scheme involving an elected parliament' (Lord Hailey). Fr.

policy, on the other hand, does not envisage future self-gov. for their colonies; development in their case is regarded as adapting the colony to occupy in reality the position now assigned to it in principle as an integral part of France. This is emphasised in the definition of the constitutional and legal status of the overseas dept and ters. within the Fr. Union (see FRANCE, *Constitution*).

The innate loyalties of the African have always been to his tribe or vil.; loyalty to the larger organisation which the white man has created can be built up only gradually. The use of the innate loyalties to introduce the idea of self-gov. was, as shown above, the essence of the fruitful principle of I. R., but the last 10 years have seen a silent revolution of imperial policy, as a result of which the days of I. R. seem to be numbered. There are 2 necessities of the coming generation for which I. R. cannot provide. By the first principle of Brit. imperial rule the purpose of the suzerain power is to make available to the colonial peoples the characteristic benefits bestowed by gov. upon its subjects at home—that is, to-day, the manifold services of the 'welfare' state. But as a method of administering social services the traditional tribal system of Africa is hopelessly inadequate. Secondly, the future political system must offer scope for the natural aspirations of Africans who, after contact with European political thought, expect as a general right those opportunities of public service and advancement which in the tribal system could only fall to them by the accident of birth. These 2 necessities, that of the *carrière ouverte aux talents* and that of the large-scale administration dictated by the economics of the social services, in themselves mean the eventual doom of I. R. Yet the system cannot be hurried to extinction; for the tribal system imposed its own restraints upon power, variable yet always substantial—the restraints of custom, in which the system itself was rooted. All over colonial Africa these are now passing. The required restraining element cannot come solely from dependence upon a popular franchise. A loyalty comparable to that evoked by the old tribal system must be engendered. Hence the efforts being made by the Brit. Colonial Office to educate Africans in self-gov. through participation in both legislative and executive responsibility at the local level. The test of their success will be the development of a true loyalty to social units of a national scale; this is the great problem that challenges the emancipating imperialism of the 20th cent. See Lord Lugard, *The Dual Mandate in Tropical Africa* (4th ed.), 1929; H. B. Thomas and R. Scott, *Uganda*, 1935; Sir R. Winstedt, *A History of Malaya*, 1935; L. S. B. Leakey, *Kenya Contrasts and Problems*, 1936; M. Perham, *Native Administration in Nigeria*, 1937; C. K. Meek, *Law and Authority in a Nigerian Tribe*, 1937; R. Emerson, *Malaysia: a Study in Direct and Indirect Rule*, 1937; M. R. Dille, *British Policy in*

*Kenya Colony* (anti-imperialist polemic by an Amer. authoress), 1937; Lord Hailey, *An African Survey*, 1938; Sir D. Cameron, *My Tanganyika Service and Some Nigeria*, 1938; M. Wight, *The Gold Coast Legislative Council*, 1947.

Indium, rare metallic element which occurs in certain specimens of zinc-blende, and resembles aluminium and thallium in its properties. Its symbol is In, its atomic number 49, and its atomic weight 114.8. It is a soft white metal, unacted on by air or water at ordinary temps., but on heating it burns to a yellow oxide with a blue-violet flame, which gives 2 characteristic lines in the indigo part of the spectrum; hence its name.

Individual (Late Lat. *individualis*, that which is not divided), originally denoted a thing indivisible in substance; Milton in his *Animadversions* speaks of the 'individual' Catholic Church. Hence, it also meant inseparable; cf. *Paradise Lost*, iv, 406, 'an individual solace.' Later it was used, as opposed to the word collective, to mean pertaining to a single person, as in the phrase 'individual effort', or to anything of a striking and original character. In colloquial speech it is often used as a noun to denote man or person.

Individual Psychology, see PSYCHOLOGY. Individualism, term originated by the Saint-Simonians, the founders of socialism, to describe the competitive society to which they were opposed. I. began with John Locke, Bernard Mandeville, and David Hume, and achieved full stature for the first time in Josiah Tucker, Adam Ferguson, Adam Smith, and Edmund Burke. Its greatest 19th-cent. historians were Alexis de Tocqueville and Lord Acton. A strand of false I. was represented in Rousseau, the Encyclopédistes, and the Benthamites (philosophical radicals); but this 'rationalistic' I. tends to develop into collectivism, the opposite of true I. (see below).

I. is primarily a *theory* of society—an attempt to explain the forces determining the social life of man. It is also a set of political maxims derived from this view of society. It shows that many human institutions grow and work without a directing mind, and that, as F. A. Hayek has put it, 'the spontaneous collaboration of free men often creates things which are greater than their individual minds can ever fully comprehend.' This is the great discovery of Adam Smith and of classical political economy (see below); it lies at the root not only of economic but of all social life, for it explains most of the order found in human affairs as the unforeseen result of individual actions. This 'anti-rationalistic' attitude to man as an 'irrational' and fallible being whose individual errors are corrected only in the course of a social process is the most characteristic feature of Eng. I. The central idea was first clearly formulated by Mandeville in *The Fable of the Bees*.

The fallacious I. of Descartes and Rousseau traced order to deliberate design. This Cartesian rationalism is in our day the characteristic attitude of

technicians and engineers to social problems. It has produced the theory of the inevitability of historical development, the tendency to fatalism, and the faith in socialism and collectivism as the environment that offers the greatest scope for human design, control, and planning.

The confusion with false I. led many thinkers to ascribe false doctrines to true I. A common error is that I. assumed a rational, 'economic man.' On the contrary, Adam Smith and the classical economists assumed that only by the pressure of the market could man be forced to act 'rationally,' that is, adjust his means economically to his ends. The realistic assumptions of the Eng. classical economists concerning the nature of man were in fact the key to their accurate analysis of the motives and working of human society; and they remain true to-day. It is because much modern political thinking assumes that man is rational, selfless, well-meaning, concerned for the public good, or even altruistic, that so much 'social planning' has proved disappointing. Adam Smith's chief concern was not so much with what man might occasionally achieve when he was at his best but rather with ensuring that he should have as little opportunity as possible to do harm when he was at his worst. I.'s chief merit is that under it bad men can do least harm. It does not require men to be good; it uses men as they are: good and bad, self-seeking and public-spirited, intelligent and stupid.

The individualists were thus primarily concerned to evolve institutions which would lead man, induced by his own motives, to contribute as much as possible to the needs of others. Their finding was that a system of private property provided stronger inducements than had been understood. They did not suppose that the system could not be improved. Nor did they suppose that there was a 'natural harmony' that would achieve the desired purpose; they emphasised the need, as Burke put it in *Thoughts and Details on Scarcity*, for 'well-constructed institutions' where the 'rules and principles of contending interests and compromised advantages' would reconcile conflicting interests without giving any one group power to prevail over others.

The common belief that I. approves of and encourages human selfishness is also erroneous. The great 18th-cent. writers referred to 'man's self-love' and his 'selfish interests' as the prime mover of human action. But these did not mean egotism: they included family, friends, and any persons or purposes for which the individual cared to exert himself. Moreover, since man cannot know more than a tiny part of society, only the immediate effects of his actions on his own circle can enter into his calculations. Whether he is selfish or altruistic, he can care effectively for only a negligible fraction of all society. The philosophical problem is not whether man is, or ought to be, guided by selfish motives but whether he should be guided in his actions

by the immediate consequences which he can know and care for, or whether he should be made to do what someone else who is supposed to understand the effects of his actions on society think appropriate. This is a matter of human nature and constitution; whether man is or is not selfish is irrelevant.

The Christian tradition had long laid down that if man's actions were to be of any merit, he must be free to follow his own conscience in moral matters. The classical economists added the further argument for human freedom that, if man is to contribute as much as he is able to society, he must be free to use his knowledge and skill and to be guided by his care for the small part of society which he knows and understands. Their problem was to devise institutions that would transform these strictly limited concerns into inducements that would lead man voluntarily to contribute to human needs that lay beyond his immediate vision. Their great discovery was that it was the market mechanism that would make man contribute 'to ends which were no part of his purpose.' In recent years this has been recognised even by leading socialist thinkers: for example, A. P. Lerner (in *The Economics of Control*, 1944) wrote that the essential social utility of the price mechanism is that 'if it is appropriately used it induces each member of society, while seeking his own benefit, to do that which is in the general social interest. Fundamentally this is the great discovery of Adam Smith and the Physiocrats.' The confusion about selfishness arose because the classical dictum was wrongly phrased: it is properly put not in the form that man is, or ought to be, guided by his own interests but that he ought to be allowed to aspire to what he (and not another) thinks desirable.

Nor is it necessary for the individualist position to suppose that man knows his interest best. The point is that, since no one can know who does know best, the only way to find out is by allowing everyone to do what he can. The fundamental presupposition is that no one knows all the answers to human needs and problems, and it is therefore wisest to allow people with varying gifts and skills to test what each can do and to be corrected by others. This argument does not suppose that men have the same endowments; it supposes that no one man is fit to judge the capacities which others possess or are to be allowed to use. The basic distinction is between treating people equally and trying to make them equal. The first is the condition of a free society; the second, as de Tocqueville put it, is 'a new form of servitude.'

From these realistic assumptions concerning human nature, I. drew the conclusion that coercive or exclusive power should be strictly limited. It stands for freedom for spontaneous association among individuals, provided it is voluntary and does not become exclusive or lead to coercion of others. Unlike anarchism, I. accepts the need for

coercive power but wishes to limit it to where it is needed to prevent coercion by others and in order to minimise total coercion in society. This limitation of coercive power does not, therefore, mean *laissez faire* in the commonly understood sense of leaving things as they are. Nor does it mean merely the protection of life, liberty, and property. It means a list of rules to govern human conduct—the agenda of gov. This in turn requires that each man shall have a known sphere of responsibility, indicated by a set of *formal, abstract rules by which each individual can know precisely his rights and responsibilities*. Such rules contrast with *orders* which lay down *specific duties*. The former mean freedom under law; the latter mean the use of legislation to destroy freedom. The rules of a liberal, individualist society would, for example, state the ways in which owners may use property of various kinds—chattels, land, inventions, literary or artistic creations; it would assist in spreading information; it would eliminate avoidable uncertainty (not by preventing people from using, for example, an invention, but by helping them to adapt themselves to it; and so on). These rules form merely a framework; within it man is otherwise free.

Such a conception of a society of individuals governed by abstract, general rules does not exclude room for voluntary associations. On the contrary, I. believes that voluntary action in families, groups, and communities can perform better what the State would have to do by coercive action. But it does mean that individuals and groups must accept the collective judgment of other people exercised through the market. This is a source of much misunderstanding. The discipline of the market may seem unintelligible and irrational; the changes it requires may be disturbing and disruptive; it may seem to be the 'blind force' of the social process. But it is the method by which people in general assess the contribution to society of particular individuals or groups. If the price of a commodity or service falls, the reason is probably that people want it less urgently and are prepared to pay less to those who make or supply it. The market is merely a device for reflecting and giving effect to the wishes and decisions of consumers. The choice is not between submission to the mercurial market and freedom from the need for adaptation to change, but between submission to an impersonal market, which leaves a wide choice of ways of responding to its dictates, and submission to the orders of officials, which normally leave none.

The latter has been the fate of the Germans. Their refusal to accept anything that was not the outcome of deliberate design explains why they have never succeeded in building truly free, liberal political institutions. (The new market economy developed after the Second World War, largely by Ludwig Erhard, may be a turning point.) The attitude

that everything must be tidily planned had produced a progressive tendency to the central control of all social processes, the condition in which only an all-powerful central government can preserve order and stability. These tendencies first appeared in the 19th cent., and the individualist philosophers, de Tocqueville, Acton, and others, found themselves opposing centralisation and favouring small nations and the federalisation (decentralisation) of large ones.

I. claims that democratic ideals spring from its basic principles. But it believes that under democracy, no less than under any other form of gov., 'the sphere of enforced command,' as Acton said, 'ought to be restricted within fixed limits.' Moreover, as F. A. Hayek has put it (*Individualism: True or False*, 1946), 'individualism... has no superstitious belief in the omniscience of majority decisions.' Democracy is based on the convention that the majority view decides common action, but it does not follow that the majority view should become the generally accepted view. The very opposite is true: the justification of democracy is that the minority view of to-day may become the majority view of to-morrow.

I. is not egalitarian. It is opposed to privilege, but it believes that gov. should not be empowered to limit what the able or the fortunate may achieve. It believes that no man or group of men should have power to decide what another man's status should be.

I. recognises the family as a legitimate unit as well as the individual; hence it sees no ground for making all individuals start at the same level by preventing them from enjoying advantages they have not earned, such as being born to parents of more than average intelligence or conscientiousness. The individualist philosophers were clear on this point: de Tocqueville said: 'Democracy and socialism have nothing in common but one word, equality. But... while democracy seeks equality in liberty, socialism seeks equality in restraint and servitude.' Acton said: 'The deepest cause which made the Fr. Revolution so disastrous to liberty was its theory of equality'; and 'The finest opportunity ever given to the world was thrown away, because the passion for equality made vain the hope for freedom.'

In short, F. A. Hayek has argued, I. embraces the fundamental attitude of humility towards the processes by which mankind has achieved what has not been designed or understood by any individual. It teaches that society is greater than the individual only in so far as it is free. If it is controlled or directed, it is limited to the powers of the individuals who control or direct it. I. is the great liberator. If man's horizon is limited to what can be consciously controlled by individual reason, and we refuse to take advantage of what can be made possible by the spontaneous association of individuals, we may achieve the fate of which Edmund Burke warned: 'everything about us will dwindle by degrees, until at length our concerns

are shrunk to the dimensions of our minds.' See ANARCHISM; CLASSICAL ECONOMISTS; RULE OF LAW; SOCIALISM.

Indo-European Languages. This term, first employed (in 1813) by the gifted physician, Egyptologist, and philologist Dr Thomas Young of Emanuel College, Cambridge, is to be preferred to 'Indo-Germanic,' as it is called by patriotic Ger. philologists, or Aryan (so termed by super-patriotic Germans), which is now technically reserved for the Indo-Aryan branch (see below). This family comprises most of the languages spoken in Europe and some of those of Asia, particularly the Indian subcontinent. The speakers of these languages have for many cents. been the leaders in the hist. of the world; their literatures are amongst the greatest. The development of these languages has been the most varied and the most rich. The languages belonging to the 3 main branches of this family, Germanic, Romance, and Slavonic, nowadays are spoken by about 325 million people, about 250 million, and about 200 million respectively. On the basis of a great deal of evidence, philologists have succeeded in constructing the Proto-Indo-European language and a 'family-tree' of the well-attested I.-E. L., although not all the scholars agree as to the place in which one or another of these languages (e.g. Hittite or Armenian) should be placed.

The main features of the I.-E. L., at least in their early stages, are as follows: A word normally consists of 3 elements, root, prefix, and ending; the grammatical relationships are generally expressed by means of inflection; and the main morphological features are reduplication of the verb stem and the vowel gradation, known by its Ger. term, *Ablaut*. The Indo-European family falls into 2 sub-families, termed from the word 100, in Latin *centum* (pronounced *centum*), and in Zend *satem*. These 2 groups are distinguished from one another by their treatment of certain palatal and labio-velar sounds (*k*, *g*; *q*, *g<sup>h</sup>*). The *centum* group (Greek, Latin, Celtic, Germanic) has *k*, *g*; *q*, *g<sup>h</sup>*, where the *satem* group (Indo-Iranian, Armenian, Balto-Slavonic, Albanian) has *s*, *z*; *k*, *g*. This subdivision was supposed to indicate that the Indo-European family may fall into 2 great groups: W. and E. The theory that the *centum* group may represent the W. group, and the *satem* the E., has been proved

erroneous by the discovery in E. Turkestan (see below)—where one would have expected *satem* dialects—of a language in which the word 100 is *kānti*. Also Hittite, which does not contain features of the W. language, has forms such as *kuis* and *kuis* (corresponding with Latin *quis* and *quid*).

One of the many vexed problems of the I.-E. L. is that of Hittite. The Hittites inhabited Asia Minor and N. Syria from the third to the first millennium BC, and during the 14th and 13th cents. BC constituted one of the chief empires of the Near E. The most important stage in the recovery of the long forgotten empire of the Hittites was the discovery in 1906-7 at Bogaz Köy (Boghaz Keui), the anct. Hattushash, cap. of the empire, of the rich royal archives containing over 20,000 documents written in cuneiform (see CUNEIFORM WRITING) on clay tablets. Some of these documents are couched in Accadian language, but the bulk is written in Hittite. This language has been recognised as an Indo-European speech since its decipherment in 1915 by the Czech scholar Bedřich Hrozný. The Assyriologist and Hittitologist Emil Forrer, on the basis of 'archaisms' in Hittite as compared with other anct. I.-E. L., has suggested, since 1921, that Hittite broke away from the parent speech before any of the other known I.-E. L. The Amer. linguist E. H. Sturtevant accepted and developed this suggestion. According to him Hittite and 'Proto-Indo-European' are both descended from an earlier language, by him termed 'Proto-Indo-Hittite.' Besides, in Sturtevant's opinion 5 other languages of Asia Minor, known from various inscriptions or from citations in the Hittite documents, are closely related to Hittite. Apparently all these early Anatolian languages preserve certain features that have been lost in all the I.-E. L. Sturtevant thus suggests the following family tree:

It may be noted that until recently Lycaian and Lydian were considered non-I.-E. L.

Recent excavations and studies have recovered other forgotten languages belonging to the Indo-European linguistic family. In the first seven or eight cents. of the Christian Era, Chinese or E. Turkestan (now called Sinkiang), almost wholly a sandy waste to-day, was 'a land of smiling cities with rich sanctuaries and monasteries stocked with magnificent libraries.' This anct. 'melting pot' of peoples of quite different forms of speech, script, and religion is now inhabited by a sparse pop.

mainly of Turkish tongue and Muslim religion. MSS. discovered since 1890 revealed that in the latter part of the first millennium AD, the pop. living between the R. Tarim and the Tienshan Mts, including the ters. of Turfan, Qarashahr, and Kucha, spoke a language belonging to the *centum* group of the Indo-European family. This language, however, presents sev. features not paralleled in the other I.-E. L., and its relationship with the other groups has not yet been sufficiently cleared up. It was assumed at first that the new language was the speech of anct Tokharistan, and it was therefore termed Tokharian, but apparently anct Tokharian was a non-Indo-European form of speech. Besides, the new language is not uniform; 2 dialects or languages can be distinguished, which nowadays are termed *Agnean* and *Kuchean*. Other newly recovered languages preserved in MSS. discovered in Turkestan are *Khotanese*, which was spoken in the anct kingdom of Khotan, and is now known to have been the easternmost Middle Iranian (or Persian) form of speech, and *Sogdian*, another E. dialect of Middle Iranian, which was widely used in central Asia for many cents., and particularly in the second half of the first millennium AD.

The Indo-European 'family tree,' with particular reference to the Italic and Celtic languages, is printed on pp. 52-3, with the 'family tree' of the Germanic languages. Various detailed questions are not taken into consideration; amongst others, the problem of the Thracio-Phrygian group of languages, which certainly were Indo-European, but too little of them is known to give them the exact place in the 'family tree.' Also very little is known about the linguistic affiliations of anct Illyrian, which was mainly spoken on the E. coast of the Adriatic Sea; the Messapii, who inhabited in pre-Rom. times the It. region now known as Apulia; the Piceni, who lived on the central It. coast of the Adriatic; and the Veneti, who inhabited the NW. coast of the same sea, apparently belonging to the same linguistic group as the Illyrians. Some scholars consider Armenian and Albanian, which apparently are isolated independent branches of the Indo-European family, as remnants of a large group, termed Thracio-Illyrian, including anct Thracian, Illyrian and allied languages, anct Phrygian, and Scythian, to the N. of the Black Sea.

The following are a few major points to be considered in connection with the Indo-European 'family tree.'

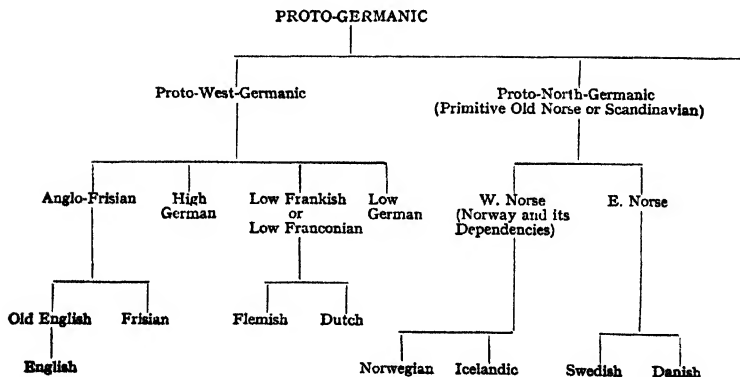

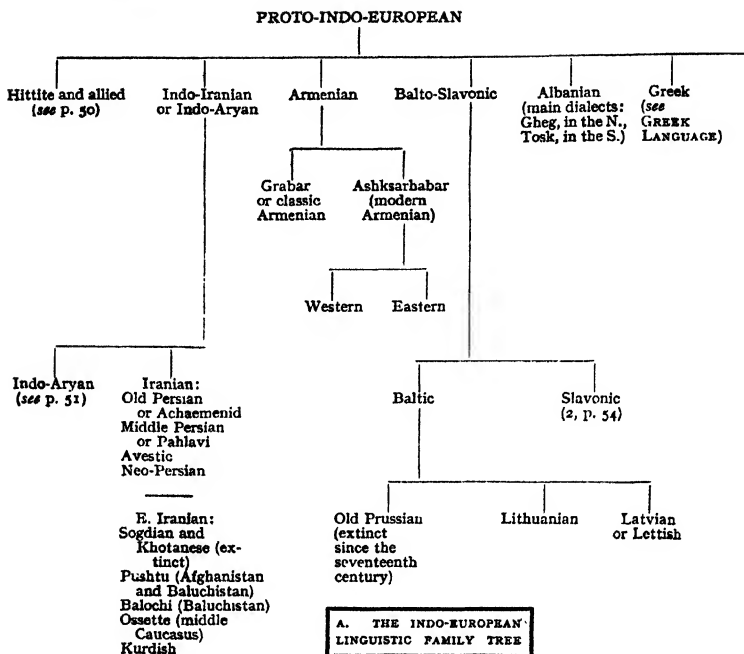

(1) The linguistic problems of India are rather complicated. Her numerous languages and dialects belong to at least 4 main linguistic families (without taking account of the still undeciphered written documents of the pre-Indo-European people of the Indus valley). Indeed, apart from the I.-E. L., there are various Dravidian languages (see under LINGUISTIC FAMILIES). Kolarian or Munda languages, spoken over the whole of central India, which are considered as having the Austro-Asiatic common substratum.

The Indo-Aryan branch is the most numerous and complicated of all the Indo-European branches. In the last cents. BC Sanskrit, which was originally a refined form of the language of the 'Madhyadesa' (the Indian homeland), developed into an artificial, literary language, the language of the Brahman civilisation. For many cents. it was the exclusive literary language of N. India. The Muslim invasion of India after AD 1000, followed by the final conquest, towards the end of the 12th cent., extinguished the Hindu political power (revived only in 1947) in N. India, and brought into use the Arabic-Persian script and the Persian influence on the Indian languages.

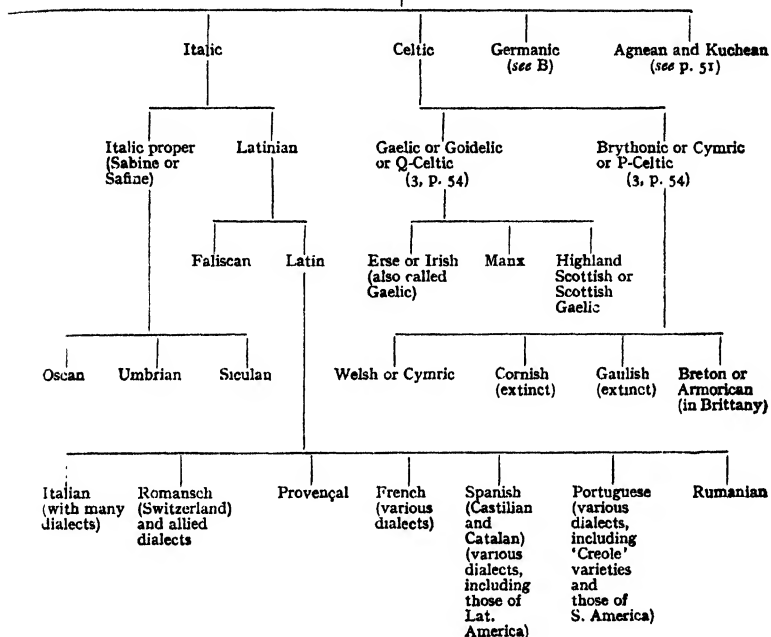

Roughly about this time, the Indian Prakrits or vernaculars began to develop into literary languages. The most important of them is W. Hindi (75,000,000 speakers); one of its various dialects, Hindustani, which was primarily the language of the N. Doab, was carried over the whole of India by the Muslims. The literary Hindustani became the modern literary language of India; early in the 17th cent. it was already known in England that Hindustani was the lingua franca of India; it is believed that nowadays it is spoken by some 65,000,000 people, and it is understood by nearly 150,000,000 people. One form, Urdu, which makes a free use of Persian and Arabic words, and employs the Persian-Arabic script, is used chiefly by Muslims and has become the official language of the new state of Pakistan. The other form, Hindi, is free from Persianisation, and owes more to Sanskrit; it is used by Hindus and is usually printed in the Devanagari character, the script of Sanskrit. Hindi (25,000,000 speakers) has 3 main dialects: Ewadhī, Baghelī, and Chhattisgarhī.

The chief languages of the central group are: (1) Punjabi (about 17,000,000 speakers), also spoken by the Brit. Sikh soldiers. The dialects are W. Punjabi or Lahnda, about 9,000,000 speakers, with 22 dialects. (2) Sindhi, about 4,500,000, with a dozen dialects. (3) Rajasthani, about 18,500,000, with the dialects of Malvi (4,500,000), Marwari, and many others. (4) Gujarati, spoken by about 11,000,000 people. (5) Kashmiri (about 2,000,000 speakers whose main dialect is Kustawari) is the most north-westerly language of this branch. Pahari ('of, or belonging to, the mountains') is spoken by about 2,500,000 people in *Sapadalksha*; that is, the lower ranges of the Himalaya, from Nepal in the E. to Bhadravai in the W.; it can be classified into E., central, and W. Pahari; the last, having many dialects (such as Mandi, Sirmauri, Jaunsari, Chameali, Kiuthali, Kulhi, etc.), is spoken by about 3,000,000 people.

More important is the E. group of the Indo-Aryan languages: Bengali (divided into sev. dialects) is spoken by about 55,000,000 people; Bihari (main dialects: Maithili or Tirhutī, Magahi, and Bhojpuri) is spoken by about 40,000,000 people; Oriya, comprising many dialects, is spoken

## PROTO-INDO-EUROPEAN

## PROTO-GERMANIC

## B. FAMILY TREE OF THE GERMANIC LANGUAGES

by about 12,500,000 people; and see, the most E. Indo-Aryan language, is spoken by about 2,000,000 people.

Only 3 Indo-Aryan languages are spoken in S. India, the most important of them being Marathi with about 23,000,000 speakers. Interesting is Konkani, a Marathi speech, with about 1,500,000 speakers in the Portuguese colony of Goa and surrounding dists.; it is mainly written in Rom. characters as adapted by the Portuguese priests. Saurashtri is spoken by about 125,000 people, mainly in Madras and Madras. In S. India the Muslims speak mainly Hindustani. Sinhalese (the language of Ceylon), spoken by about 4,000,000 people, must also be mentioned; although there are still some who maintain that it is essentially a Dravidian language, it is generally admitted by serious scholars that it is an Indo-Aryan speech strongly influenced by Dravidian. Finally, Romani, the language of the gypsies, in various parts of Europe and Asia, comprising numerous dialects strongly influenced by local languages, is generally considered an Indo-Aryan language.

(2) *Slavonic*. The earliest extant Old Slavonic documents belong to the end of the 10th and to the 11th cents. AD. They are couched in a language termed 'Early Ecclesiastical Slavonic' or 'Old Church Slavonic' or else 'Pannonian Slavonic' or 'Old Bulgarian,' and are written in the Glagolitic or the Cyrillic scripts (see under ALPHABET). The modern Slavonic languages can be divided into 3 geographical groups: E. (Russian, White Russian, and Ukrainian), W. (Polish, Czech, or Bohemian, Slovak, Wend, or Serbian, and Lusatian), and S. (Bulgarian, Serbo-Croatian, Macedonian, and Slovene).

(3) *Celtic*. The Celtic branch is commonly divided into 2 groups of languages, the Gaelic and the Cymric, which, respectively, are also termed Q-Celtic and P-Celtic. In the former group the 'Proto-Celtic' combination of a guttural with a w-sound (like *kw* or *qu*) remains *kw* or *q* or changes to *c*; in the latter it changes into *p* or *pu*.

See Meyer-Lübke, *Grammatik der romanischen Sprachen*, 1890-1902; K. Brugman, *Grundriss der vergleichenden Grammatik der indogermanischen Sprachen* (2nd ed.), 1897-1916, and *Kurze vergleichende Grammatik der indogermanischen Sprachen*, 1904; G. A. Indo-Germanic Languages, see INDO-EUROPEAN LANGUAGES.

**Indonesia**, rep. in SW. Asia, comprising ters. formerly known as the Dutch E. Indies (except Dutch New Guinea). The chief is. are Java, Sumatra, Borneo, and Celebes, many is. groups including Madoera, Timor, and Iliw archipelagos, Moluccas, Lesser Sundas, Bali, Halmahera, Lombok, Flores, Soembawa (q.v.v.), etc. Total area about 735,270 sq. m. Mainly volcanic in origin, the is. extend for some 3000 m. E.-W. in the Indian and Pacific Oceans, between W. of the Malay Peninsula and Australia. The mt slopes are heavily wooded and the forests produce teak, sandalwood, camphor, and ebony. Agric. products include cinchona, rubber, tea, coffee, sugar, rice, sago, tapioca, palm oil, and copra. Mineral resources include tin, manganese, gold, silver, nickel, diamonds, coal, and oil. Numerous industries process native raw materials. Pop. about 75,000,000 including Malayan and Papuan groups, each with many sub-divs., Achinese, Batok, Dayak, Javanese, etc. The general physical type is small, with tawny skin, black hair, mesocephalic head, flat nose, and lozenge-shaped face. Muslims are in a great majority, then Animists. Malay is the official language, but 25 others are used. The fauna represent a connecting link between Asia and Australia. The cap. is Jakarta (formerly Batavia) in NE. Java. There are univs. at Jakarta, Jogjakarta, etc. The area was settled in the 14th cent. by Hindus and Buddhists, who were superseded by Muslims in the 15th cent. The Portuguese set up spice-trading posts in the 16th cent., and the Dutch and English before the end of that cent. The Dutch E. India Co. (1602-1798) achieved complete control of the archipelago; and except for a brief period during the Napoleonic wars, the Dutch kept this power until late in 1949. A Nationalist movement began early in the 20th cent., but only became widespread during the Second World War when the archipelago was occupied by the Japanese. In 1945 the Nationalists proclaimed the Rep. of I. with jurisdiction over Java, Sumatra, and Madura: the Dutch sponsored a number of autonomous states. After 5 years of hostilities and negotiations, the Indonesian

Rep. was finally created in Aug. 1950, and admitted to the U.N. in Sept. of that year. The gov. consists of a president and House of Representatives. There are 10 provs.: W. Java, cap. Bandung; Central Java, cap. Semarang; E. Java, cap. Surubaja; N. Sumatra, cap. Medan; Central Sumatra, cap. Padang; S. Sumatra, cap. Palembang; Indonesian Borneo, cap. Bandjamasin; Celebes, cap. Makassar; Moluccas, cap. Amboina; and Lesser Sundas, cap. Singaradja.

Since 1950 there has been widespread unrest in I. as demands for regional autonomy have grown. In 1950 Java and Borneo revolted. In 1951 a peace treaty was made with Japan but was not ratified until 1958. In the following year there was a major revolt in Atjeh, the defence minister being forced to resign because of a div. in the army, and in the same year a trade agreement was made with Yugoslavia. The Netherlands-Indonesian Union was dissolved in 1954 and in 1955 and 1957 there were revolts in the Celebes and Moluccas. In 1957 there was also a military conspiracy in Java; Dutch banks were seized and martial law was proclaimed on 4 Mar. An attempt was made on the life of President Soekarno (q.v.) in 1957.

**Indonesian New Guinea**, see NEW GUINEA.

**Indoor Gardening**, see WINDOW GARDENING.

**Indore**: 1. Former Princely State of central India with an area of 9900 sq. m. and a pop. of 1,500,000. It was one of the biggest Maratha states, carved out of the Mogul empire in the 18th cent. by the Holkar family. A highland area, crossed by the Satpura Hills in the S. and the Vindhya Mts on the N., it includes parts of the valley between, watered by the Nerbada, with fertile plains and well-wooded forests. I. grows wheat, timber, tobacco, and cotton, and there are some cotton-mills and other industries. It is now part of Madhya Pradesh (q.v.).

2. Cap. of the former state of I. Situated on the R. Sarasvati, 1700 ft above sea level, it is the largest tn in the Malwa highlands, and an important trading centre. It has a number of cotton textile and other factories. The Daly College was founded for the education of scions of Indian princely families. In Brit. times the Residency to the E. of I. was outside the jurisdiction of the State. Pop. 311,000.

**Indorsement**, writing on the back of an instrument something relative to and affecting the transaction evidenced by the instrument, e.g. the I. of a bill of exchange or cheque payable to order operates to transfer the right to payment to the indorsee or person to whom the indorser hands the bill or cheque. The I. of a negotiable instrument may be 'blank,' i.e. where the name of the indorser only is written on the instrument, the effect being that the instrument becomes payable to bearer; or 'conditional,' i.e. the property in the instrument is transferred subject to some contingency being fulfilled; or

'qualified,' i.e. which enlarges, restricts, or otherwise qualifies the liability of the indorser; or 'special,' where the name of the indorsee is inserted; or 'restrictive,' i.e. it restricts the negotiability of the instrument to some particular purpose or person. For the Cheque Act of 1957 see CHEQUE.

**Indra**, in Indian mythology, the ruler of the bright firmament who stands at the head of the heaven of the gods. In Vedic poetry he is represented as performing wonderful deeds for the benefit of good men, at the same time possessing all the attributes of a warlike god.

**Indre**, dept of central France, formed of parts of the anc. provs. of Berry, Orléanais, Marche, Touraine, and Poitou. It is drained by the Indre and the Creuse. It comprises 3 main dists.: the Boischaud, in the S., a wooded, marshy plain; the Champaigne, a fertile agric. area; and the Brenne in the W., a region of moors, marshes, and ponds, now considerably improved by drainage and afforestation. Sheep are reared in Champaigne. The chief products are vines, fruit trees, cereals, beet, and vegetables. Poultry is also raised. The chief manufs. are textiles, paper, leather goods, and pottery. The prin. tns are Châteauroux (the cap.), Le Blanc, La Châtre, and Issoudun (qq.v.). Area 2664 sq. m. Pop. 247,450.

**Indre-et-Loire**, dept of central France, formed of most of the anc. prov. of Touraine, and of parts of Anjou, Poitou, and Orléanais. It is drained by the Loire and its tribs., principally the Indre, Cher, and Vienne. The chief dists. of the dept are the Gâtine, a plateau of woods and plains N. of the Loire; the Champaigne, a chain of vine-clad slopes between the Cher and the Indre; the Veron, a dist. of orchards and vines between the Loire and the Vienne; the unproductive plateau of Ste-Maure; and the marshy dist. of Breuilly. The chief products are wine, grain, and fruit. There are some textile and paper manufs. The prin. tns are Tours (the cap.), Chinon, and Loches (qq.v.). Area 2377 sq. m. Pop. 364,700.

**Indri**, or *Endrina* (*Indris brevicaudata*), sub-family of the Lemnidae, large monkey-like lemurs inhabiting Madagascar, especially the E. coast forests. They were first discovered 1780, are black and white in colour, of diurnal habits, and live chiefly on fruit. See LEMUR.

**Inductance**, or coefficient of self-induction of a coil or piece of apparatus or a network, is the magnetic flux generated by unit current and threading the circuit. A coil of  $n$  turns through which a flux  $\phi$  is produced by the current  $i$  has an inductance  $\frac{n\phi}{i} = L$ ,  $n\phi = Li$ . The voltage

induced by varying flux,  $\frac{nd\phi}{dt} = L \frac{di}{dt}$ .

$\therefore$  the inductance  $\times$  rate of change of current. See HENRY and ELECTROMAGNETIC INDUCTION.

**Induction**, Eng. Church ceremony for giving possession of a benefice to a clergyman. The I. is performed after a

mandate from the bishop to the archdeacon (or dean and chapter). The inductor takes the clergyman's hand and lays it on the key of the church door. The clergyman is then admitted, and tolls a bell as a public notification to his parishioners. The incumbent's possession is completed by 'reading himself in,' reading the Thirty-nine Articles, promising to accept them and conform to the rules of the Church.

Induction, in logic (q.v.), the process of real inference, or the proceeding from the known to the unknown. This operation of *discovering* and *proving* general propositions is contrasted with deduction, which is the method of *applying* general propositions once discovered to such particular cases as are considered to be within the scope of the estab. propositions. The great exponent of deductive principles. Aristotle, neglected I., and only identified it with a complete enumeration of facts. Bacon's *Novum Organum* contains little true I., though it contains directions for drawing up the various kinds of lists of instances. Whewell's *Philosophy of the Inductive Sciences*, 1840, marks a distinct advance, and shows a due appreciation of the cardinal point neglected by Bacon—the function of theorising in inductive research. He shows that science advances only in so far as the mind of the inquirer is able to suggest organising ideas whereby experiments and observations are made to dovetail into an intelligible system. J. S. Mill in his *System of Logic, ratiocinative and inductive*, 1843, ignores the constitutive work of the mind, and regards knowledge as the merely passive reception of impressions. Recent advances in mental science have estab. the great importance of I., and clearly show that the most valuable faculty in scientific inquiry is that of suggesting new and valuable hypotheses. See also LOGIC. See J. S. Mill (above) and A. Lalande, *Les Théories de l'induction et de l'expérimentation*, 1929.

**Induction, Electro-magnetic.** Faraday was the first to discover the phenomenon of electro-magnetic I. The following are practically the same experiments that Faraday performed. Take a cylindrical coil consisting of many turns of fine wire wound on a hollow reel (Fig. 1). Connect the ends of the coil to a delicate galvanometer. Bring the N. pole of a magnet rapidly towards one end of the spiral. The needle of the galvanometer will be deflected in one direction. Now suddenly withdraw the magnet again. The needle is deflected in the opposite direction. It can be seen that the deflection is not permanent, but takes place only when lines of force are being introduced into, or taken away from, the coil. It can be shown that the current induced is also proportional to the rate at which the magnet is introduced. Now, instead of the magnet, use a coil wound on a thin cylinder through which a steady primary current is flowing. It will be seen that when this primary coil is introduced deflection of the galvanometer needle takes place, and when it is withdrawn a deflection in the opposite direction occurs. It

can also be noted that a current is induced in the coil, which is called the **secondary coil**, in the same direction as the primary current whenever the number of tubes of magnetic induction threading the secondary circuit is *diminished*, and in the contrary direction if the number is increased. Thus attraction will occur between the coils when the tubes are diminishing, that is, when the primary coil is being removed, and repulsion when it is being brought nearer the secondary coil. Thus the induced current is such that it tends to stop the motion producing it. This is Lenz's law. Faraday, from the result of his experiments, explained the action of Arago's

FIG. 1

disk. This consists of a compass needle placed above a horizontal copper disk which is rotating in its own plane. It is found that the needle moves with the disk. Faraday stated that by the motion of the disk relative to the needle, eddy currents were induced in the disk, and these were such that they tended to stop the relative motion of the needle and disk. Thus the needle is dragged around with the disk. In further experiments with the 2 coils it is found that currents are produced in the secondary coil when the current in the primary coil is suddenly stopped or commenced. Faraday showed experimentally with his apparatus that the induced current in the secondary coil depends on the *rate of change* of the number of tubes of force threading the coil. This result is embodied in Neumann's Law which states that the induced E.M.F. in a stationary circuit is equal to the rate of decrease of magnetic flux threading the circuit.

**Coefficients of induction.** The number of tubes of magnetic I. which thread a circuit when unit current is flowing round it is called the coefficient of self-I. of the circuit. It is obvious that when the

current in the primary is stopped, these tubes suddenly diminish. A current is then induced in the primary coil itself such that it tends to prevent the diminution of the primary current. When the current is started the induced current in the primary coil tends to prevent the current starting. The number of tubes of magnetic I. threading a given circuit when unit current passes through another is said to be the coefficient of *mutual I.* of the 2 coils. We know that the magnetic field inside a solenoid when unit current is passing is  $4\pi n$ , where  $n$  is the number of turns per unit length. The area of a single turn is  $\pi r^2$ , and thus that of  $nl$  turns is  $\pi r^2 nl$  ( $l$  is the length of the solenoid). Thus the self-I. of the solenoid is  $4\pi n^2 r^2 l^2$ . This discovery by Faraday of electro-magnetic I. has led to vast progress in electric machines. Practically all modern electrical machinery depends on the I. of currents.

The *Ruhmkorff induction coil* enables us to obtain an intermittent current at high voltage from a low voltage direct current. The primary coil, P (Fig. 2), consists of a few turns of thick copper wire. The secondary coil, S, is wound over the primary, and consists of a vast number of turns of very fine wire. Both the coils are wound on a bundle of soft iron rods, AB. The primary current, which is supplied by a cell or number of cells, C, is broken at frequent intervals of time. One method of doing this is as follows: One terminal of the primary coil is connected to a fixed platinum stud, D, the other terminal to a spring which carries a piece of soft iron, E. When the spring is unbent it touches the stud D and a current passes in the primary. The core of soft iron becomes magnetised and attracts the soft

FIG. 2

iron disk, E, thus breaking contact at D. The current is stopped, and the core immediately becomes unmagnetised, the spring flies back and contact is again made. The process is then repeated. When the contact in the primary is broken, a current flows in one direction in the secondary coil, when it is made the current flows in the opposite direction in the secondary. Thus an alternating current of high voltage is set up in the secondary. In practice a condenser (not shown in the diagram) is

connected between C and D and in parallel with the spark gap at D. One function of this condenser is to suppress sparking at the gap, and it causes the decay of current in the primary coil to be much more rapid than its growth, with the result that the intermittent current in the secondary is practically a unidirectional one.

**Induction, Electrostatic.** Consider an insulated conductor C which is positively charged. Suppose AB is an insulated, uncharged conducting cylinder on which

ELECTROSTATIC INDUCTION

3 pith balls are suspended, as shown in the diagram. When C is far from AB the pith balls all hang vertically. When C is brought near to one end of AB (say the end B), the end B becomes charged with electricity of the opposite sign to that of C, whilst the end A is charged with electricity of the same sign as C. There is no charge on the middle parts of AB. This is shown by the fact that whilst the pith balls on the ends are deflected from their stands and away from AB, the middle ball is undeflected. (A more rigorous explanation is possible in terms of electric potential, q.v.) If AB is touched with the finger or otherwise connected to earth, whilst still under C's influence, it loses its charge at the end A. If C is now removed, the body AB becomes uniformly charged with electricity of the opposite kind to that of C. AB is then said to be electrified by I. or influence. It is obvious that these phenomena can be explained from the fact that like charges repel, and unlike charges attract, each other. The un electrified cylinder is considered to have an equal quantity of positive and negative electricity. Electric I. allows an unlimited number of charges to be obtained and all friction machines are based on this principle. See ELECTROSTATICS; ELECTROTROPHORUS; ELECTROSTATIC MACHINES.

**Induction, Magnetic.** Magnetic substances like iron become magnetised under the influence of magnetic force. If a N. pole were placed near a bar of iron, a S. pole would be induced on the end of the bar nearer the pole. Attraction would take place, and the bar of iron would move into a stronger part of the field. If the bar were of bismuth, a N. pole would be induced on the end nearer the N. pole of the inducing magnet and the bar would tend to move into the weaker parts of the field. A substance that is attracted by a magnet is termed a *paramagnetic* and a substance such as bismuth which is repelled is termed a *diamagnetic* substance. A substance such as iron which is strongly attracted is

termed a *ferromagnetic*. The magnetisation induced on the bar is measured by the resulting magnetic moment. The *intensity of magnetisation* is the magnetic moment per unit vol. Soft iron becomes more strongly magnetised than steel, i.e. it is more *susceptible* to magnetisation than steel. *Susceptibility* is measured by the ratio of the intensity of magnetisation to the magnetic field. This magnetic field is that field actually within the bar as found in a long needle-shaped cavity cut in the

FIG. 1

iron parallel to the applied field. If a thin disk-shaped cavity (Fig. 1) were cut in the iron perpendicularly to the magnetising field  $H$ , the force on a unit positive pole placed in this cavity is defined as the magnetic  $I$ ,  $B$ . It can be proved that  $B = H + 4\pi I$ , where  $I$  is the intensity of magnetisation. Therefore  $B = H(1 + 4\pi K)$  (where  $K$  is the susceptibility). The ratio of the magnetic  $I$  in the iron to the magnetic field is called the *magnetic permeability*,  $\mu$ .

$$\therefore \mu = 1 + 4\pi K.$$

Diamagnetics have a -ve  $K$ , and hence  $\mu < 1$ . Paramagnetics have a +ve  $K$ , and hence  $\mu > 1$ . For ferromagnetics  $\mu$  varies with  $B$ , the initial value for soft iron being about 250, and for certain alloys (e.g.

FIG. 2

Mumetal)  $\mu$  can have initial values of 20,000. If a bar of iron is placed in a magnetic field, which is gradually increased in intensity from zero, it is found that the relation between  $B$  and  $H$ , when plotted, gives a curve such as  $OA$  (Fig. 2). When the magnetising field is reduced, the relation between  $B$  and  $H$  does not give the curve  $AO$ , but another curve such as  $ARCD$ . In fact, the iron may be taken through a cycle such as  $ARCD$ . The name of *hysteresis* has been given to this

phenomenon. The  $I$  (OR) retained by the iron when the applied field is reduced to zero is the *residual magnetism* and the effect is known as *remanence*. The value of the reversed magnetic field (OC) required to reduce the  $I$  to zero is known as the *coercive field*.

Induction Coil, see INDUCTION, ELECTRO-MAGNETIC.

Induction Furnace, see METALLURGY (METALLURGICAL FURNACES).

Indulgence. This term, in Rom. Catholic theology, signifies the remission of the temporal penalty of sin, granted to a repentant sinner by Church authority. The  $I$ , however, is never considered a sacramental remission of the sin itself. Although the first recorded instance of the use of the word  $I$  was in the 11th cent. by Alexander II, the institution was found in full development during the wars of the Crusades. Serving in these was accounted an equivalent substitute for penance, provided always the service was from motives of devotion and not from mere greed or love of glory. Later, military service as a condition for  $I$ s was replaced by pilgrimages to certain great shrines.  $I$ s may be given by the Pope, and by primates and bishops within the limits of their jurisdiction. In modern times they are usually attached to works of devotion or good works of any kind in the form of remission of part or all of what would have been the old canonical penance for sin.

Indulgence, The Declaration of, issued by James II of Great Britain in 1687. A second Declaration was issued the following year. Both had for their ostensible object the suspension of all laws tending to force the consciences of the king's subjects—their real object being to relieve the Rom. Catholics. They were very unpopular, and the culminating point of the universal dissatisfaction was testified in the refusal of the 7 bishops (q.v.) to order their clergy to read the second Declaration aloud from their pulpits. See JAMES II.

Indus, S. constellation between Grus and Pavo. The chief star (of 3.2 magnitude) gives a solar spectrum. Near by are the clusters of Tucana and Telescopium.

Indus, great riv. of Pakistan, rising in the Kailas mt group, near the sources of the Brahmaputra, Sutlej, and Gogra. For upwards of 500 m. it flows in a NW. direction; at first by the foot of the Himalayas on the Tibet plateau, then through Kashmir, between the chains of Ladakh in the N. and of Zaskar in the S., amid mt scenery unmatched by any in the world. Here it receives the waters of the Shyok, the largest trib. of this its upper course. As it leaves Kashmir to enter the Punjab it turns to the SW., and emerging from the mt regions is joined at Attock by the Kabul R., from Afghanistan. From this confluence it continues to run in a SW. direction for another 1000 m. till it enters the Indian Ocean in delta form some 50 m. S. of Karachi. About the middle of this lower course through the plains it receives one great affluent, composed of the united

waters of the Sutlej, Chenab, Ravi, and Jhelum, which with the I. itself make the Five Rives of Punjab. It loses much water from passing through desert regions, but is navigable up to Attock at all seasons. During the melting of the mt snows, from May to Aug., destructive floods often occur. It is spanned by sev. bridges, even in its upper mt courses—the iron railway bridge at Attock and the cantilever 'Lansdowne Bridge' at Sukkur being triumphs of engineering skill. The total length of the I. is nearly 2000 m., its minimum width is 500 ft, and depth 9 to 10 ft. See Haij, *The Indus Delta Country*, 1894. See also INDUS VALLEY CULTURE.

**Indus Valley Culture**, term used to denote a well-marked prehistoric culture in this area of India. Its chief centres were the cities of Mohenjo-daro, 25 m. S. of Lakarna in Sind, and Harappā in the Punjab, the name Harappā being commonly used to describe the culture. Many other small tns, vills., and trading-posts which have been discovered show that a great prehistoric empire was widespread in the Indus valley. The riv. system was doubtless the geographical feature of its existence. Mohenjo-daro was excavated in 1922 and subsequently, but unfortunately not by modern methods, though the various discoveries made have provided a basis for later study. The N. of the twin cities, Harappā, was investigated in 1920 and later, but it was not until Sir Mortimer Wheeler's excavations in 1946, when he was director-general of the Archaeological Survey of India, that its great importance was realised, and the defences of its citadel were recognised for the first time. The Harappā culture, with its standard mass-produced pottery, standard weights, and building plans, has a remarkable uniformity which points to a rigid and highly evolved economic and social organisation. Its beginnings are not known, though they could scarcely be outside India itself; it had affinities and contacts with the anc. civilisations of Sumer and the Mediterranean. The Indus people lived in well-built brick houses which were provided with baths, wells, and elaborate drainage systems. Mohenjo-daro and Harappā were laid out in grid-iron tn plans. Tools and weapons were of cast and forged copper and bronze, iron being unknown. Grain was grown in quantity; cotton was known; and domestic animals included the ox, buffalo, goat, sheep, pig, dog, cat, horse, and camel. There was an active trade in metals and semi-precious stones, and artistic products included sculpture in the round inlaid with metals, and steatite stamp-seals engraved with a script which has not yet been read. Religion seems to have been centred on a rule by powerful priest-kings. Many clay figurines suggest the worship of a mother-goddess, perhaps in essence an earth-goddess, and a male god depicted on stamp-seals may be a forerunner of the great Hindu god, Shiva. At the height of its maturity the Harappā culture was not earlier than 2500 BC. It was overwhelmed c. 1500 BC by barbarian conquerors from the W. See Stuart

Piggott, *Prehistoric India*, 1952; Sir Mortimer Wheeler, *Cambridge History of India* (supplementary vol., *The Indus Civilisation*, 1953). Both have good bibliographies.

INDUS VALLEY CULTURE  
Sculpture from Mohenjo-daro.

**Industrial Accidents**, 'accidents rising out of or in course of employment.' For statistical purposes, an accident is regarded as one which is either fatal or disables the workman for more than 3 days from earning full wages for the work at which he was employed. Such accidents are classified according to their severity: whether the results are fatal, and if non-fatal whether permanent or temporary. A table of frequency rates for 2363 factories employing 2,245,015 persons (or about 10 per cent of all Brit. factory employees) gives a rate of 1.62 for all the listed industries during 1954 and is useful as a guide to the industries producing most accidents. The tables on p. 60 show the percentage relationships of totals of accidents for 1947 and 1954 to the accidents in 1937.

Typical figures of direct causes of accidents in Brit. factories are as follows (percentage of total accidents for 1954): power-driven machinery, 16.27; molten metal or other hot corrosive substances, 3.94; hand tools, 8.25; struck by falling body, 8.62; persons falling, 13.80; stepping on or striking against objects, 7.95; handling goods, 26.90; other causes, 14.21. These figures show that what are known as non-machinery accidents accounted for 83.73 per cent of the total.

See also WORKMEN'S COMPENSATION.  
See *British Journal of Industrial Safety*, 1948, and *Annual Report of Chief Inspector of Factories*, 1954 and 1955, H.M.S.O.

Year	Number of Fatal Accidents					
	Factories	Docks and Warehouses	Building Operations	Works of Engineering Construction	Total	Total per cent of 1937
1937	716	105	182	—	1003	100
1947	516	70	218	35	839	84
1954	514	40	172	42	768	77

Year	Number of Non-fatal Accidents					
	Factories	Docks and Warehouses	Building Operations	Works of Engineering Construction	Total	Total per cent of 1937
1937	176,013	8303	8223	—	192,539	100
1947	185,231	7819	8251	1096	202,397	105
1954	167,476	7594	13,731	2130	190,931	99.5

**Industrial and Provident Societies.** Societies which can be registered under the Industrial and Provident Societies Acts of 1893-1928 are those formed to carry on any industry, business, or wholesale or retail trade authorised by the rules, including dealings in land. To a certain extent the rules of registration and general statutory regulation of these societies are assimilated to those of friendly societies. Modern I. and P. S. are divisible into co-operative and building societies (q.v.). The primary characteristics of I. and P. S. are indicated by the description: 'Industrial' connotes the making of a profit by the mutual personal exertions of the members, while 'provident' emphasises the providing for the future of the members by the distribution of the profits. The hist. of I. and P. S. shows that it was long before they gained public confidence, or even met with legal recognition. According to Brabrook, they were viewed with mistrust because they became associated with ever wider schemes enunciated by promoters who probably looked upon them as socialistic organisations. Robert Owen's projects were especially illustrative of this idea. The first legal recognition of co-operative societies was in the Friendly Societies Act of 1846. The basis of the law of I. and P. S. is now to be found in the Consolidated Industrial and Provident Societies Act, 1893. No member of I. and P. S., other than a registered society, may hold more than £200 in shares. Each society must make an ann. return of its receipts and expenditure, funds and effects to the Registrar of Friendly Societies. On the application of one-tenth of the members or of 100 where the membership is 1000 or more, the registrar may appoint an inspector to investigate the affairs of the society. The Prevention of Fraud (Investments) Act of 1939 requires some societies of the investment trust and property type to transfer their registration under the Industrial and Provident Societies Acts to registration under the Companies Act, 1929, and in consequence they must conform to the prospectus provisions of the

latter Act; but they are free of the normal companies' registration fees and stamp duties on paid-up share capital. From the passing of the Act of 1929 registration under the Industrial and Provident Societies Acts was restricted to bona fide 'co-operative' organisations, including societies 'conducted mainly for the purpose of improving the conditions of living, or of otherwise promoting the social well-being, of members of the working classes'—the principle which underlay the old Industrial and Provident Acts although not expressly enacted. Before the Second World War there were 5693 registered societies, with a total membership of 9,283,000 and funds of £281,507,000. See CO-OPERATION and FRIENDLY SOCIETIES.

**Industrial Conciliation,** see CONCILIATION, INDUSTRIAL.

**Industrial Court,** permanent court set up as a result of the Whitley Committee of 1918 in which disputes between workmen and employers can be investigated and referred for arbitration or other solution in the event of no mutual agreement. See WHITLEYISM.

**Industrial Design.** The advent of the machine brought new problems in the production of objects of use, including those newly invented and those formerly made by craftsmen who were also artists. The tendency was to imitate by mechanical means the pattern and ornament of earlier times, and this was a Victorian misunderstanding only gradually overcome. The simplicity of Wm Morris's furniture was a step in the right direction, but this was a return to handicraft. In a strict sense, design for industry meant specific planning for what machines were fitted to turn out. The Victorian schools of design realised the problem but did not know how to tackle it. Improvement has

... its slogan of 'Fitness for Purpose,' and notably on the Continent by the Bauhaus, estab. in Germany after the First World War, under the direction of Walter Gropius. Brit. art schools have also instituted systematic training in

I. D. in recent years. In the U.S.A. much attention has been given to the subject, and expert industrial designers like Raymond Loewy and Walter Dorwin Teague have redesigned (or alternatively 'restyled') a host of products, from locomotives to refrigerators and sewing-machines. The importance of appropriate and attractive design in winning export markets has been recognised in Britain by the institution of a special faculty, Royal Designers for Industry (R.D.I.), and after the Second World War by the creation of the advisory Council of I. D. See H. Read, *Art and Industry—the Principles of Industrial Design*, 1934.

Industrial Design, Council of, organisation set up in 1944 whose purpose is to promote by all practicable means the improvement of design in the products of Brit. industry. It is financed by the Brit. Gov. The word design is taken to cover the many processes in the planning of goods for hand production, but more especially for quantity production by machine, and to include structure, texture, form, and decoration. Good design is taken as meaning both practical convenience and beauty. The main functions of the council are to help industries to set up design centres which operate on a co-operative basis, supported by contributions from the firms in each industry, with the addition of a grant from the Exchequer; to hold and take part in exhibitions; to publicise good design both independently and in collaboration with those adult education and voluntary associations which are concerned with design appreciation; to co-operate with education authorities and others in the training of industrial designers; to advise gov. depts on the design of goods which they purchase; and to be a centre of advice and information on all matters of I. D. for industry, gov. depts, and other interested bodies. The industrial div. of the council offers manufacturers, designers, and interested bodies a general advisory service for the promotion of improved I. D.; the information div. includes sections which offer specific services to educational bodies of every kind, to industry, and to the public. The offices are at Tilbury House, Petty France, London, S.W. 1. See INDUSTRIAL DESIGN. See also the council's magazine, *Design*.

Industrial Hygiene, see HYGIENE and INDUSTRIAL WELFARE.

Industrial Insurance. In its beginning I. I. consisted of 'burial societies' through which the working classes, by payment of small weekly sums to a mutual society, received sufficient money to defray funeral expenses when the need arose. From these comparatively obscure societies the great business of I. I. of to-day developed. A demand for whole-life insurance followed the modest requirements of 'burial funds,' and this demand was satisfied by the innovation of premiums which could be paid weekly or monthly and the issuing

of policies for smaller assured sums. These premiums are collected at the houses of the policy-holders, and it is this 'collection,' coupled with the weekly or monthly payments, which distinguishes I. I. from ordinary insurance, where premiums are usually paid annually for larger assured sums. The official limit which marks insurance as industrial is that the premiums must be collected at intervals of less than 2 months, while the sum assured must be less than £1000. This demarcation was embodied in the Act of 1923. Associated with the I. I. companies are the Friendly Societies: the administration of both is governed by the statutory measures of the same Act, and the Industrial Assurance and Friendly Societies Act, 1948. All such companies must be registered and pay a substantial deposit to the Chief Registrar, who has authority to hear and judge disputes arising out of claims, criticise balance-sheets, hold inspections, reject unsound valuations, and even direct the winding up of unsatisfactory companies. The Industrial Assurance Act of 1923 was further extended by the Industrial Insurance and Friendly Societies Act of 1929, which is concerned with (1) the computation of the minimum sum payable at death under the age of 10, and (2) the validation of the 'life of another' endowment insurance. But important amendments of the law were made by the Act of 1948. This Act (section 6) contains a prohibition of insuring money to be paid on the death of a child under 10, or, in other words, it prohibits insuring so as to render any sum payable under the insurance on the death of any person at any time before he or she attains the age of 10 years (otherwise than by repayment of the whole or any part of premiums paid). This prohibition also applies to registered or unregistered friendly societies or trade unions. By section 2 power is given to insure the life of a parent or grandparent for not more than £20, but only in respect of a person who at the time of the proposal is ordinarily resident in Great Britain; and the Act prohibits alienation of such insurances. The former power conferred on I. I. companies (and Friendly Societies) to insure money for funeral expenses is also abrogated by the Act; while, by another provision, liability on policies will not be restricted on grounds of health of the person upon whose life the assurance is taken out, if the proposer's knowledge and belief have been properly disclosed.

Like many other Brit. institutions, industrial life insurance has completely changed its purpose during its existence, besides being radically reformed. It began, as implied above, in the desire of every working man to guard himself and his family against the danger of a pauper's grave. It was to permit the inclusion of the family that Parliament allowed in this sphere alone the insurance of the life of another—an exception to the general and salutary rule that no one might insure so as to benefit financially from another's death. With the payment under the

National Insurance Act, 1946, of death benefit as from 1 July 1949, the whole original cause of I. I. comes to an end. Some thought that on the principle of *cessante ratione cessat lex* the institution of I. I. should be ended. But its potentialities for good in the future should guarantee its continuance, especially as the worst abuse has been removed by the Act of 1948. I. I. to-day has been transformed into a flexible system which enables the wage-earner (already compulsorily insured so as to guarantee him a minimum standard of living in all the changes and chances of life and a decent funeral when he dies) to assure for himself and his family all those infinitely diverse benefits at various monetary levels which he desires and for which he is willing to pay. The main remaining criticisms of I. I. to-day are its relatively high cost and the number of forfeitures. No fewer than 910,000 policies were forfeited in 1948, but this was a great improvement on 2,610,000 in 1938 and 3,160,000 in 1929. It may be added that the size and importance of I. I. are shown by the fact that the institution draws annually more than £110,000,000 from the pockets of wage-earners.

As administrator of the Industrial Assurance Act of 1923, the Chief Registrar of Friendly Societies is styled the Industrial Assurance Commissioner (offices: 17 North Audley Street, London, W.). See ann. reports of the Industrial Commissioner.

In the U.S.A. and Canada a similar system of I. I. operates. In the former country the administration is directed by the gov. of the separate states, and not by the Federal Gov., while in the latter control is vested in the Dominion Gov. under the provisions of the Dominion Insurance Act of 1927.

**Industrial or Occupational Psychology.** branch of psychology concerned with man in relation to his working life. The subjects dealt with can be grouped under the 2 headings of Fitting the Man to the Job and Fitting the Job to the Man. Under the first come vocational guidance, personnel selection and allocation, and occupational training. Under the second fall physical environment, working spoils, the design of equipment, working methods, attitudes of workers to their employment, and problems of communications and relationships. A good adjustment between the individual and his job means better satisfaction and health at work and also a higher level of effectiveness. Good adjustment depends on capacity for the work, developed by training, on the suitability of the machinery, equipment, and methods from the human point of view, and on satisfactory relationships between the people in the organisation. The development of the subject in Great Britain began with the work of the Health of Munition Workers Committee in 1915 and was continued by the Industrial Fatigue (later Health) Research Board of the Medical Research Council and by the independent National Institute of

Industrial Psychology (14 Welbeck Street, London, W.1), founded in 1920. The Medical Research Council maintains interest in the subject through its Industrial Psychology Research Unit, attached to University College, London.

In the U.S.A. industrial psychology began to develop about the same time as in Great Britain, but followed rather different lines, being particularly concerned with the selection of workers for particular jobs. Later attention was paid to personnel techniques such as job evaluation, merit rating, and supervisor training. The study of working environment, particularly the design of equipment, received great impetus during the war and has led to the development of a separate branch of the subject in the U.S.A. which is called Human Engineering.

**Industrial Party,** organisation alleged to have existed in Soviet Russia in the late 1920's consisting of leading technicians and aiming at undermining the Soviet regime through industrial sabotage. The show trial of I. P. members in Moscow in 1930 (including its alleged leader Prof. Ramzin) was an important stage in the persecution of the technical intelligentsia. See also PAL'CHINSKIY.

**Industrial Relations (Britain).** In Britain, unlike the position in many foreign countries, the relations between employers' and workers' organisations have been developed on a voluntary basis over many years. Collective bargaining between employers and work-people has for many years been recognised in Britain as the method best adapted to the needs of industry and to the demands of the national character in the settlement of wages and conditions of employment. It has produced a well co-ordinated system of conventional working arrangements affecting in the aggregate large numbers of work-people and defining, generally with great precision, almost every aspect of I. R.

**Historical and legislative development of organisations of employers and work-people.** Organisation of employers and workers grew with the development of modern industry from the 18th cent. In the 16th cent. the State regulated wages and conditions, and at the same time prohibited combinations both of workers and of employers from altering wages and conditions of work. But with the in-

ditions, in the *laissez faire* economy of the day, were left to be fixed by employers. During the 18th cent. further laws were passed prohibiting combinations in various trades, and as the result of the report of a parl. committee of inquiry the Combination Laws Repeal Act, 1824, was passed. This legalised trade societies, and the immunity thus granted to combinations for the regulation of wages and conditions led to the widespread formation of unions. This led to disputes and strikes and to agitation for the repeal of the Act of 1824. An amending Act in 1825 limited the

activities of the trade societies, making it difficult for them to take effective action without infringing the law; but the Act legalised the right to withhold labour by collective action, and this fundamental right has never been abrogated despite many changes in the powers permitted to trade unions. The immediate result of these developments was an expansion of union organisation, and the conception of one big union with a political bias emerged. Later there was concentration on industrial amelioration through smaller but stronger organisations whose aims were confined to securing recognition and improvement in wages and conditions of work. Strikes were frequent from 1825 to 1871. A Royal Commission of 1867 reviewed the position of trade unionism, and consequent on their recommendations 2 important Acts were passed in 1871—the Trade Union Act and the Criminal Law Amendment Act. The Trade Union Act of 1871 is the prin. Act on which the present-day status of unions is founded. The Criminal Law Amendment Act qualified the freedom conferred under the Trade Union Act by providing penalties for violence, intimidation, molestation, and obstruction of any person in order to coerce him for trade purposes. Since then there have been many subsequent Acts, supported by a great body of case law, and the law has been codified. These measures and judgments include the Conspiracy and Protection of Property Act, 1875 (see CONSPIRACY); the Employers and Workmen Act, 1875, dealing with disputes between employers and workmen arising out of breaches of contract and allowing courts to adjust claims for wages or damages; the Trade Union Amendment Act, 1876, amending the definition of trade unions given in the Act of 1871; the Taff Vale Judgment of 1901 and the consequent Trade Disputes Act, 1906 (see *under* TRADE UNIONS); the Osborne Case, 1909, and the Trade Union Act, 1913 (*ibid.*); the Trade Union (Amalgamation) Act, 1917 (modified by the Societies (Miscellaneous Provisions) Act, 1940); and the Trade Disputes and Trade Unions Act, 1927 (see TRADE UNIONS). A period of trade depression followed the year 1875 and lasted for 2 decades during which trade unionism lost some of its strength. Strikes were common and nearly always unsuccessful. The unions confined themselves mainly to establishing such relations with employers as would ensure the maximum benefit in wages and conditions to the workers. When this phase passed a new unionism arose with a tendency towards a more active industrial policy and a reversion to the earlier idea of one big union. But the statutory position of the trade unions was unchanged throughout this period, though the historic judgments above mentioned resulted in the further legislation indicated. Since 1868 the trade union movement has been centralised in the Trades Union Congress, the objects of which are 'to promote the interests of all its affiliated organisations and generally to improve the economic and social

conditions of the workers.' Although the origin and main activities of trade unions lie in the industrial field, they have also a direct association with politics because of the connection between the Trades Union Congress and the political Labour party. A joint body, the National Council of Labour, which is composed of representatives of the General Council of the T.U.C., of the Labour party, of the Parl. Labour party, and of the Co-operative Union, is responsible for the consideration of questions which have both an industrial and a political implication.

Employers' organisations in the form of merchant guilds (see GUILDS) and livery companies (see COMPANIES, CITY) have been in existence in Britain since the Middle Ages. These bodies, which once dealt in some measure with both trading and labour questions affecting their craft, differed materially from employers' organisations under present-day conditions. These employers' organisations, like most other Brit. institutions, have developed to meet particular circumstances and do not conform with any uniform plan. Employers' organisations fall into 3 groups: those constituted for dealing with I. R. questions, including collective bargaining with trade unions and the avoidance of disputes; those which fulfil that purpose and, in addition, deal with trading questions; and those which deal only with trading questions and which are therefore irrelevant to this article. As regards the first 2 groups, the repeal of the Combination Laws and the development of trade unionism in the 19th cent. stimulated both an increase in the number of these employers' organisations and the expansion of their activities. The extent of the industrial field they cover is estimated at about 8 million workers. Some of these organisations are local in character and deal only with a section of an industry; others are national in scope and deal with the whole field of a particular industry; while in many of the chief industries there are local or regional organisations combined into national federations; but the degree of authority exercised by regional organisations over individual members, or by federations over affiliated organisations, varies considerably. Just before the Second World War there were about 270 national federations concerned with matters relating to the employment of labour and in addition about 1550 other employers' organisations consisting mostly of local or regional branches of the national federations (an analysis of these 1820 organisations classified according to industrial groupings will be found in the *Abstract of Labour Statistics of the United Kingdom* (1922-36)). After the Second World War the total approached 2000, although with the same ratio of local to national bodies. By 1919 there had been formed the National Confederation of Employers' Organisations (now called the Brit. Employers' Confederation) to secure the co-operation of the national federations in dealing with all questions arising out of the relations between employers

and their work-people. This confederation, consisting of federations employing about 70 per cent of the total industrial pop. of Britain, is the employers' counterpart of the T.U.C. for dealing with labour questions affecting industry generally. In that capacity the confederation has represented Brit. employers at the ann. conferences of the International Labour Organisation since 1919. This confederation and the T.U.C. have long been recognised as the authoritative channels of consultation between gov. depts and organised employers and work-people on matters affecting their respective interests, and at the outbreak of the Second World War the need for the closest co-operation was at once recognised. Accordingly there was estab. in Oct. 1939 a National Joint Advisory Council of 15 representatives nominated by each organisation. It was agreed that the scope of the council's functions was to include all 'matters in which employers and workers have a common interest,' while at the same time it was not to encroach on the jurisdiction of organisations concerned with particular industries. In May 1940 the council appointed a Joint Consultative Committee consisting of 7 representatives of the Brit. Employers' Confederation and the T.U.C. respectively to advise the minister of labour and national service on all matters arising in the period of emergency. See COLLECTIVE BARGAINING. See also *Industrial Relations Handbook*, H.M.S.O., and A. Beacham, *Economics of Industrial Organisation*, 1948.

**Industrial Revolution in Great Britain**, general description given to the changes brought about in social structure by the inventions of the 18th cent. In the later part of the 17th cent. Brit. industry had benefited by the immigration of foreign artisans, and many branches of cloth-making were learned from aliens like the Walloons, and silk-weaving from the Huguenots, who came over in 1685 after the Revocation of the Edict of Nantes. Paper-making, glass-making, mechanical toy-making, and the manuf. of clocks and watches were also among the activities estab. through aliens from the Continent. But the remarkable development of industry, due to the invention of machinery in the 18th cent. and to the exploitation of the coal-mines, dwarfed the preceding progress into insignificance and resulted in a rapid and vast increase of the pop. and in the standard of living.

Before the era of machinery weaving had been a cottage industry, and yarn spinning was a spare-time industry practised all over the land by women and girls at home. Then in 1738 came the invention by Kay of Bury of the flying shuttle, which obviated the old and slow process of carrying the weft through the threads of the warp; it enabled the weaver to double his output, and, in turn, led spinners to seek mechanical aids to meet the increased demand for yarn. The next important inventions were the spinning jenny of James Hargreaves in 1764, the invention of the water-frame spinning

roller of Richard Arkwright, and Crompton's 'mule,' a combination of Hargreaves's jenny and Arkwright's water-frame—all first applied to cotton-spinning (see COTTON-SPINNING AND MANUFACTURE). Twenty-five years later came Cartwright's power loom in its perfected form; by that year his Doncaster factory was equipped with a steam-engine, and a year or two later hundreds of his looms were selling to Manchester firms. Gradually the power loom was applied not only to the cotton but also to the woollen industry. The next stride was the general supersession of water-power by steam, a change which came with the utilisation of the coal resources of the country, when James Watt patented his steam-engine. Watt's various patents were taken out in 1781-5, after which time the change from water-power to steam made rapid progress, and mills and factories were set up near the coalfields, where fuel was cheaper. Later the ironmasters began to investigate the use of coal as a smelting fuel, and with improved methods the output from their furnaces increased by leaps and bounds.

All these inventions led to the elimination of the cottage or private worker and to the rapid growth of factories, and with them of the manufacturing towns of the N. of England. Pop. shifted and concentrated about the coalfields, so that places remote from the fields declined. Agriculture as a national industry suffered permanently. Pop. increased by nearly 20 per cent in the first half of the 18th cent., and Brit. trade and wealth were augmented beyond measure; e.g. exports rose fivefold from 1720 to the end of the cent.

The view that the I. R. brought bad working conditions and misery to the masses no longer holds the field. The working conditions of the early mills and factories were usually no worse than those of the 'Domestic System' of industry which preceded the Factory System. Moreover it was only when workers became congregated in factories that it became possible for the State to lay down standards and to ensure, by the inspection provided for in the Factory Acts, that they were observed. See for the older view, J. L. and Beatrice Hammond, *The Rise of Modern Industry*, 1925, and for the new view T. S. Ashton, *The Industrial Revolution, 1760-1830*, 1948; F. A. Hayek (ed.), *Capitalism and the Historians*, 1954.

**Industrial Schools**, see APPROVED SCHOOLS.

**Industrial Trading Estates**. Estates providing and leasing sites and factories to groups of industries originated in the U.S.A. The first private enterprise estate in Great Britain, Trafford Park (Manchester), dates from 1898. Another was started at Slough (Bucks) in the 1920's. Later the gov., through the Special Areas Commissioners, set up similar estates in regions troubled by unemployment (now named Development Areas); the best known are Team Valley (Gateshead), Trofreston (near Cardiff), and Hillington (near Glasgow). These have been effective in bringing new industries

to places where older ones had declined. Under the Distribution of Industry Acts, 1945 and 1950, the Board of Trade now has powers to create such estates, to provide housing and public services, and to pay removal expenses of firms from other places (see TOWN AND COUNTRY PLANNING). See also Political and Economic Planning, *Report on Location of Industry*, 1939, and (Barlow) *Report of Royal Commission on Distribution of Industrial Population*, 1940.

have begun as a result of the impetus given to questions of health and welfare by the committees set up by the ministry of munitions in 1916 to safeguard the health of munition workers. Robert R. Hyde, who with Seebohm Rowntree was in charge of this work, subsequently, in 1918, founded the I. W. Society. In its early days much of the work of the society and similar agencies was devoted to coal-miners, and the increasing provision of pit-head baths was one of the

*Cadbury Bros. Ltd*

AMENITIES FOR THE WORKER: A DINNER-HOUR SCENE ON ONE OF THE WORKS RECREATION GROUNDS AT BOURNVILLE

**Industrial Welfare.** Since the First World War the question of I. W. has been increasingly important. It is concerned with the examination of the working and living conditions of industrial workers with the object of removing unnecessary hardships and providing amenities to mitigate the irksome nature of their work. There are many aspects to be reviewed in such service, including the study of health in industry and the proper selection of workers for suitable employment. These depts of I. W. concern the inside of the factory. Outside, such questions as housing, travelling, the visiting of the sick, recreation, etc., are dealt with. In a number of firms elaborate education schemes have been instituted, to provide both technical and social education so as to create better opportunities for advancement.

The modern movement may be said to

results. Subsequently the work in this industry was taken over by the Miners' Welfare Committee. The connection between the I. W. movement and most of the nationalised industries, however, continues to be close. The emphasis of the work has changed with the years, since many of the provisions for which the I. W. Society contended in its early days, as, for example, holidays with pay, have now been generally accepted in principle, and in many cases either within the national agreements or even incorporated in legislation. Moreover all firms of any size have now their own personnel depts with personnel officers trained to handle the human problems of industry. The Institute of Personnel Management is the professional organisation of personnel managers. While I. W. is still greatly concerned with health, amenities, recreation, and the like, more recent developments,

which are likely to continue, have been in the direction of establishing joint consultation machinery between management and worker and making an effort to see that it works efficiently. Works councils, set up to promote co-operation between workers and management, usually include in their functions the administration of welfare and social security schemes. Another subject which engages considerable attention is the selection and training of suitable men and women for posts of responsibility as foremen, supervisors, and so on. Attempts have also been made to extend the principle of I. W., which is recognised by all the larger firms, to the very many small ones, which in the aggregate represent such a large proportion of industrial workers, and where welfare provisions are not greatly developed. In short the main preoccupations of the I. W. Society to-day are in the field of human relations.

Both in Britain and in the U.S.A. (where I. W. is termed Industrial Hygiene) examinations are conducted into the problems of injury by dust and poisons and of ventilation and lighting. The medical service attacks such questions as periodical examination of workers, the establishment of dental and eye clinics, rest-houses for fatigued workers, while sanatoria and private hospitals are maintained in many industries. Research is conducted with assiduity and success, and that the movement is justified is proved by the fact that in both countries the days of labour lost by illness have considerably declined. Modern methods in factory building and lay-out have of course much influence on the provision of amenities. See also MENTAL TESTS. See *Annual Report of H.M. Chief Inspector of Factories*; pubs. and journs. of I. W. Society and the Brit. Institute of Management; Cadbury Bros. Ltd, *Record*, 1919-1939, 1939; E. Mayo, *The Social Problems of an Industrial Civilisation*, 1949.

**Industrial Workers of the World**, organisation of revolutionary labour unions formed and operating chiefly in America. It was founded in 1905 at Chicago, and was the outcome of a meeting of Socialist and trade union leaders. The most prominent of its leaders were E. V. Debs, W. Haywood, W. Trautman, and the Rev. T. J. Hagerty. The activities of the I. W. W. were generally characterised by extreme violence, and in many states a campaign of attempted suppression was launched against them, ending in the deaths of Joe Hill in Utah and Little in Butte.

After the First World War Communism absorbed many of the I. W. W. supporters, and organised opposition from the various states caused a further decline. Special laws were passed rendering such forms of syndicalism illegal, and in 1918 more than a hundred leaders were imprisoned after a trial in Chicago. Moreover the restrictions imposed by later immigration laws reduced still further a membership hitherto largely maintained or augmented by the importation of unskilled labourers. In

Great Britain minor branches were formed in London, Liverpool, and Glasgow.

**Indy, Vincent d'** (1851-1931), Fr. composer, b. Paris. Member of a noble family of the Ardèche dist. in the Vivarais. His mother d. at his birth and he was brought up by his paternal grandmother, a good musician. At the age of 11 he was sent to Diémer for the pianoforte and Lavignac for theory, and later studied pianoforte under Marmontel. In 1870 he pub. his first composition and served in the defence of Paris against the Prussian Army. To please his family he studied law, but was determined to be a musician and went for advice to Franck, who offered to teach him. He also joined Colonne's orchestra as drummer to gain experience. Pasdeloup gave the first performance of one of his works, the overture to Schiller's *Piccolomini*, afterwards part of his *Wallenstein* trilogy. Next to Franck he admired Liszt, with whom he spent sev. months at Weimar in 1873, and Wagner, whose first *Ring* cycle he attended at Bayreuth in 1876. In 1894 he joined Charles Bordes, together with Guilmant, in founding the Schola Cantorum; he taught there until his death and had many pupils of the highest distinction. From 1912 he also directed the orchestral class at the Conservatoire.

His works include sev. operas (including *Fervaal*), theatre and church music, symphonies, chamber music, songs, choral works. See studies by A. Sérleux, 1914, and L. Vallas, 1946-50; and A. Gabeau, *Auprès du Maître P. d'Indy*, 1938; N. Demuth, *Vincent d'Indy, Champion of Classicism*, 1951.

**Ine** (fl. 689-726), King of Wessex, succeeded Cadwalla. He forced compensation for the death of Cadwalla's brother from Kent in 694, conquered Geraht of W. Wales in 710, fought in Wilts against the Mercians, and in 725 crushed a revolt of the S. Saxons. He drew up a code of laws for Wessex, and, having abdicated in 726, retired to Rome where he d., the date not being known.

**Inebriates and Inebriate Acts.** The term inebriate is generally used to denote an habitual drunkard. Clinically, drunkenness (q.v.) is no more than a temporary cerebro-spinal disorder induced by the absorption of much alcoholic drink in a short space of time. It varies in form according to such circumstances as the amount of alcohol taken, the state of the stomach, the climatic conditions, and the reactions of the individual, and in its physical effect on the individual there may be many degrees of perversion of the senses, vertigo, and confusion of the intellect. But when long persisted in it may result in a diseased condition of the nervous system popularly termed inebriety. The symptoms are a craving for alcohol or an irresistible obsession with, and desire for, drink (dipsomania), producing chronic or periodical mental disorder of a depressive nature characterised by an undefined sadness, uneasiness, and apathy. The only chance of cure is to protect the subject against himself by enforcing total abstinence and

by suitable treatment with alkaline bromides or other sedatives, or by psychiatric treatment to resolve the inner conflict which is driving the person to drink. It is now generally recognised that drunkenness is invariably a symptom of anxiety; if the cause can be discovered the symptom will disappear. The Inebriates Acts allow of 2 classes of institutions: state and certified inebriate reformatories, and licensed retreats. A list of retreats for inebriety will be found in *Burdett's Hospitals and Charities*, 1930, where it is pointed out that any list of Inebriate Homes must necessarily be incomplete; only a few are licensed under the Inebriates Acts, and the majority of unlicensed homes are essentially of a private character with very few patients.

**Inebriates Acts.** The object of these Acts is to make provision for the compulsory detention and special treatment of criminal 'habitual drunkards' in state or certified inebriate reformatories, and provide for the voluntary detention of non-criminal 'habitual drunkards' in licensed retreats. In connection with the Inebriates Acts it may be noted that by the Eng. law drunkenness is no excuse for crime, though where intention is of the essence of the offence it may well amount to an extenuating circumstance; but drunkenness so far persisted in as to produce *delirium tremens*, or any other species of alcoholic insanity, renders a person incapable of committing crime in the eye of the law, though he may be confined as a criminal lunatic. (See also CRIMINAL LAW AND DRUNKENNESS.)

The Habitual Drunkards Act, 1879, enables a co. or bor. council to grant to any person or persons jointly a licence to keep a retreat. One at least of the persons to whom a licence is granted must reside in the retreat and be responsible for its management, and the medical attendant of the retreat must be a duly qualified medical man. 'Habitual drunkard' (a term now changed in the later Acts to 'inebriate') in this Act is defined as a person who, not being amenable to any jurisdiction in lunacy, is, notwithstanding, by reason of habitual intemperate drinking of intoxicants, at times dangerous to himself or herself, or to others, or incapable of managing himself or herself, and his or her affairs. The Inebriates Act, 1898, which initiated the estab. of these reformatories, gives power to the court, where a person is convicted on indictment for an offence punishable with imprisonment, but committed the crime while he was under the influence of drink, to order him to be detained in a state or certified inebriate reformatory provided: (1) the jury find, or the prisoner admits, that he is a habitual drunkard, and (2) the managers of the reformatory are willing to receive him. The committal may be either in addition to or in substitution for any other sentence.

**Inequality, term in astronomy.** For the sake of convenience the average motion of a heavenly body (supposed to be made in a circle which has the mean distance of

that body from its primary for its radius) is the first object of calculation when the place of the body at some future time is to be predicted. All the alterations which are rendered necessary by the unequal motion of the planet are called inequalities. This term is specially applied to the mean motion of the moon. See MOON, *Lunar Theory*.

**Inert Gases, formerly Noble or Rare,** name given collectively to the chemical elements helium, neon, argon, krypton, xenon, and radon, which are characterised by their complete lack of chemical affinity. They form a separate group in the periodic system (q.v.), and have a valency of 0. Helium (q.v.) is obtained from certain minerals, and from natural gas (e.g. in the U.S.A. and Canada), and occurs in certain springs (e.g. at Bath). All the I. G. except radon occur in traces in the atmosphere, whence they are extracted. Helium and radon (q.v.) are spontaneously evolved from radium. Helium is used for filling airships, being light and non-inflammable, argon (q.v.) is used in gas-filled electric lamps, and neon (q.v.) electrical discharge tubes are used in illuminated electrical advertisement signs and in aeroplane beacons. All the I. G. were discovered by Sir Wm Ramsay (q.v.), though helium had previously been detected on the sun by Sir N. Lockyer. Certain organic compounds containing inert gas atoms held in the solid molecular lattice have been recently prepared by H. M. Powell of Oxford. They are known as clathrate compounds.

**Inertia.** Newton's first law. '*That every body perseveres in its state of rest, or of moving uniformly in a straight line, except in so far as it is compelled by impressed forces to change its state.*' is sometimes called the law of I. It has always been easy to understand that force is required to set a body at rest in motion, and the property of I. was recognised from this standpoint by the ancients. It was not until the time of Galileo, however, that it was recognised that the same property held true of bodies in motion, and that it was understood that were it not for external causes, a body in motion would never of itself come to rest. The *Moment of I.* (I) of a body about a given axis of rotation is the sum of the products of the mass ( $m$ ) of each of the particles of the body and the square of their corresponding perpendicular distances ( $r$ ) from the axis.  $I = \Sigma(mr^2)$ . See MOMENTS.

**Inez de Castro, see CASTRO, INEZ DE.**  
**Infallibility, freedom from all error in the teaching of faith and morals claimed by the Rom. Catholic Church.** The question of the I. of the Church has been a subject of dispute for many cents., the dispute centring not in the question as to whether or no the Church is infallible, but in the question as to how and where its infallible utterances were made. The view of the I. of the Church held by the E. Orthodox Churches is retrospective, their teaching being that all the acts of the councils received in the E. as oecumenical are infallible. In the W. the question has

been one between the Gallican and Ultramontane parties (see GALLICANISM), and the latest decision of the Rom. Church on the subject was made at the Vatican Council of 1870. This council teaches 'that when the Rom. Pontiff speaks *ex cathedra*, that is, when he, using his office as pastor and teacher of all Christians, in virtue of his Apostolic office, defines a doctrine of faith and morals to be held by the whole Church, he, by the divine assistance promised to him in the person of blessed Peter, possesses that infallibility with which the Divine Redeemer was pleased to invest His Church in the definition of doctrine on faith or morals, and that, therefore, such definitions of the Rom. Pontiff are irrefragable in their own nature and not because of the consent of the Church.' No authoritative decision has yet been made, however, to say exactly when the Pope is speaking *ex cathedra*, and it is disputed among Rom. Catholics as to whether certain utterances are to be regarded as infallible or not. It is quite agreed, however, that the I. does not extend to pronouncements on scientific and similar matters.

**Infamy**, formerly used in Eng. law to denote the loss of status consequent on conviction for an offence involving dishonesty or inhumanity, which loss entailed disqualification as a witness or juror. The prin. crimes which involved I. were treason, felony, all offences based upon fraud, piracy, subornation of perjury, and common-law cheating. But neither past nor present moral heinousness now disqualifies anyone as a witness, though the evidence of such a person may well be discredited by a jury; and conviction for crime does not disqualify as a juror unless, of course, the person convicted is actually in prison.

**Infant**, in law, means a person, male or female, under 21 years of age. The status of infancy in law is of especial importance in regard to contractual capacity and responsibility for crime. (As to the effect of infancy on the validity of contracts, see CONTRACTS.) An adult who has made a contract with an I. cannot make it void, though the I., generally speaking, can. By the old law a male I. at 14 could contract a valid marriage with a female I. at 12. But since Lord Buckmaster's Act, 1929, both parties must have attained the age of 16 before a valid marriage can be contracted. Where the consent of parents or guardians is required a pub. of banns is void if any one parent or guardian publicly dissents. A licence cannot be obtained by an I. without the necessary consent, which must be that of the father if living, otherwise the mother, or if both are dead the guardian(s); if there is none of some person appointed by the court. For an illegitimate child the mother's consent is required. A marriage, however, is valid without consent, although the parties may incur penalties, e.g. for false swearing. An I. husband may be sued for his wife's debts contracted before marriage, but will not be liable to a greater extent than the

husband himself. I. acquired through or from his wife. For the responsibility of I.s for crimes see CRIMINAL LAW.

**Infant Feeding**, see CHILD.

**Infant Schools** in England to-day cater for children between the ages of 5 and 7 or 8: they are part of the first stage of education as organised under the 1944 Act—the primary stage. They are preceded by a number of nursery schools (q.v.) which are not compulsory, and are followed by junior schools—the last stage of primary education. The Swiss reformer, Jean Frederic Oberlin (q.v., 1740–1826), was the founder in 1769 of I. S. on the Continent. Robert Owen (q.v., 1771–1854) opened a school in Scotland at New Lanark on the Clyde in 1816 for children of working people. The headmaster, James Buchanan, was put in charge of an infant school at Westminster (1818), and on his advice Samuel Wilderspin was given the headship of a school in Spitalfields in 1820. When the London Infant School Society was formed in 1824 Wilderspin superintended the opening of numerous schools. David Stow (1793–1864) was instrumental in forming the Glasgow Infant School Society in 1826, which performed pioneer work in Scotland. The interests of the people concerned with these early movements were with children under 6 and with their moral and physical development. Their chief objective was to save young children from exploitation during the Industrial Revolution. Playgrounds were designed to promote healthy and hardy youngsters. The monitorial schools inspired by Andrew Bell and Joseph Lancaster (qq.v.) were for children of 6 and over and were intended to teach them the 3 Rs. Of the other schools—the dame, the parochial, and the Sunday schools—only the dame schools concerned themselves with children under 6 years of age. The development of a national system of I. S. dates from 1870. The age fixed for obligatory attendance was 5; local authorities were given authority to provide education for children between the ages of 5 and 13; children could, however, be accepted at 3 years. In 1871 a committee under the chairmanship of T. H. Huxley suggested that I. S. should be for children up to 7, to be followed by junior schools 7–10, with senior schools for children over 10. I. S. were to be mixed schools and the teachers should be women. The recommendations were accepted by authorities like London and Croydon and quickly became incorporated in the primary school system throughout the country. The terminology is still widely used in the mid 20th cent. After 1905, on the basis of a report on I. S., there was a growing tendency to separate nursery schools for children up to 5 from I. S. This is now universally accepted as desirable.

In the 19th cent. the influence on I. S. of Friedrich Wilhelm August Froebel (q.v., 1782–1852) was very great. The first kindergarten (q.v.) was opened at Hampstead in 1853. Physical exercises and games, story-telling, and Froebel

'gifts' were used in the education of children. Dr Maria Montessori's (q.v.) influence was also felt during the early part of the 20th cent. Her revolutionary ideas on child freedom and individual development have been widely acclaimed. Her methods, with their hint of formality, have been less generally accepted by teachers who, in England, have had a large measure of freedom in the classroom. Interest was also aroused in the writings of the Amer. philosopher and educator, John Dewey, particularly by Prof. J. J. Findlay of Manchester. At about the same time Margaret McMillan (q.v.) opened her open-air nursery school in the slum area of Deptford. In open-air shelters children were taught the elementary facts of health and cleanliness in addition to being given simple lessons. These traditions have helped to create the atmosphere which exists in many I. S. throughout the country to-day. Activity methods are widely used, group work is encouraged, learning is no longer by rote, discipline is permissive rather than authoritarian, and the full development of the child is regarded as the main aim of education. These improvements have been brought about not only by the advocacy of pioneers but through the solid achievements in the colleges where I. S. teachers are trained. See also CHILD STUDY; EDUCATION; KINDERGARTEN; NURSERY SCHOOLS. See D. Salmon and W. Hinshaw, *Infant Schools, their History and Theory*, 1904; P. B. Ballard, *Practical Infant Teacher*, 1929; J. W. Infant Welfare, see MATERNITY AND CHILD WELFARE.

Infanta, Sp. and Portuguese title formerly given to the princesses of the royal family, the eldest princess being also called 'la princesa'. It corresponds to 'infante', the title formerly given to the princes of the royal houses.

Infanticide. The practice of I. was common to anc't nations, was prevalent in India (especially among the high-caste families of Rajputana) and in China down to recent times, and is probably widely practised among aboriginal peoples at the present day. In the customs of savage races, I. is closely associated with exogamy, or the custom of marrying outside the tribal community. Female children especially suffered, for among savage tribes they were a source of weakness and danger, since they were useless as fighting units. With nations or peoples of a later date, especially the Hindus, the motives for I. were occasionally religious or superstitious, but far more often merely prudential. In India this practice—only too

glaringly evidenced by the extraordinary disproportion of the male to the female pop., for again it was the females that chiefly suffered—was virtually stamped out by Jonathan Duncan and Maj. Walker, who initiated measures which culminated in Acts authorising dists. whose percentage of female children fell below a certain average to be placed under police supervision. No less terrible in its incidence was the custom in China, and although mitigated by the influence of Christian missionaries, there is reason to believe that it is still practised. As to classical times, it is curious that the *ius vitae necisque* (right of life and death) over his children which the Rom. father had till late in the hist. of Rom. jurisprudence, and the analogous right given to the Grk head of a family, should have prevailed as late as it did in societies otherwise so highly endowed intellectually. Among the Spartans, too, there were laws positively enjoining the exposure of deformed children, as, indeed, at an earlier date among the Romans. The combined effect of the legislation of Constantine, Valens, and Valentinian, at a period strongly under the influence of the Christian fathers, put an end to the practice of exposure and took away the paternal right of life and death. In England intentional or other inexcusable I. is either murder or manslaughter, according to the circumstances. To amount to murder it must be proved that the infant was in the legal sense a human being, or, to adopt Coko's phrase, 'a reasonable creature and being.' This means that the child must have completely proceeded in a living state from the body of its mother, whether it has breathed or not, and whether the umbilical cord, or navel, is severed or not. Therefore killing a child in the womb is not murder, although it may well be punishable under the Acts relating to abortion. But if a child die, after being born alive, as a result of drugs or wounds received while in the womb, such I. is murder. (See also ABORTION; BIRTH, CONCEALMENT OF; ILLEGITIMACY.)

The Scots criminal law is not dissimilar to the English in this respect. All over Europe, and in some oriental countries, through the exertions and pecuniary assistance of Europeans, a great deal has been done to prevent I. by the institution of foundling hospitals. See J. Peggs, *Infanticide's Cry to Britain*, 1844, and A. M. Carr-Saunders, *The Population Problem*, 1922.

Infantile Diplegia, see under BIRTH PALSIES.

Infantile Paralysis, inflammation of the motor nerve cells of the brain and spinal cord. I. P. is the popular name for what is known medically as acute anterior poliomyelitis, and in common parlance 'polio.' It is characterised by fever, malaise, pains in the body, and in some cases paralysis of varying extent. Broadly speaking, cases of I. P. can be divided into non-paralytic and paralytic, and in any epidemic the non-paralytic cases considerably outnumber the more severe

paralytic type. Although known for a long time, I. P. has assumed epidemic proportions only since the beginning of the cent. Following outbreaks in Scandinavia, New York suffered epidemics of 2000 and 9000 cases in 1907 and 1916 respectively. In the Brit. Isles epidemics of I. P. have occurred with greater frequency since the war, and in each of the years 1947, 1950, 1953, and 1955 between 5000 and 8000 cases were notified. The proportion of severe cases, although not constant for each epidemic, has also tended to increase. At one time almost solely a disease of children, the age incidence has shifted to include the higher age groups and young adults are commonly affected. Even a case in a person aged 72 has been reported. Although sporadic outbreaks and odd cases may occur at any time of the year, I. P. is most evident in the hotter months of July, Aug., and Sept. By Oct. notifications begin to decline. One of the smallest known viruses is the responsible infecting agent. There are 3 main types of the virus, and within these types are various recognised strains, any of which may be the prin. cause of a particular epidemic. In this way I. P. is not unlike influenza (q.v.). As a rule one attack grants immunity but second attacks in the same person have been recorded and have probably been due to a different strain of virus against which the first attack had not provided immunity. The mode of infection is either by airborne droplets, in which case the point of entry into the host is the throat, or from contaminated food, when the host absorbs the virus in the alimentary canal. Within a week or more of the start of their illness patients excrete the virus in the faeces and it is from this source that contamination of food may occur. It is possible for healthy persons showing no signs of illness to be carriers of the poliomyelitis virus and obviously these people, and also those with clinically very mild attacks of the disease are hidden sources of infection to others which it is difficult to guard against. The symptoms of I. P. in the initial phase of an attack are sore throat, muscular pains, headache, and mild pyrexia, and are indistinguishable from the early stages of many other infections. Symptoms such as these do not arouse suspicion except during the course of an epidemic when patient and doctor are alerted. The majority of cases do not progress beyond this stage and recovery is fairly rapid. The second phase of the illness, which often follows after a temporary improvement of symptoms for a day or two, represents the attack by the virus on the central nervous system. Headache is usually severe and there is increasing muscular pain, particularly in the back. The extent and location of the ensuing paralysis depends entirely on the sites of inflammation in the nervous system. In the severe cerebral type of I. P. some of the major nerve centres of the brain may be affected, particularly the respiratory centre, or the cranial nerve which supplies

the pharynx and larynx. In these cases there is a major crisis in the respiratory mechanism. In the spinal type of I. P. the leg muscles are paralysed more frequently than the arms, and less frequently the abdominal, diaphragmatic, and intercostal muscles. Paralysis of these latter groups or muscles causes difficulty in breathing and it is here that an artificial respirator (the 'iron lung') is such a valuable aid. Treatment of I. P. consists, first, in prevention. Cleanliness in personal habits and scrupulous care in washing the hands after using the lavatory are most important. Meals should not be prepared with dirty hands, and food should be kept covered and protected from flies. Measures for the isolation of contacts of known cases will be advised by the health authority. It is well known that fatigue increases the severity of the infection and any child who develops feverish symptoms during the summer months should be put to bed as a precaution. Nor should children be allowed to exert themselves excessively when I. P. is in epidemic form. Operations for the removal of tonsils and adenoids are usually postponed during epidemic periods unless there is urgent need for surgery. It has been observed that children who contract I. P. shortly after being immunised against other infections are apt to develop paralysis in the arm which was the site of the injection. For this reason prophylactic inoculations against diphtheria and whooping cough are often withheld during the summer months. Attempts to prepare a prophylactic vaccine against I. P. were unsuccessful for a long time, the main difficulty being to find a medium in which to grow the virus which would not render the vaccine prepared from it unsuitable for injection into human beings. In 1948, however, the position was altered by the discovery of J. F. Enders, T. F. Weller, and F. L. Robbins in America that the poliomyelitis virus could be grown in tissue culture and in a medium virtually free from toxic properties. Following this up Dr Joseph Salk prepared a formalin inactivated vaccine from viruses grown in monkey kidneys. This Salk vaccine, which contained all 3 types of virus, was given a large-scale trial in the U.S.A., Canada, and Finland in 1954. The result showed that it conferred a considerable degree of protection against paralytic poliomyelitis in those children who were given the vaccine compared with those who were not given it. The Salk vaccine was released in the U.S.A. for general use early in 1955, and some 10 million children were injected. Unfortunately some children who had received vaccine from one particular source of manuf. developed the disease in paralytic form and until the reason for this was explained the vaccination campaign was halted. Investigation, however, proved that the accident was due to an isolated instance of faulty technique in preparing the vaccine, and that the viruses in the offending batch of vaccine had not been entirely inactivated

(killed) by the formalin. As soon as this fact was estab. the ban was lifted and immunisation proceeded. Meanwhile a vaccine had been prepared in this country on similar lines to that of the Salk, but containing slightly different virus strains. This vaccine was released in the spring of 1956 in sufficient quantities to immunise about 500,000 children between the ages of 3 and 9 under the provisions of the National Health Service. It is not yet possible to assess the duration of the protection which the Brit. or the original Salk vaccine will afford. This and other information, such as the optimum age at which vaccination should be performed, will emerge only from observation and from continued use of the vaccine. It is certain, however, that the new vaccine is a most valuable advance in the battle to prevent this potentially crippling and often mortal complaint. There is no specific drug treatment for I. P. and chemotherapy, except for secondary bacterial infections (such as pneumonia in cases of respiratory paralysis), is unavailing. The paralysed muscles must be treated in the appropriate manner by splinting of the affected limb and physiotherapy. The less the degree of paralysis and the earlier the signs of voluntary movement return, the greater the prospects of recovery, which may be complete. Muscles that show no signs of response after 6 months as a rule do not recover, and mechanical supports must then be provided to aid the patient toward the greatest degree of normality of movement that may be possible. The 'Drinker' respirator (the 'iron lung') and other mechanical aids to respiration have proved invaluable in the treatment of patients with respiratory paralysis.

**Infantilism**, term applied to those conditions when childish characteristics persist into later life. Where I. is myxoedematous, it is due to atrophy or inactivity of the thyroid gland, and is then identical with cretinism. The term 'infantilism' includes many other groups of cases which are with difficulty reduced to a type. The special characteristic is absence or modification of some of the secondary sexual features; e.g. hair does not grow in the arm-pit or the pubic region, and the voice may retain its childish pitch. The individual may be fully adult in other respects, but usually shows malnutrition, either generally, or in some special direction. The cause is some constitutional derangement of metabolism, and the condition generally illustrates the tendency under such circumstance towards modification of the secondary sexual characteristics. Myxoedematous I., or cretinism, is due to the disturbance of a specific secretion, that of the thyroid gland. If the gland is absent at birth, or is congenitally diseased, the sexual characters remain undeveloped during life, and the condition may not be observed until the time of puberty. The face retains the chubby appearance of childhood, the voice remains of childish pitch, the second dentition may be absent or abnormal, the

genitals are rudimentary, and the mental outlook and intellectual activity remain those of a child. When the thyroid gland is removed in adults, the resulting condition seems that of a partial reversion to childhood; the mental activities become slower and less complex, the patient is childishly irritable, and there is a marked loss of hair. The treatment of myxoedema, whether occurring in adults, or as a congenital condition, includes administration of extract of the thyroid gland, which has been found of particular efficacy in many cases. I. may also be due to nervous or emotional hold-ups, which can be resolved by psycho-therapy.

**Infantry**, name given collectively to a body of troops who fight on foot and who are normally armed only with hand weapons. The Gk, Rom., and Gothic armies all had their supplies of I., but the I. in most cases was simply that part of the fighting force which could not be mounted. The mounted men were the chosen warriors, the I. the rank and file. The armies of Greece and Rome were usually composed of more I. than anything else, and the I. fought in close serried masses, and gave by their closeness an added strength and weight to their tactics. The period between the fall of the Rom. empire and the end of the 11th cent. was that of the feudal armies, when battles were decided not by I. but by cavalry charges, and the I. of the defeated side were indiscriminately slaughtered. But a change was brought about first by the introduction of the archer, and secondly by the introduction of I. tactics which were capable of overthrowing the feudal cavalry. The battle of Falkirk (1298), between Wallace and Edward I., although it was not a victory for the I., nevertheless illustrates very strongly the new methods. The 'schiltrons' of Wallace, i.e. the circles of spearmen, did much to hold the cavalry at bay. The best example, however, was Courtrai (1302), where the burghers of Bruges overthrew the feudal army of Count Robert of Artois. Crécy was essentially a victory for the new I. tactics. The age of the feudal army was declining; the combination of the resistance of the I. and the shooting of the archers seemed about to give it its death-blow. But the lessons which I. had taught during the Hundred Years War were speedily forgotten, and cavalry again asserted its superiority. From this time onwards, however, I. was a definite part of the army. The introduction of firearms naturally enhanced this result.

The period from the opening of the 16th cent. proved that the archer was no longer of any great value, and for a time the I. were armed in Swiss fashion with long pikes. Finally, a combination of I. armed with pikes and I. armed with guns was adopted, and as these tactics commanded the enemy both at a distance and at close quarters for a time the problems of warfare seemed solved. The 16th cent. and the early 17th was the age of the mercenary soldier. Against untrained rebels this type of soldier was invincible,

and nowhere do we find a better example of this than in the Sp. wars in the Netherlands. The Thirty Years War had great effects on the tactics of the European I. The methods adopted by Gustavus Adolphus and the Swedes during that war were eagerly imitated by the rest of Europe. Especially noticeable is it that the arquebus used by the Swedes had been lightened and could now be fired without using a rest. At the end of the 17th cent. we find that the old pike tactics of the I. pass away altogether. The bayonet fixed to the muzzle of the gun took the place of the pike. Fire tactics were adopted. The enemy were riddled with fire from the guns at as short a distance as possible, and then, when the opposing ranks had been disorganised, the bayonet charge completed the attack.

the Russo-Jap. war; but the changes did not radically alter the principle, and the attack in extended order still remained the basis of I. tactics.

*Recruiting and discipline.* The head of the 'other ranks' is the regimental sergeant-major (warrant officer, class 1); the 4 company sergeant-majors are warrant officers, class 2. Both classes hold warrants from the Secretary of State for War. In the Brit. Army each regiment (except rifle regiments) carries 2 colours; the first is the 'Queen's' and the second the 'Regimental.' Before 1881 each regiment had a number. One battalion was always on foreign service and the other at home. Recruits were partly trained at regimental depots situated in the county or area to which the regiment belonged, as indicated by its title. They were then

ENGLISH INFANTRY MEETING THE NORMAN CAVALRY

In this panel from the Bayeux Tapestry the infantry are seen with javelin, axe, and bow.

From the year 1798 can be dated the beginning of modern I. tactics. The change was due very largely to the methods of Napoleon, who, having poured an overwhelming artillery fire into the masses of the enemy, brought his I. up to complete the attack. It was a combination of the 2 methods of artillery fire and I. charges. The Brit. I. methods of the Peninsular war were somewhat different. They were modelled on the old platoon-fire tactics of Frederick the Great, but they combined mobility and an ability to use cover with the massed strength of the former Ger. I. The tactics consisted in reserving fire until the enemy were within easy striking distance, and then pouring in a murderous volley and following this up with a bayonet charge. The next great epoch-making war, as far as the I. were concerned, was the Franco-Prussian war of 1870. The massed firing tactics were almost entirely relegated to the artillery, and the I., in extended order and taking advantage of every inch of cover, slowly crept to the attack. These methods subsequently underwent some change, especially as a result of the S. African war, and later of

passed on to the Home Battalion, which completed their training and, when required, passed trained men on to the battalion on foreign service to keep it up to strength. The Foot Guards are Household troops, but their organisation and training correspond in their main features to the I. of the Line. They provide guards over royal palaces, etc., and furnish royal escorts on ceremonial occasions. The standard of recruit is high and it would appear to be generally conceded that the Brit. Foot Guards are the finest I. in the world.

Changes introduced in the organisation of the I. in 1946 to meet the necessities of contemporary warfare altered the Cardwell (q.v.) system almost out of recognition. Under the test of battle experience the Cardwell system of linked battalions twice broke down. It was found, for example, that 1 brigade of a div. on an overseas front might suffer such heavy casualties that the reinforcements for its battalions on the lines of communication were inadequate to reform its ranks, while other brigades might have suffered no serious losses, and in such cases these battalions obviously had to be reinforced from other regiments.

To-day the Cardwell principle has been found to be too rigid even in time of peace. The foundation of reinforcement under the Cardwell system was that there were an equal number of battalions at home and abroad; but after the Second World War it was clear that fewer I. battalions would be required owing to the development of airborne and armoured divs., and also because the army in India would be heavily reduced with the coming of Indian Independence in 1947. Possibly the most convenient reorganisation for reinforcement would have been the formation of a Corps of I., in which postings could be carried out without regard to regimental ties. But this suggestion was resisted and compromise reached (1946) whereby a system of grouping was effected by the formation of 15 groups of regiments with territorial or traditional connections. Every battalion in each of these self-contained corps retains its separate identity. In order to reduce the total number of battalions it was decided to relegate some to temporary 'suspended animation' without officers or men on their strength, but ready to be recreated in emergency and in any case at the end of a stated period. During the course of the next few years this policy was several times reviewed, but it was not until 1956 that the decision was finally made that only one regular battalion in each regiment should be retained.

*Tactical organisation and equipment of British infantry.* The number of men which can be controlled in battle by one commander is strictly limited. The basis of I. organisation is accordingly the section, which is the largest group of men which can be personally controlled by its leader throughout the battle. Sections are grouped into platoons, platoons into companies, companies into battalions, and battalions into I. brigades which are the largest units which consist solely of I. This system, known as 'the chain of command', ensures orderly manoeuvres by any number of units in accordance with a single plan, and enables the section commander to assist in giving practical effect to the plans and instructions of the commander-in-chief. An I. battalion consists of H.Q. company, support company, and 4 'rifle' (in fact, light machine-gun) companies. It is commanded by a lieutenant-colonel, with a major as second-in-command. The H.Q. company is commanded by a major or a captain. The platoon is the smallest I. unit which can be divided into interdependent bodies each capable of fire and manoeuvre. It is thus the unit on which all I. tactics are based. The section is the fire unit. Companies of each battalion are designated by serial letters or numbers; platoons are numbered serially throughout each battalion.

After 1936 all I. battalions of the Brit. Army gradually became either 'machine-gun battalions' or 'rifle battalions,' so as to provide I. brigades consisting of 3 rifle battalions and 1 machine-gun battalion each.

During the First World War open warfare had soon become impossible, and the employment of cavalry was very much curtailed on the W. Front; and not only was the cavalry converted into I., but the proportion of I. to other arms greatly increased. Before the introduction of tanks a battle was usually a contest between opposing I. supported by artillery. As artillery could not advance to hold positions, offensive action fell entirely to I.

The modern Brit. I. is equipped with rifles, bayonets, grenades, Vickers machine-guns, Bren light machine-guns, mortars, machine carbines, anti-tank guns, and anti-tank projectors. Anti-gas equipment is also carried. The multiplicity of weapons and methods calls for a better type of recruit than formerly if he is to assimilate the knowledge for their efficient application. Consequently educational training now forms an integral part of the Brit. soldier's life. More attention is also given in the modern army to physical and recreational training so as to ensure fitness for service under more strenuous conditions. The kit carried by the infantryman has been increased in order to provide him with the means of defence (1) against shrapnel by the provision of a steel helmet and (2) against gas by the provision of a gas respirator. These additions hinder mobility to a certain extent, and I. are now, if required to operate at a distance, transported either by road or by air. This fact has given rise to 2 specialised types of I. battalion—the motor battalion which forms an integral part of armoured formations, and the airborne or parachute battalion transported either by glider or by troop-carrying aircraft. With these 2 exceptions, Brit. I. battalions tend to be of a more uniform type than those of most armies since there is no special estab. for rifle (*Jaeger, Chasseur*) or mt (*Gebirgsjaeger, Chasseur Alpin*) units.

A further characteristic of Brit. tactical I. organisation is that whereas the regiment of most armies consists of 2 to 4 purely 'rifle' battalions together with I. gun, anti-tank, and sometimes engineer companies, which all form an integral part of the regiment, the Brit. brigade is essentially a team of 3 identical battalions. In action this can form a brigade group (U.S. Combat Team) together with artillery, engineers, anti-tank guns, etc., allocated from other arms of the div., but in addition each battalion disposes, in its support company, of its own heavy weapons handled by carrier, mortar, anti-tank, anti-aircraft, and machine-gun platoons. For details of recent regimental amalgamations, see REGIMENT.

*Infection.* communication of disease by micro-organisms. The essential conditions for I. are that there should be a source or reservoir of micro-organisms, a susceptible host to receive them, and a vehicle or vector for transferring them from reservoir to host. The reservoir, as a rule, is another person who is either suffering from the infectious disease or is a carrier of the

micro-organisms which cause it; or in some cases the reservoir may be one of the animal species, as in the case, for example, of bovine tuberculosis (q.v.), anthrax (q.v.), psittacosis (q.v.), and undulant fever. Micro-organisms may be conveyed from reservoir to host in an almost unlimited number of ways. Minute droplets of micro-organism-laden moisture expelled from the mouth, throat, and respiratory passages of an infected person by coughing, sneezing, talking, or ordinary expiration are the vectors of I. in many diseases. Such particles may remain suspended in the atmosphere for some hours and are capable of circulating throughout the confines of an enclosed space. The droplets evaporate after settling, whereupon their content of micro-organisms attaches itself to dust particles. Infected sputum behaves in a similar manner. Foods, milk, and water are vectors of I. in many diseases, well-known examples being typhoid fever (q.v.), and the dysenteries (q.v.). The 'fomites,' that is clothing, bedding, books, and any articles of everyday use, may harbour and transmit micro-organisms. There are also the insect vectors, mosquitoes, fleas, lice, and flies, which are responsible for the communication of many infectious diseases, particularly those common in tropical countries. The communication of infectious disease by direct contact between host and reservoir is usually known as contagion (q.v.). The prevention of I. is the concern of the epidemiologist. See BACTERIA; EPIDEMIOLOGY; HYGIENE; and under the headings for the various infectious diseases.

**Infetment, or Sasine**, in Scots law means both the act or (prior to 1845) symbolical ceremony of giving to another the possession of heritable land and the writ or instrument of sasine in which such act or ceremony is expressed. I. being a feudal act, and the Crown being the lord paramount of all Scottish feus or fiefs, an I. can only be under a grant from the Crown. This is interpreted in practice to mean that to constitute a valid I. the transferee must show a feudal chain of title going back ultimately to the Crown. But there may be real rights without I. These exceptions include leases, servitudes (analogous to rights of way or other rights over the land of another), ual lands situate in the Orkneys and Shetlands, Crown lands, and churches and glebe of the Church of Scotland. I. is now obtained by recording the deed transferring the land in the register of sasines. It has long been settled that a purchaser, or a lender on heritable security, is entitled to rely on the registers of sasines, and is not affected by any conveyance or encumbrance which is not recorded on the register.

**Inferior Courts** comprise in England all those that are below the dignity of the High Court of Justice, and whose decisions are subject to review by the High Court. The prin. I. C. exercising civil jurisdiction are the co. courts, from the decisions in which an appeal lies to the High Court

where the amount involved exceeds £20. Where the plaintiff in the High Court has no visible means of paying the defendant's costs, the defendant may, on swearing an affidavit to that effect, get an order remitting the case for trial in the co. court. There are also certain local courts exercising a considerable civil jurisdiction, the most important being the Chancery Court of the County Palatine of Lancaster, the powers of which, within its local limits, are similar to those of the Chancery Div. of the High Court; the Mayor's Court of London; the Court of Passage of Liverpool, and the Salford Hundred Court, all exercising within their local limits a full common law jurisdiction. The courts of the univs. of Oxford and Cambridge have by auct. charters a jurisdiction in actions to which any member or servant of the univ. is a party, at least where the cause of action arose within the liberties of the univ. Other I. C. called the Eccles. Courts (q.v.) give redress in actions of an eccles. or spiritual nature. As great an authority as Stephen states that their jurisdiction rests entirely on the tolerance of the municipal law. The criminal courts of inferior degree are: (1) the general co. sessions or quarter sessions (see COUNTRY SESSIONS), which is a court of first instance and of appeal against summary convictions by petty sessional magistrates. An indictment (q.v.) may be removed to the Queen's Bench Div. from quarter sessions by order of *certiorari* (q.v.) in certain cases, such as where an impartial trial cannot be had in the I. C., or some more than ordinarily difficult point of law is involved; (2) bor. quarter sessions, with judicial functions identical with those of the co. quarter sessions, and presided over by a 'recorder' who becomes a bor. magistrate *virtute officii*; (3) petty sessional courts consisting of at least 2 justices or a police or stipendiary magistrate, or the lord mayor or an alderman in the City of London. These courts have a limited jurisdiction to try indictable offences under the Summary Jurisdiction Acts. The Queen's Bench Div. can grant a *certiorari* to transfer a case to the High Court where the magistrates exceed their jurisdiction or there is some manifest informality, and on a *special case* stated by the justices can decide any point of law submitted for the decision of the High Court. Again the High Court may issue an order of prohibition to stop proceedings where the magistrates have no jurisdiction, and generally speaking any I. Court which attempts to exceed the limits of its jurisdiction may be prevented by such an order, and conversely an order of *mandamus* may be issued to compel any I. Court to exercise its jurisdiction, at all events in cases where relief is sought in respect of the infringement of some public right or duty.

**Inferiority Complex**, in psycho-analysis an emotional idea of the self or ego, whose unconscious activity gives the sufferer an affective attitude of inferiority towards himself. It has its origin in a wounded narcissism or self-love, and may lead to a

neurosis which causes the person to doubt his capacity.

**Infidel**, term popularly used to describe a person who rejects Christianity as a divine revelation. The word does not properly apply to heathens or heretics. Muslims employ a similar term ('*giasour*,' '*kafir*,' etc.) to describe Christians.

**Infinite** connotes chiefly the attributes of the Deity or Absolute Being, but is also used negatively to describe the boundlessness and immeasurableness of space, time, or the universe. The use of the word *apeiron* (best trans. as 'unlimited' or 'indeterminate') in the Milesian school of Gk philosophers, e.g. by Anaximander, marks, however crudely, the beginning of an attempt to give a scientific statement of the universe. It is often assumed by modern thinkers that the Gk philosophers, and even such modern philosophers as Hobbes and Hegel, confounded the idea of the 'immeasurable' with that of the 'unbounded,' because, according to the methods of elliptic non-Euclidean geometry, it is at least plausible to argue that space is as 'measurable' as the surface of any *unbounded* spherical body, or the necessarily unbounded circumference of a vast circle; and, again, because geometry can conceive of an immeasurable and unbounded straight line becoming bounded by merely cutting off a small part and leaving the line bounded by the 2 terminals so formed. Whether these methods, which attempt to apply the rigid exactness of mathematical science to philosophical theories of space, are valid depends on the extent to which they may be said themselves to postulate such arbitrary assumptions as that space is in any way analogous to a sphere or that an I. line becomes finite by imagining a point of section.

**Infinite and Infinity** are perhaps the most difficult conceptions mathematicians have to make. Infinity is defined as being that quantity which is greater than every assignable quantity, and it is denoted by the sign  $\infty$ . It is most easily conceived as a limit, e.g. as the quantities  $\frac{1}{2}$ ,  $\frac{1}{3}$ ,  $\frac{1}{4}$ , ... get smaller and smaller, so  $n$  gets

larger and larger, and the limit to which  $n$  tends, as the infinitesimal  $\frac{1}{n}$  tends to zero, is  $\infty$ . In higher geometry parallel lines are those which meet at infinity, and the asymptotes of an hyperbola are the tangents to the curve at points on it infinitely distant.

**Infinitesimal**, in mathematics, is defined as a quantity smaller than every assignable quantity. The idea of an I. is obtained by supposing a quantity to decrease indefinitely but yet never actually to become zero. In calculations in general an I. may be neglected in comparison with ordinary magnitudes. If  $\epsilon$  is an I.,  $\epsilon^2$  is an I. of the second order, and  $\epsilon^3$  similarly may be neglected in comparison with  $\epsilon$ . A practical conception is obtained in astronomical problems. The distance of the stars from the earth is very great, and

the radius of the earth so small in comparison that it may be regarded as an I. and neglected in the calculations, i.e. it is immaterial whether the star's distance is reckoned to the centre or any part of the surface of the earth. This would not be true, however, in the case of comparatively close celestial bodies—the moon, for example. The ratio of two indefinitely small increments, or I.s of two dependent variables expressed as  $\frac{dy}{dx}$  forms the basis of the differential calculus (q.v.).

**Infirmity**, see HOSPITALS.

**Inflammation**, term used to denote certain tissue-changes which are accompanied by the symptoms of redness, swelling, pain, and heat-sensations. I. is primarily a protective process by which the body attempts to get rid of some irritating or injurious substance, and is a feature of almost every disease and injury. Where the tissues are injured and no germs are present, the process of repair goes on without undue swelling or pain, while any invasion of bacteria is attended by the characteristic symptoms of I., sometimes followed by suppuration or the formation of abscesses. The process of I. begins with the presence of an excess of blood, this gives the red appearance and also accounts for the sensation of heat. The blood vessels become dilated and there is considerable effusion of plasma and white corpuscles through the walls of the vessels. The continuance of the irritating stimuli causes more and more blood to flow to the part with still great effusion of plasma and white corpuscles, so that the part swells, the feeling of heat becomes more intense, and the pain takes on a throbbing character owing to the communication of the motion of the heart to the dilated arteries. The white corpuscles are busy destroying germs, dead tissue is being detached, and new tissue built up; the products of I. are carried away in the blood, or discharged from abscesses, etc. The treatment of I. is the treatment of the condition causing it. When it is due to bacterial infection the appropriate antibiotic or sulphonamide is often the treatment of choice.

**Inflation and Deflation**. In economics inflation strictly denotes an excessive supply of money relatively to the amount of goods and services; deflation denotes the opposite. Thus inflation means that the demand for goods and services exceeds their supply at current prices. Commonly, I. and D. connote abnormal expansions and contractions of money associated with marked effects on the price level. Slight inflation tends to stimulate trade, since if people expect prices to rise to-morrow they hasten to buy to-day. Deflation works the other way, since if lower prices are expected buyers will wait. A fall of particular prices does not mean deflation: it may be due to increased efficiency. Similarly inflation is possible without rising prices.

**Inflation**, or rather the policy that makes it inevitable, has great attractions for the statesman. It is a thankless task

to refuse claims, eminently reasonable in themselves, for more wages, more salary, more compensation, etc., and a great temptation to follow, in greater or lesser degree, the line of least resistance. But if 'the money is not there' concessions mean its undue creation, and the 'slippery slope' of inflation. While slight inflation may be innocuous if not advantageous, high inflation means total loss of faith in the currency, ruin to those dependent on savings, and general dislocation of business with wages and prices chasing one another in a 'vicious spiral'.

The terms I. and D. came into use in the latter half of the 19th cent. and into general use during the First World War. The paper 'greenbacks' of the Amer. Civil war represented a considerable inflation, but the First World War and its aftermath produced inflations of quite a different order. Russia, Austria, and Germany all experienced high inflation. In Germany in 1923 a new mark, the Rentenmark, was introduced, exchanging for 1 billion old marks. In modern war nations find it increasingly difficult, not to say impossible, to pay their way by taxation and savings, and, to fill the gap, resort to borrowing from the banks (so causing the creation of bank-money) as well as to printing bank-notes. Even so Germany emerged from the First World War with relatively moderate inflation: it was in the special circumstances of the post-war years that the mark became practically worthless.

The following figures of percentage increases in wholesale prices give an indication, by no means precise, of the inflation which occurred in certain countries over a 10-year period (1937-47) covering the Second World War:

	Per cent
U.S.A. . . . .	76
U.K. . . . .	77
Switzerland . . . . .	101
France (1938-47) . . . . .	889
Japan . . . . .	3,761
Italy . . . . .	5,418
Poland (Cost of living: War-saw only) . . . . .	14,953
China . . . . .	2,631,000

Beside paper inflations on the Ger. or even the Chinese model, metal inflations seem of small account. Nevertheless the Sp. conquest of America brought large quantities of the precious metals to Europe and fed the inflation that helped trade in Shakespeare's day, besides helping to diminish the value of royal revenues and send the Eng. monarchy to Parliament for more and more money. Again, the discoveries of gold in California and Australia in the middle of the last cent. inflated the money-basis of the gold standard countries. Later, improvement in mining technique had a similar effect. On the other hand the demand for monetary gold may itself cause a gold deflation, as occurred notably in the latter part of the 19th cent. and again between the wars. Superimposed on such basic movements

the 'trade cycle' brought its own alternation of I. and D., boom and slump. While the inflations of the trade cycle were in no way comparable to the extreme inflations of modern times, the loss, unemployment, and distress caused by the deflationary phase induced a search for less drastic ways of adjustment. After the Second World War hopes were centred in the International Monetary Fund. See L. von Mises, *The Theory of Money and Credit*, 1934; R. G. Hawtrey, *The Gold Standard in Theory and Practice*, 1947; G. Crowther, *Outline of Money*, 1948; F. Benham, *Economics*, 1955; First Report of (the) Council on Prices, Productivity, and Incomes, 1958. See also BANKS AND BANKING; CURRENCY; PAPER MONEY.

**Inflection**, or **Inflexion** (from Lat. *inflectere*, to bend), in grammar, the variations, changes, or modifications of form which words undergo to express various relations with other words of a sentence or clause. It forms an important div. of philology, and is subdivided into conjugation (verbs) and declension (nouns, pronouns, adjectives). Gender, number, and voice as well as case, tense, mood, and person may be expressed by I., and some grammarians include comparison of adverbs and adjectives also under this head. I. is, roughly speaking, a mark of Indo-Germanic and Semitic languages as opposed to agglutinative or analytic. It may be internal, initial, or final in Semitic, but is usually final in Indo-Germanic, words, except in cases of reduplication. Modern English has comparatively few I. left. See also GRAMMAR; PHILOLOGY. See O. Jespersen, *Progress in Language with special reference to English*, 1894.

**Inflorescence**, in plants, is the floral region, the mass of flowers, the botanical term to indicate the manner in which the flowers of a plant are grouped. The simplest form of all is a solitary terminal flower, e.g. daffodil, but more often there is a more or less complex system of branching (q.v.) in which the branches do not develop into foliage-shoots but bear flowers. The stalk upon which the flowers are borne is known as the peduncle or rachis; if the flowers spring directly from the peduncle they are said to be sessile, but if they depend from a secondary stalk they are said to possess pedicels. An I. found at the apex of a shoot is terminal, if found in the axils of leaves it is axillary. There are 2 distinct types of I.: indefinite or racemose, when the flowers at the base open first; and definite or cymose when the flowers at the apex first become mature. One of the commonest forms of the indefinite I. is the raceme, in which the flowers are connected to the peduncle by pedicels, e.g. lily-of-the-valley and bird cherry. The corymb resembles the raceme in being stalked, but the pedicels, produced at different levels, are all of different lengths and the flowers are brought to the same level, e.g. candytuft, *Sorbus domestica*. The spike is an indefinite I. with sessile flowers, e.g. plantain and gladiolus, while the catkin is a long, deciduous crowded spike bearing unisexual flowers,

TYPES OF INFLORESCENCE

A. Raceme—Bird-cherry. B. Panicle—Traveller's Joy. C. Corymb—*Sorbus domestica*. D<sup>1</sup>. Catkin—Hazel. D<sup>2</sup>. Single male flower of Hazel Catkin. E. Umbel—Dwarf Cherry. F. Capitulum or Head—*Olearia haastii*. F<sup>1</sup>. Stamens and pistil of inner florets. F<sup>2</sup>. A single ray floret. G. Thyrus—Lilac. H. Dichastium—Euonymus. I. Hypanthodium—Fig. I<sup>1</sup>. Single female flower. I<sup>2</sup>. Single male flower. J. Verticillaster—Jerusalem Sage. J<sup>1</sup>. Longitudinal section of same. K. Glomerule—Box.

e.g. hazel and birch. In the panicle the axis of the I. branches, and each branch forms a raceme, e.g. oats and traveller's joy; in the simple umbel all the pedicels are given off at one level owing to the abbreviation of the mother-axis, e.g. dwarf cherry and cowslip; in the compound umbel the axis branches in an umbellate fashion, each branch producing a simple umbel, e.g. hemlock and carrot. The type common to flowers of the family Compositae is the capitulum or head, in which the flowers are sessile and are borne on a shortened mother axis, e.g. *Olearia hoastii* and daisy. The curious I. known as a thyrus is mixed, being a raceme itself composed of short cymes, and is found in the lilac and horse chestnut. A dichasium such as is seen in *Euonymus* is a biparous cyme in which each axis produces 2 daughter axes and ends in a flower. The I. of the fig is a peculiar, hollow, pear-shaped capitulum, and the flowers are produced internally; this is called a hypanthodium. The verticillaster, common to the dead-nettle and Jerusalem sage, consists of what appear to be whorls of flowers, but these in reality stand one above the other and are borne in the axils of leaves on opposite sides of the stem. Finally, a glomerule consists of a number of cymes united to form a head, e.g. box and nettle.

Influenza seems to have been spread through Europe during the Crusades. Supposed to be an infliction of heaven, I. was named the *influentia coeli*. From this was derived the It. name I. first used in England by Huxham in 1767. I. is an epidemic (often a pandemic) disease, and spreads very rapidly. The great epidemic of 1889-90 started in the Far East and spread rapidly over all Europe. A further pandemic occurred in 1918. Since then it has appeared epidemically annually in some part of the Brit. Isles. There are two opinions on the epidemiology of I. One is that the virus persists either in a latent form or as a series of sporadic cases. From one or other of these sources an epidemic occurs at times when the susceptibility of the population permits. The second view is that the virus exists as a continuous chain of infection, first in the N. and then in the S. hemispheres. There is evidence for both opinions, and probably both are correct. The cyclical incidence of epidemics is explained partly by the transient immunity conferred on sufferers after an attack, and partly because the type of virus is modified from one epidemic to another. Diagnosis of the disease, though comparatively easy during epidemics, is still unreliable in isolated cases because the symptoms of the various forms of I. are so diverse. The view that these diverse forms are manifestations of the same disease, varying in character and intensity, is an outcome of the work mainly of Brit. epidemiologists.

The disease is sudden in onset and usually characterised by signs of inflammation of the respiratory tract, with coryza and cough; the sense of taste is markedly affected. In nearly all cases there is

much aching in the back and the joints generally. Prostration is out of proportion to the apparent severity of the illness and is often accompanied by mental depression. Weakness persists well into convalescence, which may be slow. As an epidemic gains ground the cases tend to become more severe, and pneumonia is a more frequent complication.

In epidemics of I. the predominant bacteria found in individuals suffering from the disease are *Bacillus influenzae*, discovered in 1892 by Pfeiffer and Kitasato, various streptococci, and pneumococci, but none of these seems to be invariably present. Falk and his colleagues working on the I. epidemic in Chicago (1928-9) identified a streptococcus which they believed to be the primary infective agent. It is known now, however, that the cause of I. is a filter-passing virus identified by C. F. Andrews and his colleagues in 1933. The viruses of I. pass easily through the pores of such fine filters as earthenware rods which can hold up the larger bacteria. Three main groups of I. viruses are known, called A, B, and C. The A and B groups have many substrains with distinct antigenic properties of their own. The A. viruses have caused most of the major epidemics in the past 20 years. The B viruses are more often the cause of sporadic cases and localised epidemics. 1. A attacks people of any age, whereas B and C are more to the fore in childhood infections. After the viral aetiology of I. was estab. in 1933 attempts were made to immunise human beings against the disease, but it was not until 10 years later that a successful method was achieved. But in 1947 an essentially similar vaccine was ineffective because a new strain of virus A had appeared. This posed a problem of how to incorporate in future vaccines virus strains likely to be encountered in an epidemic. Significant differences were noted in the A sub-strains isolated in I. outbreaks in Britain in 1951. Clearly these changes in the strains of viruses will necessitate changes in the composition of vaccines from time to time. Another problem is to produce a sustained immune response at a high level. Research is being carried on on both these problems and it seems that solutions will be found. During recent years efforts have been made to collect accurate statistics relating to I. The I. Unit of the World Health Organization is engaged in research on this subject.

*Asian flu.* Early in 1957 an epidemic of I. started in the E. (hence the name) and swept over the rest of the world, reaching England and America in the autumn. The causative virus was a variant of I. type A, of which there had been no previous experience in the 20th cent. Although the virulence could not be compared with that of the 1918 epidemic, it caused dislocation of industrial and school life. Mortality was low, being mainly due to pulmonary complications from secondary bacterial infection.

See BACTERIA AND EPIDEMIOLOGY. See

C. H. Andrewes, 'Influenza, World Health Organisation Monthly Bulletin No. 20, 1954 and 'Medical Research Council Report on Clinical Trials of Influenza Vaccine,' *British Medical Journal* (vol. 2), 1953.

**Information:** 1. Mode of proceeding against persons accused of crimes other than felonies. It is a speedy process, which brings an offender to trial.

2. A charge made to a magistrate of some offence punishable on summary conviction. A justice cannot issue a warrant for arrest in the first instance, except upon an I. or complaint in writing made on the oath of the informant or another person on his behalf. Where a summons only is issued in the first instance the I. need not be on oath or in writing. See Archbold's *Criminal Pleading, Practice, and Evidence* and Russell, *On Crimes*.

**Information, Central Office of.** estab. 1 April 1946, as a non-ministerial gov. dept with a separate vote, to continue most of the common service duties formerly carried out by the Ministry of Information. It acts as the central gov. agency for the production and distribution of publicity material on behalf of gov. depts, and for technical advice to them, for home and overseas purposes. Its offices are at Norgeby House, Baker Street, London, W.1.

**Information, Ministry of.** estab. as a Brit. gov. dept in Sept. 1939. Almost every aspect of Brit. publicity was dealt with by the M.O.I., and depts included the press and censorship organisation, film publicity, and a reference library of newspapers from all over the world. Information on every important development of the war was supplied to newspaper representatives, and opportunities were provided for leading personalities to tell their stories to pressmen and to answer questions. In Dec. 1945 the M.O.I. was closed and in its place were set up departmental information services supplemented by a central office (see INFORMATION, CENTRAL OFFICE OF).

**Informor.** A common I. was formerly one who preferred an accusation against another with the object of recovering a statutory reward for so doing. Actions by common I.s have been abolished.

**Infra-Red Heating.** The radiation emitted by incandescent carbon-filament lamps is largely at the red and infra-red part of the spectrum, i.e. radiant heat, and batteries of such lamps with reflectors are used for drying of paint and varnishes. The heat is steady and can be uniformly distributed over large surfaces, it is not too violent, it is easily regulated and controlled, and it emits no fumes that might damage the finish. The whole installation is easily moved.

**Infra-Red Rays,** invisible heat rays of longer wave-length than the longest visible rays of the spectrum, i.e. beyond the red; first observed by Herschel in the solar spectrum in 1800. They are of service in long-distance photography (see photograph overleaf), and they increase the power of searchlights, etc., to penetrate

clouds and fog. Portraits can be taken, with short exposures, in rooms 'illuminated' by infra-red light only, using plates sensitive to I.-R. rays. I.-R. telescopes combined with searchlights were used during the Second World War for night observation. Astronomers have made use of infra-red light for photographing the planets, and have thus obtained much useful information—on the planet Mars in particular. I.-R. rays are also used in therapeutics. See also LIGHT; RADIATION; REFRACTION; SPECTRUM AND SPECTROSCOPE.

**Infusion,** process of extracting the active principles of vegetable substances without boiling. The product of the process is also termed an I. The general method is to digest the parts containing the substance to be extracted in water. If the substance is volatile and is soluble in cold water it is better to digest the material in cold water, as it can then be extracted without admixture of other substances. Many active principles are, however, more readily soluble in hot water, and the temp. should be regulated according to the degree of volatility of the substance. When it is necessary to boil the mixture the process is known as decoction (q.v.); this is often accompanied by chemical changes in some of the substances concerned.

**Infusoria,** term applied to numerous classes of active protozoa appearing in stagnant infusions of animal or vegetable matter. The majority of them occur in great numbers, and are provided with vibratile locomotor processes of their living matter, which are practically permanent, and express the predominantly active constitution of these cells. When dirty water is held in a glass vessel between the eye and the light I. are generally quite visible, though most of them are microscopic. They occur both in fresh and salt water.

**Ingatestone,** small tn of Essex, England, 6 m. SW. of Chelmsford. It has an interesting Norman church with a 15th-cent. tower, and Rom. bricks set in the walls by the builders. An Elizabethan manor-house, I. Hall, was a refuge for Rom. Catholic priests during the Reformation. Part is now used in connection with Essex Record Office. Pop. 2650.

**Inge, Very Rev. William Ralph** (1860–1954), divine, b. Crayke, Yorks; eldest son of Rev. Wm Inge, D.D., provost of Worcester College, Oxford. Educ. at Eton and King's College, Cambridge—where his career was brilliant. He was assistant master at Eton 1884–8; fellow and tutor of Hertford College, Oxford, 1889–1904; Lady Margaret prof. of divinity Cambridge, 1907–11; dean of St Paul's Cathedral, 1911–34. In theology, I. was an extremely liberal Protestant—holding miracles and all pertaining to them very cheap. But what made him one of the most prominent clerics in England was his insistence, in learned books and popular journalism, on Platonic principles as guides to Christian practice. His apparent opposition to democracy, combined with his dry and austere manner in the

A PANORAMA OF THE ISLE OF MAN

This view was taken SW. of Wastwater, Cumberland, and covers forty miles. It was taken with a special long-focus lens and the infra-red plate and filter. The greater part of the eastern coast of the island is shown from a point near Ramsey to the low-lying land in the southerly part of the island. The range of peaks which stretches roughly across the centre of the island appears in the picture in remarkable detail considering the great distance. The rounded summit of Snaefell is a distinguishing feature of the right-hand half of the picture. To the N. is North Barrule, and the peak of South Barrule, over fifty miles away from the camera, shows clearly in the left-hand half of the picture.

pulpit, earned him at one time the sobriquet of the 'Gloomy Dean.' His writings include *Society in Rome under the Caesars*, 1886, *Eton Latin Grammar* (with Rawlins), 1889, *Christian Mysticism*, 1899, *Faith and Knowledge*, 1904, *Studies of English Mystics*, 1906, *Truth and Falsehood in Religion*, 1906, *Faith*, 1909, *Speculum Animae*, 1911, *Types of Christian Saintliness*, 1915, *The Philosophy of Plotinus*, 1918, *Outspoken Essays*—(first series, 1919), (second series, 1922), *The Victorian Age*, 1922, *Personal Religion and the Life of Devotion*, 1924, *The Platonic Tradition*, 1926, *Lay Thoughts of a Dean*, 1928, *The Church in the World*, 1927, *Christian Ethics and Modern Problems*, 1930, *God and the Astronomers*, 1933, *A Rustic Moralist*, 1937, *A Pacifist in Trouble*, 1939, *The Fall of the Idols*, 1940, *Mysticism in Religion*, 1947, and *The End of an Age and other Essays*, 1948. An excellent selection from his works is *Wit and Wisdom of Dean Inge*, by Sir James Marchant, 1927.

Ingelheim, Ger. tn in the Land of Rhineland-Palatinate (q.v.), 8 m. W. of Mainz (q.v.). Oberingelheim has an ancient fortress and a medieval church; in Niederingelheim there are the remains of a palace of Charlemagne (q.v.). The tn is the centre of a wine-producing dist. Pop. 14,000.

Ingelmunster, tn in the prov. of W. Flanders, Belgium, 7 m. N. of Courtrai, on the canal from the R. Lys to Roesselaere.

It manufs. carpets, linen, lace, velvet, and salt. Pop. 9400.

Ingelow, Jean (1820-97), novelist and poetess, b. Boston, Lincolns. She pub. her first poems, *A Rhyming Chronicle of Incidents and Feelings*, 1850, anonymously. Her poems are characterised by their novelty and charm, and her novels also are worthy of attention. Among her vols. of verse are *Poems*, 1863, which contained 'The High Tide on the Coast of Lincolnshire, 1571,' one of her best, and 'A Story of Doom,' 1867. Among her novels are *Mopsa the Fairy*, 1869, *Off the Skelligs*, 1872, *Fated to be Free*, 1875, and *Don John*, 1876. See *Some Recollections of Jean Ingelow and her Early Friends*, 1901, and an appreciation by E. A. Stodman, 1935.

Ingenohl, Friedrich von (1857-1933), Ger. admiral, a great favourite of the Kaiser Wilhelm II, whose yacht he once commanded. He was commander-in-chief of the China station previous to his appointment to the Supreme Command of the Ger. High Sea fleet in 1913. He was still in command on the outbreak of the First World War. His policy of raiding with cruisers such as at the Dogger Bank (q.v.) was not approved owing to its costliness, and in consequence he was placed on the retired list, being succeeded by Adm. von Scheer.

Ingersoll, Robert Green (1833-99), Amer. lecturer and lawyer, b. Dresden, New York, the son of a Congregational minister. He practised law in Illinois, and in

The Times

## INFRA-RED PHOTOGRAPHY

The foreshortening caused by the long-focus lens gives the Irish Sea the appearance of a great lake. Some objects, such as foliage, dyed materials, etc., photograph differently when illuminated by ordinary light and by infra-red light. Foliage, for instance, as seen in the photograph, reflects the infra-red strongly and hence appears dark in the negative and white in the print, so that grass and trees photographed in sunshine appear as if covered with hoar frost or snow.

The photograph was taken with a Taylor-Hobson-Cooke lens, and Ilford infra-red filter and plate.

1857 went to Peoria. In 1862 he became a colonel in a cavalry regiment, and in 1867 was made attorney-general of Illinois. He became known as 'the great agnostic' by reason of his lectures directed principally against Christianity. Among his writings are *The Gods and other Lectures*, 1876, *Some Mistakes of Moses*, 1879, and *Great Speeches*, 1887. See E. G. Smith, *The Life and Reminiscences of Robert G. Ingersoll*, 1904.

**Ingersoll**, tn of Oxford co., Ontario, Canada. It stands on the Canadian National and Canadian Pacific Railways, and on the Thames R. It manufs. agric. implements and furniture. Cheese, butter, and grain are produced in the dist., and there are flour and planing mills. Pop. 6728.

**Inghirami**, Tommaso (surnamed Fedra from his success as Phaedra in Seneca's *Hippolytus*) (1470-1516), poet, orator, and humanist of an It. noble family. Seven of his Lat. orations were pub. at Rome in 1777, and Erasmus says he was called 'the Cicero of his age.' Julius II made him keeper of the Vatican library. He left MSS. of a *Commentary on Horace's 'Ars Poetica'*, and *Abstract of Roman History*.

**Ingleborough**, hill in the W. Riding of Yorks, England, about 17 m. SE. of Kendal. On the S. is I. Cave containing stalagmites and stalactites, and on the top of the hill are the remains of an old camp. Altitude 2373 ft.

**Ingleford**, see HUNGERFORD.

**Ingleson**, vil. of the W. Riding of Yorks, England, situated on the Greta, about 10 m. NW. of Settle. In the vicinity are limestone caves and picturesque waterfalls. Pop. 2000.

**Inglis**, Charles (1734-1816), Anglican bishop, b. New York. He was a loyalist during the War of Independence and went to Halifax when the English evacuated New York. Consecrated in London in 1787 first Bishop of Nova Scotia, he was thus the first Eng. colonial bishop.

**Inglis**, Elsie Maud (1864-1917), Scottish woman surgeon, b. Naini Tal, India. She spent part of her childhood in Tasmania. Qualified 1892. Joint surgeon, Edinburgh Hospital for Women and Children. On the outbreak of the First World War she formed Scottish Women's Hospitals. In Serbia (1915) she helped to subdue typhus; was captured with wounded at Krushevatz. On her release she returned home and later (1916) went by Archangel to Bessarabia with hospital staff to attend the S. Slav Div., but the privations she had suffered while in captivity undermined her health and she d. in the following year, soon after returning to England.

**Ingoldsby**, Thomas, see BARNHAM, RICHARD HARRIS.

**Ingolstadt**, Ger. tn in the Land of Bavaria (q.v.), 43 m. N. by W. of Munich (q.v.). It is on the Danube (q.v.), which was diverted to pass the tn in 1363. In

1392 it became the seat of the Bavarian dukes, and during and after the Thirty Years War (q.v.) it was an important fortress and a prosperous trading centre. It declined after the transfer from the town of its univ. (founded 1472) in 1800, and the dismantling of its defences. There was much damage during the Second World War. It has many fine old churches, including the splendid Gothic *Liebfrauenmünster* (1425), has 2 castles (13th and 15th cents.), and has beautiful Gothic and baroque houses. It has motor-car and textile-machinery manufs. Pop. 46,000.

**Ingot**, cast mass of metal or alloy for working into other forms. An ingot-mould is a flask in which metal is cast into blocks.

**Ingrain Dyes**, see **DYE**.

**Ingram, Arthur Foley Winnington**-, see **WINNINGTON-INGRAM**.

**Ingram, John Kells** (1823-1907). Irish author and economist, regius prof. of Greek at Trinity College, Dublin, in 1866 and vice-provost in 1898. His *Political Economy*, contributed to the *Encyc. Brit.*, was pub. separately in 1888, and trans. into 8 European languages and into Japanese. Other works are *History of Slavery and Serfdom*, 1888, *Outlines of the History of Religion*, 1900, *Human Nature and Morals according to A. Comte*, 1901, *Practical Morals*, 1904, and *Final Transition*, 1905. As an undergraduate he produced *The Memory of the Dead*, or *Who Feels to Speak of 'Ninety-Eight?*, 1843, a poem adopted as the anthem. See C. L. Faulkner, *Memoir of John Kells Ingram*, 1907. Sir R. Palgrave, *Dictionary of Political Economy* (App. 1908).

**Ingres, Jean Auguste Dominique** (1780-1867), Fr. painter, b. Montauban. In 1796 he became a pupil of David, and in 1801 was successful in obtaining the Grand Prix. In 1806 he proceeded to Rome where he studied and worked until 1820, leaving in that year for Florence. Here he stayed 4 or 5 years and then returned to Paris. While in Italy he had carefully studied Raphael, and he brought the latter's influence to bear upon David's teaching. He again visited Rome and finally returned to Paris in 1841, having been made grand officer of the Légion d'Honneur. Among his pictures are 'The Vow of Louis XIII', 'Apotheosis of Homer', 'Stratonice', 'Oedipus and the Sphinx', 'The Odalisque', and 'La Source.' He is notable for his exactitude of observation, perfection of design, and the purity of his line. His portrait drawings in pencil are unrivalled. See lives by R. Balze, 1880, O. Uzanne, 1906, H. Lapauze, 1911, L. Fröhlich-Bum, 1924, H. Graber, 1927, L. Hourticq, 1928, and J. Cassou, 1947.

**Ingulf** (d. 1109), abbot of Crowland in Lincs, an honour conferred on him by William of Normandy, whose secretary he had been. The *Historia Monasterii Croylandensis*, printed by Henry Savile, 1596, once attributed to him, is now considered to be a forgery.

**Inhabane**, cap. of a dist. of the same

name, seaport on the Bay of I. in Portuguese E. Africa. The dist. produces rice, sugar, cotton, timber, ground-nuts, copra, maize, and rubber. Pop. (dist.) 31,457 (1950), of whom 700 are Europeans.

J. A. D. INGRES

**Inheritance**, in law, term restricted to the legal right to property by descent, or, by extension, to the property inherited. Rom. law differed radically from Eng. law in 2 important respects: (1) In Eng. law the word 'heir' (and its derivatives) is confined exclusively to the person who, prior to 1925, was entitled on an intestacy to real estate, and any title or dignity and heirlooms passing with the estate. (2) The maxim *Nemo est heres viventis* (no one is the heir of a living person) is rigidly applied so as to exclude a prospective heir or possible heir from any rights in the property until the death of the ancestor. As a corollary of (1), it is to be observed that a person named in a will of realty is by Eng. law a *devisee* and not an heir; in Rom. law the term 'heir' applied indiscriminately to all who, being in the power of the head of the family, had a natural claim on his property, irrespective of whether they took under a testament or on intestacy. To exclude effectually his own heirs, the testator had to do so by name in the will. But it was essential to institute an heir of some kind, for a Rom. testament was of no effect unless there was such a person to succeed to the *persona* of the testator, i.e. to continue his legal existence after death. Later, excluded children were given the right to impugn the will if omitted in it, and recover a certain share of the property. In Eng. law the fundamental difference in the canons of descent of real property from the Roman and systems founded on the civil law is that the rule of primogeniture has prevailed from remote feudal times until the Administration of Estates Act, 1925. The old rules of descent to

freeholds of I. were these: (1) Descent is traced from the last 'purchaser' (a technical term meaning the person who last took in any other way than by descent). (2) Descent is to the lineal issue *in infinitum*. (3) Males are preferred to females; primogeniture determines the male entitled, but females succeed equally as co-parceners (q.v.). (4) Remoter lineal issue 'representing' their own parents (who would if not deceased have succeeded to the property) take *per stirpes*, i.e. as opposed to taking *per capita* or in their own right. (5) The nearest ancestor takes on failure of lineal issue. The rules of intestate succession are now uniform for both real and personal property. See SUCCESSION, INTESTATE. See also BROUGH-ENGLISH and GAVELKIND.

**Inhibition**, used in a technical sense of the sentence passed upon a clergyman by which he is prevented from the exercise of his eccles. functions; it can therefore be used as a weapon for enforcing the laws of the Church. Also a writ to prevent a judge from proceeding further in a case.

In psychology, the word used for a subconscious urge to express the personality in some way which the conscious mind forbids.

**Inia** (*Inia geoffrensis*), toothed freshwater dolphin, found in the lakes near the Cordilleras and in some of the upper tribs. of the Amazon, where it is regarded with superstition by the Indians. It is about 8 ft in length, has a long cylindrical snout with stiff hairs, and only the merest rudiment of a dorsal fin. It is generally found in troops of three or four and is hunted on account of the oil it yields. It feeds chiefly on fish.

**Inini**, see FRENCH GUIANA.

**Inisfail**, see INNISFAIL.

**Inishkeer**, see ARAN ISLANDS.

**Inishkeel**, is. of Ireland, belonging to co. Donegal, and situated in Gweebarra Bay, with a capacious harbour.

**Inishmaan**, see ARAN ISLANDS.

**Inishmore**, see ARAN ISLANDS.

**Inishowen Peninsula**, N. of Co. Donegal, Rep. of Ireland, tapering to Malin Head, the most N. point of Ireland and conspicuous to travellers on the N. Atlantic route.

**Initial**, first letter of a word, especially of a name. Ornamentally arranged, I.s are a feature of Irish (see KELLS, BOOK OF) and Carolingian book decoration, often of full-page size and rich in colour. In the text of the Incunabula (q.v.) they were usually inserted by hand, later with woodcuts (e.g. Holbein's *Vance of Death*) or copper engraving, fitted to the typographic style. The first printed I. appeared in the Psalter of 1457. See also ABBREVIATIONS and CAPITAL.

**Initials**. In some cases signature by I. constitutes a good signature in law. Section 12 of the Civil Procedure Act, 1883, provided that in all actions upon written instruments it should be sufficient to designate any of the parties by their I., but the section is now obsolete. There are decisions to the effect that signature by I. is allowable in the case of memoranda and agreements comprised under the

Statute of Frauds (see FRAUDS, STATUTE OF). By the Wills Act, 1837, a will or codicil may be validly signed by I. only. Probably there are no documents which in the eye of the law must be signed in full, although it is clearly unwise from the point of view of identification not to do so. A deed certainly requires no signature, the traditional essentials of every deed being no more than sealing and delivery. In Scots law I. also constitute a good signature of a deed, but the genuineness of the I. must be proved.

**Initiative in Legislation**. It is a commonplace of political science that very few constitutions are really so framed as to ensure the representation of the views of the majority of the electorate upon any one particular issue. Some deny that a representative chamber like the Eng. House of Commons is returned for the purpose of effectuating the will of the majority upon every single issue, on the ground that legislative authority and omnipotence rest with Parliament and not with the electorate, and it is further asserted that any relation of agency as may subsist between the electorate and its representatives subsists only so far as the latter can be said to be entrusted with a mandate for carrying out a general party policy. Sir A. Dicey points out that it is inconsistent with the legal notion of Eng. parl. sovereignty to suppose that parl. electors have any legal means of initiating, sanctioning, or repealing the legislation of Parliament, because the opinion of the electorate can only be expressed through Parliament. Not that this view of the functions of the electorate is by any means essential to a representative polity, for in Switzerland all parl. deliberation is regarded as purely preliminary, and by the process of the Obligatory Referendum of legislative proposals a legislative measure, even after being passed by the Federal Assembly, must on the demand of a certain number of citizens be submitted to the electors for formal approval before it can become law. This, indeed, was done in the times of ancient Rome in the question literally asked of the people, 'Jubetisne?' Some of the Swiss cantonal constitutions go even further than this, by the device of the right of I. This right makes it incumbent on the legislature to pub. proposals advocated by a certain proportion of the electorate, and cause them to be voted on at the local polling stations. It must be conceded that the I. ensures the literal observance of the will of the majority, but it is questionable whether it is a sound political expedient to cast on the people at large the actual business of law-making. Practised politicians must almost of necessity be better able to formulate the general aims of the majority in detailed proposals than the people themselves. Moreover, the people are apt to be so blinded by prejudice or party passion as to be incapable of weighing up all that can be said for and against a proposed law, and certainly it must hamper indefinitely the work of legislation if every important amendment suggested at any stage of a

Bill has to be referred to the electorate for approval. Sidgwick, inspired by Bentham, advances the ingenious solution of making a member's election annually renewable with a view to deferring the final ratification of the legislative measures of the year until the ann. election, so that in the interim the people may have an opportunity for cancelling any unpopular legislative innovation. For a full discussion of the question of the control of the people over gov., see H. Sidgwick, *Elements of Politics*, 1891, ch. xxvii.

**Injection**, act of introducing a substance into one or other of the cavities of the body; or the substance so injected. The substance is generally employed as an aqueous solution and is intended to have a curative effect by direct action on the organ into which it is injected or to which it is readily conveyed by the natural processes of the body. Hypodermic I.s are made by piercing the skin and introducing the active substance into the subcutaneous tissues by means of a small syringe. Intravenous I. is the introduction of a solution directly into a vein. Intramuscular I. is the introduction of a solution into the substance of a muscle. Vaginal, urethral, and rectal I.s are other forms.

**Injector**, apparatus for forcing water into a boiler against the pressure of the steam. M. Henri Ciffard invented an I. in 1858 which is now in general use. Steam from the boiler passes into a conical pipe, the size of the opening of which can be regulated by an adjustable cone. As the steam rushes out of this, it meets the feed water, and is condensed, so creating a partial vacuum, which causes the water to rush in with a very great velocity, and to pass down another conical pipe. The escaping steam behind helps to drive it down this pipe. As it emerges from the narrow end of this conical pipe, it passes into the narrow end of another one. So, as it passes on down this expanding cone, its velocity slackens and the pressure increases. So the water is forced into the boiler through a non-return valve. This I. may be worked either by exhaust steam from the engine or by steam from the boiler. See **BOILERS**.

**Injunction** is 'an order of the Court which restrains the commission or continuance of some wrongful act, or the continuance of some wrongful omission' (E. H. T. Snell, *Principles of Equity* (24th ed.), 1954).

I.s are either *prohibitive* or *mandatory*: the former forbids the commission of some wrongful act (e.g. the blockage of a right of way or the continued infringement of copyright) and the latter orders the commission of some positive act (e.g. the pulling down of a building unlawfully erected). I.s are either *interlocutory* or *perpetual*. An interlocutory or interim I. is an order made on *prima facie* evidence on affidavit by the plaintiff, with the object of preserving the *status quo* between the parties, pending the trial of the dispute; it is usually granted on the plaintiff's undertaking to pay damages if his claim

fails. A perpetual I. is the permanent order made when the issues between the parties have been decided at the trial. The I. was originally a remedy given by the courts of equity (q.v.) to mitigate any hardship inflicted by actions in the common law courts. I.s may now be made by all divs. of the High Court and the Co. Court. Non-compliance with I.s is punishable by committal to prison for contempt of court (q.v.). The court may award an I. and/or damages. Examples of I.s are orders prohibiting the commission of nuisances, the pub. of libels, the infringement of copyright or patents, and the wrongful expulsion of members from trade unions.

**Injuries to Property**, see **MALICIOUS**.

**Ink**, material used for producing records on paper and similar substances. Its hist. dates back to 2500 BC when the Chinese made I. which was used on papyri, perfectly legible samples of which are in the Brit. Museum (see below, *Chinese ink*). Later the Romans and Greeks used plant juices and coloured pigments ground in water to produce coloured I.s. A natural I. was also employed, consisting of the dried l.-sac of the cuttle-fish dissolved in water to a sepia colour. In the 11th cent. AD, extracts of tree bark were mixed with iron to give a blackish liquid which gave a good mark on paper but was very unstable. Up to the early part of the 19th cent. various recipes were available, mainly based on extract of galls and iron; those were satisfactory for their immediate purpose but had no keeping qualities or stability. It was left to Dr Henry Stephens in 1832 to perfect the blue black I. as we know it to-day.

This depends on mixing suitable proportions of tannin materials with iron. The tannin substances are derived from gall-nuts which occur in China, Persia, and Turkey, by extraction or fermentation, whilst the iron used is in the form of the sulphate, known commercially as copperas. When these 2 materials are brought together in the presence of water, a dark solution is formed which if used as an I. would give a scarcely legible trace on the paper, but would, however, rapidly darken to a black colour by oxidation in the atmosphere. A blue aniline dye is added to give legible writing, and this colour is absorbed into the fully developed black colour and combines with it to reinforce the density of colour. Thus the blue black I. is an iron-gall type which writes blue and develops black. The iron gallo-tannates are in the soluble condition in the fluid I., but when exposed as a trace on paper the oxygen of the atmosphere converts them to the insoluble form, which is therefore waterproof as well as permanent, after full development. To ensure that oxidation does not occur in the bottle, inhibitors have to be added in the form of mineral or organic acids, which stabilise the I. and postpone the conversion to the black insoluble condition until the I. reaches the paper and can be exposed to the air. Certain other additives are required to prevent mould

growth, adjust the flow of the I., and control its penetration into the paper.

*Chinese ink* is the original I. made in China from earliest times, compounded of lampblack and gum, moulded into sticks, sometimes perfumed and dried. It was used on papyrus by moistening with water and is still obtainable to-day as 'Chinese Stick I.'

*Coloured inks* are usually solutions of aniline dyes derived from coal-tar, together with suitable preservatives and other additives to control flow of the I. and penetration of the paper. Thus Eosine can form the basis of a red I. whilst Acid Green and Methylene Blue may be used for green and blue I.s respectively. Gold and silver I.s are obtained by mixing the finely divided metals or their substitutes with gum and a solution of soluble silicate. The initial colour of these I.s is usually strengthened by the addition of aniline dyes, but as most aniline dyestuffs are fugitive to light in varying degree, these coloured I.s are not so permanent as iron-gall I.s, which retain their iron content whatever else happens to them.

Washable I.s are becoming popular as they can easily be washed out with soap and water if spilled on fabrics. They are usually blue, a dye being used that will stain the paper fibres without fixing. As a result the writing tends to smudge, especially in the presence of moisture.

*Copying inks* are made by the addition of glycerine, gum, or dextrin to a concentrated soluble tannin I. Addition of these materials greatly retards the oxidation of the tannate of iron by forming a film over the surface of the writing. This dissolves when the damp tissue paper is applied and an impression is thereby obtained.

*Indian ink* is an I. which originated in China and was formerly known as Chinese I., but nowadays is a black waterproof I. containing carbon black and shellac intimately ground together with other substances to a uniform dispersion.

*Marking ink* was formerly made with a silver salt as a base and required heat to develop the black mark. It has been almost entirely superseded by a complex mixture of organic and inorganic salts which gives a precipitate of aniline black on the fibres of the material being marked. It is most important that it should not be heated before washing, which must take place within a few days of marking to avoid damage to the fabric.

*Printers' inks* consist of pigments dispersed in varnish-like media, which may contain linseed oil, resins, and solvents. The composition of such media varies considerably with the printing process and the method used to cause the I. to dry (oxidation, evaporation, penetration, precipitation). Pigments consist of carbon black, some manuf. inorganic materials such as lead chromate, Prussian blue titanium oxide, and a large number of complex organic materials related to the dyes used on textiles.

*Sympathetic or invisible inks* are any

colourless liquid or solution of a substance which is invisible until treated with heat or some chemical reagent. Thus a solution of galls may be used which produces a writing which on washing over with a weak solution of iron salt becomes dark. If a solution of a cobalt salt is used for writing, no characters are visible until the paper on which the writing has been made is warmed. The characters then appear blue. These I.s have some application in security writing, as, for instance, characters written in a solution of quinine sulphate in water which are invisible on paper but are revealed in distinctive and intense colours when submitted to the ultra-violet lamp.

Inkerman, locality on E. outskirts of Sevastopol. There were ant. Taurian dwellings here, and in the 12th-15th cents. a cave tn. Here on 5 Nov. 1854 the British met the Russians in battle, and after a brave resistance, and when defeat seemed imminent, were reinforced by the French and gained the victory.

Inkster, vil. in Wayne co., SE. Michigan, U.S.A., a residential suburb 14 m. W. of Detroit. It has truck and poultry farming and manufs. flower pots. There is a modern psychopathic hospital. Pop. 16,728.

*Inlaid Linoleum*, see LINOLEUM.

*Inland Revenue*, Board of, had its beginning when Commissioners of Stamps were appointed in 1694 in the reign of William of Orange. Twenty-five years later, in 1719, Commissioners of Taxes were appointed. These commissioners worked independently of each other until 1834, when a Consolidated Board of Stamps and Taxes was estab. The next big change took place in 1849 when the Commissioners of Excise were absorbed by the Board, which now adopted its present title. In 1908, however, all matters connected with Excise were transferred to the Board of Customs. The 3 sources of I. R. are Death Duties, Stamps, and Taxes. Salaries and expenses of the Board for 1955-6 were £35 million. The chairman is paid £3500 per annum and the deputy chairman £2500. The seat of the Board is at Somerset House, Strand, London, WC. See also CUSTOMS DUTIES; EXCISE DUTIES; INCOME TAX; TAXATION.

*Inland Sea* (*Setonaikai*), sea of Japan, situated between the main is. on the N. and the is. of Shikoku and Kyushu on the S. It is about 240 m. in length, and its greatest breadth is 40 m. Its shores are especially beautiful, and the waters are very calm.

*Inland Water Navigation*, see CANAL.

*Inlaying*, method of ornamenting flat surfaces by the insertion into one material of a substance differing from it in colour or nature. Thus the basis may be of wood, metal, or stone, and the inlaid or encrusted material of different wood, or of ivory, marble, tortoise-shell, precious metals, etc. The art of I. is practised in the fabrication of furniture and artistic objects of various kinds. I. in wood is generally known as 'marquetry' (q.v.).

in metals it is termed 'damascening' (q.v.), and in marble and precious stones it forms a variety of 'mosaic' (q.v.) work. The word *I.* is, however, generally understood to be limited to the first of these 3. It consists in the fitting together, to form patterns, of differently coloured pieces of wood. In the Stuart period a good deal of *I.* was executed in England upon cabinets, chests of drawers, etc. In Italy the most beautiful examples of the art are on panels or choir-stalls, and in German musical instruments, chests, and cabinets are often lavishly inlaid.

**Inman, Henry** (1801-46), Amer. artist, b. Utica, New York, studied under Jarvis. He is distinguished principally for his portraits of Amer. and Eng. statesmen and men of letters.

**Inn, riv.** In Austria, one of the chief affluents of the Danube. It rises in the Engadine, Switzerland, and flows through the Tirol (passing Innsbruck) and Bavaria. Length 300 m.

**Innampura**, see LIMPOPO.

**Innate Ideas**, in the philosophy of Descartes, are the clear axiomatic principles whose certainty cannot be doubted. They are not only certain, but universal; and as they are not the result of empirical experience, they may be regarded as the primitive germs of or the irreducible minimum of truth, which nature has planted in the human intellect, and which, obscured in part by errors due to bodily conditions, the mind would find clearly within itself if it were freed from disturbing influences. Hobbes describes this kind of reasoning as merely metaphorical, and considers that there is no criterion for distinguishing this assumed clearness: to which objection Descartes replies that there is a distinction between a natural inclination to believe a thing which may nevertheless be false and a natural light which makes us know a thing to be true; which reasoning appears to be no more than superadded metaphor. Descartes applied his principles to the study of mathematics, and made remarkable progress therein; but the study of mathematics is one which peculiarly lends itself to mechanical application. In the study of the relation of mind to body, Descartes was not prepared to carry out his conception to its final consequences; since to do so would be to deny altogether the influence of the will upon our actions. Hence he formulated a theory that the mind can and may interfere in reflex actions, but that it possesses the power of pure thought in its own right. Locke, as a typically Brit. practical philosopher, denies the existence of *I. I.*, and asserts that all our knowledge comes from sense experience, the mind being only *tabula rasa*. Leibniz opposed this whole conception of images impressing themselves upon the blank mind from external objects as the basis of all our knowledge, though he agrees with Locke that, in point of time, sensations precede the relating activities of the mind. Locke practically ignores the reaction of the mind itself in knowledge; Leibniz deems this reaction the one essential thing.

But while we may admit that all truths come to our knowledge only through experience, there may still be certain truths which may properly be called innate. In other words, the vague concept 'experience' demands a closer, more subtle definition than Locke gave it, and this was supplied by later philosophers like Hume and Kant. Locke's criticism of *I. I.* has, indeed, no force against the theories of Ger. idealism; for, according to Kant, experience itself would be impossible unless it were possible for the mind to pass judgments transcending experience. With Kant, perception does not conform to the nature of objects, but the sensible object conforms to the constitution of our faculty of perception. Eng. philosophical thought is essentially utilitarian, and therefore opposed to the theory of *a priori* and innate truths—an attitude which explains the popularity in England, for a time, of the positivism of Comte or any other system of philosophy which seems to favour progress irrespective of the forces of tradition.

**Inner House**, see COURT OF SESSION.

**Inner Temple**, see INNS OF COURT.

**Innerleithen, par. and burgh** of Peebles, Scotland. The par. is intersected by the Leithen Water. There is a medicinal spring containing sodium and calcium chlorides. It is one of the centres of the Scottish woollen industry. Pop. 2300.

**Innes, James Dickson** (1887-1914), landscape painter, b. Llanely in Carmarthen, of Catalan descent on his mother's side. He studied art at the Slade School, and exhibited chiefly at the New Eng. Art Club. His earlier landscapes were painted in S. Wales, often in company with Augustus John, and his later on the Mediterranean slopes of the Pyrenees. His ability and originality exercised a strong influence on the work of his younger contemporaries.

**Innes, Michael**, see STEWART, JOHN INNES MACKINTOSH.

**Inness, George** (1825-94), Amer. landscape painter, highly esteemed for his individual interpretation of light and atmosphere; b. Newburg, New York. He studied in America, but travelled in Europe, where he admired the Barbizon painters, Daubigny and Rousseau. Among his works are 'Autumn Gold,' 'Under the Greenwood,' 'Passing Storm,' and 'Moon-rise.'

**Inniscarra, vil.** in co. Cork, Rep. of Ireland, the centre of the R. Lee (q.v.) hydro-electric scheme.

**Innisfail, tn** of Queensland, Australia, on the Johnstone R., 989 m. N. of Brisbane, in the heaviest rainfall belt of Australia with an ann. average of 140 in. It is the centre of a sugar-cane growing dist.; other industries are timber, dairying, and pastoral (cattle). Pop. 6640.

**Innisfail**, used in poetry as a synonym for Ireland, and means 'the island of the Fair.' The 'Fair' or 'Lia-fail' is the stone which, since 1296, when Edward I carried it off from Scone (q.v.), has rested under the coronation chair in Westminster Abbey. Legend tells that it was on this stone that

Jacob fell asleep when he dreamt of the flight of stairs reaching to heaven, and that the Dedannans carried it to Ireland and set it up as the 'inauguration' stone at Tara (q.v.). See CORONATION.

**Innisfree** (Inishfree), see SLIGO.

**Innishannon**, vil. in S. co. Cork, Rep. of Ireland, on Bandon R. It has excellent angling, and remains of castles in vicinity.

**Inniskilling Fusiliers**, The Royal, raised in 1689 from the forces which defended Enniskillen for William III. The 1st and 2nd battalions were respectively the 37th and 108th regiments of Foot. The regiment fought at the Boyne and siege of Limerick, in the 1715 rebellion in Scotland, and at Culloden, 1746. After the Maida campaign it went to the Peninsula, then to Waterloo. It took part in 2 S. African campaigns before going to India for the mutiny. During the First World War it fought in France, Flanders, Macedonia, Gallipoli, Egypt, and Palestine. After the First World War it was reduced to 1 battalion, and linked with the Royal Irish Fusiliers (q.v.) to form 1 corps. A second battalion was again formed in 1937. During the Second World War, battalions served in France in 1940, Burma, N. Africa, and Italy. See *The Royal Inniskilling Fusiliers; being a history of the Regiment*, 1928.

**Innocent**, name of 13 popes, of whom the following deserve particular mention:

**Innocent III** (1198-1216), successor of Celestine III. The power of the Holy See reached its zenith during his pontificate, of which the following are the most outstanding: the launching of the fourth crusade (1202), the rise of the mendicant orders, the beginning of the Albigensian crusade (1209), and the Fourth Lateran Council (1215). I. was a zealous advocate of ecclesiastical reform.

**Innocent IV** (1243-54), successor of Celestine IV. Through the Council of Lyons (1245) he excommunicated and deposed the Emperor Frederick II, decreed the revival of the crusades, and affirmed the authority of the popes in language even more unequivocal than that of Innocent III. In his Bull *Ad extirpanda* (1252) he authorised and controlled the use of torture by the Inquisition. He was the first pope to confer upon his legates a red hat, which was gradually adopted by all cardinals.

**Innocent X** (1644-55), successor of Urban VIII. He is chiefly remembered for his condemnation of Jansenism (q.v.) in 1653.

**Innocent XI** (1676-89), successor of Clement X. He successively withstood the Gallican claims of Louis XIV, and encouraged John Sobieski, King of Poland, in his campaign against the Turks. Beatified 1956.

See POPES, LIST OF THE.

**Innocents' Day**, Holy, Eng. name for the festival celebrated 28 Dec., in commemoration of the massacre of the children of Bethlehem by Herod. It was probably first celebrated towards the end of the 5th or early part of the 6th cent. In the Lat. Church mass is said in

purple vestments, probably because the Innocents 'did not enter heaven till Christ at His Ascension opened it to those who believe.' In the Gk Church the feast is celebrated on 29 Dec., being known as the Feast of the 14,000 Holy Children. Also known as Childermas (q.v.).

**Inns and Innkeepers**. Premises formerly known as inns are now designated hotels by the Hotel Proprietors Act, 1956 (see HOTEL). The word 'inn' in this context has a special meaning differing somewhat from that in common use. It denotes a place at which any respectable traveller has a right to refreshment and sleeping accommodation, subject to his willingness to pay the prices charged. The innkeeper has a duty to supply them and cannot refuse without proper excuse; the travellers' demands must, however, be reasonable, as the innkeeper can only be expected to provide what he has available. To constitute any premises as an inn, the innkeeper must 'hold out' that he undertakes such a duty. It is not necessary that an inn should be licensed for the sale of intoxicants, as a temperance hotel could be an inn. Some licensed premises might not be inns, as, for example, a public-house where the publican did not 'hold out' that he would cater for all travellers.

The common law liability of innkeepers was originally so wide that a guest could recover damages for loss of his property in every case where the innkeeper could not prove the guest negligent. To protect innkeepers from frauds on them, their liability to guests was limited by the Innkeepers Liability Act, 1863, to £30, except where the property was lost as the result of the default or wilful neglect of the innkeeper or his servant, where the property had been deposited for safe custody, or where the property consisted of a horse or other live animal, or a vehicle. This Act was repealed by the Hotel Proprietors Act, 1956.

**Inns of Court**, Gray's Inn, Lincoln's Inn, Middle Temple, and Inner Temple. To become a member of the Eng. Bar it is necessary, besides passing certain examinations in law, to be admitted as a member of and to keep 12 terms (extending over a period of 3 years) at an Inn of Court. The I. of C. are a kind of legal unit, of London, in which the barristers and students correspond respectively to graduates and undergraduates. There were formerly a number of small inns, such as New Inn, Staple Inn, and Clifford's Inn; all of these have either been bought up or in some other way acquired by the 4 remaining I. of C. With the dissolution of the sergeants' inns disappeared the ancient status of 'serjeant,' commemorated in the humorous characters of Serjeants Buzfuz and Snubbin in the *Pickwick Papers*. All the existing I. of C. are corporate bodies owning (prior to the First World War) valuable property, and appointing from time to time 'benchers' out of their own members to form the executive bodies of the societies. Twenty benches, 5 from each inn, co-opted from time to time, form the Council of Legal

**Education.** The benchers may disbar a barrister for professional or other serious misconduct. Intending equity and chancery practitioners usually join Lincoln's Inn, the 2 Temple Inns being the best for common law business. Gray's Inn apparently offers the best scope for scholarships and students' prizes. A time-honoured feature of the I. of C. is the keeping terms, not by residence or attendance at lectures, but by 'eating dinners' in the halls, the total number being 6 of each term; but there are certain exemptions; studentship and first-class honours men gaining a remission of 2 terms, and univ. men need only dine on 3 nights each term. See also **LEGAL EDUCATION**.

Disastrous damage was done to property in the I. of C. by Ger. air raids on London (1940-1).

Williams, *Early Holborn in the Legal Quarter of London, 1927*; G. B. Hurst, *Short History of Lincoln's Inn, 1946*; W. Kent, *Lost Treasures of London, 1947*; W. V. Ball, *Lincoln's Inn, History, 1947*; E. A. P. Hart, *Hall of the Inner Temple, 1952*.

**Innsbruck** ('Inn bridge'), Austrian tn, cap. of the prov. of Tirol, on the Inn. It is at the junction of the roads over the Brenner and Arlberg passes (q.v.). In the Middle Ages it was an imperial residence; the palace of Maximilian I (whose famous burial monument is in the Franciscan church) was renovated by Maria Theresa (q.v.) in Rococo. There are many fine churches and mansions, and streets of curious old houses. The univ. was founded in 1669. The tn is surrounded by mts, and is a centre for climbers and tourists. It is the commercial centre of W. Austria, and has textile and glass manufs. Pop. 95,100.

**Innuendo**, in the law of libel and slander, means that the words or gestures complained of although not defamatory in their ordinary or natural meaning are, in certain circumstances, capable of an alternative construction which amounts to a libel or slander.

**Innuendo** (Lat. *innuere*, to nod), figure of speech in which meaning is conveyed by a hint, as in Mark Twain's observation, 'The principal difference between a cat and a lion is that a cat has only nine lives.' See also **FIGURE OF SPEECH**.

**Innuity**, see **ESKIMO**.

**Inoculation**, communication of disease accidentally or intentionally to a healthy subject by the introduction of certain products of disease into the body through the skin or the mucous membrane. The chief diseases so transmitted in man are anthrax, hydrophobia, smallpox, and syphilis. Before Jenner (q.v.) introduced vaccination (q.v.), I. of smallpox was practised. The disease as thus transmitted was far less dangerous than the ordinary smallpox, and, further, rendered the inoculated subject much less liable to a future attack. Its disadvantages are obvious, in that it tended to keep the disease alive, and

further to increase its spread, but it was invaluable to those who had been inoculated, and was of great service prior to Jenner's discovery. In 1840 the practice of I. with smallpox was forbidden by law.

**İnönü, İsmet** (1881- ), Turkish soldier and statesman, and second President of the Turkish Rep. After distinguishing himself as a staff officer during the First World War, he became Atatürk's (q.v.) chief-of-staff in the Nationalist resistance movement and later (1924) Prime Minister of the rep., an office which he retained until he succeeded Atatürk as president in 1938. He was succeeded as president in 1950 by the present incumbent, Celal Bayar.

**Inorganic Chemistry**, see **CHEMISTRY**.

**Inosite**, or **Hexahydroxycyclohexane** ( $C_6H_{12}(OH)_6$ ), sweet crystalline substance, melting at 253° C., that is found widely distributed in the animal and vegetable organisms, especially in cereal brans and seeds. Little is known about its specific function.

**Inowroclaw** (Ger. Hohensalza), tn of Poland, in Bydgoszcz prov., 28 m. SSE. of Bydgoszcz (q.v.). It went to Prussia in 1772, but was returned to Poland in 1919. There was only minor damage during the Second World War. It is a spa, and has engineering, glass, sugar, and brass industries. Salt and gypsum are mined in the dist. Pop. 40,000.

**Inquest**, see **CORONER**.

**Inquisition** (Fr. *inquisition*; Lat. *inquisitio*, a seeking or searching for). In ordinary language, particular inquiry, search stimulated by curiosity or hidden motives. In law (1) a judicial investigation, inquiry, examination, an inquest; (2) the verdict of a petty jury under a writ of inquiry. 'An inquisition of office is the act of a jury summoned by the proper officer to inquire of matters relating to the crown, upon evidence laid before them' (Blackstone, *Comment.*, Bk 4, Ch. XXIII). The institution known as the I was an eccles. tribunal first outlined at the synod of Toulouse in 1229, and estab. by Pope Gregory IX after the conquest of the Albigenses in 1233. A committee consisting of sev. respectable laymen and the parish priest was ordered to be set up in every parish to search for and bring heretics before the bishops. Soon afterwards inquisitors were specially appointed by the Pope from the Dominican and other orders, but these did not supersede the bishops' courts. Persons accused of heresy were examined privately, and if sufficient evidence was found against them they became liable to eccles. penalties. If they remained impenitent the severest eccles. penalty, viz. excommunication, was pronounced against them and they were handed over to the civil authority for capital punishment. The eccles. penalties ranged from the enjoining of certain good works (e.g. almsgiving) to imprisonment for life. Informers' names were kept secret; torture was used to extract confession, while the death penalty usually took the form of burning. The I. was set up in Italy, Spain and its dependencies,

Portugal, and France, but not in England, where heretics were tried by the ordinary tribunals. It flourished chiefly in Spain, owing to the numbers of Jews and Mohammedans settled there, who, while outwardly conforming to avoid persecution, practised their own religion in secret and plotted extensively against the unity and safety of Christendom. According to Peschel's calculations about 2000 persons suffered death between 1481 and 1504 when Isabella *d.* This was the period of the Grand Inquisitor Torquemada (1481-98). The Sp. I. was suppressed by Napoleon in 1808, revived by Ferdinand VII in 1814, and was finally abolished by the Cortes in 1834. In France it was used by Philip le Bel for the suppression of the Knights Templars, but soon fell into disuse. In modern times the I. in Rome is called the Holy Office, and is composed of cardinals, judges, consultants, and other officials, under the presidency of the Pope, but its activities are confined to the censorship of books and matters relating to church law and eccles. offences. Death was regarded as the penalty for heresy by Catholics and Protestants alike in the 16th cent., but the Sp. I. has come to be regarded almost as a synonym for religious bigotry coupled with gross inhumanity.

**Insanity**, unsoundness of mind. It is hardly possible to provide a satisfactory definition of I., as it includes many widely differing states of body and mind, and excludes many forms of aberration which are associated with more or less transient diseases. When any injury is sustained by the cortex of the brain, or when poisonous matters are carried to it by the blood stream, clinical experience tells us that a disturbance of consciousness occurs. The delirium of the fever patient is due to his brain being temporarily poisoned, and a number of cases of more permanent forms of I. can be traced to definite lesions of the brain. Such conditions are often accompanied by purely physical symptoms, so that the hypothesis that I. depends ultimately upon physical causes is not altogether unjustifiable.

**CAUSES OF INSANITY.** Mental defect or disease is associated with some inherited or acquired peculiarity of brain constitution. If statistics be of any value at all, the relation of I. to hereditary nervous weakness is well estab. The descendant of insane parents may be normal, and even extraordinarily capable, but there is great likelihood of some indications of want of nervous balance showing themselves, and his general condition may be represented as a susceptibility to invasion by the agents that produce mental instability, just as a child of consumptive parents, though apparently healthy, is assumed to be less likely than others to resist invasion by the tubercle bacillus if he allows the conditions to become favourable for its development. Among other general causes of I. may be mentioned the increasing stress of civilised life. There is a fear that I. is increasing rapidly among civilised nations, and although statistics do not show that any real increase has

taken place, there undoubtedly is a greater tendency to nervous diseases which demonstrates that the nervous mechanism is being over-wrought in a number of cases. The belief that there is a relation between the stress of modern life and the incidence of mental disorder was apparently confirmed by the great increase of mental disorders during the First World War, particularly among soldiers. The general body of expert opinion, however, inclines to the view that the conditions of warfare were the occasion, rather than the cause, of the 'war shock' (traumatic neurosis). The report of the Board of Control for 1930 (pub. in 1931) comments on the continued increase in lunacy, the number of notified insane persons under care in England and Wales showing, in the 6 years under review, an average ann. increase of about 2000. But the Board found no justification for the suggestion so commonly made that the pace of modern life conduces to mental breakdown, though present-day conditions of urban life might, and probably do, tend to increase the frequency of some minor nervous disorders. Opinion as to the place of alcoholism in the causation of I. is divided. So many cases show a hist. of alcoholism, and its effects on the nervous system are so pronounced, that many claim alcohol to be the commonest cause of I. On the other hand, the cause may be confused with the effect; the lack of control which makes the confirmed drunkard is a characteristic symptom of an unsound mental constitution. Consanguinity, or marriage of near relations, is adduced as another cause. Here, again, the probability is that if the parental hist. is free from I., there is no particular tendency in that direction in the offspring. Mental feebleness is perpetuated in many of our vils. by the intermarriage of related persons with a hist. of mental deficiency; such persons are often responsible for much larger families than the average. The immediate cause of I. may be toxic poisoning through defective metabolism or through actual infection by micro-organisms. Such forms of I. as follow certain fevers, as influenza, puerperal fever, or syphilitic infection, are undoubtedly due to the presence of toxic substances in the blood. It has been further suggested that worry, violent emotion, etc., by their effect on metabolism induce changes in the blood which may ultimately cause a physical condition of the brain involving I.

**General symptoms.** Of the mental symptoms the most definite are persistent delusions or hallucinations. A delusion is a false idea, as when a patient fancies he is some great personage, or that there is a conspiracy against his life; a hallucination is false perception, as when a patient sees visions or hears voices which have no foundation in reality. It must not be thought that all insane persons suffer either from delusions or hallucinations of a definite type. Mental instability shows itself in extreme impulsiveness in action, leading sometimes to sudden

attempts at suicide. In some forms of I. it is almost impossible to keep the patient's attention for more than a few seconds: he is at the mercy of every chance impression. On the other hand, some patients cannot be roused out of an obstinate introspection. Memory is often disturbed, being either abolished or restricted to remote events. Of bodily symptoms the most characteristic is sleeplessness, and the recurrence of the habit of sleep is generally a sign of improvement. A rapid pulse rate and general lack of control of muscles are usually to be found in most types of I.

**CLASSIFICATION.** There is no universally accepted classification of the types of I., but the following outline of a simple scheme (Henderson and Gillespie) is similar to that adopted by the Royal College of Physicians (England) in its Nomenclature of Diseases:

1. *Affective reaction types:* (a) Manic Depressive; (b) Involutional Melancholia.
2. *Schizophrenic reaction types.*
3. *Paranoid and Paranoid reaction types:* (a) Paranoia; (b) Paraphrenia; (c) Paranoid states (with or without hallucinations).
4. *Epilepsy.*
5. *Mental deficiency:* (a) Idiotcy; (b) Imbecility; (c) Feeble-mindedness.
6. *Organic reaction types:* (a) Acute (Delirium); (b) Chronic.
7. *Unclassified:* e.g. some cases of folie à deux.

The *Organic reaction types* are subdivided as follows: (1) Psychoses with toxins: (a) Endogenous (Uraemia, Eclampsia, etc.) (b) Exogenous (alcohol, opium, metals, gases, etc.). (2) Psychoses with infections: (a) General; (b) Local brain infections, comprising: Syphilis, (General Paralysis, Cerebral Syphilis, and Tabes); Encephalitis; Meningitis (tubercular, meningococcal, etc.); and Abscesses. (3) Psychoses with primary degenerative brain changes. (4) Psychoses with general metabolic deficiency: (a) Pellagra; (b) Myxoedema; (c) Cretinism. (5) Psychoses with brain trauma. (6) Psychoses with organic brain diseases, e.g. brain tumour. (7) Psychoses with chronic general diseases, e.g. cardio-renal disease, pernicious anaemia, etc.

The term *Manic Depressive Psychosis* is now applied to disorders of affect, either elation or depression, which were formerly termed Mania and Melancholia in the belief that they were quite separate diseases. The characteristic symptoms of Mania are press of speech and activity, flight of ideas, and a state of 'causeless' elation, i.e. without any justifiable cause either in the conscious content or in the external circumstances. In addition, suspicion, irritability, a clouding of consciousness, disorientation, delusions, and hallucinations may all be present for a time, particularly at the height of the illness. The onset is usually acute and the bodily

indications are restlessness, insomnia, and loss of weight.

Melancholia is characterised by persistent depression. The patient is miserable, introverted, solitary, and retarded. Hallucinations and delusions (usually hypochondriacal, self-accusatory, or persecutory) may be present. The most important consideration from the point of view of care and treatment is the danger of suicide.

*Involutional melancholia* is a term, which, in its strictest application, is reserved for a group of cases of both sexes occurring at the involutional period, who have never previously suffered from any form of mental illness. Its features are depression without retardation, anxiety, a feeling of unreality and hypochondriacal and nihilistic delusions.

*Paranoia* is a chronic form of mental disease which has an insidious onset and is characterised by delusions, which are closely related, unchangeable, and bound up together into a system. The term Systematised Delusional I. is sometimes given to Paranoia and distinguishes this psychosis from other mental diseases in which the delusions are multiple, variable, and unsystematised. Delusions may be of grandeur and power or of persecution or jealousy. When delusions of persecution are present, there is considerable danger of violence as the patient may attack his supposed persecutors or attempt suicide to escape from them. *Schizophrenia* is a psychosis which occurs most typically in adolescents and young adults and is characterised by emotional apathy, absorption in phantasy to the exclusion of normal social activities, by delusions and hallucinations, and a deterioration in mental efficiency which may terminate in severe dementia. In its typical form it consists in a slow, steady deterioration of the entire personality and manifests itself in disorder of feeling, conduct, and thought and in an increasing inability to make effective contact with reality. Four varieties have been described: (1) Simple. (2) Hebephrenic. (3) Katatonic. (4) Dementia paranoides. *Paraphrenia* is a progressive delusional condition, accompanied by hallucinations of various senses and, in due course, by a varying degree of mental deterioration. The condition has been said to lie midway between dementia paranoides and paranoia in the age of onset and the severity of its symptoms. *General paralysis of the insane* is an inflammatory and degenerative disease of the brain of syphilitic causation, which is characterised by progressive mental deterioration and definite physical signs and serological findings. It usually manifests itself from 5 to 20 years after infection, but a few cases have been recorded where the disease made its first appearance 30 or more years after infection. It is commoner in males than in females, develops insidiously, and its course is frequently marked by remissions. The earliest signs are usually changes in the patient's personality (changes in behaviour, character, and mood) of which the

patient is commonly unaware. There is increasing disorientation, particularly for time, and progressive impairment of memory. A feeling of euphoria, coupled with grandiose delusions of bizarre type may be present or the patient may exhibit intense depression, even amounting to stupor and mutism. In the depressed type the ideas expressed are frequently absurdly nihilistic and grotesque. In the terminal stage of dementia the patient leads a purely vegetative existence. The disease is world wide and its appalling social significance cannot be overstressed. Syphilis transmitted to the offspring may give rise to juvenile general paralysis.

**TREATMENT.** Studies of mental disorder carried out in connection with hypnotism led to the attempt to use suggestion, and persistent suggestion still plays a great part in the treatment of mental patients. Progress towards an understanding of the true character of mental disorder resulted in the realisation that the insane man was a sick man, in need of care and supervision in place of discipline (or, as in former times, punishment) and restraint. A welcome change appears to have taken place in the attitude of the general public towards 'nervous' and mental disease. There is an increased readiness to seek expert advice and treatment early, and the old fear of social stigma appears to be almost eliminated. Probably more than any other single factor, the extensive use of psychiatry in the 3 services during the Second World War contributed to this desirable development. For the first time psychiatry in the services was fully organised and developed. Special hospitals for the treatment of neurosis and psychosis were estab. both at home and overseas. At home psychiatrists were attached to the various military hospitals, area psychiatrists worked in each command, military prisons were visited, and psychiatric opinion and advice made available at officer selection boards, intake centres, courts martial, etc. Overseas the work was often carried out in the extreme forward areas. The result was that in the services large numbers of the medical profession and an immense cross-section of the general pop. became familiar with the aims, uses, methods, and benefits of psychiatry, and after their return to civilian life they were not slow to take practical advantage of this knowledge. Further, the experience gained in the organisation of war psychiatry proved of great value in organising the extension and elaboration of civilian psychiatry which took place after the end of the war. The modern mental hospital provides its inmates with as great a measure of freedom as possible, and with great variety of occupation.

Besides rest and occupation therapy special methods of treatment have recently been introduced, which have yielded valuable results. The methods of treatment now in use include (1) Insulin therapy, (2) Cardiazol therapy, (3) Electric convulsion therapy, (4) Prefrontal leu-

cotomy, (5) Continuous narcosis, and (6) Narco-Analysis. Insulin therapy, which involves the production of a hypoglycaemia by means of insulin, has proved especially valuable in schizophrenia, particularly in young patients treated early in the disease. Cardiazol also has yielded good results in certain cases. With electric convulsion therapy the best results have been obtained in depressions, including involutional melancholia. This treatment, which can be given as an out-patient procedure, is now practised at the psychiatric clinics at most large general hospitals. The operation of prefrontal leucotomy involves the severance of the association paths between the frontal lobes and the thalamus. The general aim of the operation is to modify the disordered behaviour of those psychotic patients whose illness has been of prolonged type. Generally speaking, the possibility of serious and permanent damage to the mental functions renders it advisable to reserve the method for cases where all other suitable methods have been tried and failed, where there is no reasonable hope of spontaneous recovery, and where the patient is quite incapable of useful occupation or a modest enjoyment of life. Modern practice involves the attempt on the part of the medical man to understand his patient, and to learn, through the discovery of the purposive character of his symptoms, obsessions, and delusions, the real character of the inner conflict which they simultaneously express and conceal (cf. the psychological teaching of Freud and his followers). There is still a difference of opinion as to whether there is a distinct break between the neuroses or 'nervous' diseases, and the psychoses or I. proper; or whether the psychoses which are not due to actual lesions are merely developments of the neuroses. According to some writers, there is a fundamental difference between the two, though it is admitted that in the early stages of dementia praecox, manic depressive insanity, paraphrenias, etc., diagnosis is very difficult, and patients who are really insane may be regarded as merely neurotic. On the other hand, it is indisputable that many patients who were diagnosed as insane have been considerably benefited by psychoanalytic treatment, and some have even been cured. These differences of opinion, however, have not stood in the way of the general acceptance of the view that mental disorder of any kind calls for psychological understanding and psychological treatment. The psychological study of abnormal mental functioning has developed into a specialised branch of medical science, under the name of psychiatry (q.v.).

**DETENTION OF INSANE PERSONS.** See LUNACY ACTS.

**INSANITY AND CRIMINAL RESPONSIBILITY.** It is a fundamental presumption of Eng. law that every person of the age of discretion is sane and accountable for his actions until the contrary is proved. The burden of proving the incapacity or mental

defect is placed on the prisoner, and it is for the jury to determine, as a question of fact, whether the defence have proved that the prisoner was insane at the time when he committed the crime. The tests to be applied by the jury were formulated over a cent. ago in consequence of a plea of I. raised in the case of R. v. McNaughten (1843). The rules formulated by the judges to whom the House of Lords addressed a series of questions on the law of I. laid down 4 propositions which could be used as a guide where I. is pleaded and which can be summarised: (i) the fact that a person who knows that he is acting contrary to law, does so under an insane delusion or revenge, or a delusion that his act is a benefit to the public, is no defence if that person, even though partially deranged, knows that he is doing something unlawful at the time of the commission of the act; (ii) the test of I., which ought to be submitted to the jury, as a direction from the judge on the law, was held to be that: 'To establish defence on the ground of insanity, it must be clearly proved that at the time of committing the act the party accused was labouring under such a defect of reason, from disease of the mind, as not to know the nature and quality of the act he was doing, or, if he did know it, that he did not know that he was doing wrong'; (iii) if a person is under a delusion as to the facts which existed at the time of his wrongful act, but is not otherwise insane, his liability for those acts must be considered on the basis of his liability had those circumstances been real; (iv) a medical man who has been present throughout the trial cannot properly be asked his opinion of the state of the accused's mind at the time of the commission of an alleged crime, as this would be usurping the question which it was for the jury to decide; but it might be convenient to allow such a question where the facts are not in issue and the question is substantially on a matter of science.

Section 2 of the Homicide Act, 1957, supplements the M'Naughton rules by providing the defence of diminished responsibility in murder cases. The accused must satisfy the jury that at the time of the crime he was suffering from such an abnormality of mind as substantially to impair his mental responsibility for his act. The abnormality of mind must have arisen from some arrested or retarded development of mind or any inherent cause or have been induced by disease or injury. A mere outburst of temper would not suffice.

These rules have long been subject to criticism by legal and medical writers. The non-acceptance by the law of the defence of uncontrollable impulse (for example) in cases of shoplifting where a person is clearly suffering from kleptomania, but still knows that he is doing something wrong, has often been strongly attacked by eminent members of the medical profession. Similarly the law has not yet accepted a defence of moral I. where the intellectual faculties are sound, and where there is knowledge of the acts

performed, but the moral appreciation is diseased or affected. Moral inebility is, however, recognised under the Mental Deficiency Acts, 1913 and 1927. Where a person is mentally defective, and has vicious or criminal propensities which have existed before the age of 18, the court has power to order confinement in an institution or place for defectives under the care of a guardian. Moral deficiency or sadistic or sexual perversion do not fall within the rules of McNaughten's case unless the person either does not know what he is doing or does not know that what he is doing is wrong, and they do not form good grounds for a defence of I. The defence of I. in answer to a criminal charge is one of general application, and is not confined to cases of murder. It is, however, rarely pleaded as a defence to charges of less gravity because of the consequences of a verdict of 'Guilty but insane,' for a finding of this special verdict entails an order that the accused be kept in custody during Her Majesty's pleasure. See also CRIMINAL LAW; LUNACY; MENTAL DEFICIENCY ACTS; PSYCHOSIS.

Inscribed Stock, see REGISTERED STOCK. Inscriptions (from Lat. *in*, 'upon,' and *scribere*, 'to write') is the term given to records cut, engraved, or moulded upon hard material such as stone, metal, or clay. They are found on rocks, on slabs of stone, on temples, tombs, or anct buildings, on vases, seals, or gems, on copper plates, on iron or bronze tablets, on gold, silver, brass, crystals, ivory, and so forth. In the Bible there are numerous references to writing on stone: the tablets, on which Moses received and afterwards rewrote the Law on Mt Sinai, were slabs of stone (Exod. xxxi. 18 and xxxiv. 1), and in Deut. xxvii. 2-3 Moses was bidden to 'set up great stones and plaster them with plaster' that they might have a surface capable of taking a legible text of the Law; also Joshua 'wrote upon the stones a copy of the Law of Moses' (Joshua viii. 32). Clay was the most common writing material among the anct Mesopotamian peoples (see CUNEIFORM WRITING) and was also used in Syria (at Ras Shamra, the anct Ugarit, a particular cuneiform script was employed) and in Crete, where many thousands of clay tablets have been unearthed, as well as in some other Near E. countries. Bronze was used by Greeks, Etruscans, and Romans as a material on which to engrave votive I., laws, treaties,

and other solemn documents. The earliest extant Chinese written documents are either on bronze or on bones. The most noteworthy characteristic of the 'pre-historic' Indus valley culture (q.v.), in the middle of the third millennium B.C., is the still undeciphered script preserved in about 800 finely cut seals of stone or copper. India, and especially S. India, is particularly rich in I. of all kinds. The importance of the S. Semitic I. can be gauged when we consider that practically all we know of early S. Arabian hist., and that of pre-Islamic N. Arabia, is based upon them. Indeed these numerous S. and N. Arabian I. are our main source for the study of the once flourishing kingdoms whose splendour has been immortalised by the biblical account of Solomon and the Queen of Sheba. Also the numerous inscribed stelae and stone 'altars' and the inscribed polychrome clay pottery of the anct Mayas (Central America), as well as the wooden tablets of Easter Is., inscribed in a 'mysterious' script, may be mentioned.

Until the end of the 19th cent., when people spoke of 'ancient history' they usually meant the hist. of anct Greece and Rome; it was thought that nothing could be known about the earlier times except what is found in the pages of the Bible. In the early 19th cent. very little was known about the early Near E., the cradle of our W. civilisation. The general reader hardly realises that during the last cent. the vistas of space and time visible to the eye of man have been wonderfully extended owing largely to the discovery and the decipherment of numerous I. The civilisations of Egypt, Mesopotamia, Indus valley, Syria, Asia Minor, Arabia, Crete, etc., previously entirely unknown, or at best known only from the facts transmitted through the Bible or Graeco-Rom. writers, have been brought into the full light of hist. Scores of scripts and languages, some of which are not connected with any surviving tongue, have been deciphered; grammars and dictionaries of previously unknown languages have been written; and many aspects of historical cultures have been constructed only on the basis of I. For example, we know vastly more about the reign of Hammurabi of Babylonia, 18th cent. B.C. than we know about the reign of King Alfred of England.

Macalister, *Corpus Inscriptionum Insularum Celticarum* (vol. i), Dublin, 1945.

**Insect**, member of the invertebrate group of Arthropoda. There are over half a million species known to-day, and the likelihood is that entomology will reveal many thousands more. Thus I.s are by far the largest class of animals, and can further claim a very remote ancestry, as the Lower Silurian rocks in the earliest ages known to geologists bear distinct traces of them. A typical I. stands considerably higher in the biological scale than Peripatus or Myriapoda. Its body is enveloped in a horny substance called chitin, and is structurally composed of 3 divs., which are frequently so narrowly united that the I. seems cut up into 3 parts—a phenomenon which has given the class its name (*insectus*, Lat. 'cut into'). These 3 divs. are the head, thorax, and abdomen. The adult I. usually has wings and these are attached to the second and third segments of the thorax. Some I.s (the Diptera, or true flies) have, instead of the second pair of wings, small outgrowths, halteres, used for balancing. Beetles have the first pair represented by wing cases or elytra which protect the delicate flying wings. Two legs are present on each thoracic segment, whence an I. is called a Hexapod (6 legs). It breathes by means of air-tubes or tracheae, whence it ranks with other Tracheata.

**Anatomy of insects.** The head is made of sev. segments closely united. The mouth is situated at the front and on the under side, an upper lip (labrum) being usually present. The mouths of many I.s have 3 pairs of appendages (jaws), with which the I. procures and also masticates its food. There is also a pair of pre-oral outgrowths called feelers or antennae. Some adult I.s have 2 kinds of eyes: there are 2 compound eyes, which are set one on either side of the front of the head, and are made up of numerous 6-sided lensed facets; between these eyes

there may be present the simple-lensed eyes, called ocelli, which are often disposed in a group of three and are really only eye-points. A compound eye can be well studied in a house-fly. Larvae, that is, young I.s., have only ocelli. The thorax is made up of 3 segments, each provided with a pair of jointed legs on the lower surface. Two pairs of compressed dorsal sacs, that is (wings), are fastened to the

Ab, abdomen, showing segments; Lp, lateral plates of abdomen.

upper surface of the 2 hinder segments. In some species there is only a single pair of wings, whilst in others the second is still very undeveloped. The abdomen has no limbs, unless stings, pincers, and other weapons of offence, or ovipositors, be regarded as rudimentary limbs. This part of the trunk contains most of the organs. Appendages on the head are of 4 kinds. First, there are 2 antennae springing from the forehead. These are mainly jointed, thin, and long, and have many nerve-endings which make it probable that they serve as organs of touch, by which impressions are conveyed from one I. to another, and perhaps also as organs of smell. Secondly, there are the mandibles or biting and upper jaws, which in I.s. with the masticatory type of mouth are

simply hard plates adapted for crushing and cutting. Below these are the anterior (1st) maxillae, or lower jaws, which are provided with jointed palps (that is, sense organs), and which often have quite a complex structure. The posterior (2nd) maxillae are the fourth pair of appendages. These also are complex and furnished with palps, and are, moreover, usually united at their base to form the labia. The mouth is formed of the mandibles and the 2 pairs of maxillae, and may be of the sucking or chewing type. Thus moths and butterflies have suctorial mouth arrangements, and whilst their mandibles are only slightly developed, their 1st maxillae have become probosces by being protracted into a spiral tube. The mouths of beetles are masticatory. The trunk appendages are the 3 pairs of legs already referred to. Each limb is divided into 5 parts, namely hip (coxa), trochanter, thigh (femur), shin (tibia), and foot (tarsus) with claws and pads at the extremity. Sometimes there are tarsal hairs and glands, which enable the I. to grip a smooth surface; the legs of a daddy-long-legs are lank and long, while the water boatman can swim with his, and other insects use theirs for making a noise.

**Skin and glands.** The chitinous cuticle or integument, which forms a kind of ensheathing skeleton, often bears bristles, tubercles, scales, or hairs the last of which may be tactile or olfactory. I.s. are subject to moultings, since the cuticle itself cannot expand to allow for growth, and cast their whole skins many times before reaching their greatest size. The skin serves as a firm support for the highly developed muscles which work the wings, legs, trunk segments, and organs of the mouth and further control circulation and respiration. Bees, coccus I.s., etc., have wax glands near the bottom of the abdomen or on the back; a number of larvae, especially such as weave cocoons, have spinning glands opening near the mouth; bugs have odoriferous, and wasps and stinging ants poison glands, and few I.s. are without salivary glands, which also open near the mouth.

**The nervous system** differs from that of vertebrates by having a ventral instead of a dorsal nerve cord and in being much simpler. The nerve centres, called 'ganglia,' which are simply masses of nervous matter, lie lengthwise along the lower part of the trunk and are connected together by a double chain of nerves. From each ganglion branch nerves are dispatched to different parts of the body, and in the extreme front is a larger pair of ganglia, usually called the 'brain.' From the 'brain' the 2 nerve chains, or cords, divide so as to encircle the gullet, after which they reunite. As regards their sense organs it is certain they have some of them more highly developed than those of human beings. I.s. which visit flowers are wonderfully sensitive to fragrance and to colour, and it is largely by smell, it seems, that I.s. recognise friends and foes. Some entomologists credit them with a sixth and dermatoptic sense, because their

skin seems able to appreciate minute differences of light and shade. I.s hear by means of nerve-endings, called tympanal and chordotonal organs, which lie on various parts of the body surface and greatly surpass human beings in their auditory faculties. Many, like ants and bees, which lead a social life, show signs of extraordinary powers of intelligence and ingenuity in adapting fresh means to compass a particular end. On the other hand, much of what appears to be their most intelligent behaviour is purely instinctive, and when this is interfered with, the insect is unable to adapt itself intelligently to the new situation.

*The circulatory system* centres round the dorsal blood-vessel, or heart, which lies lengthwise along the upper surface of the body, just below the chitinous casing, and which is a tube composed of segments with valves between. Behind, this tube is closed, but in front it is prolonged into a fine channel, the aorta. The blood, which is a colourless, pale green, red, or yellow fluid with amoeboid cells, is pumped out from the heart into the various tissues until a muscular contraction of the body forces the blood back into the heart. Lucunae, which have no definite walls, take the place of blood-vessels properly so-called. The blood, unlike that of vertebrates, takes no part in the transport of oxygen.

*The respiratory system* of I.s is remarkably efficient. Air-conducting tubes, called tracheae, are distributed not-wise all over the body, and open to the outer air by means of paired apertures called spiracles, or stigmata. There are usually 2 pairs in the thorax and 10 on the abdomen, but the number varies considerably. The spiracles are often protected by hairs. In water I.s lateral or terminal outgrowths, known as tracheal gills, replace the stigmata; the oxygen dissolved in the water can penetrate through their thin surfaces. The tracheae are ingrowths from the outer cuticle; they are lined with chitin, and appear silvery and glistening; the air is probably driven through them by muscular contractions, easily seen in the abdomen of a wasp, and continuing even when this part has been cut off from the rest of the body. By the development of spiral bands of strengthening material, the tracheae are prevented from collapsing, while the diffusion of oxygen through the thin parts of the walls into the surrounding tissues can proceed freely.

*The alimentary system* varies with different species and also to some extent with different diets. The alimentary canal, which passes from front to back usually with sev. loops on the way, may be divided into fore-, mid-, and hind-gut. Mouth, pharynx, and gullet compose the fore-gut; sometimes the gullet is swollen into a kind of crop, the honey stomach of the bee; sometimes it is prolonged into a gizzard with grinding plates to promote mastication, and sometimes it has a pouch called the sucking stomach. The fore- and hind-gut are lined with chitin; not so the mid-gut. This is a chyle or digestive and absorptive stomach, and leads

into the hind-gut or intestine which is often coiled and glandular; it is longer in I.s which take solid than in those which take liquid food. The intestine absorbs digested food, and the soluble waste products leave the body by means of a set of winding threads or tubes, the Malpighian tubules, which usually grow from its upper part. Solid waste products are excreted through the anus.

*The reproductive system* is represented by paired reproductive organs, the products passing out through paired ducts, the *vasa deferentia* of the male and the oviducts of the female. The sexes are quite distinct and differ in other points of structure as well as in reproductive organs. Thus the female of the butterfly *Grylla* has no wings, and among *Strepsiptera* (bee parasites) the female never leaves the grub stage. Males can store up spermatozoa in pockets, and similarly certain females, like the queen bee, can preserve for years the spermatozoa received from the male, so that she can continue to lay fertile eggs long after her last sexual union. She does this by means of an internal seminal storage vesicle, the spermatheca. Some females have a well-developed ovipositor at the end of the abdomen. Sexual selection is practised among I.s, a fact which has probably contributed towards more speedy evolution of strength and beauty. Sometimes the males fight for some feminine prize, whilst among bees and other I.s the wooing is quite an elaborate process, the female in this case choosing her mate. Some I.s are exceptionally fertile, as, for instance, the silk moth and queen bee; others, among them certain Aphides, are remarkable for parthenogenesis, or virgin birth, i.e. development of eggs without fertilisation, which sometimes occurs for a limited period only, and is afterwards followed by normal sexual reproduction. A hive of bees usually has only 1 perfectly mature female, the queen bee; the mass of females who carry on the work have an immature sexual development, and are therefore called 'neuters,' or workers.

*Metamorphosis* is a phenomenon common to the majority of I.s. However, among Collembola and Thysanura the young, which, as in most I.s, are hatched from the eggs of the mature female, differ from the adults only in point of size, and even among lice, locusts, cockroaches, and many bugs, the only distinction between the infant and parent is the immaturity of the reproductive organs and smaller wings in the infant. These species are therefore said to be 'ametabolic,' that is, not subject to change. Cicadas, Ephemerera, and dragon-flies, on the other hand, are classed as 'hemimetabolic,' being subject to partial change. Thus a larva of the cicadas lives on the ground and has anterior limbs suited to burrowing, whilst fully grown cicadas live among grass. The dragon-fly is winged and aerial, and breathes with open air-tubes, but its larva lives in the water, and has tracheal gills for respiration. But a large number of species, including house-flies, beetles, and

## INSECTS INJURIOUS TO TREES AND SHRUBS

1. Lackey Moth (*Malacosoma neustria*). 1a. Larva. 1b. Eggs, in ring round stem. 2. Mottled Umber Moth (*Hybernia defoliaria*). 2a. Wingless Female. 2b. Larvae. 3. March Moth (*Anisopterix aescularia*). 3a. Female. 3b. Larva. 4. Brown Tail Moth (*Nygmia phaeorrhoca*). 4a. Female. 4b. Larvae. 5. Magpie Moth (*Abraxas grossulariata*). 5a. Larva. 6. Winter Moth (*Cheimatobia brumata*). 6a. Larva. 7. Wood Leopard Moth (*Zeuzera pyrina*). 7a. Larva. 8. Goat Moth (*Cossus ligniperda*). 8a. Larvae, in Willow. 9. Green Oak Moth (*Tortrix viridana*). 9a. Larva, descending from rolled leaf. 10. Codlin Moth (*Carpocapsa pomonella*). 10a. Larva on Apple. 11. Cockchafer Beetle (*Melolontha vulgaris*). 12. Rose Chafer Beetle (*Cetonia aurata*). 13. Pine Beetle (*Hylesinus piniperda*)—enlarged. 14. Garden Chafer, or June Bug (*Phyllopertha horticola*). 15. Gooseberry Saw-fly (*Nematus ribesii*). 15a. Larvae. 16. Colorado Beetle (*Leptinotarsa decemlineata*). 16a. Larvae. A. Blackthorn. B. Oak. C. Gooseberry. D. Hawthorn. The drawings are life-size, except of very small insects (actual sizes indicated by a line).

## USEFUL INSECTS

1. Lace-wing Fly—*Chrysopa* (*Nothochrysa*) *vulgaris*. 1a. Eggs. 1b. Larva. 2. Two-spot Ladybird Beetle—*Coccinella bipunctata*. 2a, 2b. Larvae, with one enlarged. 3. Seven-spot Ladybird Beetle—*Coccinella septempunctata*. 4. Spiny Fly—*Tachina* (*Echinomyia*) *grossa*. 5. Spiny Fly—*Tachina* (*Fabricia*) *ferox*. 5a. Larva. 6. Hover Fly—*Syrphus* (*Calabomba*) *pyrastri*. 6a. Larvae. 7. Hover Fly—*Syrphus ribesii*. 8. Hornet—*Vespa crabro*. 9. Sun beetle—*Pterostichus vulgaris*. 10. Green Tiger Beetle—*Cicindela campestris*. 10a. Larva, in burrow. 11. Devil's Coach-horse Beetle—*Oryctes nigriscapus*. 12. Glow-worm Beetle (male)—*Lampyrus noctiluca*. 12a. Female. 13. Violet Ground Beetle—*Carabus violaceus*. 14. Bracon Fly—*Microgaster glomeratus*. 14a. Cocoons, spun by larvae emerged from caterpillar of Common Cabbage White Butterfly, with enlarged cocoon below, showing lid. 15. Ichneumon Fly—*Pimpla instigator*. Size: see note, p. 96.

butterflies, are 'holo-metabolic' or subject to complete transformation. The eggs are deposited in such large numbers that they have individually only a very limited food storage capacity. The result is that each larva is obliged to assume a shape which will allow of its better growth and development, and the form assumed varies a great deal among the different species. The larva of a fly is a maggot which has no distinct head; that of a bee is a grub, whose head is clearly marked; and the caterpillar is the larval butterfly. The normal growth of a larva of this class is as follows: At first, after it has emerged from its shell, it is very active and greedy for food. The body is segmented and supplied with all the organs except the sexual; there are no wings nor compound eyes. In every larva, moreover, what is known as the 'fat body,' that is, a mass of fatty tissues in the trunk cavity, is peculiarly well developed. Here, after a busy life of moulting and growing, it accumulates stores of reserve food for use during the coming metamorphosis. Larvae for the most part crawl about, and to aid them in movement they may have from 2 to 5 pairs of 'pro-legs,' that is, foot-like processes, on the abdomen as well as true legs on the thorax. The period of change is called the pupal or chrysalis stage. Some larvae, such as those of the silk moth, spin cocoons of silk to serve as a shelter during the metamorphosis. The larva now becomes a 'pupa,' which is quiescent and cannot absorb food, but sometimes, as with dragon-flies and grasshoppers, the larva is transformed into a 'nymph,' which eats and continues active. Wings grow, and, what is still more marvellous, there is gradually taking place a complete reconstruction of the internal structure of the former larva. Amoeboid cells are fashioned out of the larval organs, and upon the ruin of the latter there grow new structures better adapted for the changed life that is to come. Finally the pupal husk is broken, and there emerges the 'imago' or perfect I. The task of reproduction naturally rests with the fully grown I., which sometimes dies after it is completed. The sexual organs of larvae and pupae are usually imperfect.

**Classification.** I.s are divided into 2 subclasses, Apterygota (wingless forms) and Pterygota (winged forms). In the Apterygota, which include the Bristle-tails (Thysanura) and Spring-tails (Collembola), there is no metamorphosis (or but a very slight one) in the development to adult form. The Pterygota can be readily divided into two, Exopterygota and Endopterygota. In the Exopterygota the wings develop outside the body and there is but a slight metamorphosis without a pupal stage. The Orthoptera (cockroaches, stick- and leaf-I.s, locusts, grasshoppers, crickets, etc.), Dermaptera (earwigs), Plecoptera (stoneflies), Isoptera (termites), Anoplura (lice), Ephemeroptera (may-flies), Odonata (dragon-flies), Thysanoptera (thrips), and Hemiptera (bugs) are the more important orders of this div.

In the Endopterygota the wings develop inside the body and the metamorphosis to adult form is elaborate, involving a pupal stage. The main orders of this division are: Neuroptera (lace-wings), Mecoptera (scorpion-flies), Trichoptera (caddis-flies), Lepidoptera (butterflies and moths), Coleoptera (beetles), Aphaniptera (fleas), Diptera (true-flies), and Hymenoptera (ants, bees, wasps, ichneumon flies, etc.).

**Life and general characteristics.** I.s have most diverse haunts and frequent underground caves, hot springs, and even the sea; nevertheless, the majority are aerial and dwellers on land. In tropical and temperate climates they abound, but they are represented even in the polar regions. Many, as, for instance, the pond-skater, whirligig beetle, water-scorpion, and gnat, are aquatic, at least for the earlier days of their life. Generally speaking, adult I.s are short-lived and die within a twelvemonth; the adult Ephemerid (may-fly), as its name implies, does not live beyond 24 hrs, but the queen bee flourishes for some years, and a queen ant will occasionally last for 13 hrs. The food of insects is very various. Some take the pollen and nectar from the flowers; others feed on weaker species of their own kind; others act as internal or external parasites of higher animals; others again grow fat on putrescent matter, and yet another section sucks juices secreted by living organisms. Parents will often gather a store to feed their young, even though they themselves die before the larvae are hatched. A number of I.s are able to convey information or make love by means of sound. This may be produced by the rubbing together of the rough surfaces of the outer cuticle, or by the buzzing vibrations of the leaf-like appendages near the stigmata of the air-tubes, or by the quick flutter of their wings. Thus grasshoppers scrape their legs against their wing ribs and male crickets chirp by rubbing their wing-cases together. Many Hymenoptera produce their noise by the second means, whilst the whirring sound of bees and flies is due to wing motion. The death's head moth emits a noise by blowing air out of its mouth. Sometimes the noise is purely automatic. If left unchecked I.s would multiply with an alarming rapidity. Fortunately, however, the difficulty of obtaining food, inclement weather, and the predilection which birds, ant-eaters, frogs, and fishes show for them as food, counteract their amazing fecundity. As with higher animals, so certain I.s are naturally protected by having an outward appearance which exactly counterfeits their actual surroundings. This is the case with moss- and leaf-I.s and with humming-bird moths. Other I.s are saved from molestation by disgusting fluid discharges, an unpleasant smell, a hard skin, or an offensive weapon like a sting. The social species, ants, bees, termites, and wasps, offer a most instructive and fascinating field for study by reason of their 'intelligence,' architectural skill, and developed communal life.

**Economic value.** Unconsciously, *I.s* play a great part in the cross-fertilisation of flowers as they carry pollen from one bloom to another. The 'myrmecophilous' (ant-loving) plants are actually guarded by ants from other and hostile intruders. Man owes a debt of gratitude to the hive-bee for its honey and wax, to the silk moth for its silk, and to the cochineal *I.* for a dye. But there are many species which seem purely harmful and destructive. Cattle, sheep, and horses are annoyed and attacked by the bot-fly; crops, orchards, and vines are a prey to a whole army of greedy parasitic *I.s*, and the havoc caused by a locust swarm is often immense. House-flies and fleas have been proved to be the agents which carry pathological or disease-bearing germs in a number of infectious outbreaks; the mosquito is responsible for malaria, yellow fever, and the horrible disease called *Elephantiasis arabum*, and the bite of the tsetse-fly is often fatal; lice transmit typhus, and rat fleas carry bubonic plague. It is unnecessary to enlarge on the local irritations produced by lice, fleas, and gnats. See also ENTOMOLOGY and under individual *I.s*.

Pickwell, *World of Insects*, 1939; E. W. Teale, *Near Horizons*, 1947; G. H. Stovin (ed.) and W. Stokoe (compiled), *The Caterpillars of British Moths*, 1949.

**Insect Bites and Stings.** The greatest danger from insect bites and stings lies in the disease-producing organisms that the insect may carry. In this way mosquitoes carry malaria; fleas, plague; lice, typhus fever; and so on. The biting insects which directly give most trouble to man are gnats, mosquitoes, fleas, lice, and bed-bugs. With their piercing mouth parts these insects puncture the skin and then suck blood through the proboscis. Gnats and mosquitoes pour a little saliva into the wound, so irritating it and promoting the flow of blood to the surface. Breeding of gnats and mosquitoes may be reduced by drainage of marshy places and standing water. Fish and aquatic insects that will eat the larvae should be kept in

standing water that is needed for any purpose. Strong essential oils such as oils of lavender and eucalyptus will keep away gnats, mosquitoes, and fleas. Bites should not be rubbed; irritation may be allayed by bathing with a cooling lotion and the application of ammonia. If the wound becomes septic hot fomentations should be applied. To drive away fleas, clothes and even the body may be dusted with fresh pyrethrum powder. The modern insecticides (q.v.) such as D.D.T. are also very effective. Dogs should be frequently washed with a good disinfectant dog soap. Bugs may be exterminated by fumigation with sulphur. In Great Britain the chief stinging insects are bees, wasps, occasional hornets, and ants. If the sting remains in the flesh, it should be flicked off with a quick lateral movement of the finger nail and ammonia or sodium bicarbonate solution applied. Pressing on, or rubbing, the wound is to be avoided so forcing the poison quickly into circulation. The wound should not be sucked because the poison may affect the mouth. Some insects are covered with stinging hairs. The larva of the Brown-tail moth has barbed hollow hairs containing a fluid which in contact with the skin sets up a rash resembling eczema. The hairs may be blown by the wind to clothing and cause great discomfort. An alkaline lotion containing menthol, zinc oxide, and a disinfectant gives relief.

**Insect Powder**, see INSECT BITES AND STINGS.

**Insecticides** are indispensable to all farmers and horticulturists. They are of 2 main types—stomach and contact *I.* Stomach *I.* are ingested by the insects along with the plant tissue and enter the system via the stomach. Where insects such as aphides feed by sucking the plant juices an insecticide may be used which is absorbed by the plant and remains active for some time. 'Schradan' is an example but is very poisonous and care must be exercised in its use. Contact *I.*, as their name suggests, poison insects on contact. The best-known substances of this type are nicotine, pyrethrum, derris, D.D.T., and products containing B.H.C. (benzene-hexachloride). They may be used as dusts or liquid sprays. The last two are particularly useful in controlling the external parasites of farm live-stock as they are not poisonous to the animals themselves. New *I.* are continually being discovered and tested. 'Aldrin' controls wireworms, organic phosphorus compounds such as Parathion control aphides, and D.N.C. (dinitro-ortho-cresol) is useful as a winter wash for fruit trees. Older materials such as Paris green still find limited use but are being replaced by the newer products.

**Insectivora** (Lat., 'insect-eating'), order of placental, non-volant mammals. They are small, and derive their name from their common food. All have teeth peculiarly well adapted for eating insects, with tiny conical tubercles on the top of the molar teeth. Many have a full complement of teeth—incisors, canines,

premolars, molars, and even temporary milk molars. The actual number varies with different families, but 44 is an average total. I. put the greater parts of their soles on the ground when they walk and are therefore said to have 'plantigrade' feet; there are 5 toes, each one armed with a claw. They occupy an exceedingly low place in the scale of mammalian development; many zoologists, indeed, regard them as being more or less representative of the primitive mammalian stock. In habit the I. are, generally speaking, both terrestrial and nocturnal; a few, however, like the Potamogetons, are aquatic, and others, like the tree shrews or tupaias of India and the Malay Peninsula, are arboreal. Quite a number, as, e.g., the large group of moles, or *Talpidae*, burrow in the ground. Many fossil I. have been discovered, especially in the Tertiary strata, and more than 200 living species are known. Members of this order multiply with astonishing rapidity: the hedgehog may have a litter of 8, whilst that of the tenrec sometimes numbers over 20. Their muscular system is well developed; their skin is thin, and shrews and other species are provided with scent-glands at the sides of their bodies. Australia and S. America are the only large areas of the globe where there are no I.; in all other tropical and temperate zones there are many representatives.

**Insectivorous Plants.** One of the most important of the essential elements of plant food is nitrogen. Usually it is obtained from the nitrates of the soil; parasites receive it from the bodies of their host-plants; leguminous plants living in symbiotic relationship with bacteria probably exchange some of their carbon for the nitrogenous compounds of the bacteria. I. P., however, adopt the simple expedient of entrapping tiny animals and absorbing their nutritious juices. A well-known S. Amer. example is *Dionaea muscipula*, or Venus' fly-trap. The leaf-blade forms a round flat disk edged with teeth near the apex, and each half is capable of moving inwards from the midrib. Should an insect alight on one of the sensitive hairs, the leaf-blades curl upwards enclosing the creature, and soon absorb the nitrogen it contains. The mechanism of *Drosera rotundifolia* (see *DROSERAS*), the sundew common to Brit. moors, is very similar to that of Venus' fly-trap, but it attracts its prey by means of a sticky, glistening, dew-like mucilage (hence the name 'sundew'). Another common Brit. plant of like habit is *Pinguicula vulgaris*, the butter-wort, a pretty herb with a rosette of pale green leaves growing close to the ground and a flower somewhat resembling a wild pansy. *Utricularia vulgaris*, the bladderwort, is an aquatic insectivorous plant, which produces bladder-shaped traps; the insect enters the bladder readily by means of a valve opening inwards, but it is unable to return, and after its death its decomposed elements are absorbed by the cells which line the bladder. Many I. P., such as those previously mentioned,

and also the N. American pitcher plants (*Nepenthes* and *Sarracenia*), produce an actual digestive juice. These plants would be better described as carnivorous, since the bladderwort, for instance, feeds on small aquatic crustaceans as well as insects; Charles Darwin showed that the sundew would use boiled white of egg and similar material. See L. Lloyd, *Carnivorous Plants*, 1942.

**Insel-Verlag**, Ger. publishing house, founded by Anton Kippenberg (d. 1950) in Leipzig, 1902, for the pub. of the review *Die Insel*. The firm became later a sponsor of good typography and quality book production in Germany, and specialised in popular eds. of Ger. classics and contemporary literature. After the destruction of the firm in the Second World War, a branch was opened in Wiesbaden, which now exists independently beside the rebuilt house in Leipzig.

**Inselberg** (Ger. 'is. mount'), name given to certain steep-sided hills rising abruptly from an otherwise level landscape. Is form features of certain African landscapes particularly in Mozambique, central Tanganyika, and parts of S. Africa. They are almost invariably made of granite. Their origin is still debated but it is agreed that an I. landscape may form when a mature land surface carved out of granitic and gneissose rocks is exposed to a certain sequence of tropical climates.

**Insemination, Artificial**, fertilisation of an egg by spermatozoa (semen) reaching it through some artificial agency, i.e. not by normal transference of the sperm from the male animal during mating of male and female individuals. Its most usual application is in mammals, where the earliest recorded experiments are those of Spallanzani (1780), who succeeded in fertilising dogs by sperm introduced artificially into the vagina. Artificial I. is now employed in the rearing of farm animals, especially cattle. There are several centres in Great Britain from which skilled inseminators collect the semen from high-grade bulls and inseminate cows on surrounding farms, thus saving many farmers the expense of keeping a bull. It has now been discovered that semen can be stored almost indefinitely by a deep-freeze technique and this makes it possible to use only the semen from those bulls which have been proved to be outstanding. Artificial I. sometimes establishes pregnancy in humans when normal coitus fails through some defect in the reproductive organs. There can be no legal objection to its employment when the sperm is provided by the husband (A.I.H.), but artificial I. by some outside donor (A.I.D.) is condemned as adultery by the Church (though in Jan. 1958 the Court of Session held that it was not so in law), besides raising such problems as who is the legal father of the child, or indeed whether the child is legitimate. Nevertheless A.I.D. is carried out regularly in at least one London clinic. See Barton, Walker, and Wiesner, *British Medical Journal*, p. 40, 13 Jan. 1945, and

E. J. Perry (ed.), *The Artificial Insemination of Farm Animals*, 1947.

**In-Shan Mountains**, range in Mongolia, on the N. side of the Hwangho. They rise to an altitude of from 5000 to 8000 ft, and are a part of the extensive Khingan mt-chains or tablelands of E. Asia, separating Mongolia from Manchuria.

**Insolation**, see SUNSTROKE.

**Insolvency** denotes inability to pay one's debts. The term, so far as Eng. law is concerned, is for most practical purposes replaced by the term 'bankruptcy' (see BANKRUPTCY, and on the old distinction between I. and bankruptcy). In Scots law bankruptcy is hardly a term of art, except in the phrase *notour bankruptcy*, which implies a condition of I. attended with certain statutory effects restricting the insolvent's power of dealing with his property; but it is also commonly used in connection with the public bankruptcy process of sequestration or *cessio*, under which an insolvent yields (*cessere*) his property up to his creditors. Taken in this latter sense the term does not differ essentially from the state of a debtor who has been *adjudicated* a bankrupt under Eng. law. The importance in Scots law of the condition of I., as distinct from bankruptcy which has become public, is that it has certain special effects on the debtor's power of granting alienations. The most important general effect of I. is that it is a stop in the direction of *notour* bankruptcy, it being a necessary condition of obtaining a *cessio honorum*. The special effects of I. above alluded to are that the insolvent is restrained from depleting an estate or fund insufficient to meet all claims by voluntary or gratuitous alienations, or by alienations made for an inadequate consideration or by fraudulent preferences of one creditor over others. The only courses open to an insolvent, failing his inability to regain his solvency, are to go through with his public adjudication of bankruptcy or sequestration, or to try to provide some voluntary or extrajudicial arrangement of a more or less private character.

**Insomnia**, see SLEEPLESSNESS.

**Inspectors, Factory**, see FACTORY LEGISLATION.

**Inspiration** (see also BIBLE) (Lat. *inspiratio*, *inspirare*, to breathe into), term used in theology to denote that Divine influence on the writers of the Bible by means of which their writings became a Divine revelation. All orthodox theologians are agreed in regarding the Holy Scriptures as the revelation of God in some sense, but there is much difference of opinion as to the method and extent of the Divine I. The dogmatic formula to be traced through various councils and writers from a very early date. *Deus est auctor librorum sacrae scripturae*, was explained in some detail by the Vatican Council, which pronounced that the Scriptural writings are held as sacred and canonical by the Church, 'not because after being composed by merely human industry they were then approved by her authority, not simply because they

contain Revelation without any error, but because, being written under the inspiration of the Holy Ghost, they have God for their Author.' The doctrine of *Verbal I.* was held for cents. by Protestants in a very mechanical and oracular form (see FUNDAMENTALISM). A more dynamic view of I. in various forms is now held by Protestants as well as by Rom. Catholics. The writers did not lose their own individuality, but were so under the influence of the Spirit of God that they could make no error in transmitting to mankind the truths which they were intended to convey. The theory of dynamic I. finds ample support in the Fathers. 'The Gospel,' says St Jerome, 'is not in

God, but yet a man—*inspiratus à Deo sed tamen homo*.' A theory widely held outside the Rom. Catholic Church is that of *Essential I.* which holds that the I. of Scripture relates only to faith and morals. See B. F. Westcott, *General Survey of the History of the Canon of the New Testament*, 1896; W. Sanday, *Inspiration*, 1896; J. Hastings, *Dictionary of the Bible*, 1898; C. H. Dodd, *The Authority of the Bible*, 1928; D. Davidson, *Hidden Truth*, 1934; R. H. Malden, *The Inspiration of the Bible*, 1935; Pius XII, *Divino Afflante Spiritu*, 1944; article, 'Inspiration and Inerrancy,' in *A Catholic Community on Holy Scripture*, 1953.

**Insterburg** (since 1946 Chernyakhovsk), tn in the Kaliningrad Oblast of the Russian Federal Rep. (former E. Prussia), 57 m. E. of Königsberg. It has some industry and is an important railway junction. Founded in 1337 by Teutonic knights as a castle, it has been a tn since 1583. Pop. (1939) 49,000.

**Instinct**. Everyone may be said to understand in a general way what is meant by I., despite the difficulty of formulating any satisfactory definition. Darwin himself, in his examination of the various distinct uses of the term, refrained from any attempt at definition. I. is may, however, be tentatively defined as those congenital or natural behaviour dispositions which impel an animal under given circumstances to act in a certain way without experience, and frequently without a knowledge of the object with which the action is done. Scientific psychologists have rather naturally been greatly concerned with the origin of I. and the problems surrounding it. See also BEHAVIOURISM; EVOLUTION; HABIT. For the mass of evidence accumulated on the character or manifestations of I. see C. Darwin, *Origin of Species*, 1859, and *Descent of Man*, 1871; G. J. Romanos, *Mental Evolution in Animals*, 1883; C. Lloyd Morgan, *Habit and Instinct*, 1896; A. Weismann, *Essays upon Heredity and Kindred Subjects*, 1889; S. Alexander, *Art and Instinct*, 1927; D. Katz, *Animals and Men*, 1937; K. Z. Lorenz, *King Solomon's Ring*, 1952.

**Institut de France**, estab. in 1795, is composed of the following 5 academies:

Académie Française, founded 1635 by Louis XIII; Académie des Inscriptions et Belles-Lettres, founded 1663 by Louis XIV; Académie des Sciences, founded 1666 by Louis XIV; Académie des Beaux Arts, founded 1803; and Académie des Sciences Morales et Politiques, founded 1832. Each academy has a separate organisation but participates in the advantages of the common library, archives, and funds. Election to membership is by ballot and subject to confirmation by gov. Every member receives a salary. Membership of the Académie Française is limited to Frenchmen—popularly known as the 'Immortals.'

**Institut Français**, educational centre in London, its object being to promote a knowledge of France among Eng. people—just as the purpose of the Brit. Council is to promote a knowledge of Brit. culture among foreigners. Its offices are in Queensbury Place, London, S.W.7.

**Institut Pasteur**, see PASTEUR, LOUIS.

**Institute**, in Scots law, the person in a deed of settlement or other instrument by which lands are granted (see GRANT) who takes the first or earliest estate (q.v.) or interest. Those who follow the I. are called the heirs or substitutes. If the I. dies before the disposer or grantor, the first substitute or heir takes without a service (process in Chancery for completing the title of an heir). Conditions annexed to the grant will only affect the substitutes, unless the grantor has made it clear that the I. is also to be bound. See Bell, *Dictionary*, and Erskine's *Principles of Scots Law*.

**Institute of Economic Affairs**, charitable trust formed in 1936 to teach the principles of economic science as formulated by the Eng. classical economists, Adam Smith, David Ricardo, Walter Bagehot, John Stuart Mill, and others, and later developed and applied by Alfred Marshall, and in modern times by F. A. Hayek, John Jewkes, L. von Mises, F. W. Paish, Sir Arnold Plant, Lionel Robbins, George Schwartz, and other economists of the liberal school.

The Institute was started with the guidance of an advisory council consisting of Colin Clark, Sir Oscar Hobson, Lord Grantchester, Prof. E. J. Nash, and George Schwartz. The founders of the Institute believed that if the Brit. people had possessed a better understanding of the essentials of economic science, much legislation inimical to individual effort and initiative would not have reached the Statute Book, and the persistent inflation after the Second World War would not have been allowed to develop. They believed that the social and economic upheavals which threatened the community could be avoided if the younger generation were taught the essentials of economic principles and understood the moral foundations governing the acquisition and use of property, the right of the individual to free access to competitive markets, and the need for a stable monetary system. They wanted to demonstrate the dangers of over-taxation, of

restrictive practices by capital and labour, and of the growing interference of the State with individual liberty in economic affairs.

The Institute set out to publish papers and pamphlets for distribution to schools and univs., especially to study groups in the social sciences formed among sixth form students, and to distribute articles on current economic questions to newspapers and periodicals, and to supply lecturers. It has pub. studies of sterling convertibility, pensions, hire purchase, advertising, and the earnings of the City. The work of the Institute was assisted by the pub. of R. L. Heilbroner's *The Great Economists*, 1955, and Lionel Robbins's *The Theory of Economic Policy in English Classical Political Economy*, 1952. The General Director of the Institute is Ralph Harris. See CLASSICAL ECONOMISTS and INDIVIDUALISM.

**Institute of International Affairs**, see ROYAL.

**Institute of Recorded Sound**, see RECORDED SOUND, BRITISH INSTITUTE OF.

**Institute of Sanitary Engineers**, see PUBLIC HEALTH.

**Institutes**, term formerly used to denote text-books containing the fundamental principles of a legal system. The study of Rom. law was based on the I. of Gaius which inspired the I. of Justinian. The latter, which incorporated changes in Rom. law subsequent to Gaius, were expressly pub. to promote the study of legal principles. Coke, the 17th-cent. Eng. judge, described his 4 vols. of *Commentaries upon the Common Law* as 1., although this term could be more appropriately applied to the later commentaries of Blackstone and Stephen written respectively in the 18th and 19th cents. with more logical arrangement and comprehensive exposition than Coke's I. John Erskine of Carnoch, prof. of law, wrote *Institutes of the Law of Scotland* in the 18th cent.; this was for long the leading text-book on Scots law and is even now often cited.

**Institution**, one of the necessary steps in the appointment of a rector or vicar. It is a kind of investiture with the spiritual part of the benefice, the care of the souls of the par. I. fills the vacant benefice and induction (q.v.) follows. See Phillimore, *Ecclesiastical Law*, 1845.

**Instrument of Government**, document which prescribed the powers of Oliver Cromwell when he accepted the office of Protector of the Commonwealth of England (16 Dec. 1653). Though a failure, it contains a number of interesting constitutional innovations, especially in regard to parl. representation. It provided for triennial parliaments, to be in session for not less than 5 months, with 400 members for England and 30 each for Scotland and Ireland; an army of 30,000 men; limited freedom of religion; and for an elective Protector. The parliament of Sept. 1656 drew up the Humble Petition and Advice which replaced the I. of G.

**Instrumentation**, see ORCHESTRA.

**Instruments, Electrical**, see ELECTRIC METERS.

**Insures**, Gallic tribe who crossed the Alps, and were estab. in Cisalpine Gaul by the latter half of the 5th cent. BC. Shortly before the First Punic War the Romans reduced them to submission, but they regained their liberties after Hannibal's triumphant progress through Italy. In 196 BC they finally lost their independence.

**Insula**, see LILLE.

**Insulating Materials**, electrical, substances which do not conduct electricity and are used for covering as separating conductors carrying current or exposed to high-voltage charge. Solid I. M. are natural minerals such as mica, asbestos, slate, marble, quartz, sulphur, or ceramics and glass; textiles, leather, wood, paper, fibres, plastics, rubber, ebonite. Liquids are mineral oil, paints, and varnishes. Gases are mostly insulating under normal pressure and temp. and in the absence of radiations.

**Insulator**, specially shaped body, usually of ceramics or glass, fixed on transmission line poles for carrying the conductors. Pin-type I.s vary in shape from the single bell used on telecommunication lines to the multiple-bell type used on medium-voltage power lines. They are fixed upright on the pole arm by a bolt up the middle of the I. body. Suspension-type I.s consist of a chain of disks, each with cup-shaped top, connected together by steel bolts cemented into the disk and fitting into a steel grip in the cup of the next lower I. The chain hangs from the pylon arm and the lowest I. carries the conductor. The higher the voltage, the greater is the number of disks in the chain. The 132 Kw. lines of the Brit. Grid carry chains of 10 I.s. The word I. is sometimes used for any substance not a conductor. See INSULATING MATERIALS.

**Insulin** is the active substance in the secretion of isolated groups of pancreatic cells forming the 'islets of Langerhans.' In the absence of this secretion, excess of sugar passes into the blood and causes *Diabetes mellitus*. I. is essential for the correct metabolism of carbohydrates and fats. It stimulates the oxidative breakdown of glucose, stimulates the synthesis of muscle and liver glycogen from glucose, and inhibits the breakdown of liver glycogen. In 1921, Dr R. L. Mackenzie Wallis claimed to have isolated this active substance from the pancreas of freshly killed pigs, and administered it in capsules to diabetic patients. In the same year, Dr F. G. Banting (q.v.) assisted by Best, at Toronto, isolated and named the active constituent I., and Collip (1922) purified the crude product. For medical purposes I. is now prepared from the pancreas of oxen, and is found to be beneficial only when injected. Abel (1925-8) isolated crystalline I. and determined its properties, and more recently Sjögren at Uppsala has determined its molecular weight to be approximately 35,000, and the shape of its molecule spherical. From these results, and the determination of other physical constants, he concludes that I. is a protein

belonging to the same group as egg albumin and Bence Jones protein. As yet it has not been possible to produce I. synthetically. In solution crystalline I. is stable provided the pH (hydrogen-ion concentration, q.v.) ranges from 4.5 to 7. Beyond this range it dissociates into substances of lower molecular constitution, but near the borders of the range of stability, the reaction is reversible. If the solution be too acid or too alkaline permanent dissociation will occur. For this reason I. cannot be given by mouth. I. is

*Topical Press*

DR F. G. BANTING

used in courses of hypo-glycaemic shock therapy in the treatment of mental disorders. See also DIABETES and INSANITY.

**Insurance**, contract under which one party undertakes for a consideration to indemnify another against certain forms of loss. In the present day the practice of I. has become so general that practically every contingency which may arise as the result of accident may be covered, but the earliest and most widely practised forms of I. are 'Marine,' which applies to ships and property at sea; 'Fire,' which is the I. against fire of property on land; and 'Life.' This last differs from other I.s in that, although a contract to indemnify against loss by premature death, at the same time it provides a certain benefit. For this reason life business is sometimes referred to as 'assurance,' as distinct from 'insurance,' but there is no rule for this, and the terms 'insurance' and 'assurance' are synonymous in the profession.

**MARINE INSURANCE.** The first I. business to be practised, and it is probable that for commercial purposes it originated in Flanders, being introduced into England

early in the 16th cent. Marine business differs in one notable respect from other I.s, in that, although it is done by a number of independent, self-contained companies, a large share is transacted by individuals known as underwriters. These underwriters are members of a society called Lloyd's, the name originating from a certain coffee-house in Abchurch Lane, where the original members met. Their affairs are arranged by a committee, and the subscribers include the companies who also transact the business. The society has agents throughout the world who keep in touch with the shipping at all the principal ports, and render an account of the same, together with particulars of any casualties which may have happened. An I. is divided amongst a group of underwriters, each holding a small proportion of the total amount at risk. Policies are issued to cover vessels, their freight and cargo, against all maritime risks, which include risks of navigation, fire and seizure, during a certain period, not exceeding 1 year, or for a specified voyage. The I. covers the ship or cargo, and includes the cost of the I. upon the whole. Policies may be 'time' policies or 'voyage' policies, as specified above, and are either valued, in which case the sum insured is based upon a specific bill of lading, or open, when the value of the vessel is estimated as at the date of sailing, plus the amount she would have earned on the completion of the voyage and the cargo at its invoice price. The settlement of marine losses is of particular interest, as the question of salvage following a loss sometimes presents considerable difficulty. It may happen that a vessel carrying a valuable cargo is sunk where it is possible to salvage a portion of the goods insured, and in such a case there are varying methods of effecting a settlement of the claim, and several courses open to adoption by the underwriters. For instance, they may pay the total loss and recover what they can of the salvage, themselves arranging with a firm to conduct the operations, or they may pay the insured's actual loss, after deducting the value of the goods salvaged, plus the expenses of the operations. The destructible nature of the goods insured is, of course, the principal factor, and the cost of the I. is largely affected by this. Demurrage charges and the principles governing them were revised in 1924 at a congress at Stockholm where a set of regulations arising out of the International General Average Rules of 1890 were re-drafted and adopted internationally. In 1924 the Carriage of Goods by Sea Act was passed, which adjusted many anomalies arising out of the legal questions involved in contracts of affreightment between shipowners and shippers.

**FIRE INSURANCE.** Contract of indemnity in respect of loss or damage to material property by fire. The policy-holder (termed the insured) pays a certain agreed amount (the premium) to the insurer, and is reimbursed his loss out of the fund accumulated by the insurer. Premiums are generally payable annually, and as a rule 15 days of grace are allowed for payment

of the amount due. Fire I. was first introduced into this country more than 200 years ago, but there is evidence of a type of fire I. at a much earlier date by means of levies on guilds, wards, etc. In the early days companies were formed for the sole purpose of transacting fire I. but at the present time most classes of I. are transacted by each. There are more than 100 Brit. companies underwriting fire I. in the U.K., and most of them have extended their activities overseas, where they have an excellent reputation. It is estimated that over 75 per cent of fire premiums paid to Brit. companies come from overseas, and of this amount more than half is from the U.S.A. The ordinary form of policy issued in respect of trade property covers damage by fire, lightning, explosion of coal gas (except on premises where gas is manuf. or stored), and domestic boilers. The private-house fire policy usually includes thunderbolt, subterranean fire, earthquake fires (not earthquake shock), and fires caused by rioters and strikers.

Practically any property that is capable of being damaged by fire can be insured, the premium charged being based on the hazard of the risk. For example, private houses, blocks of offices, and property of a like nature, where the risk of serious fire is slight, are termed non-hazardous, and rated accordingly, usually at about 1s. 6d. per cent. On the other hand, factories where inflammable goods are manuf., buildings of flimsy construction, or situated in a neighbourhood presenting more than usual fire risk, are deemed hazardous, and rated according to their merits. Companies endeavour to calculate the premium for any one class of trade so that over a period of years the income is sufficient to meet the losses and expenses and show a small percentage of profit. The profits of a fire I. company are usually about 5 per cent of the premium income.

To obtain data on which to calculate premiums, offices depend on their loss experience in past years. Because the scope of each office's experience is not sufficiently general for accurate results to be obtained, a number of companies now combine their analysed records for certain types of factories and shops, and charge similar rates, based on the results of their joint experience. The association formed by them is known as the Fire Offices Committee, and because of the efforts of this committee, premiums have been adjusted so that, as far as possible, each individual pays his equitable proportion to the I. fund. The members of this committee are called tariff companies, whilst those that remain distinct are known as non-tariff companies, and charge whatever premiums they think adequate, based on their own underwriting experience. In this latter group are included underwriters at Lloyds. By penalising bad features and allowing substantial reductions in premium for good, fire offices have effected tremendous improvements in methods of construction, lighting, heating, etc.

Many valuable lives are also saved every year through these improvements. The public is not generally aware of this branch of I. work, nor does it know of the time and money spent by the I. companies in testing and approving fire-extinguishing appliances, fire alarms, and building materials. Offices have surveyors and experts who may be consulted on such matters. Brit. fire brigades are now maintained by cos. and co.-bors.: in the past the duty was undertaken by the fire I. companies. Each office had its own firemen and appliances, and fixed a metal

and household effects are insured against fire, lightning, aircraft, burglary, storm, flood, and many other perils, and domestic servants I. is also included. The rate of premium is usually 5s. per cent. Comprehensive building policies include certain of these risks at a lower rate.

Another form of fire I. protection now being placed before traders and manufacturers is loss of profits or consequential loss I. The ordinary fire policy indemnifies the trader in respect of the material damage to his property, but this does not represent the full amount of his loss by a

THE SUN INSURANCE COMPANY FIRE BRIGADE IN 1820

From an old print, reproduced by permission of the company.

plaque or fire mark on every house it insured. It being the duty of a company's men only to extinguish fires in buildings insured by their employers, the brigade would remain as sightseers if the building that was afire did not bear their company's mark. (See FIRE BRIGADES AND FIRE FIGHTING.) Fire offices in London, Liverpool and Glasgow still maintain at their own expense salvage corps. Fire I. companies must, in accordance with the Assurance Companies Act, 1909, make a deposit of £20,000 in cash or approved securities with the Board of Trade before they can accept business in this country, unless they have already made a deposit in respect of some other class of I. business included in the Act. Their ann. accounts have to be lodged with the Board every year, and severe penalties are incurred if there be any breach of the Act.

Comprehensive or all-in policies in respect of private dwellings have in the past been brought out, and combine many forms of I. in 1 document. The furniture

fire. The loss of profits policy is designed to meet this need, and reimburses him for his lost profits and increased expenditure for a certain stated period (called the period of indemnity) from the date of the loss. The period of indemnity is arranged by the trader when effecting the policy, and represents his estimate of the time necessary to set the business on its feet after a fire. The usual period is for a minimum of 12 months and for industrial risks the period is normally considerably longer. The amount payable by the insurers is normally adjusted on the basis of the decrease in turnover during the period of indemnity, as compared with the similar period in the preceding year. The amount recoverable is a proportion of this decrease, and is usually the ratio of profit and standing charges to turnover as shown in the accounts for the last financial year. Expenditure on increase in cost of working is also recoverable. The I. is adjustable to suit all types of businesses. The rates are based on the fire

premiums paid for the contents of the premises. Percentages of fire loss, a form of loss of profits I., is suited only to the requirements of 1 or 2 trades. The policy pays a fixed proportion of the amount recoverable under the ordinary fire policy. In most cases the amount of material damage is no index of the resultant loss of profits, as a comparatively small fire may entirely stop the business until the damage is made good.

Sprinkler leakage I. is now offered, as many factories, shops, and public buildings are fitted with automatic sprinkler installations for extinguishing fires. The premiums usually depend on the class of goods and the number of sprinkler heads.

Average clauses, which make the policyholder bear a proportion of the loss should the property be under-insured at the time of the fire, are seldom met with in policies for private dwellings or small trade risks. It may be unwise to under-insure, for the total liability of the company is limited to the sum insured, and the policyholder cannot recover any amount in excess of that figure. The policy is normally a contract of indemnity, and the amount recoverable is the actual value of the articles destroyed at the time of the fire, i.e. the market value of similar articles less a reasonable amount for depreciation and wear and tear. It is possible, however, to insure buildings and/or machinery and plant on the basis of reinstatement, i.e. the cost of rebuilding or replacing such property by similar property when totally destroyed or, where it is damaged, the repair of the damage and the restoration of the damaged portion to a condition substantially the same as it was before the damage. No additional premium is asked for, it being essential to have a full cover to avoid the application of the average clause. The sentimental value of an article cannot be covered. Valuable pictures, books, and works of art are usually insured for an agreed amount, because of the difficulty of ascertaining their market value. I.s based on inventories made by licensed valuers are satisfactory to both insurer and insured, provided that frequent revaluations are carried out to meet changes in market value.

Policyholders should note that their fire I. company must be advised of any change in circumstances which may affect the I. Notice should be given if the policy is to apply to a new address or the benefit to be vested in another person; if any part of the premises becomes occupied for a purpose different from that in force when the policy was effected; if any additional or alternative method of lighting, heating, or ventilating the building is contemplated; or when any structural alterations are to be made. The I. company expect and require their policyholders always to act in good faith with them.

LIFE INSURANCE originally provided, as in the case of other forms of I., against a contingency, but it has long since been

extended to include a payment on a certain happening, such as death. The earliest life I. on record is dated 1583, when it is probable that I.s were granted to cover only short periods as a protection to creditors. The extension of the business was very gradual at first, but for the last cent. there has been such rapid growth that in 1870 the Life Assurance Companies Act was passed for the protection of policy-holders. In 1909 the business was further regulated by another Act. This provides that a company transacting life I. must deposit £20,000 with the Board of Trade, and must pub. ann. balance sheets and revenue accounts. It is also laid down that there shall be periodic valuations, not less frequently than quinquennially, of the assets and liabilities of each company. The 1909 Act further governs the procedure to be adopted when amalgamation of companies is contemplated, and the rights and privileges of shareholders and policy-holders are definitely established. The 2 main kinds of company are the proprietary and the mutual. With the former, there are shareholders who take a certain percentage of the profits as dividends, but with a mutual company all profits belong to the policy-holders. Two distinct branches of life I. are known as 'industrial' (see INDUSTRIAL INSURANCE) and 'ordinary,' but many companies transact only the latter type. In the industrial branch, policies are issued for much smaller sums, and premiums are collected by agents of the company either weekly or monthly. In the ordinary class policies are rarely issued for less than £100, and notices are issued for the collection of the premiums which are due yearly, half-yearly, or quarterly, except under a special scheme whereby an automatic system of monthly premiums is arranged. There is now a wide variety of classes of policy to choose from, but there are 2 main headings—namely, with and without profit. Policies under the former carry the right to share in the profits of the company, and this benefit is usually given in the form of a bonus added periodically to the sum assured, although it can, if preferred, probably be taken in cash. No such right accrues in the case of without profit policies, the premiums for which are therefore smaller. A life policy in its original form merely provided the sum assured at death, possibly within a certain time. This would now be called a term policy. It has been followed by the whole life policy, securing the sum assured at death whenever it may occur, up to which time the premiums are payable each year.

An equally important class of policy is the endowment assurance, securing payment at the end of a fixed term or in the event of previous death. With any class of policy it is possible by paying a higher rate of premium, to limit the number of payments to a maximum, and this is frequently done in the case of whole life contracts, in order to prevent having to continue premiums throughout a long life. A modern addition in life I. is an ann. benefit in the form of a temporary annuity,

payable should the life assured die within a certain time from the date of the policy. This is a 'family income' policy, intended to give extra financial assistance before the assured has had time to make adequate provision otherwise. It is not necessary for any policy to be effected on one life alone. The amount required can be made payable on the first or other death of two or more persons, or on the death of one person before another. Such contracts have their uses for business or financial transactions.

The premium for whatever policy is selected depends upon the age at entry into I., and it is usual to quote for the age next birthday. The calculation of premiums is a highly technical work, which devolves on the actuaries of the I. companies. They rely upon various statistics in the form of mortality tables. As each premium is paid, a certain amount is absorbed in expenses, and of the balance, part goes to cover the current risk, while the remainder is held as a reserve to the credit of the policy-holder against the time when the claim will arise. Thus when a policy has been in force for sev. years, it begins to be of value, and if the I. is no longer required, it can be surrendered to the company for cash. Alternatively, the company may be willing to lend on the security of the surrender value of the policy. It may also be possible to cease paying premiums and convert the policy into a fully paid one securing a reduced sum assured.

The rates of premium quoted by any company are for normal healthy lives, and evidence of good health must be furnished by each proposer for I. At one time it was necessary in all cases to submit to medical examination by a doctor nominated by the company, but within certain limits as to age and amount of policy, it is now possible to effect an I. without examination. A person may insure his own life for whatever sum he pleases, but he can insure the life of another only if he has an insurable interest therein. In all cases a proposal form has to be completed, and any fraudulent statement thereon would void the contract. Questions as to family hist. and previous illnesses are asked, and if the answers or the result of the medical examination are unsatisfactory in any way, a higher premium than that tabulated may be charged, or the I. refused altogether. At one time life policies contained many restrictions as to occupation, foreign residence, or travel, but few limitations are to-day imposed. The main exclusion is that of suicide for a fixed period from the effecting of the I. The period varies according to the company chosen, but it is generally about a year. It is usual, also, to exclude certain special risks, such as motor racing, flying accidents for those engaged in aviation, active service in time of war, tropical climates when the assured is at the date of the policy known to be proceeding thither, and so on. But many special hazards may be covered by the payment of an extra premium, and for some particular occupations and climates

an extra premium is always required. Life I. has been recognised as an essential provision, and the premiums have been made, within limits, eligible for rebate of income tax. Although formerly the full standard rate of tax was allowed in this respect, the provision has been amended so that now relief can be claimed only at a reduced rate. This is, however, still a valuable privilege which substantially cheapens the cost of life I.

**ACCIDENT INSURANCE.** The earliest form of accident I. was fidelity guarantee which was transacted on a small scale in 1840 and was soon followed by personal accident I. The scope of accident I. has extended gradually to cover a wide range of contingencies, and it is now regarded as catering for all types of I. for which provision is not made by the marine, fire, and life depts. The prin. classes are personal accident, employers' liability, motor, burglary, all risks, fidelity guarantee, public liability, live-stock, plate glass, and engineering I.

*Personal accident insurance* provides for the payment of compensation on a fixed scale in the event of death or injury by accident or incapacity by sickness. A personal accident policy is not a contract of indemnity, but where disablement benefit is covered, it is usual to make such benefits approximate as far as possible to the policy-holder's actual loss of earnings. Policies can be obtained to cover:

- (a) Accidents only.
- (b) Accidents and specified diseases.
- (c) Accidents and all sickness.

Rates of premiums are based primarily on the occupation of the person to be insured. A recent development has been the introduction of group schemes under which the employees of a firm can be insured collectively under a single policy. Such schemes can be arranged to provide for a fixed payment in the event of temporary total disablement or the benefit can be the difference between the full wages and the amount drawn under the National I. scheme. A few companies issue permanent sickness and accident policies under which the insured has the right to automatic renewal until he reaches a specified age. The policy cannot be cancelled unless the insured fails to pay the renewal premium. A medical examination is necessary for this form of contract.

*Employers' liability.* This title has come into general use since Workmen's Compensation was merged in the National I. scheme on 5 July 1948. Cover is provided to employers in respect of claims by employees or their dependents for death, injury, or disease arising out of and in the course of the employment. Employees must be under a contract of service or apprenticeship with the insured. It does not apply to sub-contractors or the employees of sub-contractors. The Law Reform (Personal Injuries) Act, 1948, which came into force on 5 July 1948, abolished the doctrine of common employment by which an employer could escape liability for claims at common law

if the injuries were caused by fellow workmen. This Act, together with the fact that an employee can make a common law claim as well as draw benefit under the National I. (Industrial Injuries) scheme, has been responsible for a considerable increase in the number of common law claims. It is also possible to make a common law claim where the injury is caused by a breach of the Factories Act, 1937. Such claims come within the scope of the employers' liability I. policy. Premiums are based on the total wages paid by the employer during the year, and a rate per cent is charged on those wages according to the trade or business.

*Motor insurance* is responsible for a substantial part of the premium income for accident I. In the U.K. and many other countries it is compulsory to have third party I. before using a motor vehicle on the road. In this country the compulsory cover is limited to liability for death of or bodily injury to third parties and was brought into force by the Road Traffic Act, 1930. It is not compulsory to insure against damage to property but in practice nearly all third party policies issued in respect of motor vehicles are in a standard form which covers both personal injury and damage to property. It should be noted that to comply with the Road Traffic Act, 1930, the motor I. policy has no limit to the amount which may be payable in respect of the death of or bodily injury to third parties. An important development in connection with compulsory motor I. was the formation on 1 July 1946 of the Motor Insurers' Bureau because there were still circumstances in which third parties injured in motor accidents were unable to recover damages to which they were entitled. The bureau ensures that each insurer will accept responsibility for dealing with claims although the insurer may for a good reason be entitled to repudiate liability under the policy. The bureau itself deals with those claims where there is no insurer and pays such claims from a fund obtained by levies on the insurers who are its members.

To keep pace with industrial development, motor I. has been subject to frequent changes in practice. There are many different kinds of motor vehicles in use and insurers have the following main divs. for the easier handling of the business:

(1) *Private type cars.* These are divided into 3 classes for rating purposes according to the extent of use. There is then further classification according to h.p., value, and the dist. in which the car is garaged.

(2) *Commercial motor vehicles.* The goods carrying type of commercial vehicle is rated according to carrying capacity, trade, and the dist. in which the vehicle is used. Premiums for other commercial vehicles, such as mobile cranes, excavators, bulldozers, and similar mechanically propelled plant depend on the purposes for which the vehicle is being used.

(3) *Agricultural and forestry vehicles.*

(4) *Motor trade vehicles.*

(5) *Motor cycles.* These are rated according to cubic capacity of engine and the dist. in which garaged.

All vehicles can be insured under any one of the following types of policy:

(a) *Comprehensive.* This gives the widest cover obtainable including loss of or damage to the insured vehicle and liability for accidental personal injury to or accidental damage to the property of third parties. Under private type car policies, passenger liability is automatically included together with other items such as personal accident benefits, medical expenses, and rugs, coats, or luggage.

(b) *Third party only.* This is for liability for accidental personal injury to or accidental damage to property of third parties. The indemnity is unlimited in amount except under commercial vehicle policies where the liability for damage to property is limited to £10,000 for any one accident.

(c) *Third party fire and theft.* This is the cover as provided under (b) with the addition of cover for loss of or damage to the vehicle by fire or theft.

(d) *'Act' liability only.* This is restricted to third party cover for personal injury claims as required by the Road Traffic Act, 1930-4.

*Burglary insurance* is mainly concerned with indemnity for loss or damage caused by breaches of the criminal law. The basic form of policy restricts cover to theft following violent or forcible entry into the premises but in many cases it is possible by paying more premium to insure against larceny or accidental loss. Separate burglary policies on the contents of private houses are falling in number as the tendency is to take out a combined policy issued by the fire dept to cover fire, burglary, public liability, and various miscellaneous risks. Since 1946 the increase in crime has caused a considerable expansion in the number of policies issued for business premises. Rating depends on the nature of the stock and the area in which the premises are situated. A recent development has been the issue of policies to cover loss of profits following burglary and housebreaking. All risks policies can be obtained covering gold and silver articles, jewellery, furs, and other valuable items against accidental loss or damage as well as theft. Rates are high and a valuation is usually required. The I. of cash in transit is also dealt with in the burglary section. Such policies have been subject to considerable revision during the past few years and they can now include loss of money on the insured's premises as well as in transit. Miscellaneous classes of business dealt with in the burglary section are goods in transit I., cycle policies, golfers' policies, and baggage policies for travellers.

*Plate glass insurance* policies cover glass against breakage from any cause except fire, explosion, and war. All types of glass can be covered. For business

premises, the premium is calculated according to the area of the glass to be insured. For special glass such as stained-glass windows, the premium is a percentage of the value. For private houses, the premium can be charged either on rental or on the value of the house or contents.

*Fidelity guarantee insurance* provides protection in respect of the default of an individual whether he be an employee or an official acting in some special capacity such as a receiver, administrator, or trustee. Premiums are usually charged at a rate per cent on the amount to be guaranteed. Commercial fidelity guarantees are required by employers to protect them against loss of money as a result of the dishonesty of their employees in the course of their official duties. A policy can be arranged for an individual employee or a collective guarantee may be obtained covering a number of employees with a separate amount guaranteed in respect of each. Under another form of policy a floating guarantee is available in which the names of the various employees to be bonded appear but with one amount of guarantee over the whole. Court bonds are those issued in respect of those persons who are required to give security as a condition of their appointment by the Court to carry out official duties, e.g. administrators, receivers, and managers. Gov. bonds are issued where security has to be furnished by trustees in bankruptcy, liquidators appointed by the Board of Trade and persons or firms responsible to H.M. Customs and Excise for the payment of duties. Local gov. guarantees are issued in respect of employees in the service of urban dist., rural and par. councils, co. councils, and municipal corporations.

*Public liability insurance* provides an indemnity in respect of the legal liability of the insured for accidental personal injury to and damage to the property of members of the public caused by the negligence of the insured or of the insured's employees in the course of the insured's business or by defects in the premises, ways, works, machinery, or plant. In recent years substantial damages have been awarded to third parties, and this factor has been responsible for a considerable expansion in this class of I. Wide cover has also become available. Frequent review of this form of I. is necessary owing to law reform and legal decisions by the courts.

A general type of policy is used for offices, shops, warehouses, and manufacturing premises. Where the only liability to be covered is that arising from defects in the premises, a special property-owners' liability policy is issued. The oldest type of public liability I. is that of horse-drawn vehicles, but such policies are disappearing with the horses. Builders and contractors can have policies covering specified contracts but the general practice is to insure all work done during the period of I. and to pay premium according to the wages paid during that period. A special class of public liability insurance is that for professional indemnities. These protect

the policyholder against claims by the public arising out of professional negligence and are issued to accountants, architects and surveyors, chemists, dentists, doctors, I. brokers, and solicitors. Other special policies are issued for personal liability, petrol pumps, schools, sporting guns, cinemas and theatres, inns, hotels and boarding-houses, estates and farms. Cover for the private individual in respect of third party claims arising in connection with his own house is usually obtained under a combined policy issued by the fire dept. A comparatively new class of public liability I. is known as products liability. Originally the cover was mainly for food poisoning but it has been extended to apply to defective products of all descriptions. Cover is for accidental injury to persons or accidental damage to property caused by defects in the goods manuf., supplied, or repaired by the insured. The policies are available to manufacturers, wholesalers, and retailers.

*Contingency insurance.* Under this category special indemnity policies are issued indemnifying against claims by missing heirs or beneficiaries, claims under lost documents, and in respect of defects of title.

*Engineering insurance* has expanded considerably in view of statutory obligations, particularly the responsibilities imposed by the Factories Act, 1937. The object of engineering I. is to prevent accidents and breakdown by means of periodical inspection of the insured plant. Most of the premium is allocated to the cost of providing such inspections by staffs of engineer-surveyors. Boiler policies cover damage to the boiler, other property of the insured, and liability for personal injury to or damage to the property of third parties as the direct consequence of explosion or collapse of the boiler. Breakdown I. covers electrical plant, steam engines, pumps, oil engines and similar machinery against cost of repair or replacement. Cover can also be obtained to pay for losses sustained whilst the machinery is out of use. Special policies are also available for lifts, hoists, and cranes, refrigerating plant, talking-film apparatus, and machinery in transit or in course of erection.

Brit. companies effect a large accident I. abroad. This is a striking tribute to the prestige of Brit. I. houses. Recently there has been an increased demand for I. against disasters due to natural causes, such as hurricanes, and during the last few years heavy claims have been met respecting damage done by tornadoes in America.

*Agricultural insurance* is undertaken more extensively in America, Canada, and Europe than in the Brit. Isles. In America injury by tornadoes and hurricanes to growing crops causes most damage, and a special branch of I. is effected to cover this contingency, while hail damage comes next in consideration. In Canada hail damage is the risk most widely covered, and frost damage I. is in operation in both

countries, though more considerably in the U.S.A., where 88 companies issue such policies. *Live-stock insurance* forms an important part of agric. I. in the U.K., though it is usually undertaken in reference to pedigree stock, and is designed principally to cover animal diseases and compulsory destruction of such animals by order of the gov. in the case of foot and mouth disease.

See R. B. Walker and D. R. Woodgate, *Principles and Practice of Industrial Assurance* (2nd ed.), 1943; G. W. Gilbert, *Motor Insurance*, 1949; W. A. Dinsdale, *Principles and Practice of Accidental Insurance*, 1952; H. A. Young and P. D. Bacon, *Principles and Practice of Life Assurance*, 1952; T. R. Smith, *Fire Insurance Theory and Practice* (3rd ed.), 1954; H. A. Turner, *Principles of Marine Insurance* (3rd ed.), 1954.

**Insurance, National.** see NATIONAL INSURANCE ACT (1946).

**Intaglio**, strictly speaking, a gem on one surface of which a design has been hollowed out so that if this side is stamped upon some material like wax, the design is impressed and stands out in relief. I.s among the Assyrians and Babylonians were usually cylindrical in shape, like the chalcodony signet of Darius I of Persia, the workmanship of which is so justly admired to-day. The Egyptians used to cut their seals on the flat basis of the 'scarabeus' or sacred beetle—a form which is very common also in Gk I.s. Gem-cutters at first used serpentine, but as their skill increased they preferred to work in onyx and other harder stones. I.s exist of gods, mythical heroes, historical people, etc., the best dating usually from one of the first 3 cents. BC (see GEM).

The term I. is used to describe engraving and printing processes in which the matter to be reproduced is below the general surface of the printing plate, e.g. in photogravure. The ink to be applied to the paper lies in the recesses of varying depth on the cylinders or metal plates. See COLOUR PRINTING.

**Integral Calculus.** The process of integration may be looked on as the inverse process to that of differentiation (see CALCULUS and DIFFERENTIAL CALCULUS). In the latter process, for a given function (q.v.) a second function is found giving the rate of change of the first function. Given the derivative of a function, the problem of integration is to reconstruct the original function. If  $dy/dx = w(x)$ , then we write  $\int w(x)dx = y(x) + C$ , where  $C$  is a constant (the significance of the integral symbol will be mentioned later). The constant  $C$  is undetermined since the derivative of any constant is always zero, and the derivative of  $y(x) + C$  is  $w(x)$ , whatever the value of  $C$ .

No general rule can be given for the integration of an arbitrary function, as was possible in the case of differentiation, but it is obvious that a familiarity with the differential calculus enables one to write down the integrals of many functions if they are recognised as the derivatives of some other known function. For

example, knowing that  $d/dx(x^3) = 3x^2$ , it can at once be said that  $\int 3x^2 dx = x^3 + C$ . An integral of this form is known as an indefinite integral. A definite integral between the limits  $a$  and  $b$  is written

$\int_a^b w(x)dx$ , and by this is meant the numerical value of the integral evaluated at  $x = b$  minus the numerical value at  $x = a$ . Thus:  $\int_a^b 3x^2 dx = (b^3 + C) - (a^3 + C) = b^3 - a^3$ . For example,  $\int_0^1 3x^2 dx = 1$ .

An example of the important class of problems that can be solved by the I. C. is the finding of the area enclosed by a given curve. If we wish to find the area

enclosed by the curve  $y(x)$ , the  $x$ -axis, and the ordinates erected at  $x = a$  and  $x = b$  (see Fig.), we divide the area into thin strips, of thickness  $\Delta x$ , by erecting ordinates along the  $x$ -axis. The area of one such strip,  $\Delta A$ , is given by the product of  $\Delta x$  and the average height of the strip, which may be taken as the value of  $y(x)$  evaluated at the mid-point of the strip, i.e.  $\Delta A = y \cdot \Delta x$ . To this approximation the total area required is the sum of all such elemental areas between the given limits. By taking a larger number of such strips, i.e. by making  $\Delta x$  smaller, a better approximation is achieved. The true value of the area is found in the limit as  $\Delta x$  tends to zero and the number of strips becomes infinite. In this limit the sum is written

$\int_a^b y(x)dx$ , where the limits of integration have been indicated. The integral symbol  $\int$  is in fact a medieval S, indicating summation.

The connection between this example and the previous discussion is seen by examining the expression  $\Delta A = y \cdot \Delta x$ , which may be written  $\Delta A / \Delta x = y$ . In the limit, as  $\Delta x$  tends to zero, this becomes  $dA/dx = y(x)$ . Thus given  $y(x)$  we are given the rate of change of  $A(x)$ , the area under the curve, and must reconstruct the original function  $A(x)$ . The required area is then  $A(b) - A(a)$ .

For a detailed treatment of the methods and applications of the I. C. a standard text-book should be consulted, e.g. G. A. Gibson, *An Elementary Treatise on the Calculus*, 1901. We give below a table of the integrals of some standard functions. It should be noted that in each case an undetermined constant should be added to the integral, as described above.

$y(x)$	$\int y(x)dx$
$a$	$ax$ ( $a$ constant)
$x^n$	$x^{n+1}/n + 1$ ( $n \neq -1$ )
$1/x$	$\log_e x$
$\sin x$	$-\cos x$
$\cos x$	$\sin x$
$x \sin x$	$\sin x - x \cos x$
$\sin^2 x$	$\frac{1}{2}x - (\sin 2x)/4$
$x \cos x$	$\cos x + x \sin x$
$\cos^2 x$	$\frac{1}{2}x + (\sin 2x)/4$
$\tan x$	$\log_e \sec x$
$\tan^2 x$	$\tan x - x$
$\sin^{-1}(x/a)$	$x \sin^{-1}(x/a) + (a^2 - x^2)^{\frac{1}{2}}$
$\cos^{-1}(x/a)$	$x \cos^{-1}(x/a) - (a^2 - x^2)^{\frac{1}{2}}$
$\tan^{-1}(x/a)$	$x \tan^{-1}(x/a) - \frac{1}{2}a \log(a^2 + x^2)$
$a^x$	$(1/a)^a x$
$a^x$	$a^x / \log_e a$
$\log_e x$	$x \log_e x - x$
$\sinh x$	$\cosh x$
$\cosh x$	$\sinh x$
$\tanh x$	$\log_e(\cosh x)$

**Integration**, see INTEGRAL CALCULUS.

**Intellectual Co-operation, International Institute of.** In 1922 the League of Nations appointed a committee which should examine international questions on the subjects of literary, scientific, and artistic work with a view to I. C. whenever possible. The committee, which was likewise the governing body of the institute, consisted of 14 members, the member for the Brit. Empire being Prof. Gilbert Murray (q.v.). The Board of Directors met every 2 months. Such subjects as the unification of scientific nomenclature and the international organisation of bibliographical and scientific information were only two of the ambitious schemes of the organisation. Its place is now taken by the U.N. Educational, Scientific, and Cultural Organisation (see U.N.E.S.C.O.).

**Intelligence, Military, and Security.** That 'knowledge is power' is a maxim assiduously followed by all countries with respect to providing their military leaders with the most complete information available regarding all other states, particularly those which are potential enemies. Details of the military, economic, and other prin. resources of an enemy give valuable data upon which a plan of operations may be based. In peace this information can be obtained in many ways, e.g. the pub. statistics of a country, research by persons interested in various aspects of public life or particular areas of that country, spies, and general information contained in the press and journals. In war the difficulties, though greatly increased, are not insur-

mountable. Spies and persons of neutral countries are employed. These can supplement information procured by air reconnaissance, by the interception and decoding of enemy wireless messages, examination of captured equipment and documents, interrogation of prisoners, deserters, and escaped civilians, and reports from 'resistance groups' in occupied territories.

I. is vital to an army, but it is almost equally important to deprive the enemy of such I. as may be valuable to his military leaders. This is the responsibility of the Security branch, and includes censorship. If he cannot be wholly deprived of it, then false I. is usually supplied to him, which, in certain circumstances, is more effective than letting him have no information at all.

I. is a responsibility of the general staff at all levels. In the Brit. Army the I. dept. of the staff is organised in 2 branches, 'A' responsible for collecting, collating, and distributing information about the enemy and 'B' responsible for security. While the bulk of the information used by 'A' comes from the observation of its own forward troops of all arms, the special requirement of 'B' can only be served by special troops, organised in Field Security Sections which are under command of fighting formation and line-of-communication commanders. Both types of I. work are carried out by the I. Corps. This was embodied as a separate unit in July 1940, under the ultimate command of the Director of Military I. The navy and the R.A.F. also maintain I. depts.

**Intelligence Quotient (I.Q.)**, see MENTAL TESTS.

**Intelligence Tests**, mental tests directed towards measuring an individual's all-round intellectual ability. Galton was one of the first to suggest the desirability of such tests, but he had no success in devising a practicable intelligence test. The first success in this field was the test scale of Binet and Simon from which modern I. T. have been derived. See also BINET-SIMON TEST and MENTAL TESTS.

**Intelligentsia**, the part of a nation that aspires to independent thinking. The term originated in Russia, where before 1917 it meant that part of the educ. society which held radical views. In contemporary Soviet Russia I. is the officially recognised stratum which includes non-manual workers above the clerical level.

**Intendant** (Lat. *intendens*, from *intendere*, to watch over), name given in early Fr. hist. to an official invested by the king with an important commission, such as the levying of taxes, the administration of financial matters generally, etc. The *intendants des provinces* date from the last 30 years of the 16th cent., and were sent by the king to restore order in the provs. after the civil wars. In 1789 the office was abolished by the National Assembly, but the dignity was restored by Napoleon under the title of 'prefect.' See G. Hanoaux, *Origines de l'institution des intendants des provinces*, 1884.

**Interamna Nahars**, or **Interamna Umbra**, see TERNI.

**Interborough Rapid Transit Company,** see NEW YORK CITY TRANSIT SYSTEM.

**Interbourse Securities,** stocks and shares bought and sold on the London Stock Exchange, Wall St, the Paris Bourse, and other stock exchanges. The best examples of such securities are gov. stock or shares, like Gk or Brazil bonds (but not Brit. Consols, which are held almost exclusively by people in the U.K.), large gov. loans, Amer. railway bonds, and E. Indian securities. The business of negotiating the sale or purchase of I. S. is done by arbitrage dealers, who purchase or sell on one stock exchange and simultaneously re-sell or re-purchase in another country similar stocks or shares of an amount to cover not only the incidental expenses of interest, commission, etc., but also brokerage. The great benefit of this arbitrage traffic is the equalisation of and stability in the prices of I. S.

**Interbred Retriever,** see RETRIEVER.

**Intercalary Days, or Months,** term given to months or days inserted in the calendar between others to adjust the reckoning of the year into agreement with the solar year. The word 'intercalary' thus means something inserted or placed between, and is used for anything interrupting a series.

**Intercolumniation,** in architecture, the spacing of columns.

**Interconnection of power stations and distribution networks** aims at safety of supply and economy of working. Each generating station is connected to a transformer station where the voltage is stepped up to the value suitable for long-distance transmission. The high-voltage transmission network is connected to regional substations where the voltage is again stepped down for primary (regional) distribution to further substations for local low-voltage supply. Substations have duplicate busbars, so that if supply from one line fails, distribution can be switched to another line. A power station works most economically on full load. When load demand decreases, some power stations shut down; the remaining ones take over the whole supply. The working is controlled from a control room, where a luminous diagram shows, at any instant, the state of the network, switch positions, voltage, current, power, in the various sections, and generators working. See DISTRIBUTION, ELECTRIC POWER; ELECTRIC SUPPLY; GRID SYSTEM.

**Intercoastal Neuralgia,** see NEURALGIA.

**Interdict:** 1. *In Scots law:* Like the I. in Rom. or civil law, and the injunction (q.v.) of Eng. law, the I. in Scots law is a decree or order of the court to restrain any act or proceedings alleged to constitute an infringement or threatened infringement of another's rights. Like injunctions, I.s are either interim or final. An I. may be granted by the Court of Session, or the sheriff courts, or, in rare cases, by the inferior or burgh courts. For illustrations of the matters in which an I. may be obtained see INJUNCTION.

2. *Ecclesiastical law.* Form of eccles. censure applied by the medieval popes, not, like excommunication (q.v.), to a

person, but to a region or whole kingdom on account of its ruler's defiance of the Holy See. Churches were closed, and no sacrament other than baptism might be administered, except viaticum *in articulo mortis*. There were no marriages and no burials with religious rites; and since the Church at that time performed the functions of a modern registrar, the bases of legal existence were threatened. The purpose behind I. was that public resentment would bring the offending monarch to his senses or end in rebellion; but this consequence did not always follow. England in the reign of John, and France in that of Philip Augustus, were both laid under I. by Pope Innocent III.

**Interest,** the price paid for the hire of money or capital. The rate per cent per annum is the I. on 100 units for 1 year. I. is either simple or compound: the former being payable on the principal alone, the latter on the amount of the principal and I. as and when it falls due. The exaction of I. was prohibited in England as early as 1197, and the prohibition rested, as elsewhere, upon religious grounds. The old usury laws fixed a maximum rate of 1., varying at different times from 10 to 5 per cent, long after everyone had been convinced that the most entire freedom in commercial matters was both the right of the private individual and the benefit of the community. Bentham was the first writer who openly and systematically condemned the usury laws, and since he wrote no legislature has ventured to do more than regulate the status of moneylenders by registration. Bentham, like Mill, ascribed the usury laws to religious bigotry. Aristotle's condemnation of usury rested on the assumption that 'money is in its nature barren,' and that I. was the productive addition to an unproductive object, which view became traditional and is quoted in Bastiat's works as a popular fallacy among socialists. An elaborate refutation of the dogma that free access to the money market tends to encourage projectors is also one of the most trenchantly successful criticisms in the *Defence of Usury*. All restrictions have been long since abandoned by the legislature, and the rate of I. left to the discretion of lenders and borrowers; but the courts may interfere on equitable grounds to prevent fraud and overreaching, and loans to infants are invalid (see CONTRACT and INFANT). Under the Moneylenders Act, 1900, the courts may reopen moneylending transactions of a 'harsh and unconscionable nature' and reduce the rate of I. Under the Moneylenders Act, 1927, compound I. on loans by moneylenders is prohibited, nor may the contract provide for the rate or amount of I. being increased by reason of any default in the payment of sums due under the contract. But the contract may provide that if the borrower makes default whether in respect of principal or I., the moneylender shall be entitled to charge simple I. on the sum due from the date of the default until the sum is paid, at a rate not exceeding the rate payable in

respect of the principal apart from any default.

It is an economic commonplace that the rate of I. is the same in all trades in the same country and at the same time. But the risk in some occupations being greater, there must be differences in the rate of I. or profits in different trades at the same time. Some economists teach that as wealth and pop. increase the rate of I. declines, because, among other causes, wealthy and populous communities afford less and less scope for any given quantity of labour and capital. Although building societies and banks determine their I. rates without any legislative regulation, these are in practice geared to the bank rate (q.v.) in force for the time being. See also MONEYLENDER and USURY. See J. Bentham, *Defence of Usury*, 1790; I. Fisher, *Theory of Interest*, 1930; J. Meado, *Rate of Interest in a Progressive State*, 1933; K. Wicksell, *Interest and Prices*, 1936.

**Interference**, term which in physical science indicates a phenomenon depending upon the action at 1 place of 2 sets of waves or vibrations. A familiar example which can be used to illustrate this is obtained by dropping 2 stones into a still pond at the same time. Circular ripples will be set up from each stone, and will eventually meet, causing disturbance. It is almost axiomatic that the greatest disturbance will occur when trough meets trough, or crest meets crest. And were the waves set up by the dropping of each stone equal in amplitude, then when crest met trough, or vice versa, the wave motion would be entirely annihilated. It can be seen, therefore, that it becomes a fundamental principle in the science of light, sound, and electricity in particular. In these cases, however, the waves are usually too small for I. to be detected or observed by the senses, unless there is a continual succession of the 2 waves, reproducing the phenomenon at the same place for a long while. Thus in light it is necessary, in order to study I. effects, to obtain 2 sources which are identical in wavelength and in phase, i.e. their wave-forms are in step. A simple experiment demonstrating I. in light is that known as Grimaldi's, as modified by Young. A simple ray of light, which we shall regard as homogeneous, is introduced into a darkened chamber, through 2 small apertures which are close together and act as the 2 identical sources. These 2 divergent rays will interfere, with the result that on the screen opposite will be shown a series of bright bands separated by dark ones. The central one, which is the brightest, is placed so that all points on it are equidistant from each aperture, and is formed by the meeting of crest with crest and trough with trough. Theoretically the series of I. bands is composed of an indefinite number, but the fading away in brightness of those bands in practice is explained by the great difficulty of obtaining pure homogeneous light. See DIFFRACTION; ELECTRICITY, *Electro-magnetic Waves* and *Maxwell's Theory*;

NEWTON; NEWTON'S RINGS; POLARISATION OF LIGHT; SOUND; SPECTRUM.

**Interferometer**. Optical instrument for producing interference fringes by the superposition of 2 beams of light originating from the same source, and for measuring the displacements of such fringes caused by a slight increase of path difference between 2 beams. The I. is the most accurate instrument for the measurement of the wavelengths of light. Michelson's and Fabry and Perot's I.s are the best-known instruments. The principle of the former has been applied since 1920 to the measurement of the angular diameter of some stars that were not near enough to be resolved by the most powerful telescopes then known. Another I. is Rayleigh's, which is used for measuring small differences in the refractive indices of gases. See also INTERFERENCE and SPECTRUM and SPECTROSCOPE. See C. Candler, *Modern Interferometers*, 1951, and S. Tolansky, *An Introduction to Interferometry*, 1955.

**Interim** (Lat. 'in the meantime'), name given during the Reformation to certain attempts made in Germany to draw up a formula which would serve as a basis of agreement between Catholics and Protestants, until such time as a general council could be held. Two major attempts were made to bring this about, resulting in the 'Ratisbon Interim' in 1541, and the 'Augsburg Interim' (q.v.) in 1548.

**Inter-Imperial Relations Report**, report of a committee of Prime Ministers and heads of delegations to the Imperial Conference presided over by Lord Balfour, unanimously adopted by the Imperial Conference of 1926. It states that equality of status is the root principle governing inter-imperial relations so far as concerns Great Britain and the dominions, which are described in the report as 'autonomous communities within the Brit. Empire, equal in status, in no way subordinate one to another in any respect of their domestic or external affairs, though united by a common allegiance to the Crown, and freely associated as members of the Brit. Commonwealth of Nations.' (Cmd. 2768.) See DOMINION STATUS and WESTMINSTER, STATUTE OF. **Interior Decoration**, see PAINTING and DECORATING.

**Interlaken** ('between the lakes'), in the canton of Bern, Switzerland, a health resort much frequented by visitors, with an elevation of about 1863 ft. It is 26 m. SE. of Bern, between Lakes Thun and Brienz, on the R. Aar. It has magnificent mt scenery, the Hüheweg commanding a fine view of the Jungfrau. Pop. 4300.

**Interlineations**, in law, additions to or alterations of a written instrument made either before or after the execution of the instrument. As a rule, I. made after execution having the effect of altering or amending the instrument in a material particular will prevent the enforcement of any rights created under the instrument. It is otherwise with I. made before execution, provided they were made with the consent of parties whose rights are affected

by the instrument. The rule of evidence is that I. on the face of a deed are, in the absence of evidence to the contrary, presumed to have been made prior to execution; but in a will I. are presumed to have been made after the testator signed his will. I. which do not affect the rights of parties who are under any liability created by the instrument are immaterial. I. made in a will should always be signed and attested, as in the case of the body of the will; and a similar precaution should be observed in regard to those made in a deed or other instrument.

**Interlocutor**, in Scots law, strictly a judgment or judicial order pronounced in the course of a suit, which does not finally determine the issue (cf. INTERLOCUTORY PROCEEDINGS). But in practice it appears to be applied to all judgments or orders of the court, whether they finally dispose of the case or not.

**Interlocutory Proceedings**. Applications or motions before a judge, master, or dist. registrar in chambers for some preliminary order, decision, or judgment in an action are called I. P. An order made in I. P. does not finally dispose of the case, but, as a rule, decides some matter incidental to the proper conduct of an action. Interim injunctions (see INJUNCTION), however, although not final, have the effect of final judgments if at the trial it is estab. that a proper case has been made out for an injunction. Application in chambers must be made by summons, or by notice of application under the summons for directions (or summons which asks the master to give directions as to the future conduct of proceedings in such matters as discovery of documents, pleadings, etc.), unless made *ex parte*, when no such formality is required. Applications to the court are made by motion, and, as a rule, at least 2 clear days' notice of motion must be given, unless the court gives leave to the contrary.

**Interlude** (Lat. *inter*, between; *ludus*, play), short piece or musical piece performed between the acts of a play or between the verses of a hymn. In drama a short performance given between the parts of a play or in the intervals of a banquet or court pageant. The characters were as a rule merely personified qualities such as Mercy and Youth. This kind of stage production, as well as moralities and mysteries, succeeded the older miracle plays, and in the early part of the 16th cent., with such plays as those of Udall and Sackville (qq.v.), kept the dramatic field until the appearance of the new school created by the Elizabethan dramatists. John Heywood (q.v.) wrote I.s and introduced a notable change into his characters by making them represent types and classes of men, such as pedlars and friars, instead of qualities. His best-known piece is *The Four P's*, 1569. The I. was revived for a time when plays were prohibited under Cromwell.

**Intermarriage**, see CONSANGUINITY and MARRIAGE.

**Interment**, see BURIAL ACTS and BURIAL CUSTOMS.

**Intermezzo** (It., 'interlude'), originally a scenic musical piece, then called *intermedio* in Italian, to serve as a diversion at a festivity; later a comic opera for 2 or 3 characters interspersed between the acts of a serious one, cultivated in the 18th cent., but dying out during its second half. Afterwards I. became a title for short pieces, especially for the piano (e.g. Schumann and Brahms); also for an instrumental piece played in the course of an opera, as in Mascagni's *Cavalleria rusticana*.

**Intermittent Fever**, see MALARIA.

**Internal-Combustion Engine** is one in which the chem. energy latent in the fuel is released by combustion or explosion in the engine itself instead of being converted in a furnace into heat used to generate steam in a boiler. The expansion of the gases produced by the combustion constitutes the mechanical driving force acting directly on the piston in the reciprocating engine or the blades in the gas turbine. In the simplest of all I.-C. E.s, the rocket motor, the gases escape through a nozzle at the rear end and the reaction or recoil on the body of the rocket drives it forwards. In actual practice, the term I.-C. E. covers the reciprocating (cylinder and piston) type only. The gas turbine (see AERO-ENGINES) is of recent origin and is at present being actively developed in connection with jet propulsion of aircraft, and for use in locomotives, motor cars (q.v.), and as prime mover in electric power stations. The reciprocating engines are conveniently classified, according to the fuel used, as oil engines (see DIESEL ENGINES) using heavy oil, petrol engines (see MOTOR CARS) using light oils, and gas engines (q.v.) using gaseous fuels. No heat engine can convert into mechanical work more than a fraction of the heat content of the working substance (see THERMODYNAMICS). In I.-C. E.s the working substance is the fuel, mixed with air since no fuel can burn except in contact with air. The thermal efficiency of an engine is the fraction of the heat input which is converted into mechanical work; it varies according to the type of engine and is largely dependent on the compression ratio, which is the ratio of the cylinder vol. above the piston when at its lowest position (expansion) to the vol. above the piston at its highest position (compression; clearance or combustion space). The calorific value of a fuel is the amount of heat (in B.Th.U.) liberated by combustion of 1 lb. of liquid or 1 cub. ft. of gas fuel (see Brit. Standard Specification, 526). The gas fuels in common use are:

		B.Th.U. cub. ft
Natural gas	. cal. value	700-1500
Coal (tn) gas	. " "	400-500
Producer gas	. " "	164
Blast-furnace or Coke-oven gas	. " "	100

Oil fuels are liquid mixtures of hydrocarbons (compounds of hydrogen and carbon in various ratios) mostly obtained by fractional distillation of petroleum. The

light oils (gasoline fraction, petrol) of sp. gr. 0.68-0.78 have a boiling-point of  $40^{\circ}$ - $200^{\circ}$  C., calorific value 19,000 B.Th.U. lb. They may also be obtained by 'cracking,' a chemical process whereby higher-boiling fractions are broken into lower-boiling compounds. Benzol is obtained by distillation of coal tar and consists mostly of pure benzene. Heavy oils have a sp. gr. 0.78-1 and boiling-point above  $275^{\circ}$  C. Coal hydrogenation and coal and coal oil distillation also yield both light and heavy oils, and these processes are likely to become of great importance in the future. Besides the calorific value, the 'anti-knock' value of a fuel is a most important characteristic. When the compression ratio exceeds a certain limit, the fuel detonates on ignition instead of burning with a steadily progressing flame, and this 'knocking' results in excessive wear of all

by the engine itself through the camshaft. In the gas engine the mixture of gas and air is sucked into the cylinder at nearly atmospheric pressure during the induction, the inlet valve being open, the exhaust closed. As the piston begins to rise, the inlet is also closed, the mixture being compressed. When the piston approaches its highest position the mixture is ignited, usually by an electric spark, and the expansion of the combustion products drives the piston down. Just before it reaches the bottom the exhaust opens and the rising piston sweeps the burnt gases out (scavenging). The cycle is then repeated. Some engines, especially of smaller size (1-8 h.p.), work on the 2-stroke principle. As the piston rises on the compression stroke a fresh charge is drawn into the crankcase, and when the piston descends on the power stroke the charge in the

THE OTTO CYCLE

moving parts. The anti-knock value of a light oil fuel is expressed in its octane number, i.e. the percentage vol. of *iso*-octane in a mixture of *n*-heptane and *iso*-octane having the same knock tendency as the fuel in question. The higher the octane number of a fuel, the higher is the compression ratio that can be used without knocking. Generally, the compounds with the most compact molecule (unsaturated and aromatic hydrocarbons) have the higher octane numbers, while the paraffins are less good. The light oils obtained by cracking have higher octane numbers than those obtained from straight-run distillation. By addition of 'dopes,' certain chemicals such as lead tetraethyl, the octane number may be increased. The heavy oils are characterised by their cetene number, the percentage of cetene in a mixture of cetene and  $\alpha$ -methyl-naphthalene producing the same ignition lag.

Most I.-C. E.s work on the 4-stroke cycle, i.e. power is supplied to the piston during 1 out of every 4 strokes, the fly-wheel keeping the engine running during the remaining 3. This cycle was first successfully applied to the gas engine by N. A. Otto (1876). The strokes are known as induction, compression, expansion (power), and exhaust. The cylinder is provided with inlet and exhaust valves at the top end, the opening and closing of which are accurately timed and operated

by the engine itself through the camshaft. Towards the end of the power stroke the piston uncovers a port in the cylinder wall connected with the crankcase through a bypass, through which compressed charge enters the cylinder sweeping the burnt gases out through an exhaust port, likewise uncovered by the piston. A ridge on the top of the piston guides the entering charge towards the top of the cylinder and prevents its being mixed with the exhaust gases. Thus the compression stroke is also an induction stroke and the power stroke is also a compression stroke. The 2-stroke engine has no valves and is simpler in construction, but owing to imperfect scavenging and loss of fuel, it is less efficient than the 4-stroke engine. In the petrol engine the volatile liquid fuel is broken up into a fine mist and mixed with the correct proportion of air in the carburettor (q.v.). Thereafter the engine behaves as a gas engine. In the modern compression-ignition (heavy oil) engine, first practically realised by Rudolf Diesel (1892), pure air only is drawn into the cylinder on the induction stroke, and this is compressed to about 400-600 lb. sq. in. whereby the temp. rises to  $1000^{\circ}$  F. At the end of the compression stroke the oil is injected into the cylinder under high pressure (solid injection), through a fine nozzle, and ignites on coming into contact with the hot air. Expansion and exhaust

follow as for the other I.-C. E.s. The oil engine has a higher thermal efficiency than the petrol engine, 30-36 per cent as against 22-25 per cent, the compression ratio being of the order of 12-16 as against 5-6 in the petrol engine. It exerts a higher torque at slow speeds, the fuel is less easily inflammable and so fire risks are less. The oil is also less volatile and loss through evaporation is insignificant. On the other hand, the oil engine is heavier in weight per horse-power, it is not as smooth in running at low load, and has not the accelerating characteristics of the petrol engine. Oil engines are now built for speeds of 1000-2000 rev./min. whereas petrol engines are available for speeds up to 6000 rev./min. Superchargers are used occasionally on all types of I.-C. E.s to raise the pressure of the injected air above atmospheric pressure. They are compressors driven through gears by the engine or driven by exhaust-gas turbines. Centrifugal fans are used, sucking in the air near the shaft and throwing it out at high pressure near the rim. See J. Okill, *Internal Combustion Engines*, 1922; J. Lamb, *Running and Maintenance of the Marine Diesel Engine*, 1939; H. R. Ricardo, *The High-Speed Internal Combustion Engine*, 1941; S. J. Young and R. W. Pryor, *The Testing of Internal Combustion Engines*, 1944; E. T. Vincent, *Supercharging the Internal Combustion Engine*, 1948; H. E. Wimperis, *The Internal Combustion Engine*, 1949.

**Internal Conversion**, see BETA PARTICLES and GAMMA RAYS.

**Internal Security Act, United States.** Passed by Congress over the President's veto, 23 Sept. 1950, and amended in 1951, 1952, and 1954, the Act consists of 2 parts: Part I, the Subversive Activities Control Act, and Part II, the Emergency Detention Act. Part I classifies Communist organisations, creates the Subversive Activities Control Board to identify such organisations, deals with conspiracy and the transmission of secrets to foreign agents, broadens espionage and sabotage laws, and requires the registration of foreign agents. Part II stipulates that the President may proclaim an internal security emergency in the event of invasion of the U.S.A., or any of its possessions, declaration of war by Congress, or insurrection within the U.S.A. in aid of a foreign enemy; it also provides for the detention of persons suspected of conspiracy for espionage or sabotage.

**International**, an association of national Labour or Socialist parties. The First I.—the I. Working Men's Association—was formed in 1864 in London by Marx and Engels. But it came before national Labour movements had been organised, and it collapsed in 1872.

The Second I. was formed in 1889. It was based on the Labour or Socialist parties of Denmark, Germany, Spain, Belgium, Austria, Switzerland, and Sweden. These parties were reformist and looked to parl. rather than to revolutionary measures to achieve their aims. Among the leaders of the I. were Branting,

MacDonald, and Stanning, all of whom became Prime Ministers. The I. gained strength as Socialist parties were formed in Britain (Independent Labour Party), Italy, Poland, Holland, and Hungary. But it collapsed at the outbreak of the First World War in 1914.

The Third I. (Comintern) was formed in Moscow by Lenin and the Bolsheviks in 1917. It comprised the Communist elements which had been excluded from the Second I. Lenin proclaimed its aim to be world revolution. Communist parties of each country received direct instructions from the Bureau of the I.

In 1923 the Labour and Socialist parties which did not accept the Communist philosophy of revolution and political dictatorship re-formed the Second I. as the Labour and Socialist I. By 1931 it comprised parties from nearly every country in Europe. But Fascism in Italy, Germany, Spain, and elsewhere eliminated sev. Socialist parties. The executive of the I. continued to meet until 1939, but the I. ceased to function after the fall of France in 1940, the Brit., Swedish, and Swiss parties being the only survivors.

After the Second World War, frequent meetings of Socialist parties from Europe and other parts of the world were held and liaison machinery was estab. There was dissension between the W. European parties, which welcomed the Marshall Plan, and the E. European parties, which opposed it. In 1948 the Socialist or Labour parties collaborating with, or accepting absorption by, the Communists were expelled. The remaining Socialist parties professing democratic principles also differed among themselves on European federation. But in 1951 the Socialist I. was formed. It is the descendant of the Second I. The Congress of the Socialist I. meets at least once every 2 years, and its council at least twice a year. The Socialist Union of Central-E. Europe, formed in 1949 by exiled parties from Bulgaria, Czechoslovakia, Estonia, Hungary, Latvia, Lithuania, Poland, Rumania, Ukraine, and Yugoslavia, is affiliated to the Socialist I. and is represented at its council meetings. The Secretariat of the Socialist I. was estab. in London. The I. maintains close liaison with the Asian Socialist Conference, estab. at Rangoon in 1953. By 1955 the I. comprised 40 parties with a total membership of nearly 10 million. It has become nearly world wide. See K. Marx and F. Engels, *Manifesto of the Communists*, 1886; N. Bucharin, *Progress of World Revolution*, 1920; J. Joll, *The Second International*, 1955; S. Rose, *The Socialist International*, 1955; *Year Book of the International Socialist Movement*, 1957.

**International Affairs**, see ROYAL INSTITUTE OF.

**International African Institute**, an international, independent, and unofficial organisation concerned with the study of African languages, cultures, and social systems (both the traditional structures

and the changes and tensions to which they are subjected at the present day), founded in 1926 under the chairmanship of Lord Lugard. The range of its interests extends over the whole of Africa S. of the Sahara. It offers research fellowships for field studies in Africa and its fellows have carried out investigations in many African territories. The institute publishes monographs and memoranda on a wide range of topics relating to African ethnology, linguistics, and various aspects of the life and culture of African peoples; its journal, *Africa*, published quarterly, is supplied free to subscribing members. *African Abstracts*, also quarterly, contains abstracts from current periodicals concerned with African studies. The institute's reference library and information services are available to members and students. Its London office is at St Dunstan's Chambers, 10-11 Fetter Lane, Fleet St, London, E.C.4.

**International Bank for Reconstruction and Development**, commonly known as the 'World Bank', was established by the U.N. Monetary and Financial Conference held at Bretton Woods (see BRETON WOODS AGREEMENT), U.S.A., in July 1944. Its function is to 'assist in the reconstruction and development of members by facilitating the investment of capital.' In 1955 it had 58 member countries, a subscribed capital of \$9,050,500,000, reserves of \$195,000,000, and operated at a profit. An Act giving effect to the Bretton Woods Agreement in the U.K. was passed in 1945. The bank may operate either by making or participating in direct loans out of its own funds, or out of funds raised in the market of a member, or otherwise borrowed, or by guaranteeing loans made by private investors.

The bank is controlled by a board of governors, executive directors, who are responsible for the conduct of the bank's general operations, and a president. Its first loan was \$250 million to France in May 1947. This was followed in Aug. 1947 by 3 more loans to Europe—\$195 million to the Netherlands, \$40 million to Denmark, and \$12 million to Luxembourg. After that the pace of lending decreased and only 2 small loans were made in 1948—\$16 million to Chile for hydro-electric development and agricultural machinery, and \$12 million to 4 Dutch shipping companies to buy ships in the U.S.A. In Jan. 1949 \$34 million was lent to Mexico and \$75 million to a Brazilian traction, light, and power company, both largely for hydro-electric schemes. By the end of 1948 the European situation had disintegrated so far that the European Recovery Plan (E.R.P.) had taken the place of reconstruction loans from the bank as the source of European reconstruction. In the early stages of the discussion of the Marshall Plan (see EUROPE, History) it was expected that the bank would be able to supplement the E.R.P. grants with loans for specific projects. But as E.R.P. developed, the possibility of any significant bank lending to Europe during the 4 years of the programme declined. The difficulties of divided responsibility

for the financing of European recovery made it unlikely that the hopes entertained would be realised until the Marshall Plan period ended in 1951. With one of its original functions (loans for reconstruction) taken over by the U.S. Gov., the bank turned from reconstruction to development. But at first it was unable to find as many projects ready for financing as it would have liked to handle, while other promising projects took longer to put into shape than expected. One defect lay in the lack of provision for technical assistance. Not only were the countries of S. America and parts of Africa, Asia, and the Middle E. underdeveloped but they were also so short of technicians that they were unable to prepare schemes in such a form as to make it possible to appraise their prospects without much additional work for which the bank was not equipped.

Most of the money made available by the bank has been dollars. The flow of dollars, although initially small compared with the flow of sterling from London before the war when Britain was the leading lender of the world, has nevertheless been increased in the 1950's. The bank must confine its loans to projects in which a return can be earned, and it must also avoid competition with private lenders. It can only be a creditor, not a shareholder. These are additional limitations of its scope. And it is for the future to reveal what role the bank will play. This role may be greater than once seemed possible, because in Oct. 1955 the bank established a new organ, the International Finance Corporation, which has wider powers than the bank itself.

To view the achievements and the role of the bank in perspective it is necessary to consider the circumstances in which it was formed and operated. The bank, like the International Monetary Fund and the General Agreement on Tariffs and Trade, was an institution established after the war and designed to be of permanent use for the re-creation of a world economy. Since world recovery has not been as great or as early as was hoped for, these institutions exist to a large extent on paper and have not yet come into full working order. This fact explains also why the semi-permanent and semi-emergency organisations, the Organisation for European Economic Co-operation, the European Payments Union, and the Sterling Area itself, have been so important in the period of post-war reconstruction. As economic recovery returns and exchange controls and other forms of discrimination in international trade are removed, these temporary organisations will tend to become less important and the more permanent ones will take their place. See INTERNATIONAL MONETARY FUND.

**International Chamber of Commerce**, see CHAMBER OF COMMERCE, INTERNATIONAL.

**International Court of Justice**, in all essentials, is the old Permanent Court of International Justice under a new name.

Its Statute, which forms part of the Charter of the U.N. (q.v.), is the statute of the Permanent Court with a few unimportant changes, and contains provisions designed to ensure continuity between the two.

Like the old court, the new contains 15 judges of different nationalities, elected for a 9-year term by simultaneous voting in the Security Council and the General Assembly, which in this context succeeded to the functions of the Council and Assembly of the defunct League of Nations. The Statute also contains

bly of the League, was formally opened 15 Feb. 1922, and held its first session 15 June 1922, in the Peace Palace at The Hague. The charter of the court was founded on the scheme provided by Article 14 of the Covenant of the League of Nations (q.v.). Some notable cases to come before the court were the *Wimbledon* (1921), a dispute between France and Germany over a vessel which was carrying munitions for Poland through the Kiel Canal; the *Mavromatis Concessions* (1924-5), a case between Greece and

THE INTERNATIONAL COURT OF JUSTICE

*Planet News*

The scene at The Hague on 26 Feb. 1948, when the hearing was opened of Britain's case against Albania over the mining in the Corfu Channel of two British destroyers in October 1946.

similar provisions for safeguarding the independence of the judges, e.g. that they may not exercise any political or administrative office or practise a profession. They are removable only by a unanimous vote of their own colleagues on the bench. Prior to the First World War there had existed a convention for the creation of a permanent court, but it remained in abeyance because the conference of 1907 could not agree on the method of appointing judges. Thus the only previous provision for settling international disputes was by way of arbitration, a method which, while effective to meet the demands of a particular and momentary situation, lacked the essential qualities of a tribunal proceeding according to precedent and systematised methods. It therefore did but little to develop international law. The Permanent Court of International Justice was constituted during the Second Assem-

Great Britain relating to concessions in Palestine; a dispute between Bulgaria and Greece involving the interpretation of the treaty of Neuilly (1924); and the court also had a long list of advisory opinions to its credit, the most notable being the Mosul dispute (1925) between Great Britain and Turkey over the Iraq N. boundary. (See also MOSUL.)

Only states may be parties to the I. C. of J., but though individuals have no direct access, a state may take up the claim of its national, and in international litigation this is a familiar kind of case. As in the Permanent Court, the submission of cases is still voluntary, but the so-called 'Optional Clause' (q.v.) has been incorporated in the new statute. Under this states may declare in advance their willingness to recognise the court's jurisdiction as compulsory in relation to any other state accepting the same obligation,

whenever a dispute falls under certain heads, the most important being the interpretation of treaties and questions of international law. Under the old statute acceptances of this clause were numerous, and where these are still in force they are deemed acceptances under the new statute, subject to such reservations as existed previously. But acceptance of the Optional Clause does not create a truly compulsory jurisdiction; it means merely that a state has agreed that in certain circumstances it will allow itself to be sued without the necessity for concluding a special agreement after an actual dispute has arisen. The question of a truly compulsory jurisdiction for the court remains the most controversial issue of its future (Prof. J. L. Brierly). The new statute expressly states, what was implicit in the old, that the function of the court is to decide the disputes submitted to it in accordance with international law. Conventional language describes disputes which a court can decide as 'justiciable' and those which it cannot as 'non-justiciable,' misleading terminology because any dispute is justiciable if the parties choose to make it so, it being for the court to decide whether or no any particular claim is well founded in law. Generally speaking it is evident that political methods of settlement will always be necessary internationally just as they are nationally, and the judicial method can never replace them.

The court itself has no means of enforcing its judgments; but all the members of the U.N. have bound themselves to comply with its judgments, and Article 94 of the charter provides that if a party fails to obey a judgment against it the Security Council may 'make recommendations or decide upon measures to be taken to give effect to the judgment.' What sort of measures or sanctions the Council could put into force, and what would be the precise effect of its 'decision,' is left uncertain.

**International Date, or Calendar, Line,** the line where the change of date occurs. It is a modification of the 180th meridian, and is drawn so as to include islands of any one group on the same side of the line, and to allow for political considerations. It is indicated by joining up the following 9 points:

<i>Latitude</i>	<i>Longitude</i>	<i>Latitude</i>
60° S.	180°	15½° S.
51½° S.	180°	5° S.
45½° S.	172½° W.	48° N.

When crossing this line on a westerly course, the date must be advanced one day; when crossing it on an easterly course, the date must be put back one day.

**International Friendship League,** voluntary and non-political organisation to promote, through travel, friendship and toleration among the peoples of the world. The H.Q. of the Brit. section is at 3 Cromwell Rd. S. Kensington.

**International Institute of Intellectual Co-operation,** see INTELLECTUAL CO-OPERATION.

**International Labour Organisation,** estab.

1919 as an autonomous institution associated with the League of Nations (q.v.). The original constitution of the I.L.O. was adopted as Part XIII of the treaty of Versailles (q.v.).

The 26th General Conference held at Philadelphia in 1944 restated the aims and purposes of the I.L.O. in the declaration of Philadelphia, which was later incorporated in I.L.O.'s constitution. The conference reaffirmed the fundamental principles on which the organisation is based, and cited in particular that: labour is not a commodity; freedom of expression and of association is essential to sustained progress; poverty anywhere constitutes a danger to prosperity everywhere; the war against want requires to be carried on with unrelenting vigour within each nation, and by continuous and concerted international effort in which the representatives of workers and employers, enjoying equal status with those of govts., join with them in free discussion and democratic decision with a view to the promotion of the common welfare.

The specific objectives of the I.L.O. set forth in the declaration include: (a) full employment and the raising of standards of living; (b) the employment of workers in the occupations in which they can have the satisfaction of giving the fullest measure of their skill and attainments and make their greatest contribution to the common well-being; (c) the provision, as a means to the attainment of this end and under adequate guarantees for all concerned, of facilities for training and the transfer of labour, including migration for employment and settlement; (d) policies in regard to wages and earnings, hours and other conditions of work calculated to ensure a just share of the fruits of progress to all, and a minimum living wage to all employed and in need of such protection; (e) the effective recognition of the right of collective bargaining, the co-operation of management and labour in the continuous improvement of productive efficiency, and the collaboration of workers and employers in the preparation and application of social and economic measures; (f) the extension of social security measures to provide a basic income to all in need of such protection

<i>Longitude</i>	<i>Latitude</i>	<i>Longitude</i>
172½° W.	52½° N.	170° E.
180°	65° N.	169° W.
180°	70° N.	180°

and comprehensive medical care; (g) adequate protection for the life and health of workers in all occupations; (h) provision for child welfare and maternity protection; (i) the provision of adequate nutrition, housing, and facilities for recreation and culture; (j) the assurance of equality of educational and vocational opportunity.

In 1946 the I.L.O. became a specialised agency associated with the U.N. (q.v.). The machinery of the organisation consists of the International Labour Conference, the governing body, and the

**International Labour Office.** The International Labour Conference, which is the supreme body of the I.L.O., constitutes a world forum for labour and social questions. National delegations to the ann. meetings comprise 4 delegates, 2 representing the gov., 1 representing management, and 1 representing labour. The representatives of management and labour are nominated by the govts. in agreement with the industrial organisations which are most representative of employers and workers in their respective countries. Each delegate speaks and votes independently, so that all points of

building up employment services, increasing productivity, the development of training facilities, and the administration of social security programmes. The I.L.O. participates in operating the U.N. Expanded Programme of Technical Assistance. The work of the I.L.O. also includes the holding of regional conferences, sessions of industrial committees to discuss the problems of particular industries on an international basis, and a variety of specialised technical meetings. The International Labour Office in Geneva acts as a secretariat, an operational H.Q., a world information centre,

THE INTERNATIONAL LABOUR OFFICE, GENEVA

view find expression. The conference adopts international labour standards which are formulated in special international treaties called conventions, and in recommendations. These are based on careful fact-finding and discussion. As a two-thirds majority of the conference is required for their adoption, they represent the general agreement of informed world opinion. The decisions of the conference are not automatically binding, but govts. must submit the conference standards to their national legislatures. When the legislature accepts a convention the gov. is bound to apply it. The governing body, which is composed of 40 persons, 20 representing the gov. and 10 the employers and workers respectively, is the executive council of the I.L.O.

On the operational side the I.L.O. provides govts. with expert advice and technical assistance in matters connected with labour and social policy. For this purpose it has estab. in various parts of the world field offices which serve as centres for assistance to govts. in such matters as

and a publishing house. It is staffed by experts drawn from many different countries, whose knowledge, experience, and advice are available to all nations which are members of the organisation. It has branch offices and correspondents in many countries.

Among I.L.O.'s ann. pubs. are the *Yearbook of Labour Statistics* and the *Report of the I.L.O. to the United Nations*. Regular periodicals in English, French, and Spanish include the *International Labour Review* (monthly), *Industry and Labour* (semi-monthly), *Occupational Safety and Health* (quarterly), *Official Bulletin* (irregular), and *I.L.O. News* (a monthly bulletin).

**International Law**, comprehensive term denoting the sum of those rules of conduct which obtain among modern civilised nations, and which regulate their mutual relations and intercourse. The 'persons' or 'parties' known to I. L. are states, and normally such sovereign independent states are recognised members of the family of nations (on the nature of the

artificial conception of state, *see* GOVERNMENT; STATE): that 'aggregate of states which, as the result of their historical antecedents, have inherited a common civilisation, and are at a similar level of moral and political opinion' (Prof. Holland). The question how far this international, or rather inter-state, code of morality may appropriately be designated 'law' has formed the subject of an extraordinarily prolific literature. One school of jurists follows the narrow but logical Austinian analysis of law, maintaining that no rule can be a law positive unless set by a given sovereign to his subjects and sanctioned by force, and that international 'law,' which must not be confused with the *ius gentium* (q.v. and *see also* EQUITY) of the Romans, is no more than a body of principles, adherence to which on the part of individual states or nations is sanctioned by the fear of war. But another school of publicists and jurists, while not for the most part venturing directly to controvert the Austinian analysis, asserts that laws are not necessarily sanctioned by forces so much as by the play of public opinion, and that the want of an actual authority to enforce observance will not deprive of their legal character rules which men habitually and conscientiously obey without any thought of fear inspired by some controlling authority. The mere fact, however, that no modern civilised state would openly declare its unwillingness to be bound by such rules as have now received the seal of International approval at The Hague conferences, and that many have submitted to arbitration with at least a show of good grace, does not alter the fact that treaties or conventions are frequently violated and immunity gained only at the price of fear of superior armaments. In Germany, for some years before the Second World War, the Ger. Gov. broke treaties without scruple, and during the war showed that they felt bound by no 'laws' other than those of expediency. The true view would seem to be that positive or municipal law and a rule of international morality have points of resemblance, but differ essentially in point of promulgation and enforcement. There is a similarity from the fact that conformity to each does to a great extent rest upon consent freely given from the recognition of an inherent and sound ethical standard. The jurisprudent aspect of I. L. is neatly summarised by Prof. Holland as the 'vanishing point of jurisprudence, since it lacks any arbiter of disputed questions, save public opinion, beyond and above the disputant parties themselves, and since, in proportion as it tends to become assimilated to true law by the aggregation of states into a larger society, it ceases to be itself, and is transmuted into the public law of a federal government.' An ambitious but ill-fated attempt to provide international rules with definite sanctions was made in the sanction clauses of the Covenant of the League of Nations (*see* COVENANT). The Covenant provided a wider sphere of I. L. with a coercive power such as it had not hitherto possessed, and in jurisprudence

is the most significant part of the Covenant. A further, if less striking, attempt to give international rules definite sanction was made in the treaty of Washington, 1922. The treaty provides that belligerent submarines shall be subject to the rules that govern surface warships in visit, search, and capture, and that violation of these rules shall be declared piracy punishable by the civil or military authorities of any Power within the jurisdiction of which the pirate may be found. Thus the treaty endeavoured to remove from the sanctions of the laws of war the fatal defects which the First World War made so patent. Experience in the Second World War afforded no evidence of any neutral availing itself of this power. While Britain stood alone, the sole defence against the ocean-wide and illegal activities of the Ger. U-boats was the Brit. Navy and its Fleet Air Arm.

*Agencies or sources of International Law.* These, according to Wheaton, are: (1) text writers of authority on the approved usage of nations, such as Ayala (q.v.), Grotius (q.v.), Puffendorf, Bynkershoek, and Vattel; (2) treaties of peace, alliance, and commerce; (3) ordinances of particular states prescribing rules for the conduct of their commissioned cruisers and prize tribunals; (4) the adjudication of international tribunals, such as boards of arbitration and courts of prize; (5) written opinions of official jurists given confidentially to their own govts.; and (6) the hist. of the wars, negotiations, treaties of peace, and other transactions relating to the public intercourse of nations. All these sources are invoked by Wheaton as a possible basis for a rule so generally recognised as to amount to a rule of I. L. Paradoxically enough, though there was until recently next to no written I. L., there has for some considerable time existed an encyclopaedic bibliography of opinions on the principles underlying its now generally recognised usages. But too much importance must not be attached to the opinions of jurists, because, while some rely upon practice and precedent, or the decisions of a court and the act of a gov., others prefer the theoretical speculations of eminent predecessors. The latter, however, are in a minority in these days of precedents, though it was otherwise in the days when the works of Grotius, Ayala, and a few others were almost the sole source of information. Treaties are the most important source, if we include under that term every form of convention, contract, or declaration made between or ratified by different states. The Declaration of Paris, 1856, the Geneva conventions of 1861 and 1906, and the conventions drawn up by the representatives of most of the leading nations at the various Hague peace conferences have by their combined effect led to the evolution of a tolerably comprehensive body of express I. L. purporting to regulate the usages of war, ameliorating the condition of the sick and wounded in war, whether on land (the Geneva Convention) or at sea (Hague Convention, 1899). These sources have,

since the First World War, been considerably supplemented by the provisions of the treaty of Versailles creating the League of Nations, and by various later agreements arising out of the amendment of the Articles of the Covenant. The convention of 29 July 1899 represented the agreement of no fewer than 24 states to submit certain disputes to a permanent court of arbitration, an innovation which still further assimilates I. L. to law proper. Provision was also made for international commissions of inquiry on disputes 'arising from a difference of opinion on facts,' although as to these last-mentioned bodies it was further provided that their reports should leave entire freedom of action to the parties concerned. Such an inquiry was held in the case of the Dogger Bank outrage on Brit. fishing vessels at the time of the Russo-Jap. war. In the express recognition of arbitration as the most efficacious and equitable means of composing differences, it is to be noted that, although most European powers bound themselves to submit to the arbitration tribunal for a period of 5 years, there was an express condition 'qu'ils ne mettent en cause ni les intérêts vitaux, ni l'indépendance ou l'honneur des deux états contractants et qu'ils ne touchent pas aux intérêts des tierces puissances.' This principle finds more definite expression in the Covenant of the League of Nations, where it is limited by considerations of aggression. This work of consolidating or codifying the usages of I. L. and creating a tribunal was supplemented by the Declaration of London (q.v.), which created an International Prize Court of Appeal and further regulated the law of contraband and blockade.

*The subjects and general principles of International Law.* The subjects or persons of I. L. are normally sovereign and independent states. Sovereignty is a fact depending on nothing else than the objective existence of all the ordinary phenomena of political independence; though such external sovereignty may require recognition by other states to enable the new sovereign state to enter the society of nations. The characteristics or elements of international personality may be summarised thus: 'Every society claiming admission to the law of nations must satisfy the following requirements: (1) It must be represented by a gov. which receives a *de facto* allegiance from its subjects; (2) it must be a sovereign independent state, though it is not necessary that there should be complete independence; (3) it must exhibit reasonable promise of durability (internal instability was one reason for delay in the recognition of the U.S.S.R. or Soviet Russia); (4) it must possess definite *ters.*; and (5) it must be recognised as a member of the family of nations.' In the theory of I. L. a state under suzerainty is no different from an individual state in a federal system, its subjects being in effect those of the suzerain state. A protectorate occupies an anomalous position midway between an independent sovereign state

and a state under suzerainty, for it remains independent and owes no allegiance to its protector, although a part of its rights have been surrendered either temporarily or permanently.

After the First World War certain *ters.* ceased to be under the sovereignty of the defeated states and were *mandated* to various powers. The mandatory representation marked a new and progressive principle in I. L. The question of the sovereignty of the mandated *ter.* raised juristic difficulties; for it might lie in the League of Nations, in the mandatory state, or in the mandated *ter.* Class 'A' mandated *ters.*, however, appeared to be largely assimilated to protected states; but 'B' (e.g. Tanganyika *Ter.*) and 'C' (e.g. S. W. Africa) *ters.* would appear to await appropriate juristic definition. (See further MANDATES; and also IRAQ; PALESTINE; SYRIA.) Again, the self-governing dominions of the Brit. Commonwealth occupy, in I. L., a position difficult to define. Before the First World War they had traces of individuality or 'international personality,' in that they had their own coinage, their own flag in the shape of a modified Brit. ensign, and they had the right to make treaties independently with foreign states on minor matters like tariffs. The effect of the First World War was to emphasise these previously tentative steps towards international personality; for the dominions secured separate representation at the Peace Conference in 1919, and became original members of the League of Nations, with separate representation on the League Assembly; while Canada, in 1921, was given the right to accredit to the U.S.A. a representative who was to be appointed by the king on the advice of the Canadian Gov., and whose duties were to deal with questions between the Crown and the U.S.A. affecting Canada. At about the same time the Rep. of Ireland had a Minister Plenipotentiary to represent Free State interests in Washington. To-day the sev. dominions exchange representatives with a number of foreign govts. (As to the relations *inter se* of the members of the Brit. Commonwealth of Nations, see IMPERIAL CONFERENCE and INTER-IMPERIAL RELATIONS REPORT.)

Some encroachment on sovereignty seems to be implicit in the right of intervention. The question of peaceful intervention has been brought into prominence by the rights possessed by the League of Nations under the Covenant (q.v.) and under treaties containing Minority Clauses. Jurists do not agree on the precise scope of the right of intervention; but the tendency of opinion prior to 1938 was towards agreement on the basis of the grounds mentioned in Articles 11 and 15 (6) of the Covenant, the net effect being that the Great Powers of Europe would no longer claim under treaties the right to intervene in the affairs of other European states while there existed in the League of Nations a means to that end. But in 1938 and the immediately succeeding years the totalitarian technique, as developed by

Germany and Italy, reversed this tendency completely and not only intervention but invasion-without-ultimatum became so common that the entire structure of I. L. was threatened.

*League of Nations.* The League, created on the ratification, in 1920, of the treaty of Versailles, and by the provisions of that treaty, was by no means novel in its conception. But it was a novel subject of I. L., for it aimed (vainly, as the Second World War proved), through the Covenant, at the promotion of international co-operation and maintenance of international peace (see LEAGUE OF NATIONS).

I. L. recognises the right of any state to place itself under any form of gov. it may choose, and to regulate its domestic concerns as it will. Again, a state may pursue any commercial or fiscal policy and maintain what armaments it may choose without thereby infringing any rule of I. L., and its judicial tribunals may assert exclusive authority over all persons and things within the ambit of their jurisdiction, whether such persons and things are foreign or not. In litigation between private individuals involving a conflict of legal systems, the application of foreign law is based on international comity (see COMITY OF NATIONS). For conflict of laws or private I. L. see CONFLICT OF LAWS.

An underlying principle of I. L. is that whether an independent nation be strong or weak does not affect its right to equality of treatment and respect in all matters directly or indirectly concerning its interests. Included in the ter. of a state are the so-called territorial waters extending for 3 m. out, measuring from low-water mark. It follows also from the general freedom of the high seas that men-of-war and other public vessels on the high seas are 'essentially and in every point treated as though they were floating parts of their home state.' Included in such fictional parts of foreign ter. are the official residences of diplomatic envoys and ambas. A movement for the recognition of free navigation on international rvs. began at the beginning of the 19th cent. and developed in the case of a number of great European rvs. in conventions between the various riparian states concerned. By the stipulations of the Congo Conference at Berlin in 1884-5, the Congo and the Niger are free, and there is a special international commission called the International Congo Commission to regulate navigation on those rvs.

I. L. concerns belligerency, or the rights and duties of states in time of war, neutrality, and the pacific settlement of international disputes by arbitration. In regard to belligerency I. L. lays down rules for the commencement of hostilities, and for determining 'enemy character,' whether of goods, ships, or persons (see ENEMY); it prescribes the permissible modes of warfare, and provides for the proper treatment of prisoners of war and wounded belligerents, though, in this connection, the policy of 'frightfulness' habitually adopted by the Germans has

involved in its application the abrogation of these rules (see also DEPORTATIONS; SUBMARINE WARFARE; AERIAL WARFARE). Further, it lays down restrictions on the conversion of merchant into war vessels on the high seas, interprets the effect of conquest upon liabilities, and the general operation of treaties, and regularises the practice of pacific blockade. The rights and duties of neutral powers are defined in the rules as to contraband (see DECLARATION OF LONDON), the supply of arms by neutral states, the right of asylum, passage through neutral ter., blockade, and the visit and search of neutral merchantmen. As to what acts on the parts of its subjects a neutral gov. is bound to restrain and what acts its subjects may do at their peril, the *Alabama* case showed that there was no clear principle before the award of 1907 as to whether a gov. might acquiesce in the preparation and sale of an armed vessel; the analogy to the principle by which a gov. incurs no legal responsibility for the supply of guns being very close. Now neutral govts. must use due diligence to prevent the arming or equipment of such vessels within their jurisdiction.

*International Law and war crimes.* The critics of the Nuremberg judgment of 1946 allege that there is no precedent for establishing the crimes with which the prisoners were tried and imposing the punishment. But the crimes and atrocities committed by the Axis Powers were beyond anything in hist. in regard to both their range and their enormity. They were international in character and therefore to be judged according to the rules of I. L. The killings charged at Nuremberg were killings which the Tribunal held could not be justified under I. L., that is the laws or customs of war. The killing of hostages, the murder of prisoners of war, the extermination of Jews and others, the slaughter of millions in concentration camps (q.v.) and in occupied countries by manifold means, were all accomplished in flat breach of The Hague and Geneva Conventions. These are Conventions which had been solemnly agreed by all the assembled nations, including the Axis Powers, for the ameliorisation as far as possible of the horrors of war. None of the prisoners at the Nuremberg trial received the death sentence unless he was found guilty of murder, that is on the counts of war crimes (see CRIMES, WAR) or crimes against humanity, and violating the laws and customs of war—the validity of which cannot be doubted for they date back to Grotius and even earlier. What was to some extent novel was that the heads of the Hitler Inner Council were individually indicted and punished for initiating and waging a war of aggression. But those who aver that there is no law against aggressive war ignore the existence of I. L. Since 1919 at least the nations have deliberately sought to outlaw war. The pact of Paris, the Kellogg-Briand Pact of 1928, was a most solemn treaty made by 66 nations which agreed to renounce war as an instrument of national policy, and the aggressors in the Second World

War were among these nations. The Pact was a declaration of I. L. by practically the whole of the civilised nations, and the Germans were guilty of a breach of that treaty and of I. L. by initiating and waging war. Hitler and his followers were therefore individually principals in the common plan of breaking that I. L., and, as the Tribunal said, the crime against peace was the most atrocious crime of all; for it let loose the whole mass crimes of slaughter, terrorism, and cruelty. That was the common plan of crime which the Nuremberg Tribunal condemned and for which they punished the individuals responsible. I. L. for international crimes was defined in conventions or treaties like the pact of Paris. It was expressly intended to put the matter beyond controversy, and these declarations were at length put into use. There is thus no ground for describing the decisions of the Nuremberg trial as *ex post facto* law. The trial is a landmark in I. L. It estab. the right of the world to inquire into the acts of military men and into the acts of govts., statesmen, and politicians charged with bringing about a war and with concerted and calculated breaches of treaty and of faith and of the laws of war. See also NUREMBERG TRIAL.

International Law, Private, see CONFLICT OF LAWS.

International Monetary Fund, one of the institutions estab. after the Second World War and intended to be a (permanent) means of establishing a world multilateral system of payments. Together with the International Bank for Reconstruction and Development ('World Bank') (q.v.) it put into effect the conception of a world central bank envisaged by the plans drawn up by Lord Keynes for Britain and Mr H. D. White for America at the Bretton Woods Conference in 1944. The I. M. F. was estab. at Washington in 1946. It may be regarded as a co-operative deposit bank. A pool of funds was formed in the first place by subscriptions (of gold and currencies) from the nations at the conference based on a formula depending on their pre-war trade. A country whose trade left it with a deficit of gold, or of a foreign currency, had the right to draw on the pool over a period of 4 years up to 4 times the value of its quota, in exchange for its own currency. Charges were payable for this facility based on the amount by which the drawings exceeded the quota and on the time for which the excess was held. Unlike a central bank, the I. M. F. sells and buys gold and currencies and does not make loans, and its funds are limited to the amounts subscribed by the member nations. This limit has also prevented the I. M. F. from ironing out extreme fluctuations in exchange rates due to the chronic lack of balance in the balances of payments of individual countries, particularly with America. The I. M. F. has not therefore realised the hopes entertained for it at Bretton Woods; but this is largely because the instability in foreign exchanges has been much greater than was anticipated.

The countries represented at Bretton Woods agreed to stabilise their currencies, and they envisaged a return to the gold standard in 5 years, with each currency freely convertible into others. They were to fix the value of their currencies, but were free to vary it up to 10 per cent. Larger variations could be made only with the permission of the I. M. F. which would be given if there was considered to be a 'fundamental disequilibrium,' i.e. an over-valuation or under-valuation due to changes in the conditions of international supply and demand. But these

rules have remained largely on paper. When France devalued the franc in 1948, Britain the £ in 1949, and other countries devalued their currencies, they did not ask the authority of the I. M. F. (One difficulty is that of publicity.) Nevertheless, it is possible that even more changes in exchange rates, perhaps with less good reason, might have been made in the absence of the I. M. F. Nor has the undertaking to abolish exchange rates been kept. Yet the I. M. F. has disapproved of some kinds of exchange controls, and can be said to have reduced their use. By 1958, full convertibility of currencies had not been reached. When it is, the I. M. F. will come into its own as a means of maintaining stability in exchange rates, and thereby assisting in the working of a liberal international system. See BREITON WOODS AGREEMENTS.

**International Press Institute**, association of over 600 editors from 30 countries, founded in 1951, for the preservation of a free press, the promotion of personal relationships, and international news exchange. Its H.Q. are in Zurich, Switzerland.

**International Settlements, Bank for**, commenced operations in 1930. It owes its existence to the Young Committee (see YOUNG PLAN), which sat in Paris in 1929, and was estab. primarily to furnish a practical and easy means for the final adjustment and distribution of Ger. reparations and those international debits and credits which remained as a result of the gigantic borrowing and lending by the nations in the First World War. The Swiss Gov. granted a charter for 15 years to the bank. All the central banks in Europe were invited to subscribe. The I.I.Q. of the bank are in Basel. Control of the bank is in the hands of a board of directors which is composed of the governors of the founding central banks, *ex officio*; a corresponding number of persons nominated by them; and the governors of certain other central banks selected by the board. During 1939-45 no board meetings were held and the bank confined itself to routine functions. But since the war it has acquired a new function as 'clearing house' for the European Payments Union, the multilateral clearing system worked by the 18 members of the Organisation for European Economic Co-operation (q.v.).

**International Telephone and Telegraph Company**, with main offices in New York City, operates telephone systems in the Argentine, Brazil, Chile, Cuba, Mexico, Porto Rico, and Uruguay. Sev. years ago, with the consent of the Sp. Gov., it bought up all the telephone companies in Spain and introduced Amer. machinery and methods. It maintains a telegraph service all over S. America and this connects with services in the U.S.A. and Europe. It also has a cable between the U.S.A. and S. America.

**Interplanetary Society, British**, founded in 1933, to promote the development of interplanetary travel and exploration by the study of rocket engineering,

astronomy, and associated sciences. The society has over 2800 fellows and members, including many Brit. and foreign workers prominent in these fields. In 1938 the society pub. provisional designs for a lunar spaceship. Further recent papers have dealt with expendable tank step rockets, atomic propulsion for rockets, and earth satellite stations. The society is particularly interested in the question of lunar circumnavigation and landing, since these represent the first objectives in interplanetary flight. The problem of directing a rocket to the moon and obtaining information by telemetering and television has been brought nearer solution by the launching of earth satellites, 1957/8, but investigation of the physiological problems involved before manned rocket flight is possible has still to be undertaken. Also, the engineering difficulties involved in building a rocket capable of a return journey are much greater than those of a missile to achieve the one-way trip. For space travel and spaceships see ROCKETS AND SPACE TRAVEL.

**Interpleader**. When a person finds himself in the position of being sued for the recovery of money or goods in his possession in which he claims no interest, but to which some third person besides the plaintiff lays a claim, he is not compelled either to incur the cost of defending the plaintiff's action or run the risk of an action at the instance of the other claimant by handing over the property to the plaintiff. His proper course is to take out an I. summons under Order LVII (rules of Supreme Court), on the hearing of which the action against him is summarily stopped and the 2 claimants are made parties to an I. issue. This is called a stakeholder's I., and is to be distinguished from a sheriff's I. The latter case arises when a third person claims goods which have been seized by a sheriff under an execution (q.v.) for a judgment debt. The sheriff's course is to serve an I. summons on both the claimant and the executive creditor, and on the case coming on before the master an issue will be directed for trial, unless the amount in dispute is under £50, when he will himself summarily dispose of it. Where the master directs an issue, the claimant must pay money into court to abide the event of the trial; if he declines the master will make an order for sale (if goods) or payment (if money) to satisfy the judgment creditor's claim. See Cababé, *Interpleader*.

**Interpolation**, mathematical process of filling in values intermediate between those given in a set of tables. A graph may be drawn based on the data from which intermediate values can be determined (see GRAPHICAL METHODS). Alternatively the method of proportional parts can be used, which is merely a particular case of finite differences (q.v.), in which only first differences are taken into consideration.

**Interrex** (Lat. *inter*, between; *rex*, king), official of ant. Rome, appointed by the senators on the death of a king to hold the supreme authority between the death

of a king and the election of his successor. He held power for 5 days, and had to belong to the patrician party. The first I. appointed named a successor, and sometimes the nomination continued to a third and even a fourth. Thus the fiction of personal selection was kept up, held to be essential to the proper transference of the religious authority of the king.

**Interrogatories.** In interlocutory proceedings (q.v.) in an action at law, either plaintiff or defendant may apply, as soon as the latter has delivered his statement of defence, to a master in chambers for leave to administer I. to his opponent. The other party must answer the I. within the period specified. The I. before delivery are submitted to the master, who may disallow all or any in his discretion. Only such I. will be permitted as appear to the master necessary for disposing fairly of the case or for saving costs. The object of I. is to obtain admissions from the other party with a view to proving one's own case and to ascertain as far as possible the case of the other party. But it is not, at least in theory, permitted to a litigant to institute a 'roving commission' of inquiry so as to work up a case out of his adversary's forced admissions or to defend a just cause by a similar process. I. must relate strictly to the matters or facts in issue (see EVIDENCE), but, unlike pleadings, are not confined to the material facts upon which the parties intend to rely, for they are generally directed to the evidence. The party interrogating is entitled to ask 'anything that can be fairly said to be material to enable him either to maintain his own case, or to destroy the case of his adversary.' But he cannot ask the names of his opponent's witnesses, nor indeed is he entitled to find out on what evidence his opponent proposes to rely to prove his side of the case. In legal slang this is expressed in the prohibition of 'fishing' I. There are sev. forms of objecting to answering I., but generally objections must be by affidavit. The customary objections are on the ground of irrelevancy, that the I. are fishing, that the matter is privileged, and that the contents of a document are asked.

**Interval, in music,** is the name for the distance in pitch between 2 or more musical sounds. The smallest I.s used in W. music are semitones, which, in a keyboard (but not in a string) instrument, have always the same distance in pitch between them, and it is the number of tones contained in the I. between 2 notes of different pitch which determines the 'size' of the I. I.s are primarily divided into 2 classes, consonant and dissonant, but the lines of demarcation between the 2 have been very differently fixed. The Greeks considered the unison, octave, fifth, and fourth more perfect than the other I.s. In medieval treatises I.s were divided into perfect, medium, and imperfect, the unison belonging to the first class, the fourth and fifth to the second, and the third and sixth to the last; the div. into perfect and imperfect is still followed by some theorists at the present

day. The simplest classification is that on the following system: I.s are reckoned upwards inclusively and by number of 'names' of notes which they contain; they are in their normal state when reckoned from the first note of the major scale, considered, for the time, as the 'tonic.' I.s one semitone 'less' than 'major' are 'minor,' and one semitone 'more' than 'major' are 'augmented,' while I.s one semitone less than 'minor' are 'diminished.'

**Intestacy** denotes the decease of a person without having made a will, or where, though a will has been made, it has been either revoked or is invalid. A person so dying is said to have died intestate, and his property will pass to his next of kin. See SUCCESSION, INTESTATE. See also DISTRIBUTION, STATUTES OF and INHERITANCE.

**Intestines.** The I. form the portion of the alimentary canal between the stomach and the anus (q.v.).

The *small intestine* is a slightly narrowing tube from 22 to 25 ft long, commencing at the pyloric end of the stomach, and after many convolutions terminating in the large intestine. It occupies the lower and middle part of the abdomen (q.v.) and is surrounded by the large intestine. The small intestine is arbitrarily divided into 3 portions, viz. the duodenum, jejunum, and ileum. The duodenum, about 10 in. long and from 1½ to 2 in. in diameter, is the shortest and widest part of the small intestine. It resembles a large C-shaped curve, its concavity embracing the head of the pancreas. It is only partly covered by the peritoneum. The middle descending portion of the duodenum receives the common bile duct and pancreatic duct. The jejunum, about 8 to 9 ft in length and 1½ in. in diameter, occupies the upper and left part of the abdomen below the subcostal plane. It joins the duodenal section on the left side of the vertebral column, and is continued into the ileum, which is about 12 to 14 ft in length and 1½ in. in diameter. This portion occupies the lower and right part of the abdomen and is highly convoluted. Both the jejunum and ileum are attached and supported by an extensive fold of the peritoneum (the mesentery). At a point about 3 ft from the termination of the ileum a small pouch (Meckel's diverticulum) is occasionally found, and is probably connected with the persistence of a part of the vitelline duct of early foetal life.

**Large intestine.** This portion of the alimentary canal is 5 to 6 ft long and extends from the ileum to the anus. It is divided into 3 parts, viz. the caecum (with the vermiform appendix), the colon, and the rectum. The colon is further divided for descriptive purposes into the ascending colon, the transverse colon, the descending colon, and the sigmoid colon. Its diameter varies from 2½ in. in the caecum to 1½ in. in the lower part of the colon, diminishing gradually throughout its length with the exception of the well-marked dilatation of the rectum referred

to later. The caecum is a blind sac occupying the right ilia fossa immediately behind the anterior wall of the abdomen and extending some 2 or 3 in. below the ileo-caecal junction. Normally this junction contains the ileo-caecal or ileo-colic valve, though cases of the absence of this valve have occurred and no inconvenience has been recorded during life. The caecum is covered by the peritoneum in front, below, and at the sides. From its posterior and left surface the vermiform appendix protrudes and usually is directed upwards and to the left, though

VERTICAL SECTION THROUGH A FRAGMENT OF THE SMALL INTESTINE

V, V, V are three villi, each covered by columnar epithelium; C, C, C are the little tubular glands (crypts of Lieberkuhn) between the villi which secrete intestinal juice. L and L are the central lacteals which convey the chyle into larger lymphatic vessels, with valves in the submucous coat. In the villus on the right the central lacteal is not shown, but here the blood-vessels are depicted. The capillary network is immediately under the epithelium; it originates from a small artery, A, and leads into a small vein, Vn.

It not infrequently hangs down into the true pelvis. Its opening into the caecum is about 1 in. below that of the ileum. So far as is known, this appendix is peculiar to man, certain of the higher apes, and to the wombat; but in some animals a peculiar formation of the distal part of the caecum may represent a condition of the appendix. Its susceptibility to disease has been dealt with elsewhere (see APPENDIX). At birth the caecum is a cone and the appendix is its apex; it is bent upon itself to form a C, and this form may persist throughout life. The colon is subdivided into 4 parts: (a) The ascending colon, a portion of the canal about 8 in. long. It is situated in the right lumbar region and ascends vertically to the under surface of the liver. (b) The transverse colon describes a bow-shaped curve, the arch of the colon, and passes across from

the right hypochondrium to the left. It is invested by the general peritoneum, which forms a separate fold for it (the transverse meso-colon). (c) The descending colon is continuous with the previous portion by a sudden bend, the splenic flexure, where is situated a remarkable fold of the peritoneum (costo-colic ligament). It descends vertically for about 6 in. to the left iliac fossa, and is usually empty and contracted, while the rest of the colon is filled with gas. The peritoneum forms a covering to it only at the front and sides. (d) The sigmoid flexure is the narrowest part of the colon. The rectum, the lowest portion of the large intestine, extends to the anus. It bears its name in the human subject as it has a marked concavity forward corresponding to that of the sacrum and coccyx. It is some 8 in. in length and ends in a dilatation (rectal ampulla) which is in contact with the back of the prostate in the male and of the vagina in the female. The peritoneum covers only a portion of the rectum, being reflected down and forming a pouch between the bladder and the rectum in the male, or between the uterus and rectum (pouch of Douglas) in the female.

**Structure and glands of the intestines.** The I. are composed of an external serous or peritoneal coat and 3 others: muscular, submucous, and mucous. The muscular coat consists of 2 layers of fibres, a longitudinal and a thicker inner circular set. The progressive contraction of the fibres of the muscular coat produces the peristaltic movement by which the contents of the I. are forced onwards. The submucous coat of strong loose areolar tissue is connected more firmly with the mucous coat than with the muscular coat. The mucous coat is thick and vascular and consists of: (1) an epithelial layer forming the intestinal glands; (2) a layer of retiform tissue which supports the blood vessels and lacteals; and (3) a thin layer of unstriated muscle (*muscularis mucosae*). In the duodenum and jejunum the mucous membrane is thrown into a series of closely placed transverse pleats (*valvulae conniventes*). The largest are about 2½ in. long and ½ in. wide at the broadest part, and they materially increase the absorbent surface to which the food is exposed. The surface of the small intestine is velvety, due to the presence of minute closely set protuberances termed villi. Two kinds of small secreting glands are found in the I., viz. the crypts of Lieberkuhn and Brunner's glands, the latter being peculiar to the duodenum. Throughout the whole length of the intestinal tract are minute masses of lymphoid tissue (solitary glands). They are especially numerous in the caecum and appendix; in the ileum they are collected into large oval patches known as aggregated glands or Peyer's patches, the long axes of which, ½ in. to 4 in. long, are arranged lengthways in that part of the tube most distant from the mesentery.

**Vessels and nerves.** All parts of the I. are supplied with a very complete system of blood and lymphatic vessels (lacteals) minutely subdivided. The nerves of the

I. are chiefly derived from the superior mesenteric plexus, and at first they and their subdvi. cling very closely to the larger arterial vessels; finally they reach the I. in very numerous branches to be distributed and redistributed in the muscular and submucous coats. For diseases of the I. see under separate headings.

**Intimidation, see THREATS.**

**Intonation, in music, the opening phrase of any plain-song melody. The term is usually applied to the first 2 or 3 notes of a Gregorian psalm-tone, generally sung by one or more selected choristers, or by the officiating priest. Its use is, as a rule, confined to the first verse of the psalm or canticle, though occasionally in the *Magnificat*, *Benedictus*, and *Venite* the opening phrase of each successive verse is sung in this way to give a greater solemnity. The term I. is also used to describe singing or playing in or out of tune: i.e. 'good' or 'bad' I.**

**Intoning, uttering prayers in the form of a musical recitative, similar to chanting, the greater part of the prayer being recited on 1 note, varied sometimes by certain simple inflections. In cathedrals and larger churches, I. greatly simplifies audible utterances as well as adding beauty, formality, and dignity to choral worship. The practice of I. is undoubtedly of ancient date, and obtains among the great majority of non-Christian nations, as well as in the Gk., Rom., Anglican, and Lutheran churches.**

**Intoxication, see ALCOHOL; ALCOHOLISM; DRUNKENNESS; INEBRIATES.**

**Intra, It, tn in Piedmont (q.v.), on the W. shore of Lago Maggiore (q.v.). It lies between 2 rivs., the San Giovanni and the San Bernardino. It has a small port and textile industries, and is popular with tourists. There are schools of chem. and electro-technology. Pop. 8000.**

**Intrados, in architecture, the inner face or underside of an arch (see ARCH).**

**Introit, part of a psalm, with antiphon and gloria sung in the Rom. Catholic Church at the beginning of the mass, as soon as the priest begins the introductory prayers. Other passages of Scripture are sometimes used. The introduction of I.s is ascribed to either Celestine (423) or to Gregory the Great (590). Some of the I.s in the present missal are taken from uninspired writers. I.s also occur in Church of England services.**

**Intromission, in Scots law, the assuming possession of the property of another either on legal grounds or without authority. I. in the latter case is contradistinguished as vitious (Lat. *vitium*, a defect). One of the commonest forms of legal I. is that of an adjudger, or creditor, who has obtained an adjudication by process of diligence against his debtor for the payment out of the rents of his debt and interest. The term is commonly used to denote financial dealings, e.g. of trustees.**

**Intrusive Dyke Rocks, see DYKES and IGNEOUS ROCKS.**

**Intuition, in philosophy, a term signifying the mental faculty of spontaneous**

knowledge of the truth as opposed to its discovery by any ratiocinative process. The concept and word are taken from the terminology of medieval scholasticism. In particular, I. in scholastic theology meant a knowledge of God in the beatific vision. The term 'intuitual,' as used later in the science of ethics, is of the first importance in that it denotes a school of thought diametrically opposed to the utilitarian. The intuitionists define the principles and method upon which are to be determined right rules of conduct by reference to a supposed moral sense; or, in other words, duty is to be measured by certain fundamental axioms or intuitively known principles of moral reasoning. The utilitarians, on the other hand, adopt no such subjective standard of good conduct, but estimate the moral value of an act by reference to an objective standard of human duties, whether utility, general happiness (universalistic hedonism), or individual happiness (egoistic hedonism). The authority of the conscience or moral sense, as opposed to what may generically be termed the social affections, was first advanced, among Eng. philosophers, in a distinct form by Butler in his *Dissertation on Virtue*, 1739, and carried further by Reid in his *Essays on the Active Powers of the Human Mind*, 1788. Reid insists on the essential difference between self-love, or regard for one's own good, and sense of duty, or conscience, where Butler seems to have leaned to a belief in their identity in a future life. Whewell, in *Elements of Morality*, 1845, endeavours to formulate a list of intuitive principles exclusive of all regard for happiness and referable to the sole governing principle of conduct, the moral reason. These I.s are compendiously defined as the principles of benevolence, justice and truth, purity and order. The introduction into the system of the term 'reason,' which, as we have seen, is directly antithetical to the primary notion of I., connotes merely the supremacy of reason over purely non-rational impulses or instincts (q.v.). Kant's use of the word *Anschauung* (literally 'beholding') is practically equivalent to perception, and he gives as instances of true forms of beholding, time and space. But, regarded subjectively, Kant names such I.s transcendental (unknowable), though objectively they are empirically knowable. See A. J. Balfour, *Defence of Philosophic Doubt*, 1920; N. O. Lossky, *L'Intuition, la matière et la vie*, 1928; K. W. Wild, *Intuition*, 1938.

**Intussusception, or Invagination, condition in which one part of the intestine passes into the adjoining portion, telescopically, just as the finger of a glove may on taking it off the hand. The contained portion is nipped and strangled. It is a not uncommon cause of obstruction of the bowels in children, but is not very common in adults. Surgical treatment is usually imperative. The ileum and the junction of the ileum with the caecum are the parts of the intestine involved.**

**Inula, family Compositae, genus of ann. to perennial herbs, formerly under**

**Conyza.** *I. conyza*, Ploughman's Spikenard; *I. crithmoides*, Golden Samphire; and *I. salicina* are native to Britain. *I. helentum*, Elecampane, of central Asia, has naturalised, being once much grown for medicinal usages.

**Inulin** ( $C_{12}H_{22}O_{11}$ ), starch-like substance which is found in dahlia and like tubers, where it forms a reserve food supply. It is coloured yellow by iodine, and is quantitatively hydrolised to the sugar fructose by dilute acids.

**Inundations**, see FLOODS AND INUNDATIONS.

**Invar**, steel alloy, containing 35 per cent of nickel and some manganese. Its length varies very little with changing temp.; hence it is used for measuring-rods and pendulum bars. See ALLOY.

**Invasion.** In the theories of the rights conferred by international law (q.v.) on invaders it is necessary to distinguish between military occupation and conquest. Occupation may imply no more than the placing of ter. under the authority of a hostile army by way, as it has been expressed, of sequestration, without any intention of appropriating it. Conquest, on the other hand, means acquisition. No such distinction was drawn until the middle of the 18th cent., with the result that the inhab. of a ter. in the possession of a foreign army were bound not only to swear allegiance to the invader, but to assist him in all respects as if he were the legitimate sovereign. After the Seven Years War juristic writings, notably those of Vattel, began to advance the doctrine that a sovereign does not lose his territorial rights in war until a formal cession at the close of the war by treaty. The prevalent modern theory appears to be that the occupying army merely takes temporary possession for certain purposes, while the sovereignty of the original owner continues for all other purposes. But until recently the practice of belligerent govs. differed from the theory which presupposes that since the invader is invested with no more than a substituted or quasi-sovereignty, the national character of the people and soil remain unchanged. The practice is a corollary of the mere rule of might, that the lives and property of the inhab. being necessarily at the disposal of the occupant, the inhab. acknowledge his sovereignty in consideration of his forgoing the extreme rights vouchsafed by superior force. The question of what acts an occupying army may legitimately do depends on circumstances. The general principle is that everything is prohibited which is not calculated to contribute to success in the military operation concerned.

The articles of the Declaration of Brussels prohibit (1) any compulsion of the pop. of occupied ter. to furnish information about the army of the other belligerent or his means of defence; (2) any pressure on the pop. to take oath of allegiance; (3) confiscation of private property, but without prejudice to the right to confiscate by way of punishment or under stress of military necessity; and

(4) pillage; and enjoin (a) the respect of family honours and rights, individual lives and private property, together with religious convictions and liberty, and (b) the general duty of taking all steps to re-establish and ensure, as far as possible, public order and safety, while respecting, unless absolutely prevented, the laws in force in the country (for full information on these points see Lord Birkenhead's *International Law*). The rights of conquest are, of course, much wider. Birkenhead defines conquest as the permanent absorption of all or part of the ter. of a defeated enemy, but lays it down that a title by conquest is only complete if the conqueror has the material strength to make his conquest good and has exhibited the intention of appropriation. The effect of the Nuremberg Trial, which followed the Second World War, is to give a new juristic conception of I. when all the circumstances establish that it constitutes the initiating and waging of a war of aggression. If this be proved the invader has no rights at all in international law but, on the contrary, both individuals and bodies responsible for launching such an I. may be tried on the capital charge. See CRIMES, WAR; INTERNATIONAL LAW; NUREMBERG TRIAL.

**Invention**, see PATENTS.

**Inventions Board**, see FISHER OF SILVERSTONE.

**Inventory and Inventory Duty.** An I. in regard to the administration of the estates of deceased persons is a list or schedule in which are enumerated all the articles comprising the personal property of the deceased. It also denotes a detailed descriptive list of the assets of a bankrupt, and the property comprised in the schedule to a bill of sale of personal effects. The duty of making an I. of a deceased's effects falls upon the executor or administrator, who should make it in the presence of at least 2 of the creditors of the deceased or the next of kin, or any 2 credible persons, and it should describe the articles serialim, with the value at which each has been appraised, especially as it may afterwards be admitted as evidence to show what is due to the beneficiaries or creditors. But to be admissible as evidence it should on completion be signed and sworn before a commissioner for oaths. It may be noted that any person interested in the estate may call upon the executor or administrator to exhibit an I., and to render an account of his administration. In Scots law the term I., besides the above applications, is used to denote the schedule made by an heir of the heritable estate of his ancestor with the object of limiting his liability for his ancestor's debts to the amount of the value of the estate so inventoried.

**Inveraray**, royal burgh and co. tn of Argyll, Scotland, 23 m. NNW. of Greenock, on Loch Fyne. I. Castle, seat of the Duke of Argyll, lies  $\frac{1}{2}$  m. NW. of the tn. The original castle was built in the 15th cent. as the stronghold of the 1st Earl of Argyll, head of clan Campbell. The new castle, dating from 1744, was

built by Archibald, the 3rd duke, who with his brother was largely instrumental in effecting the union with England. Pop. 450.

**Inverbervie**, royal burgh and holiday resort of Kincardineshire, Scotland, 13 m. NE. of Montrose. Pop. 885.

**Invercargill**, cap. city of Southland Prov., New Zealand. Area 5914 ac., including 516 ac. of gardens and reserves. Centre of rich agric. and pastoral dist. The city is well laid out with good buildings and picturesque suburbs with fine homes and well-kept gardens. The chief industries are frozen meat, wool, butter and cheese, flour-mills, timber, and coal. There are excellent sporting facilities. The port of I. is Bluff, 17 m. distant, where a P.R. firm contracted in 1956 to build a new harbour to cope with the dist.'s large export trade in primary produce. Pop. 34,293.

**Inverell**, tn of New S. Wales, Australia. It is situated in Gough co., 280 m. N. of Sydney by air. The chief rural pursuits in the surrounding dists. are sheep-grazing and fruit-growing. Pop. 7680.

**Inveresk**, par. and vil. of Midlothian, Scotland, situated on the Firth of Forth, on the site of a former Rom. settlement. The battles of Pinkie (1547) and Carberry Hill (1567) were fought in the par. Alexander ('Jupiter') Carlyle was minister here (1748-1805). Local industries include agriculture, coal-mining, and fishing. Pop. 4000.

**Invergordon**, burgh and naval base of Ross-shire, Scotland, situated on Cromarty Firth, the centre of a productive agric. area. There is a sheltered harbour with piers and a dockyard. I. castle is 1 m. to the NW. I. was the scene of a naval riot in 1931. Pop. 1500.

**Inverkeithing**, royal burgh of Scotland in Fife co., on the Firth of Forth, 10 m. from Edinburgh, one of the Dunfermline dist. parl. bors. It has a harbour, ship-breaking yards, and a paper mill. Pop. 3780.

**Inverlochy**, ruined castle in Inverness-shire, Scotland, on the R. Lochy, 1½ m. NE. of Fort William, the scene of the defeat of Argyll by Montrose in 1645. The model vil. of I. was built to house the employees of the great aluminium works near Fort William.

**Inverness**, municipal bor. and seaport, and co. tn of Inverness-shire, Scotland, situated at the mouth of the R. Ness at the junction of the Beaully and Moray Firths, 108 m. WNW. of Aberdeen. On account of its beautiful environment and fine buildings, it is the H.Q. of an immense tourist traffic throughout the summer. The chief buildings of note are the cathedral, the Town House, Old Abernethy House, royal academy, and co. hall. I. has a fine suspension bridge, and the famous Clach-na-Cudain, regarded as the tn palladium. Shipbuilding, iron-founding, distilling, and the manuf. of woollen goods are the prin. industries, and the tn has good roads and a fine harbour and docks. The open spaces of the tn include Bught Park, and the famous ground

where the most important athletic event of Scotland, the N. Meeting, is held towards the end of Sept. I. is a tn of great antiquity, having been one of the Pictish caps. Pop. 28,115.

**Inverness-shire**, co. in the highlands of Scotland, stretching from the Moray Firth to the Atlantic Ocean. It is the largest co. in Scotland, and includes sev. of the Outer and Inner Hebrides. At the time of the Rom. occupation I. was Pictish ter., but by the 11th cent. the more northerly areas of Scotland were largely under Norse rule, not wholly to be freed until 1263 (battle of Largs). There had been some attempt at colonisation under David I, and the foundations of the clan system were now being laid in I. It was after the Earl of Mar's rising in 1715 that forts were estab. and roads built to hold in check the highland clans. Prince Charles Edward raised his standard in Glenfinnan (1745); after his failure to take the throne the clan system began to break up.

I. is wild and mountainous; 228 mt tops exceed 3000 ft in height, and Ben Nevis (q.v.), the highest mt in the Brit. Isles, reaches a height of 4406 ft. The 3 great rivs. of I. are the Spey, Ness, and Beaully, and the number of lakes and hill tarns is great, Loch Ness being the most beautiful and best known of the larger lakes. There are a few fertile tracts in some of the glens and by the shores of the sea lochs, and in the N. round the Moray Firth. About 5½ per cent of the shire is cultivated, and sheep-farming is carried on extensively. Herring-fishing is also an important industry on the W. coast, and forestry is becoming increasingly important. The chief branches of industry are the production of hydro-electricity, aluminium smelting, distilling, and the manuf. of electric welding machines at Inverness (the co. tn). The tourist industry is also important. The co., with Ross and Cromarty, returns 3 members to Parliament. Area 4211 sq. m.; pop. 84,200.

**Inversion**, term used in geometry. O is a fixed point; P and P' two points on a line through O. If P and P' satisfy the relation  $OP \cdot OP' = k^2$ , where  $k$  is a constant number, then P and P' are mutually inverse points. O is called the centre and  $k$  the radius of I. Thus given O and  $k$ , for a point P the above relation determines a point P', which is said to be obtained by the process of I.

**Invert Sugar**, equimolecular mixture of dextrose and levulose (d-glucose and l-fructose), obtained by hydrolysing cane sugar with dilute acids. It readily ferments, and is used in the preparation of sparkling wines.

**Invertebrate Embryology**, see EMBRYOLOGY and PROTOZOA.

**Invertebrates**, collective term for all those animals which agree in not possessing that combination of attributes which makes a vertebrate, but have a dorsal nerve chord, a notochord, gill-slits on the pharynx, a ventral heart, and eyes which are out-growths of the central nervous

system. The chief groups of I. are Protozoa (unicellular) and the Metazoa (multicellular), further divided into Porifera, or sponges; Coelentera, unsegmented worms; Annelids, or segmented worms; Echinoderms; Anthropoda, including Crustacea, Insecta, and Arachnida; Mollusca.

**Inverurie**, royal burgh of Aberdeenshire, Scotland, 16 m. N.W. of Aberdeen, at the confluence of the R.s Ury and Don, with a golf-course and facilities for sport. Pop. 5000.

**Investiture**, in feudal and eccles. hist., the act of giving possession of a manor, office, or benefice, accompanied by a certain ceremonial, such as the delivery of a clod or a key, more or less designed to signify the power or authority which it is intended to convey. Temporal sovereigns claimed the right of investing the bishops with their sees by the formal presentation to them of the ring and crozier, a claim which led to the famous 'Investiture Dispute' between Henry I and Anselm in England, and to the bitter struggle between the Pope and the emperors of Germany in the 11th and 12th cents. At the Diet of Worms (1122) it was finally decided that the emperor should confer I. by a touch of the sceptre only, thus making no claims to confer spiritual power but merely the temporalities of the see.

**'Invincible'**, Brit. battle-cruiser (17,250 tons) carrying eight 12-in. guns, which could be fired broadside to port or starboard. She was flagship of Adm. Sturdee's squadron which defeated von Spee's at the Battle of Falkland Is. (q.v.), in which she suffered no casualties. The I. was sunk at the Battle of Jutland (q.v.), where she was flagship of Adm. Hood's squadron.

**Invincibles**, Irish secret society consisting of extremists connected with the Fenian movement (see FENIANS). The chief member was known as No. 1, and each member was acquainted with but two others—the member by whom he was nominated, and the one whom he in turn nominated. The society was responsible for a number of outrages, including the murder of Lord Frederick Cavendish (q.v.) and Mr Burke in 1882.

**Involute and Evolute**, see CURVES.

**Involution**, mathematical process of raising a quantity to any power. Its inverse process is evolution, the finding of a root. Whereas a quantity has 1 square, 1 cube, and generally 1 *n*th power, it has 2 square roots, 3 cube roots, and generally *n* *n*th roots.

In geometry, the process of I. is defined in the following way. O is a point on a straight line. Pairs of points on the line, A, A'; B, B'; C, C', etc. which satisfy OA.OA' = OB.OB' = OC.OC' = . . . = *k*<sup>2</sup> are said to be in I. O is the centre of the I. and *k* the radius of the I. A pair of points satisfying the above requirements are called conjugate points. Two points K<sub>1</sub> and K<sub>2</sub> on opposite sides of O, satisfying OK<sub>1</sub> = OK<sub>2</sub> = *k*<sup>2</sup>, are the double points of the I. Note that K<sub>1</sub> and K<sub>2</sub> are not conjugate points.

Io, daughter of Inachus, the 1st King of Argos. Under the name of Callithyia I., she was regarded as the first priestess of Hera. She was loved by Zeus, who, to protect her from Hera, transformed her into a white heifer (though some say it was the work of Hera herself). The 100-eyed Argus was then set to watch her, but Zeus dispatched Hermes to kill him, and I. was released. But Hera's wrath pursued her, and, tormented by a gad-fly, she wandered all over the earth, till at last, in Egypt, she was restored to human form and became the mother of Epaphus. Aeschylus gives a different version in his *Prometheus*.

**Iodic Acid (HIO<sub>3</sub>)**, white crystalline solid, obtained by the oxidation of iodine with concentrated nitric acid. On gentle heating it loses water and becomes converted into iodine pentoxide, which on further heating breaks up into its elements. I. A. is acid to litmus, forming salts, of which sodium iodate, occurring in caliche (Chilesaltpetre), is the principal. I. A. is a strong oxidising agent, readily giving up its oxygen with the liberation of iodine.

**Iodine** (symbol I, atomic number 53, atomic weight 127), non-metallic element which belongs to the halogen group (q.v.). It occurs as iodide in sea-water, from which it is collected by certain seaweeds, notably *Laminaria digitata* and *L. stenophylla*, which contain as much as 0.5 per cent. It is also present in crude Chile saltpetre, as sodium iodate.

**Extraction from seaweed**. The weed is burnt in pits and the ash or kelp boiled up with water and the solution concentrated. The less soluble salts separate on cooling, whilst the iodides remain in solution. The liquor is then distilled with sulphuric acid and manganese dioxide, the I. which is evolved being collected in cooled earthenware jars.

**Extraction from caliche**. The mother liquors, from which the sodium nitrate has been separated as far as possible, are passed down a tower up which passes a stream of sulphur dioxide gas. The I. is precipitated as a black, muddy substance which is purified by sublimation. When pure, I. is a greyish-black crystalline substance with a metallic lustre and a peculiar odour. It has a sp. gr. of 5.0 and melts under pressure at 114° C. On heating it sublimes, giving rise to a purple vapour. It is only sparingly soluble in water, more freely in alcohol, and especially in potassium iodide solution, forming a brown solution. In carbon disulphide and chloroform the solution is purple. With starch I. forms an intense blue coloration, and by means of this test 1 part of I. in 5 million parts of water may be detected. Chemically, I. is the least active of the halogens, but nevertheless combines directly with many metals, phosphorus, etc., and also to a certain extent with hydrogen to form hydriodic acid. Medicinally, I. and its compounds are of great importance. Its solution in alcohol (tincture of I.) is used externally for subduing inflammation. The iodides of mercury, iron, and especially potassium

College of Agriculture and Mechanic Arts at Ames, opened in 1869, now includes an Institution for Atomic Research. The first Fr. visitors were Marquette and Jolliet in 1673. I. came to the U.S.A. in 1803 as a part of the Louisiana Purchase, and entered the Union in 1846. Pop. 2,621,100. The state cap. is Des Moines (pop. 178,000). Other important cities: Sioux City, Davenport, Cedar Rapids, Waterloo, Dubuque, Council Bluffs, Ottumwa, Burlington, Clinton, Mason City, Fort Dodge. See J. Brigham, *Iowa: Its History and Its Foremost Citizens* (3 vols.), 1915; I. B. Richman, *Ioway to Iowa, 1931*; Federal Writers' Project, *Iowa: A Guide to the Hawkeye State, 1938*; C. Cole, *Iowa Through the Years, 1940*; W. F. Petersen, comp., *A Reference Guide to Iowa History, 1942*.

**Iowa, State University of**, co-educational, on the I. R. at I. City, U.S.A., was opened in 1855. It has colleges of liberal arts, commerce, dentistry, education, engineering, law, medicine, nursing, and pharmacy, and a graduate college. The univ. libraries contained 800,000 vols. in 1955, among them an outstanding Leigh Hunt collection. Teaching staff, 700; students, 9100.

**Iowa City**, cap. of Johnson co., I., U.S.A., on the I. R., 23 m. SSE. of Cedar Rapids in agric. area with limestone quarries and an airport. Industries include printing, food products, and wood products. It is the seat of the State Univ. of I. and the State Historical Society of I. Pop. 27,200.

**Iowa River** rises in Hancock co. in the state of I. and flows in a SE. direction, entering the Mississippi in Louisiana. It is navigable to I. City and is about 350 m. in length.

**Ipecacuanha**, emetic substance obtained from the roots of sev. S. Amer. plants. The true I. is a species of Rubiaceae known by the various generic names of *Cephaelis*, *Psychotria*, and *Uragoga*, and occurs in damp forests of Brazil. It is a small herbaceous plant with a prostrate stem and an annulated root. In medicine it acts as an emetic and stomachic, aids respiration, and increases perspiration. The white I. is a violaceous plant, known botanically as *Tonidium Ipecacuanha*; the bastard I. is a species of Asclepiadaceae bearing the name *Asclepias curassavica*. The active principle of true I. is an alkaloid known as emetine, now used in the treatment of amoebic dysentery. 'Dover's powder' is I. and opium.

**Ipek**, see Péc.

**Iphicles**: 1. Son of Amphitryon and Alcmene, twin brother of Hercules. Juno sent 2 serpents to kill the twins in their cradle, but the infant Hercules strangled them.

2. Son of Phylacus and Clymene, whose cattle were famous for their size.

**Iphicrates** (d. 353 BC), Athenian general, son of a shoemaker. He introduced into the Athenian army the *pellastae*, or targeteers, whose armour and weapons, devised by himself, gave them the advantages of heavy and light infantry.

**Iphigenia**, daughter of Agamemnon and Clytaemnestra. Agamemnon had provoked the goddess Artemis (q.v.) by killing her favourite hart. Artemis produced a calm, so that the fleet sailing to attack Troy was detained at Aulis. The soothsayer Calchas advised Agamemnon to sacrifice I. to appease the goddess. According to one legend she d. on the altar; but according to another, Artemis put a hart or a goat in her place at the last moment, and carried her off to Tauris. There I. became priestess in the temple of Artemis, and saved her brother Orestes with his friend Pylades from being sacrificed to the goddess by fleeing with them to Greece, carrying away the statue of Artemis from the temple. I. was worshipped in Athens and in Sparta, and she may have been the goddess under another name. See A. Verrall, *Euripides the Rationalist*, 1895.

**Ipomoea**, genus of Convolvulaceae, consists of about 300 species of herbaceous and shrubby plants of warm and tropical countries; many are cultivated for their showy flowers. *I. batatas* is the sweet potato; *I. purga*, the jalap; *I. pandurata* the wild potato vine; *I. leptophylla* the Bush Moon Flower, which, with *I. horsfalliae*, is grown in hothouses.

**Ipsambul**, see ABU-SIMBEL.

**Ipsus**, in ancient geography, was a tn of Phrygia, in Asia Minor, where, in 301 BC, Antigonus was defeated and killed.

**Ipswich**: 1. Municipal, co., and parl. bor., and the co. tn of Suffolk, England, at the head of the Orwell estuary, 69 m. NE. of London. I., once a tn of targeted lath-and-plaster buildings, and storeyed inns, now combines Elizabethan oak with modern steel and concrete. Among places of interest are the Anct House, in the Butter Market, now used as a bookshop, the architectural showplace of the tn, built in 1567; Christchurch Mansion, built between 1548 and 1550, with extensive rebuilding after a fire in 1872, now maintained by the corporation as a domestic and folk museum and art gallery; and Wolsey's Gateway (1528) in College Street, the only fragment remaining of Wolsey's ambitious plan to found a college in I. as a nursery for his Cardinal College at Oxford.

I. was the site of a small Rom. settlement, and throughout the Saxon period I., or Gypseywyk as it appears in the A.-S. Chronicle, steadily developed, until it attracted the attention of Dan. marauders. The Danes were defeated at sea off the mouth of the Orwell in 885 by King Alfred; but in 991 and 1010 they invaded the tn and set fire to it, levying a fine of £10,000 upon the inhab. In 1200 I. received its first charter, granted by King John. Edward III brought over to England 70 families from the Netherlands who were weavers and wool-workers, and the woollen industry grew rapidly in Suffolk generally. From 1446 I. sent 2 members to Parliament, but in 1918 the number was reduced to 1. In 1518 Henry VIII granted a charter confirming the corporation's anct jurisdiction over the

Orwell estuary as far as what is now the port of Harwich. Among the famous names associated with I. that of Cardinal Wolsey (b. in the tn in 1471) is pre-eminent. Many famous men have served as High Steward of the bor. since 1557, including Adm. Lord Nelson and Field-Marshal Earl Kitchener of Khartoum and of Aspal (Suffolk). Thomas Gainsborough lived here for a time, and many of his famous landscapes depict scenes on the banks of the Orwell. David Garrick began his stage career in I.

The centre of the tn and of its communal life is the Cornhill. Many of the finest shops are in the Butter Market near the tn hall. In High Street is the corporation archaeological and zoological museum. I. has sev. fine churches, the majority in the Perpendicular style: St Margaret's, early 13th cent.; St Peter's, renovated and extended in 1878 under Sir Gilbert Scott; and St Nicholas, with a 14th-cent. nave and aisles. Other churches are St Mary-le-Tower, where King John's charter was received in 1200 by the bailiffs and burgesses, rebuilt in 1860-70; St Mary-at-the-Quay, 15th cent., severely damaged by bombs; and St Lawrence, a lofty church in the Perpendicular style, with an embattled tower and 5 medieval bells. The most famous inn is the Great White Horse, used by Dickens as the scene of an amusing episode in *Pickwick Papers*. A 'Whit Hors Inn' stood on the same site in 1518, when it was probably one of the pilgrims' inns. Other well-known I. inns are the Coach and Horses; the 16th-cent. Black Horse; the Golden Lion in Cornhill; the Old Bell; the Golden Fleece, in the yard of which bull-baiting was a popular pastime; and the Neptune, originally, and now again, a private house, and noted for its oak-panelled rooms and carved woodwork. The present central library was built in 1924, and is a noted repository for Suffolk records. There are also 4 branch libraries. Twelve secondary schools are situated in the tn, and there are a wide variety of cultural organisations and ample provision for further education. I. School, which has a continuous hist. from 1477 or even earlier, now ranks as an independent public school. Formerly estab. in Blackfriars monastic precincts and elsewhere, the school moved to its present site in 1851. I. has 2 general hospitals and 6 public parks in addition to many recreation grounds (507 ac.). The corporation owns the waterworks and transport undertakings, and a modern crematorium.

The industries of I. include large engineering and agric. implement works, tobacco and cigarettes, fertilisers, yeast, textiles, footwear manufs., tanning, printing, brewing, maltings, and flour mills. Among the industrial products are electric motors and dynamos, industrial trucks, mobile cranes and excavators, water control equipment for large-scale irrigation schemes, roller mills, grain driers, air compressors, steel-framed buildings, plywood, wall boards and plastics, refrigerating plant, sacks, bags, and tarpaulins, and

garden furniture. Vessels drawing 19 ft can enter the dock (area 26 ac.) at I., and ships up to 7000 tons can berth at Cliff Quay, a new deep-water quay (1800 ft) constructed in 1923-5 on the E. side of the Orwell. The docks and quays are equipped with modern electric cranes and all rail facilities. The airport of I. (opened in 1930) on the outskirts of the tn has now been reopened, after requisition, as a public aerodrome with scheduled services to the Continent. Pop. (est. 1953) 107,500.

2. City of Queensland, Australia, on the Bremer R., 25 m. W. of Brisbane, centre of an important coal-mining and farming dist. Industrial activities include large woollen mills and railway workshops. Pop. 40,100.

Iqbal, Sir Muhammad (1876-1938), Indian poet, philosopher, and politician, whose name is linked with the first demand of his Muslim co-religionists for the creation of Pakistan. B. Sialkot, Punjab, his ancestors were Kashmiri Hindu converts to Islam. Educ. at Sialkot, Lahore, Cambridge, and Munich, qualifying for the Bar in London. I. returned to India in 1908, practised law, and entered local politics. Knighted in 1923. I. became a member of the Punjab legislature from 1927 to 1929. He was president of the All-India Muslim League in 1930 when the demand for Pakistan was made a major political objective of the party, and attended the 1st Round Table Conference in London convened to frame a constitution for India. He d. at Lahore.

For many years I. had been outstanding as a Muslim thinker and poet. Impressed by the vigour of W. thought, he tried to infuse some of this vigour into Islamic thinking in India. His first major work was a Persian *masnavi* sequence, trans. into English as 'Secrets of the Self.' With its gospel of the creative ego trying to achieve freedom and a fuller development of personality, it took the younger generation of Indian Muslims by storm. But he also insisted that the true development of the self involved sinking the self in the service of a community inspired by common spiritual traditions. He composed mainly in Persian, but also wrote a good deal in Urdu to reach his own Indian public.

Iquique, city and fine modern harbour in N. Chile, cap. of the prov. of Tarapacá, 820 m. N. of Valparaíso, on the Pacific. I. owes its commercial importance chiefly to the export of nitrate of soda, borax, and iodine. It is connected by rail with the city of Tarapacá and with various mining centres, and has a local airline to Antofagasta. I. was founded in the 16th cent. upon a peninsula between the Colorado and Cavanha headlands. Twice, in 1868 and 1875, the tn was nearly destroyed by an earthquake and tidal wave, and as a result of the war between Chile and Peru it was ceded to the former by treaty in 1883. Water is brought to the city from Pica 55 m. away, an oasis settled by Sp. soldiers in the 16th cent. Large deposits of guano are found on

the coast. The climate is rainless. Pop. 48,000.

Iquitos, tn of N. Peru, and cap. of the dept of Bajo Amazonas de Loreto, situated on the Marañón, Upper Amazon, 2300 m. from the mouth, and 1268 from Lima. It is a Peruvian flotilla naval base. There is a wireless station and a regular air service. It trades in tropical agric. products and hardwoods. Pop. estimated at 34,500.

Iran, or Eran, originally the name of the great plateau bounded on the N. by the Caspian Sea and Turanian Desert, on the S. by the Persian Gulf and Indian Ocean, on the E. by the Indus, and on the W. by Kurdistan and the Tigris. The name, which is now the official designation of the Persian kingdom, is derived from *Aryāna*, 'the country of the Aryans.' Strabo declared that the name and language extended to the Persians, Medes, Sogdians, and Bactrians, as well as to the inhab. of the SE. of I. See PERSIA.

Iranshahr, dist. and tn of Persian prov. of Baluchistan. Pop. of tn 4000.

Irapuato, tn of central Mexico in the state of Guanajuato. It is an important railway junction between Mexico and Guadalaajara. It is a mining, manufacturing, and agric. centre. Pop. 32,400.

Iraq (Mesopotamia, 'the land between the rivers'), Middle E. kingdom extending from Kurdistan on the N. and NE. to the Persian Gulf on the S. and SE., and from Persia on the E. to Syria and the Arabian desert on the W., its position being between 37° and 48° long., and from 37° to 30° N. lat. The country has an area of 160,000 sq. m. and includes the former Turkish vilayets of Mosul, Bagdad, and Basra. Estimated pop. about 5,000,000; that of the provs. is as follows: Bagdad, 805,293; Hillah, 261,903; Diyala, 273,336; Diwaniyah, 383,787; Dulaim, 193,294; Kerbela, 276,070; Kut, 224,792; Basra, 352,039; Amara, 308,108; Muntafiq, 369,806; Mosul, 601,589; Arbil, 240,273; Kirkuk, 235,878; Sulaimani, 222,732. In 1950-1 all but a few thousand Jews went to Israel. There are about 101,000 Christians and 41,000 of other faiths: Yezidis, Mandaeans, Sabbis, etc.; of the Muslims the Shi'a slightly outnumber the Sunni.

**Physical features.** I. may be divided into 3 main divs.: the Plain, the Uplands, and the Highlands. The plain consists of the delta of the Tigris and Euphrates, and extends roughly from the Persian Gulf to a line joining Faluja with Khanaqin. The soil is alluvial, and there is no stone. The rivs. run along ground a few feet higher than the rest of the plain, which is liable to be flooded when the rivs. are high. This happens each spring when the snows in the mts melt; the rise of the Tigris at Bagdad is sometimes as much as 23 ft and of the Euphrates at Faluja 14 ft. At no point is the plain more than 150 ft above sea level. In the plain the ann. rainfall is about 6 in. There are 3 chief forms of irrigation employed in I.: (1) perennial, in which the canals from the riv. are so designed that the water in the

riv. will always 'command' the land, or flow on to it; (2) inundation canals, in which the spring flood will 'command' the land and give enough water for summer crops—an unscientific form of irrigation; and (3) lift irrigation, in which water is raised by machines to flow on to fields close to the riv. With the advent of oil, motor pumps are often used for this purpose. Modern works are the Hindiya barrage on the Euphrates, the Kut barrage to irrigate land W. of the Tigris, the Bad'a regulator, and the Diala weir at Table Mt. Work has been done on the flood escape and reservoir in the Habaniya depression, and by 1956 good progress had been made with the first part of the scheme for letting the Tigris flood into the Tharthar depression, though the canal system for irrigation was not completed. In 1955 there were 14 irrigation schemes on foot, to be financed out of the oil revenue. The uplands div., or the area between the plain and the highlands, consists in the SW. portion of a gypsum desert, but in the N. and NE. of rolling plains with good soil and a rainfall thrice as heavy as that in the plain. Mosul, Kirkuk, and Arbil, the chief tns, are situated on rich soil between 700 and 1200 ft above sea level, the rain being heavy enough to grow winter cereals extensively. There is no irrigation to speak of, though round Arbil and Kirkuk it is carried on by the anct system of *kariz*. A *kariz* is a tunnel leading water by a gentle gradient from a spring in the hills to the spot required. It is made by sinking a row of shafts and digging the tunnel between them; they are left open for use in cleaning the passage. The highlands, to the NE. of a line drawn from Faish Khabour to Khanaqin, are crossed by a number of ranges of mts, rising at some points to 14,000 ft. There are many beautiful valleys and plains among these mts, and the valleys are full of flowers, mainly oleanders. Rainfall is heavy in the winter and may continue until May. Fruit is grown in the N., tobacco in the S. highlands, especially in the dists. of Sulaimaniya and Rania.

**Iraqi tribes.** Outside the cities the pop. of I. is almost entirely tribal, i.e. divided into communities of kindred families under their own chiefs or sheikhs. It is easy to observe in I. the various stages of tribal development from the nomad of the desert to the riverain cultivator, and in the transit from desert to tn (where that has taken place) the tribes have lost little of their tribal characteristics and customs. In the plain there are Bedouin tribes, nomadic pastors of camels, sheep, and horses; others are semi-nomadic or semi-settled and marsh tribes. The 3 chief Bedouin tribes of I. are the Shammar, living between the Tigris and Euphrates in the N., the Dhafir in the S., and elsewhere the Anazah. Blood feuds still prevail, and the tribes have their own unwritten codes and methods of punishing offenders or settling quarrels, and the I. Gov., in its administration, has to pay due

regard to tribal custom. Wealthy cultivators still take a pride in dwelling in black tents, while a chief of the marshmen may live in a house, though his guest house is still built of reeds in the traditional style.

**Constitution and administration.** By a treaty between Great Britain and I. (1930), Britain undertook to give I. such advice and help as might be wanted without prejudice to the sovereignty of I. and to secure its admission to the League of Nations as soon as possible. I. was admitted to the League in 1932 and became an independent sovereign state in that year. A further treaty of alliance and mutual help for 20 years was signed with Britain in 1948, but was repudiated by public opinion in I. Legislative power is vested in parliament and the king, and the parliament consists of the Senate and the Chamber of Deputies. I. is divided into 14 main divs. (liwa), each liwa being administered by a 'mutasarif' who is responsible to the ministry of the interior but is also the agent and representative of the other ministries. Each liwa is divided into 2 or more 'qadhas,' administered by 'qaimmaqams,' and each qadha into 2 or more 'nahiya,' each administered by a 'mudir.'

**Defence.** Military service is compulsory at the age of 18, usually for 2 years. The army consists of 3 divs., 1 plain and 1 mt, each with 3 infantry brigades (of 3 battalions), training brigade, 3 artillery regiments, 1 signal battalion, 1 engineer battalion, second line transport, etc.; whereas the 1 mechanised div. is to consist eventually of 1 armoured car regiment, 1 field artillery regiment, 1 engineer company, and 1 infantry brigade (4 battalions). There are service training schools, cadet and staff colleges.

**Education.** Primary education is free and compulsory. In 1953-4 some 200,000 boys and 60,000 girls attended school. There are 92 secondary schools for boys with 27,000 pupils, and 42 for girls, with 8000; foreign schools cater for 10,000 boys and 1100 girls. There is an Institute of Fine Arts and schools for technical engineering, agriculture, domestic science, health services, and nursing. There are colleges for arts and science, engineering, medicine, law, commerce and economics, pharmacy and chemistry, teachers' training, theology, and police. It is expected that these will soon be integrated into a univ.

**Health services.** These are under the Gov. Health Service. The Faculty of Medicine includes schools of medicine, pharmacy, and midwifery; the courses for nurses and officers of health last 3 years, that for pharmacists 5 years, and the full medical course 7 years. The faculty grants its own degrees. Hospitals provide more than 7000 beds for patients. Dispensaries, some of them mobile, supplement the work of the hospitals. There is also a dept of preventive medicine.

**Justice.** The higher courts are, in civil law, a court of cassation in Bagdad and 4 courts of appeal in Bagdad, Basra,

Mosul, and Kirkuk. A tribal court of cassation was created in 1950; in criminal law there is the court of cassation and 6 sessions courts, 4 of which are the civil courts of appeal; and in religious law courts of revision, both Sunni and Shi'a, sit in Bagdad.

**Agriculture.** Agriculture is still the chief occupation; much of it is 'extensive' (i.e. a light amount of work put into a large extent of land) cultivation of wheat and barley in winter and, in summer, such crops as rice, maize, sorghum, and sesame. The country round Basra produces three-quarters of the world supply of dates. Cotton has been introduced and 50,000

*Iraq Petroleum Co. Ltd*

WELDING A 24-INCH PIPELINE, IRAQ

bales were produced in 1951-2. The settled cultivators are a different class from the pastoral nomads; flocks of sheep and goats and herds of camels cover enormous areas and the desert produces fine grazing after good rains. The chief exports are dates, wool, grain (mostly barley), hides and skins, cotton, liquorice, and gail-nuts; there is also a large transit trade, mostly with Persia, worth £26,000,000.

**Oil.** The Turkish Petroleum Co., an international company comprising Brit., Amer., Dutch, and Fr. interests (it changed its name to Iraq Petroleum Co. in 1929), first found oil near Kirkuk in 1927. Five years later the construction was begun of a 12-in. pipeline system to the Mediterranean ports of Tripoli and Haifa, and by 1934 these 2 terminals were each receiving crude oil at a rate of about 2 million tons a year. Exports of oil thus continued steadily until 1948, when fighting between Arabs and Jews in Palestine resulted in the complete cessation of the flow of oil to Haifa, a flow never since

resumed. In the following year, however, a 16-in. line from Kirkuk to Tripoli was commissioned; and in 1952 a 30-in. pipeline from Kirkuk to the Syrian port of Banias was finished. These pipelines made possible dispatch from the main field of Iraq, the Kirkuk field, and from what is known as the Mosul field, of over 24 million tons in 1955, though the disappointing N. field contributed only 1½ million tons to that total.

Meanwhile fields in the S. of I., operated by the Basra Petroleum Co., as

and so on. In order that the beneficent work of this board should not be interrupted by the abrupt fall in revenue which resulted from the sabotaging of the 3 pumping stations in Syria in Nov. 1956, the Iraq Petroleum Co. in 1957 arranged to make to the I. Gov. an interest-free loan of £25 million. In mid 1957, when the 3 pumping stations in Syria were still out of action, I. was exporting about 10 million tons annually to the Mediterranean. How soon and by what extent her exports of oil to the Mediterranean

*Iraq Petroleum Co. Ltd*

THE 555-MILE 30-INCH PIPELINE FROM KIRKUK TO BANIAS, NEARING COMPLETION IN 1952

The pipeline's capacity is 17 million tons a year.

associate of the Iraq Petroleum Co., were being developed. Oil was first exported from the Basra field from the terminal at Fao in 1951; and in 1956 the volume thus exported exceeded 8 million tons. Revenues from oil—the I. Gov. enjoys 50 per cent of the profits of oil operations within I.—have proved a godsend to a country which previously lacked the finance to develop its abundant natural resources. In the utilisation of these oil revenues, I. has shown remarkable patience and far-sightedness. For in 1950, in anticipation of the larger revenues she has since obtained, I. formed a Development Board which, having command of 70 per cent of the oil revenues, has already done much in the spheres of flood control, irrigation, better communications,

will increase depends on factors not wholly within I.'s control. The export of oil from S. I., however, is confidently expected to increase. For the purpose of that export, facilities for laying a pipeline from the Basra fields through the sheikhdom of Kuwait, off which deep water lies, have been discussed. I. has undoubtedly vast reserves of oil, but her main oil-field lies, unlike the fields in Kuwait, Saudi Arabia, or Persia, far from the seaboard.

*Transport.* A metre gauge railway runs from Basra to Bagdad, with short branches to Nasiriya and Kerbela; from Bagdad the line continues to Arbil and Baiji with a branch to Khanaqin. There is a standard gauge line from Bagdad to the Syrian frontier via Mosul, and there it

connects with the Turkish railways. The total length of track is rather over 1000 m. Owing to lack of road metal, good roads are few—only 750 m. are metalled—but it is possible to motor almost everywhere in the plain, though not, of course, in the mts and marshes. Water transport is very important. Steamers ply regularly between Bagdad and Basra and in April and May between Bagdad and Mosul. In late summer and autumn steamers often stick in the mud in the shallows S. of Bagdad; none ply on the Euphrates. Sailing craft are much used, but as the current is strong and the prevailing wind NW. they have to be poled or towed upstream. Rafts (keleks) float down from Mosul; the poles are sold in Bagdad and the skins taken back to Mosul for further use. The Shatt al-Arab, the combined stream of the Tigris and Euphrates, is navigable for ocean-going ships up to Basra. There is communication by air in all directions.

**Holy cities.** Nejad, Kerbela, Kadhaimain, and Samarra are sacred to the Shi'a Muslims, and pilgrims come from Persia, India, and other countries as well as from I. Story says that the camel bearing the dead body of Ali (q.v.) stopped at Nejad and the corpse was buried there. At Kerbela Husain, the son of Ali, was killed with 300 followers and it is a privilege to be buried near one or other of these shrines. Indeed bodies are brought from Persia for interment there.

**Antiquities.** The ruins of Babylon (q.v.) are perhaps the most imposing of the Assyrian and Babylonian cities which have been excavated, and the Bagdad museum is rich in finds from these sites (see also ASSYRIA and BABYLONIA). The ruins of a Parthian palace and town are at Hatra. Little remains of medieval Arab architecture, partly because brick was the building material and partly because of the turbulent hist. of the land. The palace of Ukhaidir survives because of its isolation, and some of the mosques may be old, though visitors are not encouraged. In Bagdad itself parts of the Mustansiriya college and of a late Abbasid palace survive.

**History since 1914.** When Turkey entered the First World War as an ally of Germany, a Brit. force was landed at Basra to protect Brit. interests in the Persian Gulf. This move led to an advance into the country and eventually to the expulsion of the Turks. A proclamation was issued that the British had come to free the people of I. from the Turks and wished for a return of their old prosperity. I. became a Brit. mandate in 1919 and in 1921 Faisal was chosen as king. The foundation of a strong and independent state was not accomplished without opposition and bloodshed. There was a serious rising in the Mosul region in 1920 and further disturbances in the SW. and Mosul in 1921 and 1922; order was at last restored with Brit. help and programmes of road-making, irrigation, etc., were started. In 1930 relations between I. and Britain were defined in a 25-year

treaty of alliance, and 2 years later the mandate ended, though under the treaty Britain retained certain rights in the country in return for continued aid. King Faisal I. in 1933 and was succeeded by his son Ghazi, who was killed in a road accident in 1939; his young son (b. 1935) followed as Faisal II, with his father's cousin, Abdul Ilah, as regent. I. now reverted to a regime of intrigue and violence in which the army played a considerable part. Order was restored under Nuri al-Said, who persuaded I. to side with Britain in the Second World War. In 1941 a *coup d'état* was carried out by a group of army officers, a former prime minister, Rashid Ali al-Gillani (a descendant of the Muslim saint, Abd al-Qadir),

E.N.A.

A YOUNG KURD OF BAGDAD

and Haj Amin Al Hussein, the ex-mufti of Palestine, backed by Ger. gold and promises of Ger. military help. A first attempt in Jan. failed, but in April the rebels seized Bagdad in the absence of the regent and attacked the Brit. air base near Habbaniya. Brit. troops landed at Basra and a column from Syria crossed the desert, relieved the R.A.F., and entered Bagdad at the end of May. Rashid Ali and his chief supporters fled to Persia.

Nuri al-Said had a share in promoting the Pan-Arab congress of Sept. 1944 out of which grew the Arab League. In 1947 all Brit. forces were withdrawn except for the R.A.F. bases at Shaiba and Habbaniya. In 1948 an Anglo-Iraqi treaty was signed but immediately disowned because it did not 'realise Iraq's national aims.' The end of the Brit. Palestine mandate and the proclamation of the state of Israel brought the Palestine situation to a climax and I. troops joined in the Arab invasion of Israel. In 1953 the regency ended and the effective rule of Faisal II began. After 1948 it seemed for a time that I. might revert to the unsettled political conditions of a few years

earlier, but stability returned in some measure. The vast oil revenues encouraged considerable social and economic progress and brought prosperity which gave additional strength. Although sympathetic with the general principles of Pan-Arabism, I. remained outside the Egyptian sphere of influence. In 1955 the signing of a treaty with Turkey, the Bagdad Pact (q.v.), later joined by Pakistan, Persia, and Britain, showed I. to be a centre of stability in the increasingly disturbed Middle E. area, and one amenable to W. ideals. The Suez crisis of 1956 shook this alliance severely but, led by Nuri al-Said, I. maintained friendly relations with Britain, though deprecating her action in Egypt. During the crisis Syria cut the oil pipelines which ran through her ter., thus damaging I.'s economy substantially, but repair work on the pipelines began in Mar. 1957.

Following on the creation of the United Arab Rep. (q.v.), on 14 Feb. 1958, the kings of I. and Jordan (q.v.) signed an agreement uniting their kingdoms in the 'Arab Federation.' The federation was to be open to other Arab states; the cap. was to alternate between Bagdad and Amman every 6 months. King Feisal of I. was created the first head of the federation, with King Hussein of Jordan as his deputy; both retained constitutional authority in their respective kingdoms.

Iraq-i Ajami, formerly a prov. of Persia, almost corresponding to the anc. Media, stretching from the Mesopotamian plains on the W. to the great desert of Persia on the E. It was known to the Arab geographers as *al-Jibal* (the Mts) and came to be known as I. A. in the 12th cent. It included Hamadan, Isfahan, Qom, Kaaban, Rai, Qazvin, and Zanjan.

Irawadi, or Irrawaddy, chief riv. of Burma, is formed by the confluence of the 2 arms of the Malikha and Meh-kha, which rise in the N.E. of Assam, near the Tibetan frontier, a short distance above Bhamo. It follows generally a course from N. to S., a total distance of 1500 m., and falls into the Bay of Bengal, between the Bay of Martapan and Cape Negrais, through a wide delta with nearly a dozen mouths. The delta is a fertile rice-growing dist., but only 2 of the mouths, the Bassein and the Rangoon, are navigable for big boats. The chief tribs. are the Chindwin and the Shwell, and the chief tns on its banks are Bassein, Rangoon, Prome, Henzada, Myingyan, Magwe, Pakokku, Mandalay, and Bhamo. The riv. is the great highway for commercial traffic, and drains an area of about 158,000 sq. m. of very fertile land. See also BURMA, SECOND WORLD WAR, CAMPAIGNS IN.

Irbt, Russian tn in the Sverdlovsk Oblast, 125 m. N.E. of Sverdlovsk. It was founded in 1633. From the mid 17th cent. it had a famous ann. fair, second largest in Russia, attended by many thousand merchants; this was discontinued in 1930. Pop. (1933) 23,500 (1897, 20,000; 1926, 12,000).

Ireland, John (1879- ), composer, b. Bowden, Cheshire. He was educ. at Leeds Grammar School and at the Royal College of Music, studying under Stanford. He began with concerted chamber music and songs. Two violin sonatas followed, and these estab. his reputation at once. His best-known subsequent works are a pianoforte sonata, a symphonic rhapsody, *Mai-Dun* (1921), and a piano concerto (1932). I. has also written a large number of piano pieces and songs, one of the best-known of the latter being the setting of Mascfield's *Sea Fever*. Sev. song-cycles are important, and all his songs are distinguished by his sensitive choice of words from the finest Eng. poetry, and by the lyrical beauty and sincerity of their music, which is also found in the piano music. Character and originality mark all his work. See study by R. Hill in A. L. Bacharach's *British Music of Our Time, 1946*.

Ireland, William Henry (1777-1835), forger, inherited the interest of his father, Samuel I., author, in the works of Shakespeare; but in him it took the form of inventing documents concerning the poet, and imitating his handwriting and signature. The forgeries were so well executed that they deceived not only Samuel I., but such men as Dr Parr, Sir Isaac Heard, and Dr Warton. Encouraged by his success I. wrote 2 plays, *Vortigern* and *Roxena* and *Henry II*, which he ascribed to Shakespeare. The former was produced by Sheridan at Drury Lane in Mar. 1796. Malone exposed the fraud, which the perpetrator acknowledged in his *Authentic Account, 1796*. This was expanded (1805) into his *Confessions*.

Ireland (Irish *Eire*; Lat. *Hibernia*; in the 6th-13th cents. frequently *Scotia*; poetic *Erin* (q.v.); also, in anc. times, *Iverna*, *Juvena*, and *Ierne*, the name used by Strabo), is, lying to the W. of Great Britain, from which it is separated on the N.E. by the N. Channel (13 m. from Fair Head to the Mull of Kintyre in Scotland), on the E. by the Irish Sea (q.v.), and on the S.E. by St George's Channel (q.v.). On the N., W., and S. it is washed by the Atlantic. In shape I. is an irregular rhomboid. Its greatest length (from Fair Head in the N.E. to Crow Head in the SW.) is 302 m., and its average breadth is 110 m. The historic div. of the is. into the provs. of Ulster, Munster, Leinster, and Connacht (q.v.) remains, but politically I. is now divided into 2 states, the Rep. of I. and N. I., the latter of which is part of the U.K. of Great Britain and N. I. Area (land) 31,838 sq. m.; total pop. 4,281,422. This article deals with Irish hist. prior to 1922, and with Irish art. For later Irish hist., and for

individual details of the 2 divs., see IRELAND, NORTHERN and IRELAND, REPUBLIC OF. See also IRISH ARCHITECTURE and IRISH LANGUAGE AND LITERATURE.

*History.* The earliest hist of I. is not unnaturally wrapped up in myth and legend. We have little evidence in any authors of note regarding I., and factors which contribute greatly to the hist. of other nations are lacking here; hence we are compelled by the little we have to rely upon the probabilities suggested by research. Evidence of the inhabitation of I. by Neolithic peoples indicates that even after the Celtic settlement of I. great numbers of the earlier inhab. survived, and intermarriage between the Celtic and pre-Celtic tribes took place to an even greater extent than was customary in other lands settled by Celts (q.v.). The first Celtic settlement of Goidels occurred during the 6th cent. BC, and about 3 cents. later we find a further Celtic settlement of Brythones. Ptolemy, who gives us our earliest knowledge of I., states the names of at least 16 tribes. These names bear a striking resemblance to the tribal names of the Celts in Britain; e.g. we find the name Brigantes in both countries. The div. of the country into provs.—Ulster, Munster (E. and W.), Leinster, and Connaught—seems to have been made by the earliest Celtic settlers.

By the beginning of the Christian era we may say that I. was populated by Celts (Goidels and Brythones), together with a sprinkling of the Neolithic people and some Picts, who probably came from Scotland, and who occupied but a small portion of the country. Such is the explanation that hist. gives of the early settlement of I. The Irish, however, account for it in a very different way—a series of legendary stories, in which mythical characters, who have become almost historical, play an important part. According to legend, the first invaders came under Partolan, occupied the is. for 300 years, and were then killed off by a great plague. They were followed by the Nemedians, who came from Scythia and had a great struggle with the Fomorians. The Fomorians were ultimately successful and the Nemedians were driven out and went away to Greece. From thence, after various adventures, they returned to I., this time being given the name of Firbolgs, and this tribe settled in I. and have been held to be represented there down to the 16th cent. The next set of invaders were the tribes of the God Danu, who finally overthrew both the Firbolgs and the Fomorians. The tribes of the God Danu are supposed to have come originally from Greece but to have been driven up to Scandinavia, and from thence to have invaded I.; they held supreme command of I. down to the time of the arrival of the Milesians. The Milesians are supposed to have come originally from Scythia, to have sojourned in Egypt, and to have finally invaded I. and conquered it. This myth is historically the most important since the Milesians are held by historians

of the 16th cent. to have given the line of the high kings to I. down to the 12th cent. Names are given to the early kings and records of their deeds were kept, but of these we may take little or no notice until the appearance at the end of the 4th and beginning of the 5th cents. of Niall of the Nine Hostages. He is held to have finally set up the central kingdom of Tara (q.v.) and to have led expeditions of the Irish overseas. It has not yet been fully recognised to what an extent I. and Wales were connected during this early period, and it must be pointed out here that the expeditions of Niall of the Nine Hostages synchronise with the departure of the Romans and the raids of the Picts and Scots into Britain. Certain it is that colonies of the Irish were formed in Wales and in W. Wales (Devon and Cornwall), and it is to this period in Irish hist. that we can best trace the foundation of these colonies.

The foundation of Emania, c. 300 BC, seat of the kings of the line of Ir in the N., is regarded by Tigheerach, the famous historian and abbot of Clonmacnoise in the 11th cent., as heralding the dawn of Irish hist. It may be said, generally, that Irish hist. is reliable as to genealogies and the broad features of the prin. events from the Christian era, and that it is fairly reliable, from a remote period, as a guide to such outstanding events as the foundation of Emania and the victory of Labraidhe (Lowry), grandson of Laoghaire, over the usurper (Coffey) at Diun Riogh on the Barrow. It is, however, not until the time of Patrick that there are definite political subdivisions in I. as distinct from the mere supremacy of certain families in various parts of the country. A short time prior to the Christian era the most powerful kings in I. were those who ruled in Emania. Thus to Tuathal is attributed the foundation of the kingdom of Meath and the great dynasty of Tara, which governed the clans of the open plain from the sea to the Shannon and later appointed branches to rule over those of more than half of I. There were 2 other dynasties the origin of which is assigned to the 2nd cent.: the Leinster and Munster, whose kings were rivals of Conn, famous grandson of Tuathal; and these 3 leading dynasties supplied the independent rulers of all parts of I. except Ulaidh (Ulster) for cents. and struggled with each other for the supremacy of the country. Tara reached its zenith in the reign of Cormac MacArt (q.v.), a grandson of Conn, who is one of the prin. figures in the copious literature on the exploits of the Fianna or 'Fenians.' The kings of Tara had attained such power in the 4th cent. that they were then waging war in Britain and even sending military expeditions to the Continent. The Rom. dominion was on the wane and the Gaels came over to make common cause with the enslaved Britons and Picts against the Romans. One of the most famous leaders of these expeditions was Niall, King of Tara, whom we have mentioned above,

who was eventually slain on the banks of the Loire (AD 405). During Niall's reign his 2 half-brothers, Brian and Fiachra, estab. themselves in the palace of Cruachan (in Roscommon) and thenceforth the kings of the W. kingdom were chosen exclusively from their descendants. Other new kingdoms were founded in the NW. near the site of the modern Derry. The state of Oriel was also founded at this time. It had been wrested shortly before the Christian era from the Clanna Rury, the most powerful kings of I. Their sway extended from Ulaidh, and in early times spread over nearly all the N. and as far S. as Tailte in Meath; but following the 7 years' war between Connor and Maëve of Connacht, in alliance with Fergus of the Red Branch, the power of the Clanna Rury steadily declined.

Immediately before the introduction of Christianity we find the permanent estab. of 4 kingdoms ruled over by the posterity of Conn—Tara, Oirghialla, Alleach, and Cruachan. The normal head of this confederacy was the chief king in Eire, styled High King, a purely nominal title but implying a superiority which was not recognised by the dynasties of Ulaidh, Laighin, or Caiséal (Ulster, Leinster, and Cashel). These 7 independent states into which the is. was divided at this time remained—albeit modified under changing conditions—the spheres of political influence in I. until the whole Gaelic fabric was destroyed at the battle of Kinsale in 1603; but to trace the fortunes of these 7 dynasties is the purpose of any hist. of Gaelic I. Their supremacy in their own kingdoms remained permanent, and the rivalries which often convulsed them were between competitors of their own families. It is possible that Christianity conduced to this political stability. The traditional Five Provs. (Ulaidh, Connacht, Laighin, and the 2 Mumha) are popularly supposed to be represented by the modern 4 provs.; but the representation is not wholly accurate. The first div. into 4 provs. was eccles. when the Synod of Kells (1152) grouped the Church around the arch-dioceses of Armagh, Cashel, Tuam, and Dublin. The creation of prov. 'presidents' in the 16th cent. by the Tudors gave them definite recognition in political affairs. The accepted index to the internal political constitution of these Irish states is the 'Book of Rights' (Leabhar na g-Ceart), traditionally ascribed to St. Benignus, disciple and successor of St. Patrick.

The religion of early I. cannot be easily traced. The inhab. appear to have had many gods, in fact, to a certain degree, to have been pantheistic; there is evidence also to show that they were fire worshippers, and we know that right up to the 15th cent. the sacred fire at Kildare was kept burning. The most tangible side of the belief of the early Irish, however, is their undoubting faith in the existence of fairies. The tribes of the God Danu are held, after the invasion by the Milesians, to have disappeared into the hills and to have reappeared as fairies.

We have also lists of the names of the Irish gods, but these gods seem to have been very shadowy beings concerning whom little is known. The priests or druids of the country play an important part as teachers, prophets, and wizards. Their powers were great, and it was supposed that they were able to perform miracles. One side of the belief of the Irish must not be overlooked here, since it survived for some very considerable time during the Christian period, and that is the idea that after death certain changes could be made by the dead person, and that he could appear now as a wolf, now as a fish, and again as a bird. Only certain people were held to have this power, but in one case at least it was held that all the inhab. of Ossory could change themselves into wolves at will.

Irish historians aver that the country had reached a high state of civilisation at the coming of St. Patrick (q.v.). The Irish Milesians are described as a martial and cultured people who, in an age when most of Europe was still in an uncivilised state held their Ollamhs, poets and historians, in equal reverence with their royal chiefs. Cnts. before the Christian era, they are said to have estab. a Fels (q.v.) or central parliament which assembled triennially at the Ard-ri's or High King's court on the Hill of Tara. Thither came the Fíles or poets, the Seanchuidhes or chroniclers, the Ollamhs or teachers, the Brehons or judges, the druids or priests (considered by some to have been rather magicians and teachers than priests), and the chieftains and kings of the various tribes, to approve or amend the old laws, make new laws, dispense justice, and to record their annals. The laws made in anct I., known to-day as the Brehon laws (q.v.) were, for that remote period, so wonderfully just, wise, and equitable as to win the admiration of modern law students. Again, the beautifully wrought brooches and other ornaments of the Irish of pagan days, still extant and preserved in Irish museums, reveal their progress in art and refinement in dress.

Some of the Irish are said to have been Christians when St. Patrick arrived in 432, but it is a fallacy to suppose that the country had been partly converted before then. Christianity had already been the official religion of the Rom. Empire for a cent.; the Irish and Romans had for a long time been in close contact, both commercially and in warfare; there was a constant influx of Brit. slaves and continuous intercourse between the British and the Irish—from all of which it is reasonable to suppose that Christianity was known and practised among the Irish before the coming of St. Patrick. Some of the Irish saints, such as Ailbe of Emly, Declan of Ardmore, and others, are said to have been Christians when St. Patrick came, and to have submitted to him. But the number of Christians in I. then must have been small, and there was no organised Christian Church before the time of St. Patrick. The relations between I. and Britain were very intimate. A Brit. Christian

Church had certainly been founded long before this date. The growth of Pelagianism in Britain had, before the end of the 5th cent., made it necessary for Rome to send missionaries to stamp out the heresy, and one of these missionaries, Palladius, was certainly sent to I. Christianity, however, whilst probably well known in the S., had made little progress in the N. and W., hence it was to these parts that Patrick gave his own personal attention. He himself, born in Britain, had been enslaved and had spent 7 years of early manhood amongst the Irish, hence he was familiar with their language and customs. He took with him at least 2 followers who spent their time in the S., spreading the gospel and organising the churches. His success was great, but has probably been over-rated; in any case he found great opposition, and he allowed numberless practices which did not actually run counter to the doctrines of Christianity, and which had been accepted by the Irish in pre-Christian days. The system of society made it essential that he should convert the heads of the tribes before the faith would be accepted by the tribespeople, and he succeeded in establishing a system by which native Irishmen became priests and in turn converted their brethren. Schools and churches were erected, and the see of Armagh established. I. in this way became definitely connected with the W. Church. Bishops were consecrated and the land was divided into dioceses which probably coincided with tribal divs. The Church was, however, during the cents. which followed, to adopt a very different system from that set up by Patrick. The Irish Church has to a very great extent been regarded as a monastic Church, but this was certainly not the system of St Patrick. The Church was founded on practically a personal basis; religious colonies originating from one centre became and remained daughter settlements of the parent body. The head of a religious foundation was the possessor both of spiritual and temporal rights, and frequently it came to pass that the headship of a religious foundation passed entirely into lay hands.

The monastic system was early introduced into I., although it was not until Christianity had gained firm hold on the country that the form usually associated with I. appeared. The earlier type seems to have been somewhat loose and to have led to much disorder. Further, the Irish bishops did not have any territorial jurisdiction and the consequence was that the number of bishops was very large. Each tuath, or tribe, had, however, a bishop who was recognised as an official member of the tribe and who had a considerable amount of influence and power. Judged by the standards of W. Europe the Church in I. was morally somewhat lax, but this was probably due as much to the struggle between the old and new religions as to anything else. Finian was the founder of the famous monastery at Clonard, which was the beginning of the foundation of

that series of monasteries which made I. the centre of learning for W. Europe. Scholars flocked to these monasteries, which were simply encampments of students, i.e. a series of mud huts built by the students themselves. Here they lived and provided themselves with food by their own labour, and received their learning in the open air. These monastic settlements were conducted on lines very much more severe than the earlier had been. The monks were shut off entirely from the laity, and the sexes were separated. This monastic movement seems also to have been accompanied by much missionary enterprise. Missionaries of the Celtic Church went everywhere—Columba (q.v.) to Iona, Aidan (q.v.) to Northumbria, Columbanus (q.v.) to W. Europe. In the Orkneys the Celtic Church was established, and Ireland, when discovered by the Vikings, was found to have been visited previously by missionaries of the Celtic Church. The Saxon kingdoms in the N. and centre of England owed their conversion to Irish missionaries from Iona. St Aidan became the first Bishop of Northumbria and was succeeded in Lindisfarne by 2 other Irish monks. The Irish missionaries had brought learning as well as religion, and Northumbria became the cradle of Anglo-Saxon literature. The Irish missionaries soon found themselves in opposition to those of Rome. The Rom. tonsure had probably been introduced into I. by St Patrick, but the Irish had certainly gone back to the old druidic tonsure, whilst on the matter of calculating Easter they had remained true to the Jewish method. The following were the more celebrated saints of I. and the schools with which most of them were connected: St Benignus, a native of Meath, favourite disciple of St Patrick and his successor as Archbishop of Armagh; St Brigit, who founded the most famous convent in I., at Kildare; St Ciaran, of Meath, who founded the monastery and school of Clonmacnoise on the Shannon, in which many important Irish annals were compiled; St Brendan, who founded the monastery of Clonfert; St Finian, of Moville, who founded the school of Moville (near Newtownards); St Comhgall, a native of Ulaidh, who founded in that dist. the monastery of Bangor, whose fame rivalled that of Clonard and in which many of the Irish missionaries were educ.; and St Carthach, of W. Munster, who founded the famous school at Lisamore. The few prominent names mentioned here represent but a small part of the work for Christianity performed in Europe by Irish zeal. Most of it was done by unknown monks in the many monasteries scattered over W. and central Europe. These were continually being recruited by monks from I., who for ages continued the labours of St Columbanus and St Gall. Irish influence on the Continent was the result of no transient effort, but was due to a great movement which endured for 6 cents., from the 6th to the 12th.

From the 4th to the 8th cent. the

political hist. of I. is a long story of relentless and practically uninterrupted tribal warfare. The descendants of Niall of the Nine Hostages remained Ard-ri of I. down to the beginning of the 11th cent., but were seldom powerful enough to be able to maintain peace in the country. The Church was not strong enough to perform the work of the Ard-ri, and moreover the personal character of Church gov. made the Church often a party to the quarrels of the tribes. The descendants of Niall of the Nine Hostages were divided into 2 great branches, the S. Hy Niall and the N. Hy Niall. At the beginning of the 6th cent. the Scots from Dalriada (q.v.) made their settlements in Argyllshire, and ultimately, after strenuous struggles, obtained the crown of a more or less united Scotland (*see SCOTLAND, History*). About the middle of the same cent. Tara ceased to be the residence of the Ard-ri, many legends being connected with the desertion of this centre. The records tell us only of constant wars, constant successions, and short reigns. The country was in a state of anarchy. One event alone needs to be mentioned, the attempt to rule Dalriada (Argyllshire) as a subject kingdom of the Ard-ri of I.; this attempt, however, was given up. The position of the Ard-ri was unenviable. He could command no real allegiance save that of his own immediate tribe. The army of I. consisted of the tribes commanded by their own chiefs. The chiefs owned allegiance to the Ard-ri, but allegiance of such a shadowy type that it counted for nothing. Such was the state of I. when the Vikings began a series of raids which developed into a settlement.

The first invasion of the Norsemen occurred towards the end of the 8th cent. The Norwegians were the first to come, and, aided later by the Danes, they made settlements on the E. coast. Irish writers distinguish between the natives of the 2 countries: the earlier, who came from Norway, are called Fionn-gaill ('White Foreigners') and 'Lochlanns'; the Dub-gaill ('Black Strangers') or 'Danars' came later from Denmark. The distinction between them is, however, not clearly marked and they are often confused. In popular language the invaders are collectively known as the Danes, while Eng. writers make reference to them as the Norse, or Vikings, or Ostmen. The domination of I. by the invaders for over a cent. was not altogether a misfortune, since it brought that country into closer contact with the countries of the Continent and with W. civilisation. Many of the Irish tribes fought in the armies of the Danes who invaded England. Foreign trade, especially with Scandinavia, flourished. After the middle of the 10th cent. there rose to fame in I. the great Brian Boromhe (q.v.), a Dalcais prince who defeated the Danes and forced them into the position of a subject race. After bitter struggles with the reigning dynasty Brian managed in 1002 to become Ard-ri himself, and during the 12 remaining

years of his life he ruled a peaceful and prosperous I. He strengthened justice, he made good laws, and he built schools. But he had still to face the hostility of the Danes and the jealousies of the Irish chieftains. In 1014 was fought the famous battle of Clontarf, which again broke the power of the Danes, but in which Brian himself was killed. His death was a serious blow to monarchy in I., and led

National Museum, Dublin

#### THE LISMORE CROZIER

An outstanding example of medieval Irish art believed to date from the twelfth century. The staff is of yew, and the crook is of bronze, with bosses of coloured enamel. Lismore was the site of a monastery founded by St Carthach in 633.

in the cent. or more following his death to the weakening of the central power and internecine strife. The hist. of I. from the battle of Clontarf to the Anglo-Norman invasion is a record of continual strife between the O'Briens of Munster, the O'Neills of Ulster, and the O'Connors of Connaught for the Ard-riship of I. Relations with England during this period were not intimate, but were nevertheless usually fairly cordial. The disorderly condition into which the Church in I. had fallen was to a large extent remedied at the synod of Kells in 1152, which estab. 4 archbishoprics (one of them in Dublin, which as a Danish bishopric had been

subject to Canterbury), and which did much to abolish the anarchic state of Church gov. The Church had remained, however, sufficiently strong to produce numbers of devoted clerics, aware of the need for reform. Most conspicuous among them was St Malachy (q.v.), abbot of the monastery of Bangor. Having partially restored that famous school, he was made Bishop of Connor, and by much toil revived religion there. He set himself the task of carrying out 2 reforms in particular: the first of these was the organisation of definite dioceses. This work of reform and organisation, begun 40 years previously by Gilbert, Bishop of the Norse of Limerick, and Celsus, Bishop of Armagh, and carried on by Malachy, was completed at the synod of Kells. A National Church arose, and the unity of the Church in I. was clearly estab. under a recognised primacy but with full recognition too for the various constituent elements. The other great reform to which Malachy devoted himself was the revival of the monasteries. Most of the early monastic institutions in I. were independent bodies, the Columban monasteries being the sole instance of an affiliated Order. The strict discipline of these rules had been relaxed and Malachy resolved to restore it. The Canons Regular and the Cistercians, who practised the severe discipline estab. by the Irish missionaries in Europe, were employed by Malachy to restore the old monastic spirit in I., and for that purpose he brought communities from the Continent and sent Irish students to be trained in European monasteries. The Irish had, between the 4th and 12th cents., advanced but little so far as their social conditions were concerned. A species of feudalism had grown up, but the tribal system and the Brehon laws remained in existence. When Henry II succeeded to the Eng. throne he had already planned the conquest of I. Pope Adrian IV (q.v.) had given his sanction to the idea, and had desired the conquest as a means of bringing the Irish Church into closer contact with Rome. In 1166 Dermot Macmurragh, exiled from I. because of his tyranny, and also because of the hatred he had roused by carrying off the wife of the chieftain of Breffni, arrived in Aquitaine and asked for help from Henry II. The king was at that time too much occupied with other affairs to attend to Irish matters himself, but he gave Dermot permission to raise forces from amongst his Lords of the Marches. Dermot applied to Richard de Clare, Earl of Pembroke (usually called Strongbow, q.v.), and, by promising him the hand of his daughter and the ultimate possession of his kingdom, induced that earl, whose fortunes were not at their highest level, to help him. Strongbow did not cross over until 1170, but Fitz-Stephen and Fitz-Maurice crossed with a small company of men in 1169, and began the Anglo-Norman conquest of I.

It is impossible to follow here the fortunes of the first adventurers; suffice it to say that by their superior skill and their

united efforts they restored Dermot and paved the way for the overlordship of Henry II which that king estab. when he visited I. in 1172. The kings of I. were forced to acknowledge Henry as their overlord, the country was placed under the administration of a Norman governor, the barons who had fought in I. were granted Irish lands, and the Irish Church was brought by the synod of Cashel into complete union with the Church of Rome. The Irish were, however, allowed to retain their old Brehon laws, and the Anglo-Normans were left to maintain themselves in their dominions as best they could. The hist. of I. for some time after this date is the record of continuous strife between the Norman barons attempting to extend their power and the Irish attempting to retain their customs, laws, and civilisation. The conquered ter. was known as the Pale, and the whole of I. was ruled nominally by a Norman governor. John was made Lord of I. in 1185, but soon made himself hated, as he was later in England. The real rulers of the land were the de Lacys, who had been granted huge ters. by Henry II, and who, by subinfeudating their land, introduced those great Norman families who have played such an important part in the hist. of I. During John's reign, however, Eng. power increased, as it did during the reign of Henry III. The reign of Edward I saw the power of the colonists still on the increase to such an extent that they were able to help Edward in his wars with Scotland; but although in Connaught and in Ulster the power of the English was still increasing, nevertheless the Celtic tribes were not yet utterly beaten. During the reign of Edward II Edward Bruce tried to conquer the is. and to drive the English out, but after sev. futile victories he was finally overcome and slain at the battle of Dundalk. The reign of Edward III witnessed the passing of the Statute of Kilkenny (1367), which forbade the intermarriage of the Anglo-Normans and the Irish; it also saw the creation of the earldoms of Desmond and Ormonde, added to that of Kildare. Richard II led 2 expeditions to I., with both of which he did little good; the Celtic reaction was strong and was strengthened by the baronage. One of the main results of Richard's second Irish expedition was that it allowed time for the house of Lancaster to usurp his throne. The period of Lancastrian rule was one of extreme misery for I. Henry IV could do little, Henry V was too busily occupied elsewhere to turn his attention to I., whilst Henry VI's regents did very little indeed. Richard of York was made governor of I. in 1449 for 10 years. He ingratiated himself with all parties and became extremely popular. Edward IV's reign was remarkable for nothing save its lawlessness and the fact that Tiptoft, Earl of Worcester, became governor of the is. and was responsible for much bloodshed. During the reign of Henry VII was passed the famous Poyning's (q.v.) law, which gave control of the Irish legislature to the

Eng. council, and was responsible for much contention at a later date. The Earl of Kildare espoused the cause of Lambert Simnel (who was crowned 'king' in Dublin) in 1487, but certain of the Irish, and in particular the tn of Waterford, were strong supporters of the Tudors. Henry VIII did not turn his attention to I. until fairly late in his reign. By this time the Anglo-Norman families were Irish in almost every respect. Most of them no longer acknowledged any law save that of the tribal system of anc I. But the king struck with a heavy hand, the power of the house of Kildare was broken, and the country was slowly recovered from the hands of the feudal lords. Henry himself adopted the title of King of I., and the Irish were gradually brought to look to the power of the crown for the redress of their grievances. The native chieftains were also granted titles from the crown and were encouraged to come to court as often as possible. The reign of Edward VI saw the beginning of the attempt to introduce Protestantism into I. The attempt was a failure, although it was supported by those in authority. The sincere Catholicism of the people was only too evident, and Mary had no difficulty in restoring the old faith; but the monastic lands which had been seized were not given back, and in fact Protestants from England found in Dublin during Mary's short reign a place of refuge from persecution.

We may revert here to a consideration of the hist. of the progress of the Reformation in I. in the Tudor period. Henry VIII's doctrine of his eccles. supremacy received little support in I., where there was no desire for religious innovations. In 1535 Henry appointed a commission to initiate the enforcement in I. of the Reformation. At its head was George Browne, an Eng. Augustinian friar, who had been chosen Archbishop of Dublin by the king and consecrated for that office by Cranmer, Archbishop of Canterbury, without any authority from the Pope. But the new archbishop secured only the support of the Bishop of Meath, and he quarrelled violently with the deputy viceroy, Lord Leonard Grey. In 1538 a parliament, assembled in Dublin, was required to pass 'the Act of the Supreme Head' providing severe penalties for those who obstinately refused to acknowledge the king to be head of the whole Church in I. By another Act, 'first fruits' of eccles. offices were to be paid, not to the Pope, but to the king. Henry's next step was to undertake the dissolution of the Irish monasteries and convents. There were in I. about 600 religious houses, including 70 convents. By the end of 1553 almost all those in Leinster, most of those in Munster, and some in Connaught had been suppressed. In Ulster and in remote parts of Connaught and Munster, however, monasteries continued to exist till the early 17th cent. The pretext advanced for the suppression was that they were the abodes of idolatry and superstition, whereas, in fact, the religious

houses of I. had performed a number of indispensable social services for the people, including education and hospitals. The dissolution was accompanied, in sev. cases, by violence and bloodshed, and many religious suffered imprisonment and even death for their refusal to adhere to the doctrine of the royal supremacy. In 1539 another commission was set up to find and destroy relics and to transfer images and valuable ornaments, such as golden chalices, to the king's use. Browne then tried to evangelise the more distant parts of his archdiocese, and in the result the Irish privy council asserted that 8 bishops and 2 archbishops came before them in Clonmel to take the required oath. But of bishops of papal creation only 5 'conformed,' and these were deposed for heresy by the Pope. Of the lower clergy few within the Pale took the supremacy oath, and scarcely any outside it. Outwardly I. might conform to the reformed doctrines, but at this period it was the practice in the country to enter into engagements without any intention of carrying them out.

When Mary *d.*, Elizabeth I, a champion of the Reformation, but one devoid of religious zeal, intended that the State Church of England should exercise sway over I. too. In 1560 she directed the Irish Parliament to pass 2 important Acts: the Act of Supremacy, declaring her supreme governor, both in eccles. and spiritual and in temporal matters, and denying papal jurisdiction; and the Act of Uniformity requiring the use of a Reformed Prayer Book at public worship. But this religious legislation was far from being strictly enforced anywhere in I., and in a great part of the country it was impossible to enforce it. Even where the authority of the Eng. gov. was effective the queen was careful not to provoke hostility or even rebellion by too great severity. But this moderation was not due either to humanity or to weakness on her part. Throughout her reign she directed her Irish policy to the political subjugation of I. and its reduction to uniformity with England not only in religion, but also in speech and social customs. Resistance to this policy led to persecution of the Catholics. The realisation, at length, in I. that the Reformed doctrines were closely linked with the imposition of foreign rule proved, indeed, to be a cohesive influence among the people, who hitherto had fought and died mainly in the interests of clan conflict. But now, under the goad of foreign rule, a broader patriotism grew up through the stimulus of the threat to Catholicism. Elizabeth found, therefore, for her religious policy in I. many zealous adversaries, while her supporters numbered only the few whose private interests, rather than zeal for the policy, had induced them to 'conform.' The bishops and priests who refused the Oath of Supremacy were generally deprived of their sees and livings and superseded by Englishmen or Irishmen of more pliant dispositions. But the wretched stipends

of the sees and livings were not likely to attract men who could hope for eccles. preferment in their own country. In consequence the churches were neglected and suffered to fall into ruins, and in many places no parochial duty was done. In the parts of the country, however, where the authority of the Eng. gov. was as yet only nominal, conditions were better, especially before the Desmond insurrection had devastated the S. and the O'Neill wars ruined the prosperity of Ulster.

With the accession of Queen Elizabeth the State Church was restored in I., but the most noteworthy events in Irish hist. during this period are the O'Neill and later the Geraldine rebellions. Shane O'Neill had been elected chieftain by his tribe and claimed the earldom of Tyrone, which had passed to a bastard brother, Brian O'Neill. The Eng. supported the claim of Brian, but Shane was able to keep up a continual contest with the crown until finally, in 1567, he was killed.

The crushing of the Shane O'Neill rebellion was followed in I. by a great religious revival. The counter Reformation, which was doing so much to restore Catholicism on the Continent, worked with tremendous rapidity in I., influenced and helped to a very great extent by Jesuit priests. The immediate outcome of this religious revival was the Geraldine rebellions. The second of these, led by the Earl of Desmond, was only put down after 4 years' continual struggle. The Irish were helped during this period (1579-83) by the Spaniards and the Italians, and were crushed finally with great cruelty. The rebellion had been practically confined to Munster, which was finally subdued by huge confiscations and Eng. settlements; amongst the settlers were the poet Spenser and the adventurer Raleigh. The final rebellion during Queen Elizabeth's reign broke out in 1595 under O'Neill, Earl of Tyrone. Essex, sent to quell it, made terms with its leader and returned home; but Mountjoy, by means of a series of fortresses from which he ravaged and laid waste the land, finally conquered it (1603). Tyrone admitted defeat, and was allowed to keep his lands and title. The wars in I. had of a necessity been barbarous ones, both because the English unjustifiably regarded the Irish as savages and also because I. was struggling for all that England held in greatest hate—Catholicism and the friendship of Spain. The atrocities of the time, equally ferocious on both sides, cannot be palliated, but can be understood against this conflict. The system of plantations developed during the reign of James I. The possessions of the earls of Tyrone and Tyrconnel were confiscated, and the lands of Ulster were apportioned to Scottish and Eng. settlers (mainly Presbyterians) and to other grantees, including London companies and Trinity College, Dublin. The administration of Strafford (q.v.) is the most important event of the early part of Charles I's reign. He promoted industry, law, and order; he restored the

country to something approaching prosperity, but his order was the order of repression, his discipline the discipline of the iron hand. His worst and most unjust work was the attempt to 'settle' Connaught, but before he could carry out that work he was recalled to help Charles in England (1640). In 1641 a great rebellion broke out in I., supported both by the 'old Irish' and by the Norman-Irish. It was inspired by hatred of the rule of Strafford and by the fear of what would happen under Puritan rule. Undoubtedly thousands of Protestants perished, although in a number of cases the figures have been grossly exaggerated. The situation was complicated by the outbreak of civil war in England, and the Irish sent some help to the king, who was continually intriguing with them. In 1649 the execution of the king released the parl. troops for service in I., where the young king, Charles II, had been immediately recognised. The methods of Cromwell and Ireton were thorough, and the Irish were crushed altogether. The garrisons of Wexford and Drogheda were massacred, and every priest that the Puritans found was indiscriminately slaughtered. The 'old Irish' and Norman-Irish landowners who had opposed the Commonwealth were banished W. of the Shannon 'to Hell or Connaught,' and their estates were divided up among the Cromwellian soldiers and those (many of them London merchants) who had 'adventured' money to finance the campaign. The only merits of Cromwellian rule were the restoration of order and the prosperity which followed a peace of desolation. The Catholic religion was, however, sternly repressed. After the Restoration only a minority of the old families recovered their estates, but the Rom. Catholic religion was given a certain degree of toleration, and for the greater part of the reign Ormonde ruled I. for the Eng. king. The country was on the whole peaceful, but the trade restrictions imposed were rapidly alienating the Irish people still further, and were the cause of considerable trouble at a later period.

The revolution of 1688 was the immediate sign for the outbreak of hostilities between the Catholics and Protestants of the N. of I. Londonderry and Enniskillen were besieged, and the Protestants found themselves hard set to hold their own. Londonderry remained uncaptured, whilst the besieged in Enniskillen broke out and won a victory at Newtown Butler. The siege of Londonderry is memorable for the fortitude of its inhab., who held out for nearly 4 months, repelling every attack and suffering extreme privation and, at the end, stark famine (having eaten all the horses, cats, dogs, rats, mice, tallow and starch in the tn), until some Eng. ships broke through the obstructions of the riv. and so raised the siege and saved the tn. In 1690 was fought the battle of the Boyne (q.v.), after which James II left the country and returned to France. William III also returned to England,

and the Irish rebellion was crushed by John Churchill, Duke of Marlborough, assisted by Ginkell, one of Wm's Dutch generals. Cork and Kinsale fell. The Irish were defeated at Aughrim, and finally Sarsfield (q.v.), after a magnificent defence, surrendered Limerick, and returned to France with his followers to found the famous Irish brigades. The capitulation of Limerick had, in addition to allowing the Irish freedom to enlist in the service of France, also promised toleration for the Catholics to the degree allowed during the reign of Charles II.

were allowed them. These reforms were the immediate outcome of the Amer. War of Independence. I. had to be better treated, or there was the possibility of her also breaking away. The prin. result of this war, however, was the granting of an independent parliament. The Brit. troops had perforce been withdrawn from I. for service in America; Fr. invasion seemed imminent. The Irish, Protestant and Catholic alike, formed a volunteer force to resist invasion. Then gradually they discovered their own power; led by Henry Grattan (q.v.), and practically

*British Railways*

THE GIANT'S CAUSEWAY, CO. ANTRIM

But the Penal Code, passed by a Protestant parliament, did not recognise this latter clause. The Code was a series of vindictive anti-Catholic laws, which denied to the Catholics any rights of citizenship and any ownership of property. The gov. of I. passed into the hands of a Protestant oligarchy. Many of the great landowners were never in the country, and their representatives treated the Irish peasantry with the utmost cruelty. Parliament was in the hands of the great Protestant families, and the Church under the control of absentee and often irreligious bishops. The Irish people were downtrodden, their trade repressed, and their land taken from them. Thousands of them emigrated, and the flower of the Irish nation served the enemies of England, since England refused to use their services. Towards the end of the cent., however, Catholic repression was lightened, and sev. concessions in the matter of ownership of land

under the threat of rebellion, they obtained the repeal of Poyning's law after trade restrictions had been withdrawn (1782).

The next important event was the French Revolution, which Catholic and Protestant alike hailed as the greatest blessing of the age. The United Irishmen (q.v.) were formed, Fitz-William promised that which he could not fulfil—Catholic emancipation (q.v.)—and finally the state of I. became anarchic. The United Irishmen were sternly repressed and disarmed. Ulster underwent a brutal persecution at the hands of an armed force, and was finally disarmed. In 1796 the Fr. invasion under Hoche (q.v.) had failed at Bantry Bay. In 1798 the Irish rebellion broke out. To a great extent it was a national rising. The leaders held out for Catholic emancipation and parl. reform, and the peasantry were fighting for separation from Great Britain. The battles of New Ross and Vinegar Hill

were the only two engagements of importance, and both were defeats for the rebels. A Fr. landing was a failure, since it came too late, and Pitt saw that only union could end such anarchy. But union was distrusted and disliked. It was only at enormous expense and after much bribery by means of honours that it was brought about. Grattan, ever a patriot, spoke strongly against it. In 1800, however, the Act of Union was passed, and in 1801 it became law. The Irish were to be represented in parliament by 28 Irish peers and 4 bishops, elected for life by the whole of the Irish peerage. One hundred members were to represent 1. in the House of Commons. 1. was to pay a certain amount to the Brit. exchequer, was to be given absolute free trade with Great Britain, and was to keep her judicial and executive systems, Pitt intended the Act

E.N.A.

## PEAT CUTTING IN CONNEMARA

of Union to be accompanied by a measure of Catholic emancipation, but the king (George III) pleaded his coronation oath and refused to hear of it. Finally, rather than break a pledge, understood if not definitely given, Pitt resigned (1801). Rom. Catholics were unable to sit in the House of Commons until 1829, when the Rom. Catholic Emancipation Act was passed permitting them to do so. O'Connell (q.v.) was the great Irish leader of this time. In 1846 the potato crop failed, and famine made conditions terrible in 1. About this time 1. also began to feel Amer. competition in the corn market. Great Britain adopted Free Trade, and 1., with the loss of protection for her wheat, soon found it impossible to compete with America. Measures were introduced attempting to alleviate the suffering of the small-holders, who, in many cases, were evicted by the impoverished land owners, and thousands of Irishmen emigrated to the U.S.A. and Canada. From 1864 to 1914 1. may be seen to change from a land of tillage to one of pasturage. The political unrest was aggravated during these years by the land question. Gladstone brought forward in Parliament 2 Home Rule (q.v.) Bills, one in 1886 and the other in 1893, but both were rejected. The work of the Irish leader Parnell (q.v.) in consolidating the Irish Home Rule

party deserves notice during this period. Again, sev. years later, the Liberal party under Asquith introduced a Bill for Home Rule for 1., and in 1914 this Bill received the Royal Assent. But owing to the First World War the operation of the Act was suspended. During the First World War many Irishmen volunteered and fought for Great Britain, and John Redmond (q.v.), the leader of the Irish parl. party, used all his influence to assist the Brit. cause. But trouble between the 2 countries was still brewing. In 1916 there was a rising in Dublin, and after the war and the death of John Redmond matters grew worse. The political leadership of the country had slipped from the hands of the Parliamentary party, and Sinn Féin (q.v.) was becoming the dominant force in 1. Irish representatives returned in the general election of Dec. 1918 met in an independent parliament (*Dail Eireann*) in Dublin, and affirmed the independence of the country. Guerrilla fighting began in 1. between the forces of the Crown and the supporters of Sinn Féin, and was ended by a truce in 1921, in which year a parliament for the 6 N.E. cos. of 1. was estab. by the N. Unionists. In consequence of a treaty signed on 6 Dec. 1921, dominion status was accepted for the other 26 cos., and the Irish Free State (*Saorstát Eireann*) came into being. For subsequent developments in 1. see GREAT BRITAIN; IRELAND; NORTHERN; IRELAND, REPUBLIC OF.

*Art.* The introduction of Christianity into I. gave rise to a splendid development of decorative and ornamental art, in which pre-Christian, Celtic, and Byzantine elements of style are all combined in rich and distinctive fashion. The influence of the Irish artists extended to Scotland and Northumbria. *The Book of Kells* (q.v.) and the *Lindisfarne Gospels* (q.v.) are masterpieces of this school of illumination (7th cent.). Stone crosses (see *Cross*) and beautiful metalwork are other aspects of Irish Celtic art, and the National Museum, Dublin, has many fine examples, including the Tara Brooch, the shrine and bell of St Patrick, the Cross of Cong, the Lismore Crosier, the Ardagh Chalice (see also *CELTIC ORNAMENT AND SCOTLAND* (ART)). In modern times I. has contributed a number of distinguished painters to the hist. of Brit. art. They include James Barry (1741-1806) (q.v.), Daniel Maclise (1806-70) (q.v.), Wm Mulready (1786-1863) (q.v.), Sir Martin Archer Shee (1769-1850), Sir Wm Orpen (1878-1931) (q.v.), and Sir John Lavery (1857-1941) (q.v.), while Jack Butler Yeats (q.v.), brother of the poet (d. 1957), has admirably reflected Irish life and feeling. Louis le Brocqy is notable among a number of living painters in the Rep. of I. The Royal Hibernian Academy, Dublin, performs the same national function as the London Royal Academy.

*Ireland, Church of*, was founded, according to tradition, by St Patrick, who has always been regarded as the patron saint of the country, in the 5th cent. In the 7th and 8th cents. the Irish Church was one of the most flourishing in Christendom (see *IRELAND, History and ROMAN CATHOLIC CHURCH*). Despite the outward continuity of the present C. of I. with the pre-Reformation Church, it has for cents. been the Church of only a section of the people, of whom by far the larger portion remained under papal jurisdiction. The first convocation of the Irish clergy was held in the reign of James I, the Irish articles being drawn up in 1615. These were accepted by the Irish Church in 1634. Their distinctly Calvinistic tone is indicative of the way in which the C. of I. has always inclined more in the direction of the advanced reformers than has the Church of England. During the 17th cent. its most important prelates were John Bramhall, Archbishop of Armagh, Jeremy Taylor, Bishop of Down, and Wm King, Bishop of Derry. The Act of Union of 1800 linked the Churches of England and I. into the 'United Church of England and I.', but the reformed doctrines made no progress. In 1833 the Church Temporalities Act abolished 2 of the 4 Irish archbishoprics and 8 of the 18 bishoprics. Finally, in 1869, a Bill for the disestab. of the Irish Church was passed on the

introduction of Mr Gladstone. Before the Act came into operation (1871) a synod of the Irish Church was held which declared its adherence to the auct. constitutions of the Church, and since then no doctrinal or disciplinary changes of importance have been made. The C. of I. now has about 1000 clergy, and nearly 500,000 adherents. See R. Mant, *History of the Church of Ireland*, 1840; Lee, *Irish Episcopal Succession*; T. Olden, *Church of Ireland*, 1892; L. Gougaud, *Christianity in Celtic Lands*, 1932; W. Phillips, *Church of Ireland from Earliest Times*, 1833; M. V. Ronan, *Reform in Ireland*, 1836; T. J. Johnston, J. L. Robinson, and R. W. Jackson, *A History of the Church of Ireland*, 1953.

*Ireland, National University of*, estab. at Dublin under the Irish Universities Act, 1908, and came into full working order on the dissolution of the Royal Univ. of I. on 31 Oct. 1909. It is a teaching univ. and comprises 3 constituent colleges and 1 recognised college. The constituent colleges are Univ. College, Dublin, which had its origin in the Catholic Univ. of I., founded by Cardinal (then Dr) Newman in 1851 (commenced work in 1854); Univ. College, Cork, founded in 1845 as Queen's College, Cork, and opened to students in 1849 (its name being changed in 1908), with a special faculty devoted to dairy science; and Univ. College, Galway, founded in 1845 as Queen's College, Galway, and opened to students in 1849 (its name being changed in 1908), a centre of Gaelic culture, courses being available through the medium of the Irish language in the faculties of arts, science, and commerce. St Patrick's College, Maynooth, founded in 1795, is a recognised college of N. U. of I. (recognition being granted by the Senate in 1910), and is the chief centre in I. for the training of the Catholic diocesan clergy.

Courses for degrees in the following faculties are provided in the constituent colleges: arts, philosophy and sociology, Celtic studies, science, law, medicine, engineering, architecture, commerce, general agriculture (Dublin only), dairy science (Cork only), veterinary medicine (Dublin only). The courses in the faculties of arts, philosophy and sociology, Celtic studies and science, at St Patrick's College, Maynooth, are recognised by the univ. Apart from the teaching staffs of the colleges, the univ. has no teaching staff.

*Ireland, Northern*, political div. of the U.K. of Great Britain and N. I., comprising the 6 N.E. cos. of I.: Antrim, Armagh, Down, Fermanagh, Londonderry, and Tyrone (qq.v.), including the co. bors. of Belfast and Londonderry. It is sometimes referred to as 'Ulster' (q.v.), although 3 cos. of the auct. prov. of Ulster belong to the Rep. of I. (see *CAYAN*; *DONEGAL*; and *MONAGHAN*). N. I. is bounded on the N. by the Atlantic, on the N.E. and E. by the N. Channel and the Irish Sea, and on the S. and W. by the Rep. of I. Area 5238 sq. m.; pop. (1956) 1,396,600. Cap. Belfast (q.v.).

TABLE I

Counties	Area in Statute Acres	Population
Antrim (Belfast)	702,948	237,400
Armagh (Armagh)	312,766	114,700
Belfast Co. Bor.	15,357	453,900
Down (Downpatrick)	609,035	244,500
Fermanagh (Enniskillen)	417,912	52,500
Londonderry (Londonderry)	512,576	107,800
Londonderry Co. Bor.	2,200	51,500
Tyrone (Omagh)	779,545	131,700
Total for N. Ireland	3,352,339	1,393,800

**Geography.** The coastline of N. I. is rocky and wild on the N., and has sev. deep indentations: Lough Foyle in the N., Belfast Lough in the E., and Strangford and Carlingford Loughs in the SE. The surface in general consists of volcanic plateau, and is drained by the R.s Bann, Blackwater, Foyle, Lagan, Main, and Mourne. The fertile plain, in which lies Lough Neagh (q.v.), the largest lake in the Brit. Isles, is bounded on the NE. by the hills of Antrim, and on the NW. by the Sperrin hills. In the SE. of co. Down are the Mourne Mts (q.v.), which rise to 2796 ft in Shev. Donard. Lough Erne (q.v.) bisects Co. Fermanagh NW.-SE.

**Area and Population.** The land areas (in acres) and the estimated pops. of the cos. in 1955 were as shown in Table I (assize tns given in brackets).

Vital statistics for the year 1955 were: marriages, 9513; births, 28,965; deaths, 15,407. The number of divorces, separations, and marriage nullities in 1955 was 154.

**Constitution and government.** Under the Government of Ireland Act, 1920, as amended by the Irish Free State (Consequential Provisions) Act, 1922, a separate gov. and a separate parliament were estab. for N. I. (see IRELAND, *History and Ireland, Republic of*). The partition of I. is a dominant political grievance in the Rep. of I. and has led to incidents of violence (renewed in recent years) which, however, have been condemned by the gov. in Dublin as well as by the gov. in Belfast. The constitutional position of N. I. is referred to in the Ireland Act, 1949 (of the Parliament of the U.K.), which says: 'It is hereby declared that Northern Ireland remains part of His Majesty's dominions and of the United Kingdom, and it is hereby affirmed that in no event will Northern Ireland or any part thereof cease to be part of His Majesty's dominions and of the United Kingdom without the consent of the Parliament of Northern Ireland.'

The Parliament of N. I. consists of a Senate of 24 elected senators and 2 *ex officio* senators, and a House of Commons of 52 elected members. Senators hold office for a fixed term and are elected by members of the House of Commons on a system of proportional representation.

The House of Commons lasts for 5 years, unless dissolved sooner; it is elected by universal, adult, direct suffrage (according to a system of proportional representation until 1929). The Parliament has power to legislate for N. I., except in regard to: (1) matters of imperial concern (the Crown; making of peace or war; military, naval, and air forces; treaties; titles of honour; treason; naturalisation; domicile; external trade; submarine cables; wireless; telegraphy; aerial navigation; light-houses; coinage; trade marks); and (2) certain matters 'reserved' to the Parliament of the U.K. (postal services; post office and trustee savings banks; designs for stamps). The executive power is vested in a governor, who acts on behalf of the queen. He holds office for 6 years, and is advised by ministers responsible to Parliament. In addition to its representation in its own Parliament, N. I. also returns 12 members to the Parliament of the U.K. The first sitting of the N. I. Parliament was in June 1921. At the general election of March 1958 there were returned: 37 Unionists, 7 Nationalists, 4 Labour, 1 Independent Labour, 1 Republican Labour, 1 Independent Nationalist, and 1 Independent. Labour is the official opposition.

**Agriculture.** Agriculture is of primary importance. Most farm holdings are small. The acreage devoted to the cultivation of the prin. crops in 1956 was: oats, 256,300; barley, 5030; dredge corn, 3860; wheat, 1320; rye, beans, peas, 690; potatoes, 116,320; turnips, 9990; cabbage, 3920; other crops, 6250; flax, 8430; fruit, 8860; rotation and permanent grass, 1,778,090. The numbers of livestock in 1956 were: cattle, 919,500; sheep, 889,000; pigs, 661,000; poultry, 11,549,500.

**Resources and industry.** The mineral resources of N. I. are small. Some 2500 persons are employed in mines and quarries. The chief industries are linen manuf. and shipbuilding. The value of linen goods and yarn (mostly originating in N. I.) exported from the U.K. in the year ending 30 June 1956 was £20,000,000. The N. I. linen industry exported other goods to the value of £3,250,000. Normally the textile industry employs about 100,000 persons. Some 52,000 workers are employed in engineering and ship-

building. The output capacity of the Belfast shipyards exceeds 200,000 tons per year. The aircraft industry employs about 8000 workers, and other important engineering manufs. are agric. machinery, tabulating machines, radio and gramophone equipment, and electronic equipment. The gov. encourages the expansion of industry by capital grants and the provision of gov.-built factories at low rents or on repayment terms. Total sales of electricity in 1955 amounted to 834,500,000 units. The planned capacity of generating plant in 1961-2 is 641,000 kw.

*Irish Linen Guild*

#### FLAX HARVESTING IN NORTHERN IRELAND

The flax is put into the retting dam where it will steep for about ten days.

**Commerce.** The value of imports in 1955 was £295,000,000, and of exports £267,000,000. 76.4 per cent (by value) of the total imports came from (or via) Great Britain, and 6.3 per cent from the Rep. of I. Of exports 95 per cent went to (or via) Great Britain, and 3 per cent to the Rep. of I.

**Religion.** The membership of religious bodies as recorded in the census of 1951 was: Rom. Catholics, 471,460; Presbyterians, 410,215; Church of I., 353,245; Methodists, 66,639. The Rom. Catholic Church has 1 archbishopric (Armagh, primacy of all I.) and 4 bishoprics. The Church of I., also, has 1 archbishopric (Armagh, primacy of all I.) and 4 bishoprics.

**Education.** In 1955-6 there were 1601 primary schools, with 205,712 pupils and 6240 teachers; 81 grammar schools, with 31,815 pupils and 1649 full-time teachers; 31 secondary intermediate schools, with 12,961 pupils and 522 full-time teachers; 31 technical intermediate schools, with 5341 pupils. There were also 192 centres for further education, with 3129 full-time and 30,302 part-time pupils. The Queen's Univ. (q.v.) of Belfast had 2630 students. Magee Univ. College, Londonderry (a recognised college of the Queen's Univ. since 1951), had 154 students.

**Health and social services.** The Health Services Act (Northern Ireland), 1948, provides for a comprehensive health service similar to that in operation in Great Britain. The social-security schemes in N. I. differ from those in Great Britain only in minor details.

**Justice.** N. I. has a Court of Appeal (from which an appeal lies to the House of Lords), a High Court of Justice, and a Court of Criminal Appeal. County courts have civil (up to £100) and criminal jurisdiction, and act as appellate courts from the decisions of resident magistrates. In 1935 the judicial functions of the justices of the peace were vested in permanent judicial officers called resident magistrates; justices of the peace retain their administrative functions and have a jurisdiction (out of Petty Sessions) in cases of drunkenness.

**Communications.** Roads and streets are divided into 5 classes: trunk, 348 m.; class 1, 960 m.; class 2, 1747 m.; class 3, 2761 m.; unclassified, 7814 m. Public transport services are provided by the Ulster Transport Authority, the Great N. Railway Board (which operates also in the Rep.), and the Belfast Corporation. In 1955 there were 83,542 private cars, 21,001 motor bicycles, 25,146 goods vehicles, and 22,867 agric. engines. Passenger and freight services operate between Belfast and Heysham, Liverpool, Glasgow, and Ardrossan; between Larne and Stranraer; and between Londonderry and Glasgow. Vehicle ferries operate between Larne and Preston, and Belfast and Preston. Brit. European Airways Corporation maintains services between Belfast (Nutt's Corner) and London, Liverpool, Manchester, Birmingham, Glasgow, and the Isle of Man.

**Finance.** The bulk of the taxation of N. I. is imposed and collected by the U.K. gov., which makes certain deductions and remits the balance (the Residuary Share of Reserved Taxes) to the N. I. Exchequer. The allocation of this balance is determined by the Joint Exchequer Board, which consists of a chairman appointed by the queen, and one representative each of the U.K. Treasury and the N. I. Ministry of Finance. The N. I. Parliament has limited powers of taxation, and also raises money from time to time for capital purposes by means of stock and savings certificates. The public estimates for 1956-7 were: public income, £74,262,000; expenditure, £74,207,000; contribution from U.K., £12,500,000.

*History.* N. I. is an integral part of the U.K. (q.v.), and to a large extent its hist. since 1920, when the gov. of N. I. was estab., is the hist. of Great Britain (q.v.). A number of distinctive features are, however, worthy of mention here.

The N. I. Parliament met for the first time in June 1921. The Unionist party (in favour of continued union with Britain, and with a strongly Protestant membership) had a large majority; it has retained a substantial majority up to the present

(1940), when he was succeeded by J. M. Andrews. Craigavon was a fervent champion of continued union with Britain, and during the early years of the Irish Free State, when civil strife spread over the border into N. I., his forceful character had an immense and steady influence on N. I. politics. In 1929 proportional representation (by which the Parliaments of 1921 and 1925 had been elected) was abolished. Various Acts of the Parliament at Westminster, in 1928, 1932,

*Irish Linen Guild*

#### BLEACHING IRISH LINEN

day (1958). The Unionist party has all along included people bound together primarily by their view on the importance of the Brit. connection, but often differing in their views on other major issues. In general Unionist domestic policy can be approximated to progressive Eng. conservatism, though there are differences. In recent years the growth of a N. I. Labour party, also pledged to retain the Brit. link but far more radical in its other views than the Unionists, has tended to narrow the Unionist membership slightly. In the 1958 general election the Unionists again won a large majority, but the N. I. Labour party won some seats in Belfast.

N. I.'s first premier was Sir James Craig, subsequently Viscount Craigavon (q.v.); he held office until his death

1945, and 1947, have removed some of the restrictions put on the N. I. Parliament by the original Act of 1920.

N. I. was severely hit by the depression of the 1930's, and unemployment in Ulster remained high until 1939. N. I. announced her unity with Great Britain in the Second World War on 4 Sept. 1939, and many of the leading military figures on the Brit. side (e.g. Alanbrooke, Alexander, Auchinleck, q.v.) were Ulstermen. N. I.'s agriculture and industries contributed substantially to the Brit. war effort, and for the first time for many years there was full employment. In 1943 Sir Basil Brooke became premier; he has held office ever since, being created Viscount Brookborough (q.v.) in 1952.

After the Second World War, N. I.

like the U.K., enacted legislation in the sphere of health, housing, etc., which transformed N. I. into a 'welfare state' after the Brit. pattern. During the 1950's unemployment in N. I. increased considerably, the percentage of unemployment being higher there than elsewhere in the U.K. Strenuous efforts have been made to persuade new industries to build factories in the area, Lord Chandos (q.v.) being, since 1955, chairman of the Advisory Development Council for N. I.

Ireland, Republic of (Irish, Poblacht na hÉireann), independent rep., comprising the whole of I. (q.v.) except for the 6 N.E. cos. (see IRELAND, NORTHERN). From

*Irish Tourist Association*

THE RIVER LEE AT CORK

Since the end of the Second World War the Irish Republican Army (q.v.) has caused a number of incidents in N. I. and there have been some fatal casualties on both sides. Except in the few known anti-partitionist areas of N. I., the effect of these raids has probably been further to harden N. I. public opinion against any agreement with the Rep. of Ireland which might involve a weakening of her ties with Britain. Ever since 1920, however, there have been close economic links between N. I. and the Free State (later the Rep.), and the two govts. have frequently co-operated on economic matters.

N. I. has welcomed royal visitors with great enthusiasm on sev. occasions; notable royal visits include those of King George VI in 1937 and 1945, and of Queen Elizabeth II in 1953.

See D. A. Chart, *History of Northern*

1922 to 1937 it was known as the Irish Free State (Irish, *Saorstát Éireann*). In the constitution of 1937 it was given the name Éire (see *Constitution and government* below). It is, also, sometimes referred to colloquially as 'Southern Ireland' (in distinction to N. I.), although in fact it includes the most northerly part of I. The Rep. of I. is bounded on the NW., W., and S. by the Atlantic, on the SE. by St George's Channel, on the E. by the Irish Sea, and on the NE. by the political div. of N. I. Area 26,600 sq. m.; pop. (1956) 2,898,264. Cap. Dublin (q.v.).

*Geography.* There are no dominating mt ranges but there are detached groups of mts; these occur for the most part in coastal regions. The highest elevation is some 3000 ft., while the average height is about 400 ft. The chief groups are the Wicklow Mts (q.v.) (Lugnaquilla, 3039

ft.); the Derryveagh Mts (q.v.) in the NW. (Errigal, 2466 ft.); the Macgillcuddy Reeks (q.v.) in the SW. (Carrantuohill, 3414 ft.); the Galtees in Tipperary and Limerick; the Knockmealdown Mts (q.v.) in Tipperary and Waterford; the Comeragh Mts (2597 ft) in Waterford; Slieve Bloom in Laois and Offaly; and the Twelve Pins (2395 ft) in Connemara. The central part of the country consists of a wide plain, about 250 ft in elevation, in which there are many morasses, the largest of these is the Bog of Allen (q.v.). These morasses are not unhealthy and produce large quantities of turf (peat), which is used for fuel. The lakes of I. are numerous. Those lying in the centre are Derravaragh, Ennelt, and Owel; Allen, Roe, and Derg (q.v.v.) are connected by the R. Shannon; to the NW. are Melvin, Gill, Gara, and Conn; and on the borders of Mayo and Galway are the great loughs, Mask and Corrib. The lakes of Killybeg (q.v.) are renowned for their beautiful setting. The country is watered by many rivers. The chief of these is the Shannon (q.v.), the largest riv. in I., which rises in the NW. and flows in an arc to the Atlantic in the SW. The rivers flowing to the W. are for the most part short and rapid and of little use for navigation. Along the E. coast the principal rivers are the Slaney, flowing from the Wicklow Mts into Wexford harbour; the Avoca (q.v.); the Liffey (q.v.); and the Boyne (q.v.). The SE. dist. is drained by the Nore, Barrow, and Suir (q.v.), which unite in Waterford harbour. Other important rivers of the S. coast are the Blackwater, the Lee, and the Bandon (q.v.v.). The coastline of the N., W., and S. is very much broken up with inlets, loughs, and rivers. The chief inlets of the NW. are the bays of Donegal and Sligo. From Malin Head (the most northerly point of I.) in Donegal, westwards and southwards, the coast is fringed with many small is.; from N. to S. are Tory Is., Aran Is., the Inishkea Is., Achill Is., the Aran Is., and Valentia Is. Along the W. coast mts border closely on the sea, giving a rugged and wild appearance; the largest inlets in the W. are Clew Bay, Killary Harbour, Killybeg Bay, Galway Bay, the mouth of the R. Shannon, Dingle Bay, the mouth of the Kenmare R., and Bantry Bay. The S. coast, not so much fretted as the N. and W., contains the fine harbours of Cork and Waterford. The E. coast is still more uniform in character, but contains the inlets of Wexford harbour, Dublin Bay, and Dundalk Bay.

**Climate.** The climate of the Rep. of I. resembles that of Great Britain, but is more equable. It is greatly influenced by the Gulf Stream and the SW. winds. In Great Britain the W. mts present a barrier to the SW. winds, but the Rep. of I. has no mt ridge lying N.-S. and consequently has a heavy rainfall fairly evenly distributed. This accounts for its frequently luxuriant vegetation (whence the name 'Emerald Isle'). The mean temp. in Jan. is seldom below 40°, while in July

the extreme mean temps. are 58° in the N. and 60° inland.

**Area and population** (see Table II). The total pop. shown in censuses since 1926 has been: 1926, 2,971,992; 1936, 2,968,420; 1946, 2,995,107; 1951, 2,960,593; 1956, 2,898,264. According to the preliminary report of the 1956 census, the number of births in the intercensal period 1951-6 exceeded the number of deaths by 134,623, whereas the total pop. declined by 65,771. The net emigration from the Rep. of I. during the period was thus 200,394. The cos. with the greatest rates of net emigration were (in order) Leitrim, Donegal, Monaghan, Mayo, Wicklow, Cavan, Sligo, Longford, Roscommon, Clare, and Tipperary.

**Constitution and government.** The independent status of I. was affirmed in Jan. 1919 by a National Parliament (*Dáil Éireann*) elected in Dec. 1918 (see *DÁIL ÉIREANN: HOME RULE: IRELAND, History; SINN Féin*). According to Brit. law, however, I. remained part of the U.K. In 1920 an Act of the U.K. Parliament provided for the setting up of separate parliaments for 'N. I.' (the 6 NE. cos.) and 'S. I.' (the remaining 26 cos.). A N. I. Parliament was duly elected on 24 May 1921, but in the rest of the country the Act remained inoperative. On 6 Dec. 1921 a treaty was signed between Great Britain and the representatives of *Dáil Éireann*, by which dominion status was accepted for I., subject to the right of N. I. to opt out. As a result the Irish Free State (*Saorstát Éireann*) came into being, its ter. being that of the 26 cos. In Dec. 1925 the boundary between the Irish Free State and N. I. was fixed by an agreement between Great Britain, the Irish Free State, and N. I. Subsequently the constitutional links between the Irish Free State and the U.K. were gradually removed by the Free State Parliament. In 1937 a new constitution gave the state a republican form of gov., but the state continued in association with the states of the Brit. Commonwealth until 18 April 1949 when, on the coming into force of the Republic of Ireland Act, 1948, this association was terminated, and the description of the state was declared to be the Rep. of I.

The constitution of 1937 is still the fundamental law of the state. It was approved by *Dáil Éireann* on 14 June 1937, and was enacted by means of a plebiscite on 1 July 1937. It gives the state the ancient name of Éire, or, in the Eng. language, I. The constitution applies in theory to the whole of I., but it provides that, pending the reintegration of the national ter., the laws enacted by the Parliament estab. by the constitution shall have the same area and extent of application as those of the Irish Free State. The state is declared to be sovereign, independent, and democratic. The right is affirmed of the Irish nation to choose its own form of gov., to determine its relations with other nations, and

to develop its life, political, economic, and cultural, in accordance with its own genius and traditions.

The State recognises the family as the natural, primary, and fundamental unit group of society, possessing inalienable and imprescriptible rights antecedent and superior to all positive law. Parents have an acknowledged right and duty to provide for the education of their children. The rights of citizens to personal liberty, free expression of opinion, peaceable assembly, and the formation of associations and unions are safeguarded. Freedom of conscience and freedom in the practice and profession of religion are,

subject to public order and morality, guaranteed to every citizen. No religion may be endowed or subjected to discriminatory disability. The special position of the Rom. Catholic Church, as the guardian of the faith professed by the majority of the citizens, is recognised, but other religious denominations existing at the time of the coming into operation of the constitution are also recognised. The constitution sets forth certain principles of social policy, but these are intended for the general guidance of the National Parliament, and are not cognisable by the law courts. The National Parliament is called the *Oireachtas* (q.v.),

and consists of the President of the Rep. and 2 Houses: a House of Representatives called *Dáil Éireann* and a Senate called *Seanad Éireann*. Amendments of the constitution can be effected only with the approval of the people given at a referendum. Irish is the first official language of the state, but English is recognised as a second official language.

**Local government.** There are 27 administrative cos. and 4 co. bors. The co. councils manage co. affairs generally, and have power to levy rates, borrow money, and hold property. The powers of co. bor. councils are similar. The administrative cos. include the urb. co. dists., which are urb. areas that have been constituted sanitary dists. Each such dist. has an elected council to administer the Acts relating to sanitary, housing, and urb. road services, as well as being the sole rating authority within its area. There are 56 urb. sanitary dists. as well as 28 tns whose elected tn commissioners exercise certain minor functions. The local gov. bodies are administered by a system which combines elective bodies with officials called managers. The co. manager is the manager for every elective body in the co.; he is a paid official, of wide powers, whose removal from office is subject to the sanction of the central authority. Elections to local councils are held according to the principle of proportional representation by means of the single transferable vote. Women are eligible for election in the same way as men. A central body called the Local Appointments Commission is charged with the duty of selecting suitable persons to be appointed by local authorities to chief executive offices, professional and technical offices, and certain other offices.

**Political parties.** The largest political parties are *Fianna Fáil* and *Fine Gael* (q.v.). Other parties are the Labour party, which originated with the addition of political functions to the T.U.C. in 1912, and became a separate body in 1930; *Clann na Poblachta* (q.v.); *Clann na Talmhan*, the Farmers' party, founded in 1938; and the new *Sinn Féin* party.

**Agriculture, etc.** The country is predominantly agric. The acreage devoted to the prin. crops in 1957 was: wheat, 396,900; malting barley, 111,500; other barley, 203,500; oats, 455,300; rye, 2700; potatoes, 263,500; turnips, 108,700; sugar beet, 70,900; cabbage, kale, etc., 54,400; flax, 400; hay, 1,944,700; fruit, 12,300. The area under pasture was 3,062,200 ac. The total acreage given to

crops and pastures was 11,765,000, an increase of 83,600 ac. on 1956. The figures for live-stock on 1 June 1957 were (1956 figures given in brackets): milch cows, 1,232,200 (1,186,500); heifers in calf, 118,600 (109,500); bulls, 18,100 (19,000); other cattle, 3,083,700 (3,221,500); horses, 260,700 (276,400); sheep, 3,723,400 (3,439,300); pigs, 906,700 (747,100); turkeys, 1,285,800 (1,527,000); geese, 492,600 (540,500); ducks, 741,300 (767,300); other fowl, 12,406,700 (13,627,200). In 1955 7614 persons were engaged in fishing, and there were 645 motor-, 582 sail-, and 1537 row-boats. The value of fisheries in the same year was: demersal fish, £593,140 (193,916 cwt.); pelagic fish, £93,005 (109,603 cwt.); shell fish, £196,103.

**Resources and industry.** The mineral produce of Rep. of I. is small; gypsum, marble, slate, and limestone are quarried, and minor quantities of coal, copper, iron, lead, and barytes are found. There are large supplies of turf (peat). The gross value of output for the prin. industries in 1954 was: grain milling, etc., £31,390,816; tobacco, £30,567,822; butter (creamery), cheese, milk products, £30,192,846; bacon, etc., £26,327,806; assembly and repair of motor vehicles, £16,875,849; bread, biscuits, etc., £15,417,934; sugar, cocoa, chocolate, etc., £15,367,527; brewing, £13,190,659; clothing (factories), £12,444,320; woollen and worsted (excluding clothing), £11,372,394; slaughtering, etc. (excluding bacon), £11,050,616; metal trades, £9,192,095; printing, publishing, £8,580,591; paper, etc., £7,702,588; hosiery, £6,634,581; boot and shoe (factories), £6,273,537; wood and cork manufs. (excluding furniture), £6,165,072; structural clay, asbestos, cement, concrete products, etc., £5,730,994; electrical machinery, etc., £4,722,476; miscellaneous textile manufs., £4,692,853; leather, £4,657,839; oil, paint, ink, polish, £4,282,673; linen, cotton, £4,044,027; fertiliser, £4,029,408; preserved foods, £3,545,896; furniture, etc., £3,510,193; railway equipment, £2,801,658; chemicals, £1,915,004; butter blending, margarine, etc., £1,833,915; glass, china, etc., £1,818,712; aerated and mineral waters, £1,728,888; machinery (other than electrical), £1,656,093; malting, £1,616,834; distilling, £1,504,165. Electrical resources (both hydro-electric and from turf-fired generators) are being extensively developed.

**Commerce.** The value of imports and exports of merchandise for 3 years was:

TABLE III

	1955 £	1956 £	1957 £
Imports	207,700,000	182,800,000	184,800,000
Total exports	110,900,000	108,100,000	131,200,000

The values of the prin. types of merchandise in 1955 were:

TABLE IV

	Imports £	Domestic Exports £
Live animals	4,067,923	44,617,474
Food, drink, tobacco	41,946,990	34,671,010
Other raw materials and manufs.	151,000,421	22,211,677

The distribution of external trade in 1957 was:

Canada . . . . .	3,738,223	786,507

Trade with the U.K. in 1956 (Brit. Board of Trade returns) was: imports to U.K., £89,748,807; exports from U.K., £103,296,842; re-exports from U.K., £5,796,499.

**Religion.** Religious affiliations were not enumerated in the census of 1956. According to the census of 1946 they were: Rom. Catholics, 2,786,033; Protestant Episcopalians, 124,829; Presbyterians, 23,870; Methodists, 8355; other professions, 12,020. In 1955 the Society of Friends had 830 members. The Rom. Catholic Church has archbishoprics of Dublin (primacy of I.), Cashel, and Tuam, and bishoprics of Meath, Ardagh and Clonmacnoise, Clogher (cathedral in Monaghan), Kilmore, Raphoe, Clonfert, Elphin, Ferns, Galway and Kilmacduagh, Kildare and Leighlin, Ossory, Cloyne, Cork, Kerry, Killaloe, Limerick, Waterford and Lismore, Achonry, Killala, and Ross. The Church of I. (Protestant Episcopalians) has an archbishopric of Dublin (primacy of I.), and bishoprics of Meath, Kilmore, Tuam, Ossory, Cashel, Cork, Killaloe, and Limerick. *See also Constitution and government above.*

**Education.** Elementary education is given in the national schools and is free. In 1955 there were 4872 national schools, with some 479,500 pupils and 13,900 teachers. State-aided training colleges numbered 6. Since the estab. of the state the Irish language has formed an essential part of the curriculum for schools subsidised by the gov. Secondary schools are under private control, many of them being conducted by religious orders. Schools receiving state grants are open to inspection by inspectors of the Dept of Education. The number of recognised secondary schools in 1955-6 was 474, attended by 59,306 pupils; 246 vocational schools had 90,777 pupils in 1954-5; they were maintained partly by the rates and partly by gov. grants. The estimated state expenditure for these centres in 1956-7 was £1,179,510. Education in agric. science is provided by the univs., by the Dept of Agriculture, and by the co. committees of agriculture. Univ. education is given at the univ. of Dublin Trinity College, q.v.), founded in 1591, and at the National Univ. of I., founded in Dublin in 1909, which has

constituent colleges at Dublin, Cork, and Galway. St Patrick's College, Maynooth, is also a college of the National Univ. Univ. statistics for 1955-6 were:

judges, and has appellate jurisdiction from all decisions of the High Court, and on questions of law from all decisions of the Circuit Court in workmen's compensation

*Health and social services.* Persons unable to provide for medical attention from their own resources are entitled to free general practitioner, specialist, and hospital services (including medicines and appliances, and maternity and child services). Persons in the 'middle income group' (insured persons, those whose yearly means are less than £600, and farmers whose property has a rateable valuation of £50 or less) are entitled to free specialist, maternity, infant welfare, and mental hospital services, and to hospital treatment at a charge not exceeding 6 shillings per day. Hospital treatment for T.B. and certain other infectious diseases is free to all sections of the community. Pupils of national schools have free health services, and there are free child welfare clinics (for children under 6) in many urb. areas. Insurance services were unified by the Social Welfare Act, 1952. There is a gov. department of social welfare under the direction of a minister. Children's allowances are payable for the second and each subsequent child in a family. In addition to insurance benefits there are the following assistance services (subject to means and, sometimes, residence tests): non-contributory widows' and orphans' pensions; old age pensions, payable at 70; blind pensions, payable at 21; unemployment assistance to those not eligible for unemployment benefit. A person unable to provide the necessities of life for himself is eligible for public assistance.

*Justice.* Judges are appointed by the president on the advice of the gov.; they are independent in the exercise of their judicial functions, and their remuneration may not be reduced during their terms of office. A judge may be removed from office only for stated misbehaviour or incapacity, and then only on resolutions passed by both Houses of the Oireachtas. Judges of the Supreme, High, and Circuit Courts are appointed from among practising barristers; judges of the District Court may be appointed from among practising barristers or practising solicitors. The jurisdiction and organisation of the courts are dealt with in the Courts of Justice Acts, 1924-53.

The Supreme Court consists of the Chief Justice (who is *ex officio* an additional judge of the High Court) and 4 other

cases. A bill which has been passed by both Houses of the Oireachtas may be referred to the Supreme Court by the president (after consultation with the Council of State) for a decision on the constitutionality of the bill or any of its provisions. The High Court consists of a president (who is *ex officio* an additional judge of the Supreme Court) and 6 other judges, and has full original jurisdiction in and power to determine all matters and questions, whether of law or fact, civil or criminal. It has original jurisdiction in matters touching the constitutionality of any law, and on circuit acts as an appeal court from the Circuit Court. There is also a Court of Criminal Appeal (consisting of a judge of the Supreme Court and 2 judges of the High Court), and there is a Central Criminal Court (consisting of a judge of the High Court).

The country is divided into circuits for the purposes of the Circuit Court, the president of which is *ex officio* an additional judge of the High Court. The Circuit Court has jurisdiction in civil matters up to £600 in contract and tort and £2000 in equity (but with the consent of the parties its jurisdiction is unlimited), and in criminal matters has jurisdiction in all cases except treason, murder, piracy, and allied offences. It acts also as an appeal court from the District Court. The District Court has a summary jurisdiction in minor criminal cases and in civil cases (except for slander, libel, seduction, slander of title, malicious prosecution, and false imprisonment) where the claim does not exceed £50. Criminal cases (except minor cases) are tried by a judge and a jury of 12; the verdict of a jury must be unanimous. Where a jury is used in a civil case the agreement of 9 members is sufficient.

*Defence.* Subject to the provisions of the Defence Act, 1954, and under the direction of the President of the Rep., the defence forces are controlled by the gov. through the minister for defence. He is advised by a council of defence. The defence estimates for 1956-7 provided for 25,000 all ranks. Recruitment is on a voluntary basis. Minimum service in the army is for 3 years, with 6 years on the reserve. Enlistment in the navy is for 6 years, with 6 years on the reserve. The naval service has 3 corvettes: *Macha*, *Cliona*, and *Maev*. There is an Army

Air Corps, and there is a part-time force called *Forsa Cosanta Aitiuill* (F.C.A.).

**Communications.** The net tonnage in foreign trade in 1955 was: entered, 9852 vessels of 8,987,938 net tons; cleared, 9903 vessels of 9,017,593 tons. There are 566 m. of inland navigation, including the Grand Canal (208 m.), the Shannon navigation (150 m.), and the Royal Canal (96 m.). In 1955 there were 50,377 m. of public roads, comprising 9855 m. of main roads, 39,501 m. of co. roads, and 1021 m. of co. bor. and urb. roads. In 1955 there were 127,511 private motor cars, 40,175 commercial goods vehicles, 6314

in circulation. The Bank of I. (founded 1783) had, on 31 Dec. 1955, a capital of £2,769,230. Other banks are the Hibernian Bank, the Munster and Leinster Bank, the Provincial Bank of I., the Royal Bank, the Ulster Bank, the N. Bank, the National City Bank (affiliated to the Bank of I.), and the National Bank. (See Table VII, page 161.)

**National flag and anthem.** The national flag is green, white, and orange (in vertical bands). The national anthem is *A Soldier's Song*.

**History, from the institution of the Irish Free State in 1922.** (For the hist. of

*Bord Fáilte Éireann*

#### THE ROCK OF CASHEL, COUNTY TIPPERARY

The buildings on the rock include a round tower, Cormac's Chapel, a cathedral dating from Norman times, and a medieval castle and hall.

public service vehicles, 21,436 motor bicycles, and 40,175 agric. tractors. The length of railway track in 1955 was 2259 m., and the railways carried 17,240,418 passengers, 3,153,254 tons of merchandise, and 843,905 live-stock. Public transport services are provided mainly by *Córas Iompair Éireann* (C.I.E.) and the Great N. Railway Board (acquired jointly by the govs. of N. I. and the Rep. in 1953). Services operated by Aer Lingus (which has regular flights between Dublin and Shannon, and various cities of Great Britain and continental Europe) carried 402,255 passengers, 13,338,360 lb. of cargo, and 3,632,710 lb. of mail in the year ended Mar. 1956. An Irish transatlantic air service, Aerlínte, was inaugurated in April 1958. It is operated in conjunction with the Amer. Seaboard and W. Airlines.

**Finance.** The unit of currency is the Irish pound, which has the same value as the pound sterling. There is a distinctive Irish currency, in the same denominations as Eng. currency. Eng. currency is also

I. prior to 1922 *see* IRELAND.) The Anglo-Irish treaty of Dec. 1921, was ratified by Dáil Éireann in Jan. 1922 and a provisional gov. of the Irish Free State was set up. The first task of the new gov. was to settle the civil disturbances which had resulted from the refusal of a minority of the Sinn Féin (q.v., and *see* IRISH REPUBLICAN ARMY) leaders to accept the provisions of the treaty. After a period of guerilla fighting the 'Irregulars' were suppressed, but during the trouble, on 1 Aug. 1922, Arthur Griffith (q.v.), the president of the executive council, died, and 10 days later Michael Collins (q.v.) was assassinated. Mr W. T. Cosgrave (q.v.) then became head of the executive, and Mr T. M. Healy (q.v.) was nominated as governor-general; Mr Healy was succeeded in 1928 by Mr James McNeill. Mr Cosgrave's pro-treaty party (*see* FINE GAEL) remained in power until 1932. The Republican party (*see* FIANNA FÁIL) of Mr de Valera (q.v.) put forward candidates at parl. elections, but these, when successful, could not sit in the Dáil

because of their refusal to take the Oath of Allegiance to the Crown. In 1927 the Dáil passed an Electoral Amendment Act making it necessary for parl. candidates to subscribe to the Oath in order to be eligible for election. The Fianna Fáil candidates thereupon took the Oath, declaring beforehand that they regarded it as an 'empty formula.' After the general election of Feb. 1932, the Fianna Fáil party, by uniting with Labour and Independent members, secured a majority in the Dáil, and a gov. under Mr de Valera's leadership took office. A bill

commutation of the annuities, the special trading duties were amended, and the Brit. Gov. relinquished the rights in the Irish naval ports (such as Cóbh and Lough Swilly) which it had been given by the treaty of 1921.

In 1935 the Dáil passed bills to abolish the Senate and univ. representation. The governor-general was replaced by a seneschal. These matters were, however, reconsidered before a new constitution (see above) was framed in 1937. The new constitution declared I. to be a sovereign, independent state; no mention was made

TABLE VII

	1956-7 Estimates
<i>Receipts</i>	£
Customs	43,255,000
Special import levy	3,000,000
Income, profit, super taxes	28,234,000
Excise	18,265,000
Post office	7,700,000
Stamp duties	1,875,000
Estate, etc., duties	2,850,000
Motor vehicle duties	5,750,000
<b>Total</b>	<b>121,791,000</b>
<i>Expenditure</i>	£
Agriculture, land division, etc.	14,827,000
Education, science, art	12,630,000
Social welfare	20,969,000
Debt service	19,673,000
Post office	7,200,000
Police	4,019,000
Army and army pensions	8,664,000
Superannuation	3,227,000
Food subsidies	8,184,000
<b>Total</b>	<b>132,791,000</b>

was introduced to abolish the Oath of Allegiance; it was passed by the Dáil but was rejected by the Senate. A more serious issue was the gov.'s decision not to continue the payment to Great Britain of the Land Annuities, and its refusal to submit the matter to arbitration by a Commonwealth tribunal. These annuities originated in the various Land Purchase Acts, under which Irish tenants were enabled to purchase their holdings through loans made by the creation of land stock. The ann. sum due was £3,000,000. The Brit. Gov. endeavoured to collect the money by imposing tariff duties on Free State exports to the U.K., and the Free State retaliated with duties on U.K. imports. While this 'economic war' was going on, the Free State Gov. initiated plans aiming at the estab. of economic self-sufficiency. The question of the Land Annuities was settled in April 1938 by an agreement signed in London (after negotiations between Mr de Valera and Mr Neville Chamberlain), under which the Irish Gov. paid £10,000,000 in

of the Crown, but the External Relations Act of 1938 remained in force, giving the Crown certain functions in the concluding of treaties and the accrediting of diplomatic representatives. The govs. of the U.K. and the dominions agreed that the constitution should not effect a fundamental alteration in the position of I. in the Commonwealth. When the Second World War broke out, the Irish Gov. declared the neutrality of the state, a position which was maintained throughout the war. A large number of Irish men and women from the 26 cos., however, joined the Brit. forces, and many others found war work in the U.K. The last formal links with the Brit. Commonwealth were severed in April 1949 by the coming into force of the Republic of Ireland Act, 1948. The *Taoiseach*, Mr J. A. Costello (q.v.)—whose coalition gov. had succeeded the Fianna Fáil administration in 1948—had previously made it clear that this step was being taken without any feelings of ill-will towards the Commonwealth or the Crown, and

the Brit. Prime Minister, Mr Attlee, had pledged that Great Britain would not treat the Rep. of I. as a foreign country or her citizens as foreigners. The Ireland Act, 1949 (of the U.K. parliament), subsequently recognised the secession of the Rep. of I. from dominion status, and confirmed citizens of the Rep. in the rights which they had hitherto enjoyed in the U.K. In 1951 Mr Costello was defeated at the polls by Mr de Valera's Fianna Fáil party, but was again returned to power in the general election of 1954. At the general election of Mar. 1957 Mr Costello was defeated and Mr de Valera again became *Taoiseach*.

Minor, and in early youth a disciple of Polycarp (q.v.). He was a priest of the church at Lyons under Pothinus, its bishop, and at his martyrdom in 177, in the persecutions of Marcus Aurelius, succeeded to the see which he held for 25 years. He laboured as a missionary among the pagan Gauls, but is best known for his attempts to mediate between the Pope and the churches of Asia Minor in their dispute about the proper date of Easter, and for his opposition to the Gnostics (q.v.) and the Valentinians. The earliest account of his martyrdom under Severus is that of Gregory of Tours, and is probably a mistake. Of his

**Ireland Island, see BERMUDAS.**

**Irenaeus**, St (c. 120-203), Bishop of Lyons (Lugdunum), b. Smyrna, Asia

Minor, a few fragments of *Adversus Haereses*. In the original Greek, and a barbarous Lat. trans. of it are all that remain. See editions of his works by Erasmus, 1526; A. Sieren, 1848-53; W. W. Harvey, 1857; and in Clark's Ante-Nicene Library; and Le P. Salvator Herrera, *St Irénée de Lyon évêque*, 1920; L. Spikowski, *La Doctrine de l'église dans St Irénée*, 1926; S. Lundström, *Studien zur lateinischen Irenaeus Übersetzung*, 1943.

**Irene**: 1. (c. 752-803), Byzantine empress. She came from a talented but impoverished Athenian family, and married Leo IV in 769. On the death of Leo (780) she ruled over the empire as regent, her son, Constantine VI, being only 10 years of age. She restored orthodox image worship. Constantine was proclaimed sole ruler by the soldiers in 790, but I. plotted against her son, and had his eyes put out. A marriage between herself and Charlemagne was at one time a possibility. From 797 to 802 I. ruled alone, but in 802 she was banished to Lesbos, Nicephorus, her treasurer, being placed on the throne.

2. Goddess of Peace, daughter of Zeus and Themis, worshipped at Rome (as Pax) and at Athens.

**Ireton, Henry** (1611-51), Parliamentarian general, b. Altenborough, Notts, graduated at Cambridge Univ., 1629, and studied law. Married Cromwell's daughter, Bridget, and acquired great influence in the Parliamentarian party. Took an active part in the Civil war, on the outbreak of which in 1642 he was nominated captain of a troop of horse to be raised at Nottingham, near which in his estates were situated. In 1645 he became Commissary General of the Horse in the New Model Army. He signed the warrant for the execution of Charles I. In 1649 he went to Ireland as Cromwell's deputy. He d. of fever when besieging Limerick. See life by R. W. Ramsey, 1949.

**Iria**, see **VOGHERA**.

**Iria Flavia**, see **SANTIAGO DE COMPOSTELA**.

**Iriarte, Tomás de** (1805-91), Sp. poet, b. Orotava, Tenerife Is. He began his literary career by the trans. of Fr. plays, publishing his first original comedy, *Hacer que hacemos*, in 1770. In 1771 he became official translator in the foreign office at Madrid, and in 1776 keeper of the records in the War Office. A dull didactic poem, *La Música* (1780, Eng. trans., 1807), inspired by Haydn, was much admired, but his fame rests mainly on his *Fabulas Literarias* (1782, Eng. trans., 1806), 2 of which, *The Donkey Flautist* and *The Dancing Bear*, are especially celebrated. See E. Cotarelo y Mori, *Iriarte y su época*, 1897.

**Iridaceae**, family of monocotyledonous plants, consisting of nearly 1000 species, which flourish in temperate and tropical lands. They are usually herbaceous plants of such beauty as to justify their cultivation for ornament alone. Genera include *Acidanthera*, *Anthylozys*, *Babiana*, *Crococinia*, *Crocus*, *Dierama*, *Ferraria*, *Freesia*, *Gladiolus*, *Iris*, *Ixia*, *Schizostylis*, *Spazaris*, *Tigridia*, *Tritonia*, *Watsonia*, etc.

**Iridium**, one of the metals of the platinum group. Its symbol is Ir, its atomic number 77, and its atomic weight 193.1. It occurs as an alloy of platinum, and also of osmium in the Urals, Brazil, and elsewhere. It is fusible only with difficulty, extremely insoluble (in the massive form it is not attacked by *aqua regia*), and separable from its allied elements only with difficulty. The best method for its preparation is that devised by St. Claire Deville and Debray. This consists in fusing osmiridium with zinc, distilling off the latter so as to leave a porous mass. This is powdered, mixed with barium nitrate, and ignited. The osmium is converted into barium osmate, and the Ir. into its oxide. On boiling with nitric acid the osmium is volatilised as the tetroxide, while the Ir. is obtained in solution from which the double ammonium chloride can be prepared. This, on ignition, gives Ir. in a spongy form, which, on fusion with lead and subsequent treatment with nitric acid, gives the pure metal. Ir. is used for pointing gold pen-nibs, for electrical sparking contacts, and for making standard measures. Its compounds resemble those of platinum (q.v.).

**Iridosmine**, see **OSMIRIDIUM**.

**Iriga**, tn of the prov. of Camarines Sur, Luzon, Philippine Is. The chief products are rice, Indian corn, and abaca. Pop. 42,049.

**Iris** (Gk 'rainbow,' of which she is the personification), daughter of Thaumias by Electra, and sister of the Harpies. She appears in the *Iliad* as messenger of the gods, but is not mentioned in the *Odyssey*. Most of the early poets represent her as a virgin deity, but Alcaeus describes her as the wife of Zephyrus and mother of Eros.

**Iris**, one of the larger of the asteroids (q.v.), first discovered in 1801 and 1802.

**Iris**, family Iridaceae, genus of about 200 species, tuberous or bulbous perennial herbs of temperate regions of the N. hemisphere. Rhizomatous or non-bulbous I.s are divided into 7 sections: 1. Bearded (Pogon): *I. germanica*, 2. Cushion I.s (Onocycclus): *I. gatesii*, *I. tortitii*, *I. iberica*, 3. Regelia I.s: *I. hoogiana*, *I. korolkowii*, 4. Pseudoregelia I.s: *I. sikkimensis*, *I. hookeriana*, 5. Beardless (Apogon): *I. sibirica*, *I. douglasiana*, *I. hexagona*, *I. kuempferi*, *I. laevigata*, *I. unguicularis*, etc. 6. Crested (Evanzia): *I. tectorum*, *I. japonica*, *I. cristata*, etc. 7. Pardonopsis: *I. dichroma*. Bulbous I.s are divided into 3 sections: 1. Reotulata type, including *I. danfordiae*, *I. bakeriana*, *I. histrioides*, 2. Juno: *I. alata*, *I. graeberiana*, *I. bucharica*, 3. Xiphoid: *I. linguaria*, Dutch I.s, Sp. I.s, Eng. I.s, while *I. nepalensis* and *I. collettii* form another section, and *I. sisyrinchium*, with a cormous rootstock forms a section its own. There are innumerable vars. and hybrids. I.s native to Britain are *I. foetidissima*, the Gladdon or Stinking I., *I. pseudacorus*, Yellow Flag, *I. spuria*, *I. versicolor*, and *I. germanica* is naturalised. See W. R. Dykes, *The Genus Iris*, 1913; G. Anley, *Iris, their Culture and Selection*, 1948; N. L. Cave, *The Iris*, 1950.

**Irish Architecture**, prior to the Anglo-Norman conquest of the country in 1169, comprised sundry small chapels or oratories erected after St. Patrick's landing in AD 432; and numerous round towers, built as refuges or watch-towers after the Dan. and Norse invasions in the 8th cent., e.g. at Clonmacnoise, Glendalough, Ardmore, Cashel, Kilkenny, Kildare, Kells, and Donaghmore. Carrickfergus Castle near Belfast was erected soon after the Eng. conquest, and there was naturally much activity in building churches in the Romanesque or 'Norman' style. These included Cormac's Chapel at Cashel, 1134; the Nun's Chapel at Clonmacnoise, c. 1163; the doorway of Clontarf Cathedral, c. 1166; and the chapel of St. Saviour at Glendalough. The building of the 2 cathedrals at Dublin then began, Christ Church in 1172 and St. Patrick's in 1190; but their architectural style did not differ substantially from contemporary work in England. The other chief Gothic churches in Ireland are Kilkenny Cathedral (mid 13th cent.) and the abbey of Muckross, Quin, and Holycross. In 592 Queen Elizabeth I founded Trinity

College, Dublin; but building in general languished throughout the disturbed 16th and 17th cents. Kilmainham Hospital, Dublin (1680), is a rare exception. During the 18th cent., however, the brilliant Georgian period beautified Dublin with many notable buildings, including the Custom House, the Four Courts, Trinity College with its fine library, the House of Lords, the Bank of Ireland (formerly the Parliament House), the City Hall (formerly the Royal Exchange), and the Casino at Marino. Rich noblemen adorned the city with handsome town houses, and built splendid country mansions elsewhere, e.g. Powerscourt. Important buildings of the past hundred years include the Anglican cathedral (1863-70), the Church of Christ the King (1928-30), and the Franciscan church (1950-5) at Cork; the National Library of Ireland (1890) and the Church of St Thomas (1930), both in Dublin; the Belfast City Hall (1896-1902); and the Parliament Buildings of N. Ireland at Stormont near Belfast (1928-32).

**Irish Free State (Saorstát Éireann)**, name given to 'S. Ireland' by the Irish Free State (Agreement) Act, 1922, which created a dominion in Ireland (excluding the 6 cos. of 'N. Ireland,' q.v.) on the Canadian model. In 1937, under the gov. headed by Mr de Valera (q.v.), the name of the state became Ireland (Éire). See IRELAND, REPUBLIC OF.

**Irish Fusiliers (Princess Victoria's), The Royal**, formerly the 87th and 89th Regiments. The 87th was formed in 1793, and fought under Abercrombie in Egypt in 1801. It gained great fame as the '*Faugh-a-Ballagh's*' (Clear the Ways) in the Peninsula, where Sergeant Master-son of the regiment captured the first Fr. Eagle during the campaign. It then took part in the Crimean War, the 1882 Egyptian campaign, and the Burmese War of 1885. The R. I. F. took part in the S. African War (1899-1902), and was at the relief of Ladysmith. During the First World War it raised 14 battalions, which fought in France, Flanders, Macedonia, Gallipoli, and Palestine. After the war it was reduced to 1 battalion, and joined with the Royal Inniskilling Fusiliers to form 1 corps. In the Second World War the regiment was part of the famous Eighth Army and fought in many battles on the It. front. Detachments of the regiment also formed part of the Brit. garrison in Leros. See M. Cunliffe, *The Royal Irish Fusiliers, 1793-1960*, 1962.

**Irish Guards**, formed in 1900 to commemorate the gallantry of Irish regiments during the S. African War, 1899-1902. It was formed from volunteers from other regiments of foot guards. During the First World War it raised 3 battalions which served in France and Flanders, bearing the following honours, among others, on its colours: Mons, Marne, Ypres, Gheluvelt, Loos, Somme, Passchendaele, Cambrai, Bapaume, Hindenburg Line, and Sambre. In the Second World War the I. G. fought in numerous battles in Italy and in NW. Europe.

'**Irish Independent**,' founded in 1905 as a halfpenny daily newspaper and pub. in Dublin. For hist., see its golden jubilee number, Jan. 1955. It is independent of all political parties and promotes Irish art and industry. It specialises in foreign and Catholic news and features serials as well as literary criticism. The *I. I.* and its satellites the *Evening Herald* and the *Sunday Independent* are strong in world sports news.

**Irish Language and Literature.** *Language.* The languages which were spoken in the Brit. Is. at the beginning of recorded hist. belonged to the Celtic section of the Indo-European family, and were thus closely related to Gaulish and the other Celtic languages of the Continent. It would seem that the various Celtic languages were still quite closely interrelated 2000 years ago, but by the time we begin to find datable literary documents the 2 surviving groups, Brit. and Irish, had certainly become mutually unintelligible. The Brit. group split up comparatively early into Welsh, Cornish, and Breton; Irish, on the other hand, remained 1 language, both at home and in the Irish colonies in Scotland and Man, for many cents.; it is only in the last 400 years that Scottish Gaelic and Manx (see SCOTTISH GAELIC LANGUAGE AND LITERATURE) have emerged as separate languages. The word for this language was, in its oldest form, *Goidelg*; from this has developed the Scottish *Gàidhlig*, and the Scottish dialect is therefore known as Gaelic, while the Irish type has been usually described simply as Irish.

*Literature.* While there is no evidence that the Celtic peoples had a common literature, they had many similarities in social structure. Classical writers describe the Gauls as having a threefold class system; as well as the nobles and the common people, there was a third class, called *druides*, concerned, like the Brahmins of India, with religion and learning. Although Rom. learning was well known to the *druides*, they did not use the Lat. alphabet for writing down their language, but preferred to hand on their doctrine by word of mouth. The same seems to have been true of Ireland, for, although the learned men there must have had enough information about Latin to construct the Ogam (q.v.) alphabet, they did not use it for writing. The coming of the Christian missionaries to Ireland must have brought about a great struggle between 2 rival systems. The details are quite uncertain but we find that eventually a sort of compromise was arrived at: the church took over all the religious functions of the learned men, and used Latin for these purposes, while the learned men adapted the Lat. alphabet for writing Irish, which they used to deal with the whole field of law and tradition. Ireland thus became the first country outside the Mediterranean area to possess a vernacular literature.

The learned man (usually called *filí* rather than *druid*, 'druid,' which was apparently unacceptable to the Church)

did not, of course, look on himself as a literary man; he was the guardian of a primitive tradition rather like that which we find in the Old Testament, where hist., religion, law, and genealogy are all mixed up together. Even in matters of technique the comparison will stand, for rhyme and metre in the modern sense were unknown to early Irish, while rhythm, alliteration, and parallelism were used in heightened passages, so that it is often hard to say where prose ends and poetry begins. This is the type of literature which was transmitted by word of mouth before it began to be written down, and it soon came to be influenced by the Lat. literature which existed side by side with it; we find quatrains with lines of regular length, adapted from Lat. hymn metres, and rhyme. The ordinary saga is a heroic story of a few thousand words, usually showing both the old rhetorical devices and the more modern verse. For the earliest period of Irish literature, that is, from the 7th to the 10th cents., this is the commonest form of prose; like the Homeric epics, its theme is a far earlier period, of pagan chariot-riders and head-hunters, and of men fettered by tabus (*geasa*), and it must embody very old traditions. These sagas have attracted many translators and adapters; the story of the sons of Uisliu, for example, which introduces Naisiu and Deirdre, has been handled by Yents and Synge. They are essentially short stories, unlike the sagas of Iceland, for the Irish never mastered the composition of a long epic. It is usually said that the famous Cattle-raid of Cooley (*Táin Bó Cúailnge*) was an attempt at an Irish Aeneid; if so, it was a singularly unsuccessful one, for, after a good beginning, it falls away into a string of disconnected incidents.

Although saga literature has the greatest appeal for the modern reader, it was not the only type of prose written during the early period, for we also find masses of genealogical and historical material—these categories were indistinguishable in the minds of the compilers—as well as law texts and saints' lives. These 2 latter classes, which purport at least to represent the life of the Christian Ireland in which they were written, if of little literary importance, are nevertheless of considerable value for the information we can deduce from them about the political and social life of the period.

As has been said already, the distinction between prose and verse was originally an unimportant one to the Irish *filí*. No doubt there were certain types of composition which were normally put entirely into the heightened language which later becomes verse—panegyrics, for example. These were the function of the *bard* (q.v.), who was originally one of the lower classes of the *filí*; it was in later periods, when poets found themselves depending more and more upon the panegyric for their livelihood, that the word *bard* came to be applied to them generally. But little bardic verse, in the proper meaning of the word, survives from the early period;

indeed we have comparatively little of the work of the *filí*, except for a considerable number of tantalising fragments quoted as examples in later works of metrics. But, to make up for this, there is a great body of religious and nature poetry, in metres less elaborate than those of the professionals, written and preserved by monks. This kind of writing, which no doubt began with the hermits of the early Irish Church, lasted from the 8th to the 11th cents. It is the first example of personal poetry in Irish, and, in its almost Jap. economy of words and directness of observation, the most appealing to the modern reader.

The 12th cent. brought a considerable change in the nature of Irish literature. We find an increasing preoccupation with the past; indeed our knowledge of the earlier literature is mainly due to great collections made in the 12th and subsequent cents. This may well have been because continuous change in the language had made the older literature obscure even to the learned (1 glossary from the beginning of the 10th cent. survives); certainly the classical language evolved at this time represents a clean break with those periods usually called Old and Middle Irish. From the beginning of the 13th cent. onwards we find that literature was in the hands of a new hereditary lay class, whose primary economic support was the composing of praise-poems, and who may therefore be accurately described as bards. The language which they evolved, and which, for the writing of verse at least, remained unchanged for 4 cents., is usually called Early (or Classical) Modern Irish. As collectors they were antiquarians, but as writers they were modernists. For prose themes they drew on the folk-tales of Fionn and the Fianna (the cycle to which the story of Diarmaid and Gráinne belongs and the ultimate inspiration of the Macpherson forgeries), as well as on all the romantic material of contemporary Europe, with which the Norman invasion of 1175 had brought them into contact. In only one respect did European manners affect the verse of the period: some of the poets, and rather more of their aristocratic patrons, succeeded in combining the conventions of *amour courtois* with the technique of bardic poetry to produce witty and polished love poems, of which all too few have come down to us. For the rest, the bardic verse, though highly polished, was heavy and lifeless. The prose, on the other hand, under the influence of foreign models, grew increasingly flexible, though showing that inclination to rhetoric and bombast which always threatens Irish literature.

The first period of Irish literature might be described as primitive and indigenous, the second medieval and European. As a medieval literature it stands comparison with any in Europe, though it favoured the survival of medievalism long beyond its time. The Irish had had no tns; these were founded by Scandinavians, Normans, and English, and remained strongholds of

foreign culture even when the rest of the country was thoroughly Irish. As a result, there was no Irish-speaking bourgeoisie and no Irish univ. where the new ideas of the Renaissance could have free play; and, after the Reformation, anti-English feeling made all contemporary ideas seem dangerously tainted with Protestantism. Again, the lack of the means of unfamiliarity with printing. While books had been freely available in most European lands from the 16th cent. onwards, Irish continued to be written by hand on vellum until the end of that cent., thus making it a luxury available only to the great. When the power of the Irish aristocracy was finally broken during the reign of Elizabeth I, the literary class had lost their only support; by the middle of the 17th cent. they had ceased to exist.

The period which followed, and which lasted up to the beginning of the 19th cent., was that of an almost underground popular literature, written and circulated in paper MSS. At first an attempt was made to keep up the old classical speech, but this proved too hard for those who had not received the long professional training, and the local dialects, never before permitted in writing, made their appearance (as did Scottish Gaelic, and Manx). Song metres like those of English and Welsh were evolved, though still ornamented with alliteration and assonances in the traditional Irish style. The praise-poem did not completely die, since there were always a few great houses where Irish was understood and appreciated, but the more peasant themes of ballad, satire, and *pastourelle* tended to predominate. The prose, for the most part, was of an escapist kind; flamboyant reworking of Flann stories mingled with knightly romances of the kind which Cervantes had laughed to death in Spain cents. before. On the whole, the poetry is more satisfactory than the prose; as late as the beginning of the 19th cent. we find the fine *Midnight Court*, medieval in concept but contemporary in execution, being produced in co. Clare by Brian Merriman, and circulated by word of mouth, as well as by MS. After that, however, the literature, declining with the language, became more and more a matter of folksongs, and even these began to dry up after the great famine of 1846-7.

Up to now Irish literature had been the natural product of an Irish-speaking society, but politics brought a strange development. In the closing years of the 19th cent. there were still over 600,000 people whose native language was Irish, but though they had a rich inherited folk culture, they were largely apathetic as to its survival. Meanwhile a number of nationalists, few of whom spoke Irish, had arrived at the conclusion that a separate language was an essential mark of nationality, and the Gaelic League was founded in 1893 with the object of saving the language. It was swept along on a great wave of patriotic enthusiasm; Irish classes were organised throughout the

country, and every patriotic Irishman made at least an attempt to learn the language. Meanwhile, however, economic conditions in the Irish-speaking areas continued to deteriorate and emigration to increase, so that the strange picture presented itself of the pop. of these areas decreasing while the number of Irish speakers increased steadily, at least in theory. In the early days of the Gaelic League attempts had been made by those who had learned Irish to create a new literature; these were at best pedestrian and at worst ridiculous. But as an Irish-reading, if not Irish-speaking, public began to grow up, writers came from the Irish-speaking dists., and ever since the estab. of the Free State in 1922 there has been writing of a reasonably high standard; such names as Tomás Ó Críthin, Seosamh Mac Grianna, Máirtín Ó Cadhain, Liam Ó Flaherty (better known as a writer in English), and Máirtín Ó Direáin might be mentioned. It cannot be denied, however, that there is an element of artificiality in the situation whereby writers come from the Irish-speaking areas to live in Dublin and, to a large extent, write for an audience whose native language is English but who know Irish well. The future of the Irish language, as well as of its literature, depends on the extent to which the Irish-speaking areas can be preserved and built up.

Jackson, *Language and History in Early Britain*, 1953; G. Murphy, *The Ossianic Lore and Romantic Tales of Medieval Ireland*, 1955; *Irish Writing*, No. 33, 1955; G. Murphy, *Early Irish Lyrics*, 1956.

Irish Moss, see CARRAGEEN MOSS.

Irish Nationalist Party, see NATIONALIST.

'Irish Press, The,' daily morning newspaper, founded 1931 and pub. in Dublin. Its main policies are furtherance of industrial development and increase in agric. output; political outlook, national. It is strong in features for women and sport columns. Associated pubs. are the *Sunday Press*, founded 1949, a paper of wide popular appeal, and the *Evening Press*, founded 1954, and noted for its bright layout and magazine section, with a sale mainly in and around Dublin city.

Irish Regiment, The Royal, formed from certain independent companies which were regimented in 1683, which had originally formed part of the Cromwellian forces in Ireland. It fought at the Boyne and at Limerick under William III. It greatly distinguished itself at the fall of Namur in 1695, where its conduct gained from William III the grant of one of his own badges, the Lion of Nassau. It fought under Marlborough at Blenheim, etc., and under Abercrombie at Alexandria in 1801. It took part in the Crimea (1855-56),

Afghanistan (1879-80), New Zealand (1881), and Egypt (1882) campaigns, and was at Tel-el-Kebir. It was also in the S. African War of 1899-1902. In the First World War it raised 9 battalions, which served in France, Flanders, Macedonia, Gallipoli, and Palestine. As a consequence of the inauguration of the Irish Free State the regiment was disbanded in July 1922. See G. Le M. Gretton and S. Geoghegan, *The Campaigns and History of the Royal Irish Regiment* (2 vols.), 1911-27.

**Irish Republican Army (I.R.A.)**, name given to certain military or para-military organisations aiming at the estab. or extension of an Irish rep. A secret, oath-bound society, the Irish Republican Brotherhood (I.R.B.), founded in America in 1858 and associated with the Fenians (q.v.) in Ireland, became the most potent force within the Irish Volunteer movement, which was formed by nationalists in 1913 to counter the Unionist Volunteers of the N. of Ireland. In 1916 many of the Irish Volunteers took part in the 'Easter Rising' in Dublin (see SINN FÉIN), following the declaration of an Irish rep. In this way the I.R.A. was born. Later, after the convening of the first Dáil Éireann in 1919, the I.R.A. came into conflict with Crown forces throughout Ireland. After the ratification of the Anglo-Irish treaty of 1921, the I.R.A. (the 'old I.R.A.') split into 2 parts: the army of the Irish Free State (q.v.) and a (new) Republican Army, which supported those Sinn Féin leaders (see CHILDERS and DE VALERA) who rejected the treaty. In the guerilla conflict which ensued the Free State Army was victorious. During the 1930's the I.R.A. appeared in new form as a secret body of extremists. Its members organised bomb explosions in Great Britain, where severe punitive measures were taken against them, and numbers of them were deported to Ireland. In Ireland the Fianna Fáil (q.v.) gov. had prohibited para-military organisations, and during the Second World War it interned suspected members of the I.R.A.; a few I.R.A. members were executed. In the mid-1950's persons calling themselves members of the I.R.A. began a series of raids on police and other establishments in N. Ireland and, to a small extent, in England, causing loss of life and much damage to property. Strict security measures were instituted in N. Ireland, and sev. members of the I.R.A. were imprisoned. The gov. of the Rep. of Ireland also took vigorous emergency action in 1957; sev. I.R.A. men were imprisoned, and a larger number interned in a camp at the Curragh.

**Irish Rifles, The Royal**, see ULSTER RIFLES, THE ROYAL.

**Irish Sea**, sea which lies between England and Ireland, connected with the Atlantic on the N. by the N. Channel, and on the S. by St George's Channel. The greatest breadth (between Morecambe Bay, Lancs, and Dundalk Bay, Louth) is 150 m.; the greatest length is about 110

m. Within its boundaries are the Isles of Man, Anglesey, and Holyhead.

**Irish Setter**, see SETTER.

**Irish Terrier**, rather large dog, varying in weight from 17 to 25 lb.; with a hard, rough, and wiry coat, without any tendency to curl. Its usual colour is a bright reddish-brown, but varies through different shades of brown. Its head should be long and rather narrow; the ears small, filbert-shaped, and lying close to the head; the eyes small and hazel, and the nose black; the fore-legs straight and strong with round thick feet; chest narrow with deep brisket, and back straight and strong; the tail, if not cut, should curve. The I. T. is quite a modern breed, dating from about 1870; it is much valued for its affection and pluck.

IRISH TERRIER

T. Fall

'Irish Times,' daily paper pub. in Dublin, founded in 1859 by Maj. Lawrence Knox as a Unionist journal, and purchased in 1873 by Sir John Arnott. It is now a non-partisan newspaper, dedicated to the constitutional reunification of Ireland. The I. T. Co. also publishes a Sunday newspaper, the *Sunday Review*, and the *Irish Field*, a weekly devoted to every form of sport.

**Irish Water Spaniel**, see SPANIEL.

**Irish Wolfhound**, supposed to be the oldest breed of dog in the U.K., but the original breed in reality has died out, and information concerning it is only obtainable by tradition, although sev. attempts have been made to reproduce it. The old I. W.s enjoyed a great reputation for their strength and their courage in attacking wolves. In appearance they seem to have been of 2 kinds, one resembling a greyhound and the other a mastiff. Modern I. W.s are the result of the endeavours of Capt. Graham of Dursley, Glos., to reproduce the old breed, but there is no positive proof that they do so. They are the result of crossing the Great Dane and deerhound, but a fine specimen exhibited in 1895 was the result of crossing a bitch of Scottish hounds strain with a dash of Siberian wolf strain, with a

Russian wolfhound. The points of this modern breed, as required by the I. W. Club standard, are: general appearance not quite so massive as the Great Dane, but more so than the deerhound, the largest hunting dogs in existence, with minimum height of 31 in. and weight of 120 lb. (bitches 28 in. and 90 lb.), head long and narrow, muzzle long and moderately pointed, and ears small, and greyhound-like in carriage; neck long, very strong and muscular, well arched without dewlap; chest very deep and breast wide; back moderately long; loins arched; belly well drawn up; tail long and slightly curved, of moderate thickness and

T. Fall

## IRISH WOLFHOUND

well covered with hair; shoulders muscular and sloping; elbows well under; muscular thighs with second thigh long and strong, and hocks well let down; feet moderately large and round with toes well arched; hair rough and hard on body; any colour that appears in the deerhound but black is rare.

**Iritis**, inflammation of the iris (*see* EYE). I. may be acute, in which case it is usually due to a spreading infection from the conjunctiva and cornea. This is a painful condition; the eye is bloodshot and there is profuse watering. The patient resents light and any use of the eye is difficult. In acute I. the inflammatory exudate is apt to form adhesions between the iris and the lens, thus fixing the pupil. Once formed, adhesions are difficult to break down. Treatment consists in atropine drops to dilate the pupil and to keep the iris from contact with the lens, hot fomentations, an eye shade, and the appropriate antibiotic therapy locally and systemically. Chronic I. is as a rule due to tuberculous or syphilitic infection, or may arise from some chronic septic focus in the body such as pyorrhoëa (q.v.). Adhesions to the lens are a usual complication. Treatment consists in treating the causative infective organism.

**Irkutsk**: 1. Oblast in SE. Siberia, NW. of Lake Baykal, situated on the central Siberian uplands, and largely covered with coniferous forests. There are large coal, iron ore, gold, salt, and mica deposits, and

vast water-power resources. Engineering, coal- and gold-mining, lumbering, grain growing, and cattle breeding are carried on. The prin. tns are I., Cherekhovo, Angarsk, and Bratsk. It is an area of banishment, with labour camps and great construction projects. Area 302,000 sq. m.; pop. (1956) 1,757,000, mostly Russians (since 17th cent.), also Buryat and Evenki.

2. Cap. of the above, on the R. Angara and the Trans-Siberian Railway (q.v.). It is an important economic centre, with engineering, wood-processing, light and food industries; it has a hydro-electric power station (660,000 kw.), and is the chief transportation centre in E. Siberia. It is the cultural centre of E. Siberia, with a branch of the U.S.S.R. Academy of Sciences and a univ. (founded 1918). Founded in 1652 as a Cossack fort, it became a tn in 1686, and cap. of E. Siberia in 1822. From the late 17th cent. it was the main base for trade with Yakuts, Buryats, Mongolia, and China; from the 1830's it was the administrative centre of the Lena goldfields, and from the 1850's the base of Russian advance into the Far E. Its industrial development dates from the 1930's. It has been a place of banishment since the 18th cent. Pop. (1956) 314,000 (1800, 20,000; 1892, 51,000; 1917, 90,000; 1939, 243,000).

**Irlam**, urb. dist. of Lancs, England, 7½ m. SW. of Manchester, on the Manchester Ship Canal, but still partly agric. It has steel works, soap and margarine factories, engineering works, and tar distilleries. Pop. 15,000.

**Irmin**, Teutonic god of the old Germanic tribes of the Herminones. The huge wooden posts called I. Pillars were raised in his honour and worshipped by the Saxons in their wars with the Christian Gauls. The chief seat of this cult, Irminsal (Westphalia), was destroyed by Charlemagne in 772. 'Irmin's Chariot' was an anct name for the Great Bear.

**Irnerius** (sometimes called the 'Lucerna juris'). It. jurist, b. Bologna early in the 12th cent. He founded a school at Bologna, and at the instance of the Countess Matilda directed his own and his pupil's attention to the *Institutes* and *Code* of Justinian. He appears to have held office under Henry V after 1116, and to have d. under the Emperor Lothair before 1140. He is generally considered the first of the Glossators, and the author of an epitome of the *Novellae* of Justinian called the *Authentica*. *See* monograph by P. Vecchio, 1869, and F. C. Savigny, *Geschichte des römischen Rechts im Mittelalter*, vol. iii, 1826-51.

**Iron**, Ralph. *see* SCHREINER, OLIVE.

**Iron Age**, third of the 3 technological ages of man formulated about 1836 by C. J. Thomsen, a Dan. curator, demonstrated stratigraphically by his student Worsaae in the peat-bogs of Denmark, and since generally accepted by all archaeologists. These ages were not everywhere contemporary; thus the I. A. began in Asia Minor c. 1200 BC, in central Europe about 900 BC, in China about 600 BC, in

Britain in the 6th and early 5th cents. BC, and in the Fiji Is. not until an expedition there in the late 19th cent. The economical working of iron, particularly for use in agric. tools and weapons, was a great step forward in civilisation, and it was in fact the chief underlying cause of an urb. revolution from which was to arise an organisation of labour and of foreign trade over a large area, and the beginnings of city life and a political consciousness.

The earliest culture of the Early I. A. in central Europe is named after Hallstatt,

BC; the Early Rom. I. A., c. 0 BC-AD 200; the late Rom. I. A., c. AD. 200-400; and the Germanic I. A., c. AD 500-800. The Viking Period, c. AD 800-1000, is noted for its iron weapons, and notably for axes and swords inlaid with silver.

Further Celtic immigrants to Britain about the middle of the 3rd cent. BC brought much developed cultures, chiefly from the Marne in N. France, named after a type site at *La Tène* ('the Shallows') on Lake Neuchâtel, Switzerland. The various *La Tène* cultures grew from trading

IRKUTSK OBLAST: LAKE BAYKAL

The railway on the lakeside serves Baykal mica mines.

'Soviet Weekly'

an exceptionally rich cemetery in Upper Austria, which is within 40 m. of Noricum, one of the famous iron-mines of antiquity. Relics of both bronze and iron were recovered, and stages in the evolution of the sword in both metals provided a relative chronology. But the Hallstatt civilisation as a whole is exceedingly complex, as may be seen from a study of the various hybrid stocks which reached Britain in the 6th to 5th cents. BC, and comprise a culture known as 'Early Iron Age A.' The vil. sites of All Cannings Cross, Wilts.; Hengistbury Head, Hants; and Scarborough, Yorks, have yielded typical pottery, and there are notable 'camps' or hill cities at the Trundle and Cissbury, Sussex, and Figsbury, Wilts.

It may be noted here that the I. A. of Scandinavia is sometimes considered as 4 main periods: the Celtic I. A., c. 400-0

contacts made between the highly civilised urb. peoples of the Mediterranean and the Hallstatt farming communities N. of the Alps. They used iron extensively for military and household gear, and the metal-smiths were skilled craftsmen as may be seen from such examples of their work in Britain as the Battersea Shield, the Witham Shield, and the Thames Helmet, all in the Brit. Museum. The peoples of the 'Iron Age B' culture, as this is usually called in its wider aspect, were in the main an aristocracy, but the 6 chief groups which can be recognised differ much in their agric., domestic, and military traditions. Among the important sites and relics in Britain are the *murus gallicus* forts of Scotland; the charioteers of Yorks; the wealthy lake vils. of Meare and Glas-tonbury with their fine woodwork and textiles; those of the Atlantic tin-traders

and merchants of Cornwall; while the cultures of Wessex have been demonstrated in the brilliant excavation of the gigantic hill-fort of Maiden Castle, Dorset. Other remarkable hill-forts with strong defences of this period are Hambury, Devon, and Cadbury and Ham Hill, Somerset.

IRON HOLLOW CELT  
WITH HANDLE REST  
(Hallstatt)

A third period in the Early I. A. is that dominated by the *Belgic* culture of N. Gaul, which had itself grown by the pressure of the Celts and Germanic peoples of the Lower Rhine on the Marnian culture of La Tène. In Britain the Belgae arrived about 75 BC, as adventurers, then later as colonists. They were riverside farming folk, and with their new equipment of heavy wheeled ploughs which dealt effectively with loams and clays, they were enabled to follow up the clearance of woodland and to start an agric. revolution. The same ruler, Diviciacus, held sway both in Gaul and Britain at one period; there was a system of inscribed gold coinage; a flourishing export trade in corn,

cattle and cattle-products, gold, silver, iron, and slaves; and the infiltration of Rom. civilisation secured the import of luxuries in return. The cremation cemeteries of *Aylesford* and *Swarling* in Kent with fine wheel-turned pedestal urns and bronzes represent the sepulchral evidence. On the economic side of this final period of the I. A. is the foundation of states to replace tribal groups, and the estab. of urb. caps.—*Verulamium* (St Albans), *Calleva* (Silchester), and *Camulodunum* (Colchester).

The bibliography is extensive, but the best general statement is Stuart Piggott, *British Prehistory*, 1949, with references. A conspectus and good illustrations are contained in *Later Prehistoric Antiquities*, British Museum, 1953, which also gives a list of references to I. A. sites. See also ARCHÆOLOGY; BRONZE AGE; PREHISTORY; STONE AGE.

**Iron and Steel.** Iron (Symbol Fe, atomic number 26, atomic weight 55.85) is the fourth most abundant element on the earth. It is only very rarely found in the free state, and then mostly as meteorites which have come from other worlds than ours. Its more usual occurrence is in combination with oxygen as oxides, or with sulphur as sulphides (pyrites). Only the former are true ores of iron, as the latter is infrequently used as a source of extraction of iron owing to the high sulphur content and difficulty of removal. Iron ore, as mined, contains varying quantities of impurities, such as silica, alumina, lime, sulphur, and phosphorus, which have to be removed, as well as the oxygen, before malleable steel or iron is produced. This is done almost exclusively by heat in the presence of a reducing agent such as coke, charcoal, or other carbonaceous material. Terrestrial iron was known early in the prehistory of Mesopotamia and Asia Minor; iron forging was perhaps discovered in Armenia where there are rich ores. The process had spread to N. Europe by c. 500 BC. It developed into an industry which to-day produces well over 100,000,000 tons of steel annually. Prehistoric man used iron for tools, weapons, domestic and horsegear, and particularly for agric. implements such as hoes and sickles.

The primitive processes of working gave a pasty semi-solid malleable metallic product in one operation. The small pieces of iron, weighing only a pound or two at the most, could be hammered into shape with the tools of the early craftsmen. Owing to its extensive distribution throughout the world, iron manu. was widely carried out. Improvement on the crude forging process, though slow, was definite: larger units were built, more powerful blowing machines were introduced, until about AD 1300–1400 an unexpected result was achieved. Instead of the partly malleable product, a liquid metal flowed from the furnace, which was found, on setting, to be hard and brittle. This substance we now know as pig iron, and the reason it is so hard and brittle is that it contains about 4 per cent of carbon whereas the prior malleable iron

was practically carbon free. The expert ironmaster soon found a way out of the difficulty by a further treatment of the pig iron in a separate furnace and thus there was the beginning of the present-day double process for producing steel or malleable iron. The iron ore, which contains about 30 per cent oxygen, is heated in a blast furnace with coke to produce pig iron, which contains no oxygen but 4 per cent carbon, the balance being iron. The pig iron is then heated in a steel-making furnace to reduce the carbon to from 0.02 to 1.6 per cent carbon, which is the range of steels from very soft to very hard.

**SOURCES OF IRON.** Although iron is widely distributed throughout the crust of the earth, the prin. ores from which it is extracted are comparatively few. Among the more important are (i) Magnetite ( $\text{Fe}_3\text{O}_4$ ), containing 72.4 per cent iron; a black ore which, in line with its name, is very magnetic; (ii) Haematite ( $\text{Fe}_2\text{O}_3$ ), containing 70 per cent iron; its colour varies from bluish-grey to red, and one well-known form is the so-called 'kidney ores' of Cumberland; (iii) Limonite ( $2\text{Fe}_2\text{O}_3 \cdot 3\text{H}_2\text{O}$ ), containing 59.9 per cent iron; its colour varies from various shades of brown to yellow; and (iv) Siderite ( $\text{FeCO}_3$ ), also known as spathic iron ore, contains 48.3 per cent iron; its colour varies from pale yellow to brown and grey.

Pyrites ( $\text{FeS}_2$ ) is not really a source of iron as it contains too much sulphur to allow a profitable extraction of iron from the raw material. It is a mineral which occurs widely and extensively throughout the earth's crust, but its development as a source of iron is a problem for future generations.

**EVOLUTION OF IRON AND STEEL MANUFACTURE.** In the Middle Ages pig iron was produced in primitive blast furnaces using charcoal as fuel, which was burned by an air blast from bellows driven by water wheels. The pig iron was cast into sand beds, allowed to go cold, broken up, and then the second process of conversion to malleable metal was carried out in a separate furnace known as a charcoal refinery. Once again the fuel used was charcoal, made by partial burning of wood with a controlled and limited access of air. The product of the refinery was a semi-solid spongy mass known as charcoal iron or wrought iron, which was removed from the furnace by tongs and hammered into a solid bloom of malleable metal. Later this bloom was reheated in a Chaffery and rolled into billets, bars, and other shapes. During the 17th cent. the growing shortage of wood for conversion to charcoal caused the ironmakers to look elsewhere for a possible source of heat. Coal had been known for several centuries beforehand and it seemed a likely substitute. Early experiments were not successful, but eventually success was obtained by treating coal so as to convert it to coke in the same way as wood has been converted to charcoal. The charcoal charged to the blast furnaces was replaced by coke by Darby in 1760. The

charcoal used in the refinery was also replaced by coke and by long-flaming coal. From this developed the puddling process for production of wrought iron, but again only giving a semi-solid spongy product. The blast furnaces of Darby's day in the late 18th cent. had an output of 10 tons per week, which was considered colossal. Modern blast furnaces, which have been developed from it, have an output up to 1000 tons per day.

The major problems of steelmaking may be classified under 2 headings: (1) heat; (2) refractory material able to resist heat. Iron ore does not react with carbonaceous reducing material until a temp. of over 700° C. is reached. From this it follows that man could not know iron until he had learned how to make fire, which in an open grate or camp fire reaches a temp. of about 1000° C. But pure iron does not melt until a temp. of 1539° C., and it requires about 1600° C. to get a proper superheat so that the metal can flow during casting. By burning coal and air at room temp. in an open grate with forced draught it is possible to get about 1400° C., which is still short of the melting point of pure iron and accounts for the production of charcoal iron and coke in the semi-solid pasty condition. The fact that the blast furnace gave liquid metal arose from the absorption of 4 per cent carbon by the pure iron. This metal is not malleable and melts at 1250° C.

Two methods of producing the high temp. necessary to melt pure iron were evolved at roughly the same period: by Bessemer in 1856 and Siemens in 1866. The method perfected by Bessemer was the more remarkable as it consisted simply of blowing cold air through molten pig iron. This not only removed the excess 4 per cent of carbon, but also other undesirable elements such as silicon and manganese, and at the same time increased the temp. of the metal from some 1350° C. to over 1600°. The method used by Siemens is known as the regenerative principle. When coal or wood at room temp. is burned by air at room temp. in an open fire the maximum temp. reached is about 1000° C. The effect of putting a 'blower' in front of the fire so as to create a good draught and force all the air into close contact with the fuel is well known. By this means temps. up to 1400° can be obtained, but this is still not sufficient to melt pure iron. Instead of using air at room temp. Siemens tried out the idea of preheating the air, so that by starting off at a higher temp. he expected to get a higher final temp. in the furnace. His early experiments were unsuccessful until he combined the initial idea with another one—converting coal into a combustible gas by burning it with a limited air supply in a gas producer. He then preheated both this producer gas and the air for combustion to over 1250° C. and thus was able to start off work with an initial temp. as high as can be obtained in an open grate. The final temp. reached after combustion was thus in the region of 1750° C. The method of preheating the

air and gas is known as the regenerative principle. The hot gases from the furnace pass through 2 chambers, known as regenerators, in which brickwork is loosely stacked and to which the waste gases give up their excess heat. On reversing the furnace the incoming air and gas pass through these 2 chambers and increase their temp. to over 1000° C. before being burned in the furnace. On passing out at the far end the waste gases reheat 2 corresponding chambers at that end. The Siemens regenerative furnace has

more usual, after storing in a mixer; and by charging hot steel ingots to the reheating furnaces for rolling.

*Production of steel from pig iron.* Essentially iron ore is iron plus a considerable quantity of oxygen; steel is iron plus a little carbon (0.04-1.5 per cent), so the fundamental action of steel-making is to remove much oxygen from ore and replace it with a little carbon. This is done in a preliminary stage of converting coal to coke, a primary stage of converting iron ore to pig iron in blast

*Richard Thomas & Baldwins Ltd*

BLAST FURNACE FOR THE PRODUCTION OF PIG IRON

proved by far the most successful way of producing steel economically. Electric arc and electric induction furnaces have become widely used for special types of steel. The temps. possible in these 2 types are well in excess of the melting point of pure iron at 1539° C.

The development of the integrated plant for the production of steel represents the most important recent advance. The principle is to have the coke ovens for production of coke, the blast furnaces for the production of pig iron, the steelmaking plant for the production of steel, and the rolling mills for fabricating to shape, all on the same site. This makes for considerable fuel economy, as large quantities of heating gases are evolved from the coke ovens and blast furnaces as a by-product. Further heat is conserved by charging molten pig iron to the steelmaking plant direct from the blast furnaces or, as is

furnaces, and a secondary step of steel-making in Bessemer, open hearth, or electric furnaces.

*Production of coke.* Suitable types of coal are heated in coke ovens out of contact with air, which converts the coal into coke and evolves large quantities of a combustible gas known as 'coke oven gas.' By-products such as ammonium sulphate, tar, and crude benzol are extracted from the gas which is then passed to the plant for use as a means of heating.

*Production of pig iron.* Pig iron is produced in vertical shaft furnaces; iron ore, limestone, and coke being charged at the top and air blown in at the base. An account of the process as carried out in 1531 says: 'There are five men who keep the fire to melt the ore, having 12 pence per day each. And there are four men at the Bellows whereof three blows at a time and one of them stoude voyde to refresh

the others, for they bloweth six or seven hours at every gaddle that is melting, and thus they make two gaddes a day each weighing 1 cwt.' In 1780 Darby replaced the charcoal which had previously been used as fuel with coke. Outputs by this improvement were increased to 1½ tons per day. In modern blast furnace practice outputs of 1000 tons per day are known.

Iron ore as mined is not pure iron and oxygen; it contains varying amounts of silica, lime, alumina, sulphur, phosphorus, and other extraneous materials which have to be eliminated. Much of this is done in the production of pig iron in the blast furnace, but there is an additional pick up of about 4 per cent carbon. The effect of this is to produce a hard, brittle product known as pig iron which is subsequently treated to produce steel, cast iron, etc.

A modern blast furnace is a circular stack about 100 ft high and with a maximum diameter of 18 to 26 ft. There is a skip hoist for taking ore, limestone, and coke from the bottom for charging through a bell and cone at the top level. Air blast is supplied at the base through tuyères from a powerful blowing engine, and it is preheated in Cowper stoves, the idea of hot blast being first developed by Neilson in 1828. The iron ore, limestone, and coke while descending through the furnace meet the ascending current of hot air which burns the coke, converts the ore to pig iron, and allows the impurities to settle as a liquid slag floating on top of molten pig iron. At regular intervals the slag is tapped off through a slag notch and discarded, while the pig iron is tapped through a separate iron notch and either cast into pig beds or transferred while still molten to a mixer where it is retained until required in the steelworks.

*Iron castings.* The pig iron as originally produced from the blast furnace is melted in special air or cupola furnaces, where its carbon content is adjusted to the required amount, and other constituents such as silicon, manganese, sulphur, and phosphorus regulated to the desired specification. The cupola furnace is similar in construction to a blast furnace, but is much smaller. It is charged at the top with coke and pig iron. A blast of air forced through tuyères near the base causes the coke to burn, and develops sufficient heat to melt the iron, which is tapped off through a metal spout into a ladle, from which it is poured into the moulds prepared to the shape of the casting required. Owing to its ease of melting and fluidity when melted, the iron can be formed into intricate shapes in various sizes weighing from a few pounds to upwards of 100 tons. The various types of castings require different compositions of metal according to the use to which they are to be put. For engineering purposes the cast iron must be strong but not too brittle, while for ornamental purposes the main requirement is fluidity in order that the metal may take a sharp impression of the intricate shapes. In other cases it is important that the finished

casting should be easily machined. For engine cylinders the iron must have strength, hard-wearing surface, and easy casting properties owing to the thin sections required in certain places. For conversion to malleable castings the iron should be low in silicon, giving a white fracture. The castings are malleablised by annealing in iron ore. Additions of about 0.05 per cent of magnesium or cerium or both to cast iron renders it tough and ductile even without subsequent annealing, the product being known as spheroidal graphite cast iron or nodular cast iron. High duty cast irons are produced from specially refined pig iron, and may additionally contain alloying additions such as nickel, chromium, molybdenum, vanadium, etc. Cast-iron pipes may be made by centrifugal casting. In making chill castings such as rolls, the surface of the main body is rendered very hard by casting the metal into a cast iron mould instead of the usual moulding sand.

*Production of wrought iron.* Although the amount of wrought iron produced to-day is comparatively insignificant, yet it was the most important process for converting the hard brittle pig iron to a malleable product until steel manuf. by the Bessemer and open hearth processes became well estab. just prior to the start of the present cent. In making malleable metal from pig iron the essential process is to remove the excess carbon, silicon, manganese, sulphur, and phosphorus. This is carried out by oxidation and the conversion of the oxides thus formed into a fluid slag which can be separated from the metallic product. The difference between wrought iron and steel is that the former is produced in a semi-solid pasty condition much intermixed with slag, while the latter is made in a completely liquid form and the separation of slag from it is virtually complete. Wrought iron is made by the puddling process. About 5 cwt. of cold pig iron are charged into the furnace and melted down in a lining which consists primarily of iron oxide. On completion of melting the puddler lowers his damper which brings the bath up on the boil and much of the slag formed is boiled over the sill plate into a buggy. Later the charge begins to set back, boiling over ceases, and then 'puddling' commences. This is one of the most onerous jobs carried out close to a furnace at high heat for over half an hour that has ever fallen to the lot of man. The pasty white-hot metal is divided into 4 by pushing a rod through it, then each of the 4 pieces is turned and moved about in the furnace until it has reached a suitable state of malleability. The pieces, weighing about 80 to 100 lb., are removed separately, and compressed by a shingling hammer to remove excess slag and formed into a suitable shape for further reheating and rolling.

*PRODUCTION OF STEEL.* Steel is made by a variety of processes of which the most important are (1) Crucible; (2) Bessemer; (3) Open Hearth; (4) Electric Furnace. Except in the first case there is a further

subdiv. into acid and basic processes. As the difference between acid and basic is the same in all 3 processes, it may be briefly dealt with first. In an acid furnace the refractory lining, on which the charge of pig iron and scrap steel is melted, is made of silica brick on top of which is fritted silica sand. In a basic furnace the furnace bottom is lined with magnesite brick on top of which dolomite is rammed. Although the nature of the refractory used for the bottom is the only essential difference, yet it has a very considerable effect

*The Bessemer process.* Bessemer took out his early patents in 1856, and within a few years the process was being operated successfully on a commercial scale. In this process, molten pig iron is converted into steel by blowing air through a Bessemer converter. The difficulties to be overcome in the early days arose from the fact that (i) it is necessary to blow vigorously through the molten metal right to its very core; (ii) blowing must only take place when the whole of the metal is in the converter; (iii) it must be possible to stop

*Richard Thomas & Baldwins Ltd*

STEEL-MAKING FURNACE: SIEMENS OPEN HEARTH PROCESS

in removing impurities. With an acid bottom it is impossible to remove any sulphur or phosphorus; in a basic furnace their removal is possible. Acid steel is still made for special qualities, but the present tendency is to change over more and more to the basic process.

*Crucible steel.* The crucible steel process was invented by Huntsman in 1740. It is still used, more particularly in the Sheffield area, for making high-grade steels. As it is purely a melting process, with no refining, it is necessary to charge pure materials. The crucible furnace is oval in shape and takes 2 pots side by side, with room around them for coke. When the crucible is hot enough, a charge of 50 lb. of blister steel is emptied through a sheet-iron funnel and the cover put on. On melting, the charge is 'killed' with ferro-manganese and aluminium and poured into a mould.

and restart blowing at will. The converter is pear-shaped, lined with refractory, containing holes in its base through which air is forced at a pressure of about 25 lb. per sq. in. In operation the converter is turned down to the horizontal and a charge of molten pig iron poured in; the air blast is then turned on and the converter turned up to the vertical position. The air, in passing through the metal, removes carbon, manganese, silicon, and sulphur, and at the same time increases the heat from about 1250° C. as charged to 1600° C. During blowing there is a violent evolution of sparks from the mouth of the converter, and the change in composition of the metal can be fixed by the appearance of the flame. When the melter judges that the metal is correct, the converter is turned down, the blast switched off, and the finished charge poured into a ladle before teeming into

moulds. The Bessemer process was not widely used in this country but had a very considerable development on the Continent. Within recent years 2 large basic Bessemer plants have been erected in this country, with satisfactory results.

*The Siemens-Martin open hearth process.* The Siemens open hearth process was perfected by Sir W. Siemens in 1866, and the first commercial plant for its production was erected at Landore, S. Wales, in the following year. The original furnace was about 1 ton capacity, and had a potential output of about 1000 tons per year. To-day about 100,000,000 tons are made annually by this process. Cold pig iron and scrap steel are charged into the hearth of the furnace and melted down by a hot flame produced by the combustion of preheated air. This preheating is done on what is known as the regenerating principle. The waste gases coming out from one end of the furnace pass through loosely stacked brickwork to which they give up their heat. Every half-hour the direction of flow of the gases is reversed and the incoming air and gas are preheated to a high temp. (about 1250° C.). In this way flame temps. of 1750° C. are obtained when the 2 are combusted in the hearth of the furnace. The steel is thus heated to a temp. of 1600° C., which is the maximum generally required for low carbon steels. After clear melting there is a quantity of molten metal covered by a slag containing the impurities. The remaining impurities in the metal are removed by feeding in iron ore and scale or limestone until a suitable composition of the metal is obtained. This is determined by taking samples from the bath and testing them by chemical analysis. When the composition is considered satisfactory a tap-hole is opened at the back of the furnace and the molten metal and slag is allowed to flow out into ladles. The metal is deoxidised to suitable condition by additions of ferro-manganese, ferro-silicon, and/or aluminium. From these it is teemed into moulds. The pig iron used varies from 20 to 80 per cent, according to the required composition of the steel, an average figure being about 50 per cent of pig iron and scrap metal.

*Electric furnace steels.* Electric furnaces may be classified into 2 types: (1) arc furnaces; (2) induction furnaces. Of these the former is much more widely used. In the arc furnace heat is generated by a spark between the carbon electrodes and the charge of metal. The temp. of the arc itself is well over 3000° C., so that the local heat is very intense. Owing to the high cost of electric current required, the electric arc process is more generally worked with a charge of 100 per cent of scrap steel, in order to cheapen the process. The charge is melted down in a manner similar to that in the open hearth process. It is further refined as before by additions of iron ore and limestone. Finally the metal is cast and teemed as before. The electric furnace is used in the manuf. of high-grade steels, the basic furnace being more widely used as it

has considerable advantages in removing sulphur and phosphorus and producing 'Killed' steel comparatively free from oxide inclusions. It is improbable that the electric furnace will be able to compete with the Bessemer and open hearth processes in the manuf. of steel for constructional purposes and the more common uses, except under special conditions. It will, however, prove a serious rival and will probably finally oust the older processes of steel making in high-quality grades.

The electric induction furnace has been further advantageous in replacing the older crucible steel process. As in the crucible furnace there is no refining, and pure metal is charged into the crucible and melted down by a high frequency induction current which generates terrific heat in the metal itself, and causes it to melt rapidly. At the same time the metal is stirred up so as to give very uniform composition.

*Steel castings.* These can be made from open hearth furnaces, both acid and basic, from small converters, from crucibles, and from the electric furnace. For general foundry work it is more common to find a small open hearth or Tropenas converter, fed with molten iron from a cupola. It is important to see that the metal is thoroughly killed during the casting operation, otherwise difficulties are likely to arise due to the formation of blow-holes inside the casting. For steel castings the moulds used may be classified either as 'green sand' or 'dry sand,' the former being used for light castings and the latter for heavier castings. 'Green sand' moulds is the general term for those which have not been dried previous to the metal being poured in. 'Dry sand' moulds are made much as above but are faced with moulder's composition and give a clear skin.

*Straight carbon steels.* The properties of steel are considerably altered by varying the carbon content. In general, increasing carbon content from 0.04 per cent to 1.5 per cent gives harder steels with a higher tensile strength but decreasing ductility and machinability. Some typical ranges and uses are indicated in the following table:

Carbon	Name	Uses
0.04-0.08	Dead mild	Sheets, tinplates, pipes, plates
0.08-0.25	Mild	Structural steels, reinforcing rods
0.20-0.45	Carbon	Rail steels, axles
0.45-0.65	Medium carbon	Holding-down bolts
0.65-0.9	High carbon	Drills and other tools
0.9-1.5	Ultra High carbon	Chisels, turning tools, files, razors, etc.

Straight carbon steel can be hardened by quenching in water from a suitable temp. between 750° and 950° C. according to carbon content. This hardening is accompanied by an embrittling effect

which can be minimised by tempering the quenching steel to suitable temps. below 700° C. The degree of tempering is controlled by the time and temp. at which the tempering operation is carried out.

**Alloy steels.** Steel has found a very extensive use in industry and commerce due to the fact that it is possible to produce such a wide range of properties by varying the carbon content and heat treatment. There are certain difficulties with straight carbon steels which have been overcome by the introduction of the so-called 'alloy steels,' i.e. steels containing considerable percentages of alloying elements such as nickel, chromium, etc. The number of such steels on the market to-day is well into the thousands, but efforts were made during the recent war years to reduce the numbers and so simplify production, and yet retain the valuable properties which such steels have conferred on them by the use of alloying additions.

**Nickel.** Nickel steels, owing to their strength, are widely used for stressed parts. With carbon around 0.15 per cent and nickel 3-5 per cent, the so-called 'case-hardened steels' find a wide application in heavily stressed parts requiring a very hard outer surface and a tough core. With a somewhat higher carbon content and similar nickel, the steels have many uses in engineering where both strength and toughness are required. High nickel steels containing 25-40 per cent nickel are used for their resistance to corrosion, special electrical properties, and due to the fact they are practically non-magnetic.

**Chromium.** Chrome steels are used because they produce greater strength and hardness. Additions of from 0.5 to 2.5 per cent chromium are typical. Such steels are used for tyres and springs. The addition of 12-20 per cent chromium produces the well-known stainless steels, first developed by Harry Brearley about 1913.

**Chrome-nickel.** It is more usual to find both chromium and nickel, as the combination makes for many advantages in hardness and strength combined with ease of heat treatment, to produce suitable properties. In the stainless steel series, the so-called 18/8 (18 per cent chromium, 8 per cent nickel) is widely used to-day, as they have the widest range of corrosion resistant properties. They are also satisfactory as heat-resistant steels. They have a wide use, but perhaps the best known is for table knives, where they have been a boon to the harassed housewife.

**Vanadium.** Vanadium is generally present in alloy steels in relatively small amounts, less than 1 per cent, and more often less than 0.25 per cent, but this has an important effect in increasing the toughness of the steel. It has perhaps its widest use in chrome-vanadium steels, which are used because of their extreme strength and toughness. A common analysis is 1 per cent chromium and 0.15 per cent vanadium. It is also added in small amounts to produce a high degree of hardness in tool steels, armour-piercing projectiles, rock drills, etc. Vanadium

steel castings are noted for their high elastic properties, strength, and toughness.

**Molybdenum.** Molybdenum is present in steels also in quantities under 1 per cent, and in association with the more common alloying elements, such as nickel and chromium. It has got a marked effect in increasing the strength both at room and elevated temps., and is an important addition to remove a difficulty known as temper-brittleness. There is a fairly wide range of molybdenum steels, each type having its own special application. Molybdenum iron castings are used where a hard-wearing surface is required, while it has also been found advantageous in chilled iron rolls.

**Manganese.** Although manganese is present in all straight carbon steels to an extent of 0.3-1.5 per cent, it is not considered as an alloying addition. The high manganese steels containing about 12 per cent are true alloy steels. They were put on the market by Sir Robert Hadfield in 1882, and have found many uses due to their hardness and high resistance to wear. They are quite commonly used for railway crossing points and for crushing machinery. In war-time they were used for steel helmets. It is a non-magnetic steel.

**Silicon.** High silicon steels containing 0.5-5.0 per cent have important electrical properties—a high permeability with low hysteresis and eddy current losses. They are used in electrical transformers. Steels containing from 14 to 20 per cent have a high resistance to corrosion by acids which enables them to be used for containing vessels. A silicon-manganese steel has found extensive uses for general engineering purposes and armour plate.

**Tungsten.** This element is used in high-speed tool steels and in magnet steels. Its effect in high-speed tool steels is to retain the cutting edge while allowing the steel to reach a red heat. Ordinary carbon tool steels, which may be harder initially, are tempered under similar conditions and lose their hardness. Modern high-speed tool steels contain 15-20 per cent tungsten.

Steels containing from 5 to 6 per cent have good magnetic properties and are used for magnets of generators, magnetos, etc.

**Cobalt.** Cobalt steels containing from 25 to 35 per cent cobalt give a magnet steel superior to the tungsten magnet steels, and are also used for service at high temps.

**Copper.** About 0.5 per cent copper is said to be beneficial in increasing the corrosion resistance of ordinary mild carbon steels.

**Lead.** About 0.25 per cent lead is incorporated with certain steels to improve their machinability. Lead does not alloy with steel and it exists as dispersed globules throughout the metal. A typical steel of this class is known as 'Ledloy.'

**Sulphur.** Although sulphur above 0.08 per cent is generally considered bad in steel, making it hot-short, yet up to 0.3 per cent is added in order to improve machinability.

See R. Jenkins, *The Early History of Steel Making in England*, 1923, and *Iron-making in the Forest of Dean*, 1926; T. S. Ashton, *Iron and Steel in the Industrial Revolution*, 1924; R. A. Hadfield, *Faraday and his Metallurgical Researches*, 1931; A. Allison, *Outline of Steel and Iron*, 1936; J. B. Fortune and P. B. Mann, *The Story of Iron*, 1948; J. Dearden, *Iron and Steel To-day*, 1956; J. M. Camps and C. B. Francis, *The Making, Shaping, and Treating of Steel* (7th ed.), 1957.

**Iron Cross**, see ORDERS OF KNIGHTHOOD (GERMANY.)

**Iron Gates**, narrow passage in the course of the Danube (q.v.) on the border between Yugoslavia and Rumania. It is a defile between the S. and of the Carpathians (q.v.) and the Miroch range of the Balkan Mts (q.v.). It was made navigable by the construction of the Síp Canal, 1890-6. Length 2 m., fall about 16 ft.

**Iron Losses** in transformers are due to hysteresis and eddy currents in the core. When the primary current reverses, the magnetic flux reverses, but the increasing and decreasing flux values during a cycle of the alternating current do not follow the same curve (see INDUCTION, MAGNETIC). The 'hysteresis loop' formed by the flux curves represents loss of energy, which goes into heating of the core. Eddy currents (q.v.) induced in the core by the current also represent loss by heating. When the transformer is on open circuit, no current flows in the second winding; a wattmeter in the primary will give a reading representing the power lost by magnetising the core—the iron loss, neglecting the small copper loss in the h.v. primary.

**Iron Lung**, see AEROTHERAPEUTICS.

**Iron Mask**, *The Man in the*, mysterious figure of great romantic interest in Fr. hist. He was a political prisoner in the reign of Louis XIV who, when travelling from one prison to another, always wore a mask. He finally *d.* in the Bastille in 1703. The mystery of his identity still remains an historical problem.

Etienne de Juncea (*d.* 1706), lieutenant of the Bastille, recorded in his official journals that on 18 Sept. 1698 Saint-Mars, the new governor, arrived at the prison from the Ile Ste Marguerite, bringing with him in a litter a prisoner whom he had formerly held in custody at Pignerol. This prisoner always wore a black velvet (not iron) mask, and his name was never told. He *d.* on 19 May 1703, and was buried in the par. cemetery of Saint Paul, his name being registered as 'M. de Marchiel'. The name actually recorded in the register was 'Marchiolu'.

Stories spread about the prisoner even during his lifetime, and in 1745 and 1746 it was asserted in *Mémoires secrets pour servir à l'histoire de Perse* that he was the duke of Vermandois, the illegitimate son of Louis XIV and Mlle de la Vallière, and was imprisoned for life for having assaulted the dauphin. Public interest was further aroused by Moubly's romance, *L'Homme au masque de fer*, and by the

writings of Voltaire on the subject. Voltaire, under the head 'Ana' in *Questions sur l'encyclopédie*, asserted that the 'Mask' was a bastard elder brother of Louis XIV and the son of Anne of Austria and Cardinal Mazarin. His theory, with romantic additions, was adapted by Dumas in his novel.

A much more feasible conjecture, supplied by Lord Acton and Funck-Brentano, is that the 'Mask' was Count Mattioli (*b.* 1640), a minister of the Duke of Mantua. He negotiated with Louis for the surrender of Casale, but the Fr. king, discovering that his dealings were treacherous, had him kidnapped (1679) and conveyed to Pignerol. This would appear to be the most likely answer to the mystery, though a number of vital points still remain unanswered.

The mysterious prisoner has also been identified with Eustache Dauger, imprisoned at Pignerol in July 1669. Andrew Lang, in *The Valet's Tragedy*, 1903, identified this Dauger with one Martin, the valet of Roux de Marsilly, a Huguenot intriguer in England. Barnes (*The Man of the Mask*, 1908) found Lang's theory untenable, and suggested that Dauger was really James de la Cloche, the natural son of Charles II. Lang proved subsequently that James de la Cloche was identical with 'Prince' James Stuardo, who *d.* in Aug. 1669 at Naples. It has also been suggested that the prisoner was Fouquier (q.v.) but the historical evidence does not support this theory.

As well as the works already mentioned, see J. Delort, *Histoire de l'homme au masque de fer*, 1825, and *Histoire de la détection des philosophes*, 1829 (which contains the correspondence between Saint-Mars and Louvois); M. Topin, *L'homme au masque de fer*, 1870; T. Jung, *La vérité sur le masque de fer*, 1873; F. Funck-Brentano, *Légendes et archives de la Bastille*, 1898; F. Laloy, *Qui était le masque de fer?*, 1931.

**Ironbark-tree**, popular name applied to sev. species of *Eucalyptus* for a very obvious reason. *E. resinifera*, the red-gum tree, receives the name most often; it attains a height of 150 to 200 ft in Australia, and is noted for its hard bark, durable wood, and the gum which it exudes.

**Ironclads**, originally wooden ships protected by iron plates as used in 1782 at the siege of Gibraltar. The French used them in the Crimean War, and at that time built 4 iron-plated line-of-battle ships. In 1860 Britain built the *Warrior*, an iron steam battleship, with 4-in. plates.

**Ironmongers' Company**, one of the twelve greater livery companies (q.v.) of the City of London, tenth in order of seniority. It was in existence as the 'Ferriers' guild in 1300. The I. C. received a grant of Arms, 1455, and was incorporated by royal charter, 1463. It exercised control over the iron trade. Sir Christopher Draper (Master of the company for eight years) was Lord Mayor in 1566, and it is thought that the record of his pageant provides the first detailed

account of an organised and regular Lord Mayor's Show. The first hall in Fenchurch Street was acquired in 1467, rebuilt in 1587 and in 1751, and was destroyed by enemy aircraft on 7 July 1917. This site was abandoned and the hall rebuilt in 1925 on the site of Shaftesbury House, in Aldersgate Street. The I. C. devotes much of its income to charitable purposes and as trustee administers many charities.

**Ironside**, Sir William Edmund (1880- ), 1st Baron, soldier. Was in the Brit. secret service in Ger. SW. Africa during the Herero campaign, receiving the Ger. service medal for his good offices. He was appointed to command the Brit. expeditionary force sent out to Archangel during the latter part of the First World War. His conduct of the operations against the Bolshevik forces concentrated along the Dwina showed generalship of a high order. Commanded the Ismid Force, 1920; N. Persian Force, 1921; Commander, Meerut Dist., India, 1928-31; Colonel Commandant, Royal Artillery, 1932-40; Governor and Commander-in-Chief, Gibraltar, 1938-9; Inspector-General of Overseas Forces, 1939; Chief of the Imperial General Staff, 1939-40; Commander-in-Chief, Home Forces, 1940; field marshal, 1940. He wrote *Tannenberg: the First Thirty Days in East Prussia, 1925, and Archangel, 1918-19, 1953*.

**Ironside**, nickname given to a man, particularly a soldier, who displayed great bravery. Edmund II, King of England, appears to have been the first in Eng. hist. to receive the name. It was applied to Cromwell (q.v.), and to his cavalry, those 'God-fearing men' whom he trained to iron discipline. They were the chief means of the parl. victories in the field.

**Ironton**, city, co. seat of Lawrence co., Ohio, U.S.A., on the Ohio R. (bridged) near Ashland, Kentucky. It occupies a central position in a dist. abounding in bituminous coal, limestone, and fruit. Pop. 16,300.

**Ironville**, eccles. par. of Derbyshire and Notts, England, 3 m. SE. of Alfreton. Pop. 3000.

**Ironwood**, name given to the wood of many different trees on account of its hardness and durability; it is applied to some 52 different genera of trees. A good timber-tree of India is *Mesua ferrea*, the Nagas or I., family Guttiferae. *Olea laurifolia*, black I., and *Tadalia lanceolata*, white I., are found in S. Africa.

**Ironwork**. Iron, like bronze, has been used for casting (q.v.), but the purest use of iron in decorative art is to be found in wrought I. Since early days iron has been used for weapons of war, but, owing to the effect of rust on iron, little early I. is now left to us. Iron appears to have been used by the anc. Egyptians at an early date, but was regarded as a precious metal; from Assyria and Babylonia comparatively few objects made of iron have survived. The Hebrews used iron considerably, and the Phoenicians made vessels of iron with which they traded. Pliny mentions Grecian iron statues,

while Plutarch writes of a polished iron helmet which shone blue like silver. We know from writings that the Greeks fully appreciated the beauty of iron and knew about the casting, forging, welding, embossing, tempering, polishing, and inlaying of iron. They used iron for such things as chariots, agric. implements, and in shipbuilding, while in Sparta coins and jewellery were often made of iron. The Romans continued with I.; they used the metal for armour, window-bars, and grilles. Barbaric races used iron before they were conquered by the Romans, and continued to use it with greater success than their conquerors. Up to the 14th cent. I. was the work of a smith, and he made and decorated such things as grilles, door decorations, and hinges. During the 14th cent. a change came over I. The smith now began to work the iron when cold, using file and saw, chisel and vice, whilst sheet iron also was cut and hammered into patterns. Thus came into being the armourer and locksmith, who used heat for working the iron only in the preliminary stages, and who were capable of carving a statuette out of a solid lump of iron. This change over I. derived from the E., and designs often more suited to wood and stone were carried out in iron. The Fr. iron-workers produced after this time the best I., their output being both beautiful in design and delicate in finish. During the cents. that followed iron was used for such things as locks, door handles, screens, firebacks, knockers, grilles, gates, and railings; and the designs used in the work included scrolls, rosettes, leaves, flower patterns (particularly the passion flower), and heraldic devices. See METALWORK. See also C. Ffoulkes, *Decorative Ironwork*, 1913; J. S. Gardner, *Ironwork*, 1927-30; J. A. R. Stevenson, *Din of a Smithy*, 1932.

**Irony** (Gk *eirōneia*, 'disimulation') is the use of words to convey a meaning opposite to their literal sense. Most commonly it gives censure under cover of praise, and is often used colloquially, as in 'You're a fine one!' An example from Shakespeare is:

'A trim exploit, a manly enterprise  
To conjure tears up in a poor maid's eyes!'

**Socratic irony**, named from the tactics employed by Socrates in his famous dialogues, means the feigning of ignorance in an argument in order to lead on and perplex an opponent.

**Dramatic irony** occurs when the audience in a theatre perceive in some words of the dialogue an underlying significance which is not apparent to the actors.

See also FIGURE OF SPEECH.

**Iroquois**, name given by the French to one of the great confederations of the N. Amer. Indians possessing the highest form of governmental organisation of any aboriginal tribes N. of Mexico. The league was originally composed of 5 tribes, the Mohawk, Oneida, Onondaga, Seneca, and Cayuga, called the 'Five Nations,'

and dating from the 16th cent., when it was led by Hiawatha and Dekanawida. About 1720 the Tuscaroras were admitted to the league, which was henceforth known as the 'Six Nations.' They numbered at that time about 12,000. Their original home seems to have been round the upper reaches of the R. St Lawrence, from which they moved S.-westwards and occupied the greater part of Upper Canada, the whole of New York state, and a large part of Pennsylvania, Ohio, and Michigan. A section of them moved S. to the Carolinas. They were equipped with guns by the Dutch and dominated many other tribes. In the border warfare with the French, the I. always sided with the English, while their bitter enemies, the Algonquins, fought for the French; they also, with the exception of the Oneidas, fought for the English in the Amer. War of Independence. The surviving Iroquoian stock number about 7000, mainly in Canada and New York state. They were studied by the Amer. ethnologist L. H. Morgan (q.v.). See I. H. Morgan, *League of the Ho-de-no-sau-nee or Iroquois*, 1901; C. Wissler, *The American Indian*, 1938; F. G. Spock, *The Iroquois*, 1945.

**Iroquois Language**, see NORTH AMERICAN NATIVE LANGUAGES.

**Irradiation**, in physics and medicine, exposure to radiation, usually infra-red, ultra-violet, or X-rays. Also used to describe bombardment by atomic particles, e.g. electrons, protons, neutrons. I. is also the name given to a particular optical illusion. When white objects or objects of a very bright colour are seen on a dark ground they appear larger than they really are. Thus a white square on a black ground seems larger than an exactly equal black square on a white ground. The phenomenon differs very much in different people and even in the same person on different days, and is probably due to a spreading of the excitation of the nerve cells in the retina.

**Irrational Numbers**, see SURDS.

**Irrawaddy**, see IRAWADI.

**Irradenta**, It. patriotic and political society which was particularly active immediately after 1878, when it had for its avowed object the liberation from foreign rule of all territories outside the boundaries of Italy, in which, it was claimed (sometimes wrongly), Italian was universal, i.e. S. Tyrol (Trentino), Görz, Istria, Trieste, Tessino, Nice, Corsica, Malta. It waned in importance after the Fr. occupation of Tunis in 1881, when Italy formed the Triple Alliance with Germany and Austria.

**Irrefragabilis**, Doctor, see ALEXANDER OF HALES.

**Irrigation** (Lat. *in* and *rigare*, to water) is the artificial application of water to land, as contrasted with watering by manual labour. I. is of great antiquity, as is shown by many I. works in India, Egypt, and China. (See also IRAQ.) No trace of scientific I. is found in the sculptures and paintings of ancient Egypt, but in works of as early a date as 2000 BC the practice of baling up water is represented.

Among the simpler forms of water-raising machinery the following may be mentioned: a pole with a bucket at one end of a crossbeam and a counterpoise at the other (known in India as a 'denkil', or 'paecottah,' in Egypt as a 'shadoof'), largely used in the Nile dist.; rude water-wheel, consisting of earthen pots on an endless chain which runs round the wheel, is termed a 'sakya' in Egypt and a 'harak' in N. India. By means of this a pair of oxen can raise water as far as 18 ft. and keep from 5 to 12 ac. irrigated. The 'churras' of India is a large leather bag, suspended from a rope which passes over a pulley and is raised by a pair of bullocks which go up and down a slope equal in length to the depth of the well. I., which is effected by means of canals, naturally depends on the discharge of the riv. in connection. When the riv. varies very much in vol., being very low in the dry season and flooded in the wet, a complete control of the water is necessary for the engineers, and the canal is therefore very costly. Such is the system on the Cuttack Canal, in connection with the Mahanadi R. The canals of Lombardy, on the other hand, are much less costly, as there is no great variation in the rivs, on which they depend, the Ticino and Adda, owing to the restraining influence of Lakes Maggiore and Como. The canal system of N. India contains works of hydraulic engineering unsurpassed in any country. In the S. of India I. is always required for the rice and sugar-cane crops, though maize and millet can be grown without any such aid. Generally speaking, the other dists. of India can manage without I. in good years. When most of the rain-watered lands of the U.S.A. had been taken up by settlers, the problem of the so-called arid lands came into prominence. There were vast areas in the Middle and Far W. states, and in some parts of the S. states, deficient in water. Companies were formed solely for I. purposes and to fix services to intending settlers, and under the Reclamation Act of 1902 the U.S. Gov. set aside a sum from the sale of public lands to finance great I. projects. Water rights were then sold to the settlers. In many places enormous dams have been built, and these, in turn, have proved valuable, because of hydro-electric power. To-day the U.S.A. ranks third in the irrigation countries of the world: the Indian peninsula has about 80 million ac.; China about 50 millions, and the U.S.A. over 26 millions. In Egypt I. works have been carried out on a very large scale; the delta formed by joining Cairo, Rosetta, and Damietta is intersected by many channels, and much benefit has resulted. Lower Egypt has been irrigated by a dam constructed at Assiut in 1902, which, however, failed in very dry seasons. The difficulty was partly met by raising the height of the barrage so as to hold back the waters, but as further areas came into cultivation it became necessary to construct a feeding lake. This was accomplished by constructing the Aswan (q.v.) Dam at a cost of

23,000,000 and thus creating a reserve of 5000 million tons of water. The masonry dam at Alicante on the Monegre R. dates from 1759, and is said to have a capacity of 130 million cub. ft. of water. In Italy, Spain, and in the S. of France I. is extensively carried on. The newly constructed Hume Reservoir at the junction of the Murray and Mitta Mitta R.s will eventually store 2,500,000 cub. ft. of water, which runs off a catchment area of 6000 sq. m. of mountainous country on the border of Victoria and New S. Wales (see MURRAY RIVER). Experience has shown that for successful I. a thorough system of drainage in conjunction therewith is a necessity.

in which the same water is used many times. (3) Subterraneous I., in which the water is drawn up through the soil to the surface. This is applicable only to level surfaces. (4) Warping I., in which the water is allowed to stand on the land until it has deposited the mud, etc., contained in it. The proper management of water meadows requires great care and skill. There must be neither too much nor too little water; the flow must be regulated with exactitude, etc.

*Irrigation problems of the British Commonwealth.* It was estimated by S. F. Harris (*Soil Alkali*, New York, 1920) that in 1920 about 100,000,000 ac., or 7 per cent

From 'In Lotus Land' by H. G. Ponting

#### IRRIGATION IN JAPAN

Beyond the tea pickers can be seen the small fields from which the barley crop has been harvested and which are flooded for the reception of the rice shoots.

This principle was overlooked at first in modern works, and the complete saturation of some districts in consequence had a prejudicial effect on their fertility. Generally speaking, the water used in I. not only supplies the moisture so necessary for vegetation, but fertilises the soil by furnishing such mineral constituents as salts of potash and soda, sulphates of lime, soluble silica, etc. In proportion as the water is rich in these, the effect on the soils is similar to that produced by a dressing of bone-manure. Sewage water is unquestionably even more valuable for irrigating purposes than ordinary water, owing to the large amount of putrefied animal and vegetable matter contained therein. The drainage of many towns is thus turned to a profitable use at the present time. Various systems of I. are used to suit the special requirements of the case, one of the following being generally used in England: (1) Bedwork I.; this is the most effective system, but is also the most costly. (2) Catchwork I.,

of the total area of the earth's surface under cultivation, was farmed by I. Since that year thousands of additional ac. have been added, and it is thought that the area of land under I. will continue to increase. This is probable because nearly one-third of the earth's surface receives only 10 in. of rain or less annually, and over another third the rainfall is between 10 and 20 in. Over most of this latter area little if any additional water is needed, except for intensive crops, although special methods of cultivation, aimed at moisture conservation and known as 'dry farming,' have to be adopted. But on land receiving less than 10 in., I. is generally essential if any kind of profitable crop production is to be undertaken. The geographical distribution of regions of deficient rainfall comprises a considerable proportion of the Brit. Commonwealth. The successful development of a stretch of land for I. farming and the maintenance of the fertility of the soil involves a constant attention to economic, engineering,

and scientific factors. The engineering problems connected with the construction of dams, main and branch supply canals, drainage ditches, and pumping stations, like the economic factors, are specific to each dist. and are executed in accordance with fixed principles. The scientific factors comprise the questions of the composition of the water available for I. and the chemical composition and physical properties of the soil. They apply not only to the development of new areas, but also to the maintenance of the fertility of existing I. areas. The scientific factors relate to the concentration of soluble salts (sulphates, chlorides, nitrates and carbonates of sodium, potassium, and magnesium, and chloride and nitrate of sodium) in arid conditions; the effects of soluble salts on soil fertility and on the physical state of the soil; and the tolerance of vegetation to alkali conditions. The complete cycle of soil changes which are traceable may proceed rapidly or be so slow that a noticeable change occurs only over a considerable period of years; but sooner or later the danger or deterioration confronts every irrigated area. Thus the famous I. of the Nile valley, where fertility has been maintained for cents., now appears to be showing the first signs of deterioration owing to a change in cultural methods. In the old or basin system of I., after the winter crop of wheat or *bersem*, the land remained fallow from May to Aug. Economic factors, in particular the extension of the area under cotton and maize, have necessitated perennial I., the necessary water for these summer crops being held by the Aswân dam and delivered as required. Under this system the frequency of the *sheraqi* or summer fallow period is much diminished, with the result that difficulties in cultivation and decrease in yield of the more sensitive crops are beginning to creep in. A. Howard and G. L. O. Howard have summarised the principles underlying water saving for the wheat crop in India as follows: (i) I. water must be spread over the largest possible area; (ii) it must interfere as little as possible with the natural aeration of the soil; (iii) heavy waterings reduce the proportion of grain to total crop and increase the growth period; (iv) a limited water supply encourages deep root development; and (v) the soil moisture must be conserved as far as possible by a surface mulch of dry soil. The problems of I. in the Brit. Empire are being faced in different ways in different parts; but it is evident that I. is not simply a matter of providing a water supply; it necessitates constant vigilance by soil experts, otherwise deterioration sets in. See B. A. Keen, *Memorandum on Irrigation Practice and Problems* (Empire Marketing Board pamphlet), 1927; D. Thorne and H. Petersen, *Irrigated Soils*, 1949; O. Israelson, *Irrigation Principles and Practice*, 1950; O.E.E.C., *Farm Irrigation*, 1954; H. Addison, *Land, Water, and Food*, 1955. See also DRY FARMING.

**Irritability in Plants, or Sensitiveness is**

the manner in which they respond to the action of external forces such as (1) gravity, (2) light, (3) mechanical contact or pressure, (4) moisture, etc. (see TROPISM). Instances of irritability to contact are the leaves of the sensitive plant sundew, the stamen of *Berberis*, and the lobes of the stigma of the musk, which close together when touched. Response to presence of moisture is shown by growing roots, which are said to be positively hydrotropic. See also INSECTIVOROUS PLANTS.

**Irsina** (formerly Montepeloso), It. tn. in Basilicata (q.v.), 19 m. WNW. of Matera (q.v.). Pop. 10,500.

**Irthlingborough**, par. and urb. dist. in Northants, England, on the R. Nene, and 2 m. NW. of Higham Ferrers. It has large ironstone quarries, and manufs. of boots and shoes. Pop. 5090.

**Irtysk**, riv. in W. Siberia, chief trib. of the Ob'. It rises in the Altay Mts in Sinkiang (China), flows NW. through Lake Zaysan to Tobol'sk, then N., joining the Ob' from the left. Length 2760 m.; major tribs. Tobol and Ishim. The I. passes through regions with rich deposits of non-ferrous metals (see ALTAY), coal (see EKIBASTUZ), and salt, fertile steppes (see BARABA; KULUNDA; VIRGIN LAND CAMPAIGN), and forests. Almost the whole I. is navigable; navigation started in the 17th cent. The main goods shipped are timber, grain, and coal. The chief ports are Omsk, Semipalatinsk, Pavlodar, Ust'-Kamenogorsk, and Tobol'sk. Ust'-Kamenogorsk and Bukhtarma hydro-electric stations were built in the 1950's.

**Irún**, Sp. tn in the prov. of Guipúzcoa, on the Bidasoa (q.v.). It was very badly damaged in 1936 during the civil war. It is the first Sp. station on the Paris-Madrid railway, and is the customs station for road travellers. It has a Renaissance church and tn hall, and manufs. pottery. Pop. 18,000.

**Iruña**, see PAMPLONA.

**Irvine**: 1. Royal burgh and seaport of Ayrshire, Scotland, on the R. I. It is the bp. of John Galt, the novelist, and James Montgomery, the poet. Robert Burns lived in I. for a few months in 1781-2, and the local Burns Club has a unique collection of Burns's MSS., including *The Cottar's Saturday Night*. An industrial tn with many of the amenities of a holiday resort, its chief industries include hosiery factories, engineering works, chemical works, iron and brass foundries, etc. Five golf-courses are in the neighbourhood. Pop. 15,000.

2. Riv. in Ayrshire, Scotland, rising on the borders of Lanarkshire, which flows W. to divide the dists. of Cunningham and Kyle and empties itself into the Firth of Clyde at Irvine burgh. Trout and salmon are found in the riv. Length 30 m.

**Irvinestown**, agric. tn and rural dist. of co. Fermanagh, N. Ireland, near Upper Lough Erne. Pop. (rural dist.) 12,000.

**Irving**, Edward (1792-1834), cleric, b. Annan, Dumfriesshire. Educ. at Edinburgh Univ. he became a master at Haddington (1810) and at Kirkcaldy (1812). Here he taught Jane Welsh (afterwards

Mrs Carlyle) and fell in love with her, but he was already engaged to a Miss Martin whose family prevented him from breaking off the engagement. In 1815 he obtained a licence to preach from the Church of Scotland, and 4 years later became an assistant to Dr Chalmers, then in Glasgow. In 1822 he became the minister of Cross Street Chapel, Hatton Garden, London, and his sermons became extraordinarily popular. In 1823 he pub. *For the Oracles of God* and *For Judgment to Come*, in which he declared his belief in the second personal advent of Jesus Christ. His popularity waned as his views developed. His belief in Christ's oneness with men in the attributes of humanity was misinterpreted, and he was accused of imputing sinfulness to Christ. In 1830 he was tried before the London Presbytery, and 2 years later was deposed from the ministry. He was a conspicuous forerunner of what became known as the Catholic Apostolic Church (q.v.). He never held more than a subordinate office in it, and *d.* before its full estab. He became 'chief pastor' of the first church set up in London, in Newman Street, but *d.* shortly afterwards in Glasgow. His complete works were pub. in 5 vols. by Gavin Carlyle (1864-5). See Carlyle's *Reminiscences*, 1881, and biographies by W. Wilks, 1854, Mrs Oliphant, 1862, and A. L. Drummond, 1897.

Irving, Sir Henry (1838-1905), actor, whose original name was John Henry Brodribb, was the son of a Somerset tradesman, who afterwards settled in London. The boy's tastes always inclined to the stage, and, while he was a city clerk, he took lessons in elocution, fencing, and dancing. At the age of 18 he threw up his job and secured an engagement in a stock company at Sunderland and, later, another at Edinburgh. He remained in the provs., learning his art, until 1866, when he made his London debut at the St James's Theatre as Doricourt in *The Belle's Stratagem*. At the same theatre, in the following Dec., he played Petruchio to the Katherine of Ellen Terry. He was now firmly estab. as a London actor, but he did not achieve any marked success until 1870, when his performance of Digby Grant in *The Two Roses* made him popular. His Alfred Jingle in *Pickwick* added to his laurels, but he first became famous when he played in *The Bells at the Lyceum* (25 Nov. 1871). In 1874 he played Hamlet for 200 nights, and with this performance he rose to the head of his profession. Four years later he became manager of the Lyceum, and, with Ellen Terry as his leading lady, made it the first theatre in the country. His prin. successes were Hamlet, Shylock, Benedick, Malvollo, Dr Primrose (in *Olivia*), Landry (in *The Dead Heart*), King Lear, Becket (in Tennyson's play), and Corporal Brewster (in *A Story of Waterloo*). I. was not a good man of business; his production expenses were heavy, his generosity unbounded, and when in 1898 his store of scenery was burnt down, he had to part with the lessorship of the Lyceum, though

he continued to act there until 1902. In the following year he played in *Dante* at Drury Lane, then went for the eighth time to America, made a tour in England, and in April 1905 revived *Becket* at Drury Lane, where he was enthusiastically received. He went on tour again, but his health was broken, and after a performance of *Becket* at Bradford on 13 Oct. he collapsed, and *d.* a few hrs later. He was buried in Westminster Abbey. I. was the greatest figure in the theatrical world of his day. He had many mannerisms, but against these he had dignity, and a great conception of tragedy. His dominant quality was magnetism, not that of all-mastering eloquence, for his voice was neither resonant nor strong, but rather of passionate yet quiet intensity. He had strongly marked physical handicaps, but these disabilities he overcame in the end by patient effort, and towards the latter part of his life he was a model of precise diction. I. had a loyal and generous side to his nature, and as a man was the embodiment of courtesy and distinction. He was a great man as well as a great actor, and it was often said of him that he would have risen to eminence if he had followed any other profession. I. was the first actor to be offered a knighthood, and, after having declined it 12 years earlier, in 1895 he accepted the honour. He married the daughter of Surgeon-Gen. Daniel O'Callaghan in 1869, but they separated 5 years later. Lady I. (who *d.* in 1935) was the mother of Henry Brodribb I. (q.v.) and Laurence I. (q.v.). There are sev. lives, including those by Bram Stoker, 1906, A. Brereton, 1908, Gordon Craig, 1930.

Irving, Henry Brodribb (1870-1919), actor, b. Bayswater, London; elder son of Sir Henry I. (q.v.). Educ. Marlborough and New College, Oxford. He joined Ben Greet's company and met Dorothea Baird whom he married in 1896. He repeated many of his father's parts, but added a reputation in comedy—e.g. Crichton, the butler in Barrie's *Admirable Crichton*, 1902. Acted in America, 1906; Australasia, 1911. For the last 6 years of his life, lessee of Savoy Theatre. His hobby was criminology—he wrote *Life of Judge Jeffreys*, 1898, *Book of Remarkable Criminals*, 1918, and *Last Studies in Criminology*, 1921. See A. Brereton, 'H. B.' and Laurence Irving, 1922.

Irving, Laurence Sydney Brodribb (1871-1914), actor; younger son of Sir Henry I. Educ. at Marlborough and in Paris. His first appearance on the stage was at Dundee in 1891, under Benson. He wrote *Peter the Great* for his father, 1898. His best impersonations were Karl Skule in *The Pretenders* and Takeramo in *Typhoon*, by Melchior Lengyl. I. and his wife (Mabel Hackney) were drowned in the sinking of the steamer *Empress of Ireland* in the St Lawrence R. in 1914.

Irving, Washington (1783-1859), Amer. short story writer, essayist, and historian, b. New York City, son of a merchant who had emigrated from Scotland. After a desultory education, I. entered a law office, but in 1804 went on a European

tour in search of health. On his return in 1806 he was admitted to the Bar, but devoted himself instead to writing. In 1807 he ed. *Salmagundi or the Whim-Whams and Opinions of Launcelot Langstaff and Others*, a miscellany in which he had sev. collaborators. In 1809 appeared *Diedrich Knickerbocker's History of New York*, a satire on the city's manners and politics which has become an Amer. classic. In the war of 1812 he was aide-de-camp to the governor of New York. In 1815 he sailed again for Europe, where he remained for 17 years and became very much 'Europeanised.' In Britain he was welcomed by Campbell the poet and introduced to Scott, whom

wrote with charm on every subject he touched, and was the first to give Amer. literature a permanent standing abroad. See his *Life and Letters*, ed. by P. M. Irving, 1862-4; also lives by G. S. Hellman, 1925; S. T. Williams, 1935; Van Wyck Brooks, *The World of Washington Irving*, 1946.

**Irvingites**, see IRVING, EDWARD, and CATHOLIC APOSTOLIC CHURCH. The term I., repudiated by those to whom it refers, is one of which Irving on his death-bed expressed abhorrence.

**Irvington**, tn of Essex co., New Jersey, U.S.A., 3 m. SW. of Newark. It manufs. rubber and metal products, clothing, toys, hardware, tools, paper, and pigments. Pop. 59,000.

**Irwell**, riv. of Lancs, England, rising 2 m. S. of Burnley, and flowing, in a tortuous course, through Bacup, Rawtenstall, Bury, and Manchester, to the Mersey at Irlam. The Manchester Ship Canal is now included in the lower part of its course. Length 40 m.

**Irwin, Edward Frederick Lindley Wood**, 1st Baron, see HALIFAX, 1ST EARL.

**Is**, see HIT.

**Isaac**, only son of Abraham and Sarah, b. in their old age (Gen. xvii. 17). God, to test Abraham's faith, ordered him to be sacrificed, intervening to save him at the last minute (Gen. xxii). When 40 years old he married his cousin Rebecca, who bore him twin sons, Esau and Jacob. He lived a peaceful, uneventful, nomadic life, and d. in Hebron aged 180. See ABRAHAM. See also H. H. Rowley, *Recent Discovery and the Patriarchal Age*, 1949.

**Isaac I (Comnenus)** (d. 1061), Byzantine emperor of Constantinople (1057-9), the first emperor of the house of Comnenus. He had served in the army, and on the deposition of Michael VI was declared emperor by the soldiers. He reformed the finances, forced the clergy to contribute to the state revenue, and repelled the attacks of the Hungarians in the N. In 1059 he abdicated and retired to the monastery of Studion, where he d.

**Isaac II (Angelus)** (d. 1204), Byzantine emperor of Constantinople (1185-95 and 1203-4), succeeded Andronicus I. In 1195 his brother Alexius seized the throne by force and I. was blinded and imprisoned. Eight years later he was restored to the throne, but was too weak, mentally and physically, to rule, and d. in 1204, shortly after the murder of his son, Alexius.

**Isaacs, George Alfred** (1883- ), Brit. politician and trade union official, b. London. He was elected Labour M.P. for the Gravesend div. of Kent, 1923-4, and for Southwark in 1929-31, and since 1939. I. held various junior appointments in the Labour govs. before the Second World War, and was parl. private secretary to the first lord of the admiralty, 1942-5; he was made a privy councillor, 1945. He was a member of the Royal Commission on Workmen's Compensation, whose recommendations resulted in the passing of the National Insurance (Industrial Injuries) Act, 1946. He was secretary

WASHINGTON IRVING

he visited at Abbotsford in 1817. I. then produced *The Sketchbook of Geoffrey Crayon, Gent.* 1819-20, the first number of which contained his famous story 'Rip Van Winkle.' *Bracebridge Hall*, 1822, and *Tales of a Traveller*, 1824, were both pub. in London. From 1826 to 1829 he was on the staff of the U.S. embassy in Spain, and wrote a series of historical and romantic works, including a *History of the Life and Voyages of Christopher Columbus*, 1829, *A Chronicle of the Conquest of Granada*, 1829, and *The Alhambra*, 1832, a collection of tales. From 1829 to 1832 he was at the U.S. legation in London. Returning to America in 1832 he pub. a number of stories of frontier life: *A Tour on the Prairie*, 1835, *Astoria*, 1836, and *The Adventures of Captain Bonneville*, 1837. From 1842 to 1846 he was Amer. minister to Spain, then settled at his house 'Sunnyside' near Tarrytown on the Hudson, where he spent his last years. Among his last works were *Wolfert's Roost*, 1855, a collection of sketches, and lives of Oliver Goldsmith, 1849, and Washington, 1855-9, this last a monumental work in 5 vols. Though not an author of great power or originality, I.

of the National Society of Operative Printers and Assistants (*Natsopa*) (1909-1949); past president of the Printing and Kindred Trades Federation; chairman of the Trades Union Congress General Council, 1945; president of the World Trade Union Conference, London, 1945. I. was minister of labour and national service, 1945-51, and minister of pensions, Jan.-Oct. 1951.

**Isaacs, Sir Isaac Alfred** (1855-1948), Australian lawyer and statesman, *b.* and educ. at Melbourne. Admitted to the Victorian Bar, 1880. Q.C., 1889. Member of Legislative Assembly, Victoria, 1892. Solicitor-General of Victoria, 1893, and Attorney-General, 1894; entered Commonwealth Parliament, 1901. Was a member of the Convention which framed the Commonwealth Constitution. Attorney-General, Commonwealth of Australia, 1905. High Court judge, 1906. Knighted, 1928. Chief Justice, Australian Commonwealth, 1930-1. Governor-General of Australia, 1931-6, being the first Australian to be so appointed.

**Isaacs, Jorge** (1837-95), Colombian poet and novelist, *b.* Cali; son of an Eng. Jew turned Christian and planter and married to a Sp. woman. Attended school at Bogotá; at 16 went to London to complete his education. In 1864 his first vol. of poems was enthusiastically received. In 1867 he pub. *Maria*, an 'idyllic romance,' somewhat autobiographical. Filled a diplomatic post in Chile. Was a member of Colombian Congress, and director of public instruction at Ibagué, where he d.

**Isaacs, Rufus**, *see* READING, MARQUESS OF.

**Isabela:** 1. NE. coast prov. of Luzon, Philippines, area 4069 sq. m. It is mountainous and covered with forests. Coffee, sugar-cane, rice, corn, and tobacco are cultivated, and cattle-raising is carried on. Pop. 264,495. The cap. is Ilagan (q.v.), pop. 35,384.

2. Trading centre in Negros Occidental prov., Philippines. Rice and sugar are grown, and sugar is also milled. Pop. 33,740.

3. Tn on Basilan Is., Zamboanga prov., Philippines. It ships lumber and coconuts; corn and rice are grown. There is a fishing industry. Pop. 1000.

4. Abandoned vil. and cape on the N. coast of the Dominican Rep. (q.v.), W. Indies, and 36 m. WNW. of Santiago. It was founded by Columbus (1493). the first permanent European settlement in the New World.

**Isabella** (1292-1358), Queen of England, daughter of Philip IV of France and wife of Edward II of England, whom she married in 1308. Edward neglected her for his favourites and in 1325 she went to France. There she collected forces, and, being joined by Roger Mortimer, her lover, and other barons, landed in England (1326), and attacked and defeated the king. Edward was deposed, imprisoned, and murdered. She and Mortimer ruled supreme for a time, but in 1330 Edward III had Mortimer executed,

and I. was forced to spend the rest of her life in retirement.

**Isabella** (1451-1504), Queen of Spain, daughter of John II of Castile and Leon, and a descendant of John of Gaunt. She married Ferdinand II of Aragon in 1469. In 1474 she succeeded her brother on the thrones of Castile and Leon, and 5 years later, when Ferdinand became King of Aragon, the couple were rulers of all Spain. I. was undoubtedly the visionary and the enthusiast in the royal partnership, while her husband was the diplomatist. Hers is primarily the responsibility for the introduction of the Inquisition into Spain (1480). She was a woman of extraordinary drive and courage, mingled with extreme bigotry; her enthusiasm inspired her countrymen in the final defeat of the Moors, and it was I. who encouraged the New World exploration on which Sp. power in succeeding cents. was to rely so much. *See* lives by I. L. Plunket, 1919, and A. S. Wittlin, 1936.

**Isabella II** (1830-1904), Queen of Spain, *b.* Madrid, the eldest daughter of Ferdinand VII. She was proclaimed Queen of Spain at the age of 3, on the death of her father, who had persuaded the Cortes to repeal the Salic law. Her title was disputed by her uncle, Don Carlos, and her reign was a succession of quarrels and intrigues. In 1846 she was persuaded to marry her cousin, Prince Francisco de Assis de Bourbon (1822-1902), from whom she was separated in 1870. In 1868 she was forced into exile, and abdicated 2 years later in favour of her son, Alfonso XII.

**Isabey, Jean Baptiste** (1767-1855), Fr. portrait painter, *b.* Nancy. He studied under Dumont and David, and was employed at Versailles, where he painted the portraits of most of the celebrities of his time. He painted many of the revolutionaries, including Barrère and Saint-Just, and was patronised in turn by Napoleon and Josephine, and by the Bourbon sovereigns. Talleyrand made him official painter for the Congress of Vienna, 1814. Apart from portraits, his best-known works are 'Isabey's Boat,' 1796, and 'Review of Troops by the First Consul.' He is noted as a draughtsman and lithographer. *See* life by M. E. Taigny, 1859.

**Isaeus** (c. 420-350 BC), Attic orator, son of Diagoras, *b.* Chalcis in Euboea. He was a pupil of Isocrates, and wrote judicial orations for other people, and founded a school of rhetoric at Athens, in which Demosthenes is supposed to have been his pupil. Twelve only of his speeches are extant (ed. by T. Thalheim, 1903). They throw an important light on Attic law. *See* Sir R. C. Jebb, *The Attic Orators* (2nd ed.), 1893, and K. Freeman, *The Murder of Herodes and other Trials*, 1946.

**Isafjörður**, tn in W. Iceland, a fishing and trading centre with small-scale printing and publishing industries. Pop. 2711.

**Isaiah**, son of Amoz, greatest and most important of Jewish prophets, was of high social rank, an inhab. of Jerusalem,

married and the father of a family. The heading of the book tells us that he prophesied from the year of King Uzziah's death (740 BC) through the reigns of Jotham, Ahaz, and Hezekiah; and a late tradition (cf. Heb. xi. 37) tells us that in the days of Manasseh he suffered death by being sawn asunder, but nothing is said of this in Kings. Aben-Ezra was the first to call attention to the fact that the book was capable of subdiv., and later critics have carried on the work most vigorously. The chief break comes after ch. xxxix. Chs. xl to lxvi contain many passages that may show them to be post-exilic. The people are addressed as those who have already suffered the punishment of their sins and who are now in exile. Cyrus, who reigned more than a century after the death of I., is actually named, as a sign that Yahweh will fulfil his promises in the near future. This section is itself generally divided into 2 parts, xl-lv and lvi-lxvi, known respectively as Deutero-Isaiah and Trito-Isaiah, of which the second is the earlier in date. It must, however, be admitted that Jewish tradition never had any notion of more than one author for the whole book (cf. Ecclus. xlviii, 23 ff.) and as the second portion of the work undoubtedly reaches the supreme height of O. T. prophecy it is hard to know how so sublime a prophet could have been forgotten. The Dead Sea Scrolls, in the complete I. they contain, show no break between I and II Isaiah. The subdiv. of the earlier part of the work is more uncertain and dubious. Certain portions such as xlii-xiv, 23, xxiv-xxvii, etc., may be post-exilic since they presuppose the conditions of later times. The oracles of I. correspond to 4 invasions of Palestine. The first is that of Tiglath-Pileser (ch. ii to the beginning of x, including the famous Emmanuel prophecies, and possibly also certain later parts); the second, that of Sennacherib (ch. xxviii, containing the first promises of the coming prince whom later ages have identified with the Messiah). The third invasion is that of Sargon, whether or no it included Judah (xx-xxxi, 10; and perhaps chs. x. 5-34 and xxii). To the last invasion, that of Sennacherib, belong most of the chapters from xx-xxv. See S. R. Driver, *Isaiah*, 1888; G. A. Smith, commentary in *The Expositor's Bible*; G. W. Wade, *The Book of the Prophet Isaiah* (Westminster Commentaries), 1911; C. C. Torrey, 1928; E. J. Keesano, 1943.

**Isandhiwana**, isolated kop (q.v.) in Natal (q.v.), 11 m. from Rorke's Drift (q.v.), S. Africa. Here, during the Zulu war, Col. Durnford's column of 800 Brit. troops and as many native levies were surprised and annihilated by 20,000 Zulus (q.v.) under Cetewayo (q.v.), 22 Jan. 1879.

**Iasar**, or **Iser**, riv. of central Europe, rising in the Austrian Tirol (q.v.), and flowing N. and NE. through Bavaria (q.v.) to the Danube (q.v.), near Deggen-dorf. It passes Munich (q.v.). Length 220 m.

**Isaure**, Clémence, see CLÉMENCE ISAURE.

**Isauria**, anct. dist. in Asia Minor,

bounded by Pisidia, Lycaonia, and Cilicia. In Rom. times the inhab. were noted as pirates. They were overcome by P. Servilius in 78 BC, but soon rebelled and were a constant source of trouble. The Isauri are said to have been effectually subjugated in the reign of Justinian (6th cent. AD). Two of the Byzantine emperors were Isaurians: Zeno (AD 474-491) and Leo III (718-41). See W. M. Ramsay, *Historical Geography of Asia Minor*, 1904.

**Ischalis**, see LICHESTER.

**Ischia** (Gk Pithecusa; Rom. Aenaria), very fertile and picturesque is. in the Bay of Naples (q.v.). It is 6 m. from the mainland. In the centre of the is. is Mt Epomeo (2589 ft), from which the ground slopes down all round to the sea. The is. suffered earthquakes in 474 BC, 92 BC, AD, 1302, and AD 1883. It was attacked by the pirate Barbarossa in 1541, by the Duke of Guise in 1547, and by Nelson (q.v.). Murat (q.v.) took refuge here in 1815. The prin. tns are 1, the cap., on the NE. coast (pop. 10,000), and Casamiciola (q.v.). There are many mineral springs, and the is. is known for its fruit, wine, and fish. Area 18 sq. m.; pop. 31,000.

**Ischl**, Bad, Austrian tn in the prov. of Upper Austria, at the confluence of the Traun and the I. It is the prin. tn of the Salzkammergut (q.v.), has saline springs, and is a tourist and health resort. There is a salt industry. Pop. 13,000.

**Iseo**, Lake (It. Lago d'Iseo; anct. Sebinus Lacus), lt. lake in Lombardy (q.v.), between Bergamo and Brescia (q.v.). It is enclosed by mts on 2 sides and contains a large, mountainous is. (Monte Isola, 1950 ft). The lake is traversed by the R. Oglio, a trib. of the Po (q.v.). Length 15½ m.; maximum breadth 3 m.

**Iser**, see ISAR.

**Iseran**, pass (9085 ft) in the Alps, in Savoie (q.v.) dept, France, connecting the valleys of the Arc and the Isère.

**Isère**: 1. Dept of SE. France, lying E. of the Rhône (q.v.), and drained also by the I. It and its tribs., the Drac and Romanche. It is very mountainous and heavily wooded in the SE., including the massifs of Grando-Chartreuse and Vercors, and part of the massif du Pelvoux. In the NE. it is lower, but it is generally infertile except in the riv. valleys. Some wheat, potatoes, tobacco, and hemp are grown, and livestock is reared. In the I. valley wine is produced. Coal, iron, and lead are found, and hydro-electric power is well developed. There are metallurgical, chemical, textile, paper, and glove (Grenoble) industries. There are 3 arrons.: Grenoble, La Tour-du-Pin, and Vienne (q.v.). The cap. is Grenoble. Area 3178 sq. m.; pop. 626,200.

2. Riv. rising in the Alps, and, winding W. and SW. for 180 m. (100 m. of which are navigable) through the depts of Savoie, I., and Drôme, joins the Rhône a few miles above Valence.

**Iserlohn**, Ger. tn in the Land of N. Rhine-Westphalia (q.v.), 40 m. ENE. of

Düsseldorf (q.v.). In the Middle Ages it was known for the making of armour. Textiles and iron and steel goods are manu. Pop. 47,000.

**Isernia** (anc. *Aesernia*), It. tn in Abruzzi e Molise (q.v.), 22 m. W. of Campobasso (q.v.). It was originally a Samnite tn (see *SAMNITUM*), and was taken by the Romans c. 260 BC. In 1799 it was stormed by the French, and in 1860 it was sacked in a Bourbonist revolt. The tn has a cathedral, and has numerous antiquities; the massive polygonal walls which form the foundation of the present tn walls are attributed to the Samnites; a subterranean Rom. aqueduct still supplies water to the tn, and there is a notable Rom. bridge. I. is an important centre of communications, and has textile, pottery, and brick industries. Pop. 160,000.

**Isfahan**, tn and dist. of Persia. The dist. is bounded on the N. by Kashan. Ardestan, and Golpayagan, on the E. by Na'in, on the S. by Shahreza, and on the W. by Faridan. Wheat, rice, cotton, opium, tobacco, and fruit are produced. The tn, the cap. of Persia under the Safavid dynasty from the time of Shah Abbas I (1587-1629), lies on the Zayandeh Rud, which is spanned by fine bridges. The tn contains a number of fine buildings, including the Chehel Sotun (Hall of Forty Pillars), built by Shah Abbas I, the Friday Mosque, part of which was built in the reign of Malikshah (1072-92), the Shaykh Lutfallah Mosque, and the Royal Mosque, the 2 last-named being built by Shah Abbas I. To the S. of the tn is the Armenian suburb, Julfa. I. is the main centre of the Persian textile industry. Pop. of tn 254,900.

**Isk**, in Scots law, means 'outgoing,' in the sense either of exit or the expiry of a lease.

**Isherwood, Christopher** (1904- ), novelist, b. Disley, Cheshire. His father, who was killed at Ypres in 1915, was an army officer, and I.'s early years were spent in various garrison tns. He was educ. at Repton School and Corpus Christi College, Cambridge. After temporary employment as a private secretary and tutor, he went in 1929 to Berlin, where he stayed until Hitler came to power in 1933. From schooldays he had formed a close friendship with W. H. Auden (q.v.) with whom he collaborated in 3 plays notable for their expressionist technique—*The Dog beneath the Skin*, 1935, *Ascent of F 6*, 1937, and *On the Frontier*, 1938. In 1938 he went with Auden to China for the purpose of writing a book about conditions there. The result of this further collaboration was *Journey to a War*, 1939. His first novel, *All the Consplorators*, was pub. in 1928, followed by *The Memorial*, 1932. His next novel, *Mr Norris Changes Trains*, 1935, showed a considerable advance and estab. his reputation as a writer with a capacity for realistic and humorous perceptions and a clear prose style. In Jan. 1939 he went to the U.S.A. with the intention of becoming a permanent resident. His interest in metaphysical studies allied him with the Vedanta Society in Los

Angeles, and he has collaborated in a trans. of the Bhagavad-Gita. Living in California, he has also worked as a script-writer for films. His autobiographical work, *Lions and Shadows*, was pub. in 1938. Later novels are *Prater Violet*, 1945, and *The World in the Evening*, 1954. The *Condor and the Cow*, 1949, tells of a visit to S. America.

**Ishii, Kikujiro**, Viscount (1866-1945), Jap. diplomatist; b. Chiba. Studied law at Tokyo. Was in the consular service and afterwards he became vice-minister of foreign affairs, 1908. Amb. to France, 1912, till made minister of foreign affairs, 1915-16. Viscount and member of House of Peers, 1916. Amb. to U.S.A., 1917-19; and to France from 1920. Acting-president of Council of League of Nations, 1921. Delegate to Naval Disarmament Conference, Geneva. Killed, together with his wife, at their home in Tokyo in an Amer. bomber attack, 25 May 1945.

**Ishim**, riv. in SW. Siberia, left trib. of the Irtysh. It rises in the Kazakh hills and flows through fertile land now being rapidly cultivated. Length 1400 m.

**Ishimbay**, tn in Bashkiria (Russia), on R. Belaya, S. of Sterlitamak. It is the centre of the I. oilfields, the first to be exploited in the Volga-Urals oil region. It was founded in 1932, becoming a tn in 1940. Pop. (1956) under 50,000.

**Ishmael**, son of Abraham by Hagar, the Egyptian handmaiden (Gen. xvi, xxi, 9 ff.). Through Sarah's jealousy, I., at 15, was, with his mother, expelled and driven into the wilderness, where a guardian angel directed them to water. The boy became a famous archer, married an Egyptian, and became ancestor of the Ishmaelites. Mohammed claimed descent from I., and Muslims assert that he is buried with his mother in the Kaaba at Mecca.

**Ishtar**, or **Istar**, anc. Mesopotamian goddess of fertility and unrestrained sexual love, of wedlock, maternity, and war, associated with Tammuz (q.v.). See *ASTARTE*.

**Ishwar Chandra**, see *ISWAR*.

**Isidore of Seville**, or **Isidorus Hispanensis**, St (c. 560-636), Bishop of Seville and Sp. encyclopaedist. He was educ. in a monastery and became distinguished in his controversies with the Arians. In 599 he was chosen Bishop of Seville, and became famous for his powers of administration and his learning in science, hist., and theology. He was present at the councils of Toledo (610) and Seville (619), and it was his influence that altered the organisation of the church in Spain. He wrote an encyclopaedia from his own knowledge. It included law, science, hist., and theology, and helped to keep alive some knowledge of learning through the Dark Ages. His feast day is on 4 April. He was declared a Doctor of the Church by Benedict XIV.

**Isidorian Decretals**, or **False Decretals**, spurious amplification of the canonical collection in use in the church of Spain in the 8th cent. The compiler assumed the

name of Isidore, taking in addition the name of Mercator. The collection is divided into 3 parts. The first contains 70 letters (forged) attributed to various popes. The second contains a collection of conciliar decisions and the forged 'Donation of Constantine' (q.v.). The third is a series of decretals from the Nicæan council. The object of the forger was to reform the canon law and to increase the authority of bishops as against civil rulers. The I. D. were very skillfully composed, and became the cause of violent controversy.

**Isinglass**, a practically pure collagen (q.v.) prepared by drying the swim bladders of various fish, used especially for clarifying wines and beer. It is manuf. chiefly in Russia, Canada, Brazil, and the Indies.

**Isis**, name sometimes given to the upper reaches of the R. Thames (q.v.) above the point where it is joined by the R. Thame (q.v.). The usage is poetic and literary rather than exact and local; it is found in the sixth (enlarged) ed. of Camden's *Britannia*, 1607. The form I. has no etymological connection with the name 'Thames'.

**Isis**, anct Egyptian goddess, whose name means 'seat,' personified the throne of Osiris (q.v.), whose sister-wife she was. She became the type of a dutiful wife and mother. With the elevation of Osiris to chief god she became chief goddess, and eventually her worship, with that of Serapis (q.v.), spread to Rome and Greece. Her temple, built at Philæ by Ptolemy II, was the last centre of paganism in Egypt, being closed by Justinian in the 6th cent. See also HORUS.

**Iskander Beg**, see SCANDERBEG.

**Iskanderun**, Turkish name for ALEXANDRETTA (q.v.).

**Iskra** (Russian 'spark'), unofficial organisation within the Russian Social Democratic Labour party (q.v.), set up in 1900 by Lenin, Martov, and Potresov for the purpose of uniting the more orthodox Marxist and politically minded party members against reformism and economism (q.v.). They pub., together with the Liberation of Labour Group (q.v.), a newspaper *Iskra*, and endeavoured by all means to gain control of the party's local committees. Having succeeded in most cases I. organised a packed Second Congress of the party, but themselves split during the Congress, the 'hard' Iskraists forming the Bolshevik faction. During the I. period Lenin's organisational and tactical principles were for the first time formulated and put into practice. See L. H. Haimson, *The Russian Marxists and the Origins of Bolshevism*, Cambridge, Massachusetts, 1955, and B. D. Wolfe, *Three Who made a Revolution*, 1956.

**Isla de León**, see SAN FERNÁNDO.

**Isla de Pascua**, see EASTER ISLAND.

**Isla de Pinos**, see ISLE OF PINES.

**Isla Grande**, see TIERRA DEL FUEGO.

**Isa y Roja**, José Francisco de (1703-81), Sp. satirist, Jesuit priest, and a famous preacher, b. Vidanes, Leon. He lam-

British Museum

pooned the ignorance of the Sp. priesthood in a novel entitled *Historia de famoso predicador Fray Gerundio de Campazas*. The book was prohibited (1760) in consequence of the storm of protests raised by the victims, but he pub. a second part in 1770 unknown to his superiors. He also completed, shortly before his death, the trans. of Lesage's *Gil Blas* into Spanish. In 1850 his *Obras Escogidas* came out as vol. xv of the *Biblioteca de Autores Españoles*. With the other Jesuits he was banished from Spain in 1767, and went to Bologna, where he lived until his death. See B. Gaudeau, *Les Prêcheurs burlesques en Espagne au XVIII<sup>e</sup> Siècle*, 1891.

**Islam** (Arabic, meaning to submit, to surrender), the religion preached by Mohammed; an adherent is Muslim (Moslem) or Muslimman which is the Persian adjective. The faith is summed up in the confession, 'There is no god but

God and Mohammed is His prophet.' It proclaims the unity of God, demands obedience to Him, believes in an after life of bliss for believers and torment for the wicked, and makes Mohammed the last and final exponent of God's mind; he is the seal of the prophets. He did not claim to bring a new religion but to revive the faith which was taught first to Adam and then to Abraham, was believed in by Moses, Jesus, and all other prophets, but corrupted by their followers. Some in Arabia had rejected the current worship of idols; such men were called *hanif* (the word is probably Syriac, where it means pagan) because they differed from the mass of their fellows; Mohammed took the word, applied it to Abraham, who came before Moses and Jesus and so was neither Jew nor Christian, and also to his own teaching. His message is contained in the Koran (q.v.) which was not collected into a book till after his death. The 5 'pillars' of I. are belief in one God, prayer, almsgiving, the pilgrimage, and fasting in Ramadan (q.v.); an attempt was made to add a sixth, the *jihād*, the holy war against unbelievers, but it failed. Prayer should rather be called worship, for the prescribed forms contain no intercession; it is performed 5 times a day: before sunrise, after midday, in the late afternoon, at sunset, and when the night is dark. (It is curious that the 5 are not mentioned in the Koran, but they were fixed very early as all sects observe them.) Worship is preceded by an ablution and the worshipper faces Mecca. Each 'prayer' consists of sections, varying in number from 2 to 4 with a prologue and epilogue; a section consists of a litany said in various attitudes, sitting, standing, bowing, and with the forehead touching the ground. Worship may be performed anywhere, but preferably in a mosque. Every act of worship should be preceded by the intention to perform it; this easily degenerates into formalism, but it is a noble ideal. After the set ritual a man may offer what petitions he pleases. The midday prayer on Friday is the service of the week, with a sermon, and all men should attend. Alms might be called a religious tax, for the amount which the believer has to pay is fixed according to his wealth. Everyone who can should make the pilgrimage (see HADJ) to Mecca once; a visit to Medina at the same time is meritorious but not obligatory; the rule is that only those who can afford it shall make the pilgrimage, but many of the poor ignore this. The fast is during the daytime in Ramadan (q.v.), from a little before sunrise till sunset; the sick, travellers, and women with child are excused, though they ought to fast the same number of days in another season of the year. In addition many fast 2 days in every week. The popular idea of the armies of I. with a sword in one hand and a Koran in the other is quite wrong.

I. provides rules for the whole of life; a complete code begins with ritual purity, without which no worship is possible,

treats of sales, murder, and lays down the right way to trim beard and moustache. In theory all laws have the same importance. What had sufficed for the infant state in Arabia was inadequate when the Muslims ruled from the Atlantic to India, so further laws had to be made. One solution of this problem was found in the words and acts of Mohammed, and a great mass of 'traditions' grew up, reports of what he said and did. The most revered collection was arranged to provide answers to legal problems. Another solution was to follow the practice of Medina. A system was built on these answers; a new case was regarded as like one which had been previously settled: solution by analogy (*kiyas*); and finally, when the authorities had agreed on what was to be done, it was sound religion, *ijma'*, the agreement of all Muslims, 'for my people will not agree in error.' The Sunnites (see below), who are the great majority of Muslims, are divided into 4 schools or rites, all equally orthodox; they differ not on dogma but on points of ritual and law. In N. Africa only Muslims are allowed into mosques, for this is the ruling of the dominant rite; in Syria the practice is different.

Differences about doctrine arose. The first began as a political problem in personal rivalry for the headship of the state, but it was soon complicated by ideas of legitimacy, the divine right of kings, and perhaps Persian nationalism. The Shiites (q.v.) upheld these ideas. At the other extreme were puritans who asserted the equality of all Muslims, so that an Abyssinian slave might be the ruler under God. The Arabs, like their contemporaries, expected one man to be head of the state. The earliest rulers were called caliph (deputy, successor) or commander of the believers and were absolute under the law. In theory the law was fixed by scholars and the caliph was only its executive officer. The early caliphs remained Arab chiefs, accustomed to hearing the opinions of the tribe, especially its elders; but the final decision rested on the chief. The nascent religion was surrounded by other faiths which provoked thought on the nature and sovereignty of God and man's free will. The growth of Muslim doctrine was accompanied by divergent opinions which were later branded as heresies; Gk philosophy helped the ferment, and it took some 400 years to form a body of doctrine which was accepted as orthodox. Another ingredient in I. is quietism, which began in ascetic practices and developed into the formation of quasi-monastic orders (see DERVISH) and in the realm of ideas into pantheism; neo-Platonism was largely responsible for these growths, but Christian, Buddhist, and Indian influences may have helped. Celibacy is no part of the monastic ideal in I. The above remarks apply especially to that majority of the Muslims who call themselves Sunnites because they follow the custom (*sunna*) of Mohammed. (This is an

example of a common noun being given a special meaning.) They recognise the first 3 caliphs as lawful rulers, while the Shiites call them usurpers.

The messianic idea is strong and many have claimed to be the mahdi (q.v.); e.g. the founder of the Fatimid dynasty in Egypt (d. 934), the founder of the Almohades (d. 1130), and the mahdi in the Sudan (d. 1885). Others strove to restore religion to its original purity without making special claims, e.g. Abd al-Wahhab, founder of the dynasty which now rules most of Arabia. Sometimes the dervish orders have taken to politics, as the Senussi (q.v.), who have given a king to Libya. There are no priests, but as the law is the voice of God a renowned lawyer is very near to being a priest. Justice was cared for by the judge (*kadi*), the chief of the police, and the inspector of the markets, who also kept an eye on schools to see that the boys were not taught from improper books. There were legal experts to whom the judge could turn for advice in complicated cases. Later in Turkey the chief expert, the shakh al-islam, was a most important person. There was also an extraordinary court to hear those who could get justice in no other way; in early days the ruler himself presided. Now in most countries only questions of personal status are heard by the kadi, as modern codes of civil, commercial, and criminal law have been introduced.

Marriage is a civil ceremony; till recently the Koran has been interpreted as allowing 4 wives, but modern reformers say that this is a mistake. If a man takes a slave as a concubine, her children inherit equally with those of a wife. A foster mother ranks as a true mother, so the prohibited degrees include the relatives of the foster mother. Slavery is permitted and the owner is adjured to treat his slaves kindly, 'to give them the same food and clothes as he himself uses,' and often a slave, bought to be a companion of the son of the house, has been his servant, friend, and champion to the end, though remaining a slave. Strict rules for the div. of an inheritance are laid down; males take twice as much as females (wise when it was decreed), and the testator cannot will away more than a third of his estate or will anything to the chief heir. Modern legislation has changed some of this. Law is also modified by local custom; in Malaya and among the Berbers custom is stronger in many ways. Other social legislation forbids wine, interest on money, and pictures or sculpture of living beings. This last prohibition has had a great effect on art, causing the development of Arabic writing as an ornament in books and on buildings and of arabesque in architecture.

At death the body is washed, shrouded in grave clothes, and carried on a bier without a coffin to the grave, which is so constructed that the earth does not press on the body. A martyr who dies in battle is not washed. As a rule the prayer over the dead is not said in a

mosque. In the grave the dead man is visited by 2 angels who ask him what was his religion; if he can reply 'Islam' he is left in peace, otherwise he is tortured by them and by the walls of the grave pressing upon him. Some think that the body remains in the grave till the resurrection, others think of the good as in some sort of paradise. Educ. Muslims interpret as symbols the sensuous images in the Koran which describe the life to come. The solidarity of the Muslim world is amazing. In the 14th cent. a native of Morocco travelled across the Muslim world to India where he was employed as a judge, and he found himself everywhere at home, even if some local customs shocked him. It is not very different to-day, though now nationalism threatens this solidarity. Mustafa Kemal tried to make Turkey a secular state, but much of his work has been undone. One effect of the impact of Europe on I. has been the introduction of modern codes of law, and it seems to produce agnosticism; but for many years to come it is to be expected that in a crisis W. ideas will prove to be a veneer and the Muslim will come to the surface.

Roughly speaking all lands where Arabic is spoken—Turkey, Persia, Afghanistan, Pakistan, and N. Africa as far as the Tropic of Cancer—are solidly Muslim, and there are believed to be 24 million in U.S.S.R., 30 million in China, and 4½ million in the Balkan states, besides those in Malaya and Madagascar.

See also ARABIA and MOHAMMAD.

Islamic Architecture, see MUSLIM ARCHITECTURE.

Island (O.E. *ieg*, *isle*, and *land*), piece of land surrounded by water, but exclusive of continents (see CONTINENT). Greenland (less than one-fourth the size of Australia) is possibly an ice-bound archipelago. New Guinea, with an area of 303,000 sq. m., Borneo (284,000 sq. m.), Madagascar (227,000 sq. m.), and Sumatra (162,000 sq. m.) are the next largest I.s; Great Britain comes sixth on the list, with an area of 83,700 sq. m. I.s may be divided into 2 classes, continental and oceanic. The former are the result of the submergence of a coastal range, or may have been formed by the sea cutting through the neck of a peninsula, or the eating back of an inlet until a piece of land was cut off. In all cases, except Madagascar, these I.s are connected with the mainland by a continental shelf, and their flora and fauna are similar to those of the adjacent continent; for example, the I.s of the W. coast of Scotland bear this relation to Great Britain, which itself bears the same relation to the continent of Europe. I.s may be classed according to their structure: they may be solitary, as Iceland; in chains, like Japan; or in archipelagos, as in the Aegean. Oceanic I.s rise abruptly from great depths, and show no

geological continuity with the mainland. They are due to various causes, and may be either 'volcanic,' due to the gradual rising above the waves of submerged mountain peaks, or to a violent volcanic upheaval of the ocean bed; or 'coral island,' due to the active building of the corals themselves, or the skeletons of marine organisms (see CORAL). Numerous submarine I.s have been discovered which only require volcanic action or the deposition of sediment to rise above the surface of the ocean. Within recent years many flat-topped submarine I.s, rising abruptly from the ocean floor, have been found in the Pacific. They are known as sea mts or guyots. See also GEOGRAPHICAL DISTRIBUTION.

**Island Arc**, name given to a group of I.s. forming an extended chain, usually running for many hundreds of m. across the ocean. The arcs are frequently flanked by ocean troughs which often extend to very great depths, while the individual I.s. along an arc may lie upon a submarine ridge. 1. A.s occur most frequently in the Pacific and off SE. Asia; the Aleutians and E. Indies form good examples. The I. A.s of the present day occur in regions of fairly recent tectonic activity and frequently show very recent signs of vertical movement relative to sea level. Active or recently extinct volcanoes may be present, and marked departures from the normal gravitational field of the earth near I. A.s indicate that they result from forces within the earth's interior which are still operating at the present time, as does the high frequency of earthquakes near many I. A.s.

**Island Scots**, body of highlanders, descendants of Somerled, thane of Argyll and lord of the Isles, who settled in Ireland, establishing themselves in the mts of Ulster, and plundering the surrounding country. The Earl of Sussex made an attempt to subdue these Macdonalds (MacDonnells), but failed. They were finally defeated by their former ally, Shane O'Neill (q.v.), who took their leader, Sorley Boy MacDonnell, prisoner. The English restored the MacDonnells, and Shane O'Neill was slain by one of the highlanders in a brawl (1567).

**Islandmagee**, peninsula 7 m. by 2 m. on the coast of Antrim, N. Ireland, near Larne (q.v.).

**Islands**, Bay of, bay on the W. coast of Newfoundland, in the Gulf of St. Lawrence, forming an estuary at the mouth of the Humber R. It is famous for its beautiful scenery, and is within easy reach of good fishing and hunting.

**Islandshire**, part of Northumberland, England. It was at one time part of the co. of Durham; it includes Holy Is. and some dists. near Berwick-on-Tweed.

**Islas Baleares**, see BALEARIC ISLES.

**Islas Canarias**, see CANARY ISLANDS.

**Islas de Barlovento**, see WINDWARD ISLANDS.

**Islas de Sotavento**, see LEEWARD ISLANDS.

**Islay**, I.s. of the Inner Hebrides, Argyll, Scotland, 13 m. W. of Kintyre, separated

from Jura (q.v.) by the Sound of I. The lochs Gruinart and Indaal penetrate so deeply that the W. portion is almost separated and is known as the Rhinn of I. The highest summit is Ben Bheigeir (1609 ft). Fishing, dairy-farming, and whisky distilling are the chief industries. Bowmore is the chief tn. I. was once the prin. seat of the 'Lords of the Isles,' but the Campbells finally gained the I.s. in 1616. Area 235 sq. m.; pop. 4267.

**Isle-Adam**, L', fr. tn in the dept of Seine-et-Oise, on the Oise. It is a popular swimming resort. Pop. 4000.

**Isle de Richelieu**, see JAN MAYEN.

**Isle-Jourdain**, L', fr. tn in the dept of Gers, on the Save. The church is partly 10th cent. It has great horse, cattle, and poultry fairs. Pop. 3500.

**Isle of Dogs**, see DOGS.

**Isle of Ely**, name given to the N. portion of Cambs, England, on account of its having been at one time isolated by marshes, being included in the region of the Fens; it has been drained and is now fertile land. Famous as the scene of the final stand of Hereward the Wake. It returns 1 member to Parliament.

**Isle of France**, see PORT LOUIS.

**Isle of Man**, see MAN, ISLE OF.

**Isle of Pines**: 1. Is. of SW. Cuba, 80 m. off Batabanó, with an area of 1180 sq. m.; it has some minerals and quarries; but the islanders are chiefly engaged in rearing cattle, and cultivating grape, fruit and winter vegetables for the U.S. market. The townships are Nueva Gerona and Santa Barbara. Pop. 10,000.

2. Also an Is. dependency of New Caledonia, 30 m. to the SE., with an area of 58 sq. m. and a pop. of about 600.

**Isle of Thanet**, see THANET, ISLE OF.

**Isle of Wight**, see WIGHT, ISLE OF.

**Isle-sur-la-Sorgue**, L', fr. tn in the dept of Vaucluse, on the Sorgue, 12 m. E. of Avignon. It has a fine 14th-17th-cent. church, and has a textile industry and a trade in agric. produce and wine. Pop. 7000.

**Islebius**, Magister, see AGRICOLA, JOHANN.

**Isleham**, vil. of Cambs, England, 10 m. SE. of Ely. Chippenharn Fen, 3 m. SE. of the railway station, is a natural reserve of Fenland of particular interest because of the insect, plant, and bird life which it contains. Pop. 1500.

**Isles**, Lord of the, Scottish title claimed by the descendants of Somerled (d. 1164), thane of Argyll. Somerled was a descendant of Colla Uais of Ireland. He succeeded in driving the Norsemen from Argyll and the W. Isles, establishing himself as an independent prince; his lands included Kintyre and the Isle of Man. His descendants maintained themselves in the same manner. In 1411 Donald of the I. who had become very powerful, claimed the earldom of Ross through his wife, including the Isle of Skye. The Earl of Mar, with an army of Lowlanders, marched against him, and Donald was defeated with great loss at the battle of Harlaw in Aberdeen. John Macdonald, 4th lord, committed treason, and was

deprived of his earldom of Ross (1475). In 1493 the Estates declared the lordship itself forfeit to the Crown. The title is now held by the heir to the throne of Scotland.

**Isles of the Blest, or Fortunate Isles**, mythical group of is. on the edge of the W. Ocean, peopled by the blessed mortals who were 'never to die.' Sev. nations seem to have believed in this myth. Tradition places the underworld of the anc. Egyptians, the realm of the goddess Amentet (q.v.), somewhere in the W.; the Babylonians believed in an isle of the blessed encircled by 4 rivs. The Gk belief expressed by Homer appears to connect them with the Elysian Fields. Plato describes in his *Timoeus* how Solon was told by Egyptian priests of a country larger than Asia Minor, which was overwhelmed by the sea. This was known as 'Atlantis' (q.v.), and the surviving is. were termed the Fortunate Isles. A very early tradition suggests that an unrecorded voyage to the Canary Isles and Madeira may have gained these places this mythical name. The Celtic Avalon (q.v.) of King Arthur and St Brendan's Is. were represented as blest with summer all the year round, and 'therefore fortunate.' There are also legends of Lyonesse (q.v.) off Cornwall and many others.

**Isleworth**, dist. of Middx, England, part of the bor. of Heston and I., situated on the Thames about 12 m. from London. It is mentioned in the earliest recorded Middx charter (695), and was a royal manor from 1227 until granted by James I in 1604 to the Earl of Northumberland, in whose family it has remained. I. is a flourishing market garden and nursery area, and soap is the only manuf. of importance. Syon House, in a park near the riv., is a seat of the Duke of Northumberland. Originally a 15th-cent. Brigittine nunnery, it was rebuilt in the 16th cent., and has later alterations, including remodelling by Robert Adam.

**Islington**, Sir John Poynder Dickson-Poynder, 1st Baron (1866-1936), Eng. politician and administrator. He sat as Unionist member for the Clippenham div. of Wilts 1892-1910, but took an independent line as a strong free-trader. In 1910 he was appointed Governor of New Zealand.

**Islington**, parl. and metropolitan bor. of N. London. It includes the anc. manors of Canonbury, Holloway (qq.v.), Highbury, Barnsbury, and part of Kingsland. The building of New Road from c. 1756 onwards, joining the area of Marylebone with the city of London, led to the gradual development of the vil. of I. and the surrounding area. I. contains 2 prisons, Pentonville (1842) and Holloway (1850). Other buildings include the Agric. Hall, Great N. London Hospital, the N. Polytechnic, London Fever Hospital, and the London School of Divinity, St John's Hall, Highbury. The New Riv. runs through I., and on I. Green there is a statue of Sir Hugh Middleton, the founder of the New Riv. scheme. The bor. returns 3 members to Parliament. Area

3092 ac.; pop. 230,500. See also CALEDONIAN MARKET and COPENHAGEN FIELDS.

**Ismail**, see **IZMAIL**.

**Ismail Pasha** (1830-95), Khedive of Egypt, who by his senseless extravagance opened the door to European intervention in Egyptian affairs. In 1863 he became viceroy, having successfully crushed a formidable revolt in the Sudan. In 1867 he persuaded the Turkish sultan to recognise him as khedive, and 4 years later became virtually independent. By 1874, the year of the annexation of Darfur, he had piled up a national debt of over £100,000,000, and in 1875 sold his Suez

ISMAIL PASHA

canal shares. The final result of foreign interference was the abdication of I. P. in 1879 in favour of his son Tewfik. The remainder of his life was passed in exile. See P. Gabites, *Ismail: the Malignant Khedive*, 1933, and G. Douin, *Histoire du règne du khédive Ismaël*, 1934.

**Ismailia**, tn. of Egypt, on the Suez Canal, and connected by rail with Suez and Cairo, with fine public squares and gardens. Pop. 25,194.

**Ismailis**, Muslim sect, an offshoot of the Shites (q.v.), which accepted as its head Ismail (d. 760), a son of the sixth imam; the father had designated him as his successor but cancelled this designation for his drunkenness; the orthodox accepted this cancellation but others declared it invalid. Muslim historians condemn the I. as 'extremists.' The sons of Ismail fled from Medina and carried on a vigorous propaganda by missionaries. The early hist. of the movement is obscure as it worked in secret, but about 860 Abdullah ibn Maimun was in Syria guiding the activities of the sect. One emissary went to Yemen and founded a small state, another to N. Africa where he prepared the way for the Mahdi, who may have been a descendant of Ali (q.v.) son of Abu Talib or of Maimun. He founded a state in Tunisia in 910 and a later ruler

founded the Fatimid dynasty in Egypt (969-1171). A split occurred in the Egyptian section in 1094. Hasan ibn Sabbah went to Egypt for instruction in 1075 but was turned out; he went back to Persia, and in 1090 captured Alamut, becoming the leader of the Assassins and the first Old Man of the Mts. He and his successors terrorised the country till they were finally crushed in 1256. In Syria the sect played a prominent part during the crusades, and sev. important men fell victims to their daggers. They took neo-Platonism as their philosophy: the ultimate is unlike anything else so we cannot say that it is or that it is not, and the primal reason is the first thing which can be known. Everything is an emanation from that, and the spheres and stars have great influence on human life. The world passes through 7 epochs, each introduced by an apostle who is followed by a series of delegates till the last age ends under the Lord of the Age. There is an elaborate hierarchy beginning with a Speaker and descending through prophet, delegate, preacher, and lower ranks. One of their learned men saw a correspondence between the hierarchy and the order of nature, so argued from the truth of the second to that of the first. The sect still exists in Syria and, till recently, in Yemen; in India it takes sev. forms, among them the Bohoras. The connection with the Karmathians is obscure. See B. Lewis, *The Origins of Ismā'īlism*, 1940.

**Ismay, Hastings Lionel**, 1st Baron (1837- ), Brit. soldier and administrator, educ. at Charterhouse and Sandhurst. He served in India and Somaliland (First World War), and subsequently had a distinguished career in India. From 1951 to 1952 he was secretary for commonwealth relations in Churchill's Conservative gov., but resigned this post on his appointment as secretary-general of N.A.T.O. (q.v.), a position he held from 1952 to 1957. He was made a baron in 1947.

**Ismay, Thomas Henry** (1837-99), Eng. shipowner, b. Cumberland. He started a shipbuilding business of his own at Liverpool, after serving a short term of apprenticeship, and engaged particularly in the Australian trade. In 1887 he entered into partnership with Wm Imrie, and formed the Oceanic Steamship Co. in 1869, later to become chairman of this company, popularly known as the White Star Line, and a director of many other industrial enterprises.

**Ismene**, daughter of Oedipus and Jocasta, who wished to share the punishment of Antigone, her sister, for burying Polynices.

**Ismet Pasha**, see İNÖNÜ.

**Isnik**, see NICAËA.

**Isobar**, line drawn on a chart joining places of equal atmospheric pressure. The chart may represent the earth's surface or a surface at a constant height above the earth.

**Isochronism**, that property possessed by an oscillating system, e.g. a pendulum, whereby the time taken for each complete oscillation is constant. Because of their

practical I., musica instruments such as tuning forks, organ pipes, and stretched strings give notes whose pitch is independent of the intensity. See ELASTICITY and SOUND.

**Isoclinic**, and **Isogonic**. When a magnet is suspended freely from its centre of gravity, and allowed to come to rest, it is found that it takes up a definite position at a given locality. The vertical plane passing through the axis of the magnet is called the magnetic meridian. The angle between the plane of the geographical meridian and the magnetic meridian is called the declination. This varies from point to point on the earth's surface. Isogonic lines are lines connecting places on the earth's surface at which the declination is the same. The angle made by the axis of the freely suspended magnet with the horizontal is called the inclination or dip. At the 2 magnetic poles the dip is 90°; at the magnetic equator its value is zero. The N. magnetic pole is close to lat. 74° N., long. 100° W., and as a result of the Fr. expedition to the S. Pole in 1951-2 it was found that the position of the S. magnetic pole was in lat. 67° S. and long. 142° E. The dip has intermediate values at places between the poles and the equator. Isoclinic lines are those connecting places on the earth's surface at which the inclination or dip is the same. See MAGNETISM.

**Isocrates** (436-338 BC), Athenian orator, a former pupil of Gorgias, Prodicus, and Socrates (qq.v.). Unfitted by temperament for public life, he opened (c. 390) a school of rhetoric, first at Chios then at Athens, and at the same time wrote orations for others. He committed suicide after Chaeronea. Twenty-one of his orations and 9 letters have survived. Though lacking in originality, I. was an outstanding advocate of pan-Hellenism, and he created a prose style which influenced Cicero. There is an ed. (with trans.) of his surviving works by G. B. Norlin and L. van Hook (3 vols., Loeb Library), 1928-45. See H. M. Hubbell, *The Influence of Isocrates*, 1914.

**Isoyanides**, **isonitriles**, **Carbamines**, or **Carbylamines**, class of carbon compounds, isomeric with the cyanides, but containing the group -NC, in which the alkyl group is united to carbon through a nitrogen atom. They are extremely poisonous, have a disgusting odour, and on hydrolysis with a mineral acid yield formic acid and an amine. They cannot be hydrolysed by alkalis, and are made by heating a primary amine (e.g. aniline) with chloroform and alcoholic potash. See NITRIDES.

**Isodimorphous Substances**. Two substances are said to be isodimorphous when they each crystallise in 2 distinct forms (i.e. are dimorphous) and in each of their dimorphous forms are isomorphous. For example, arsenic and antimony trioxides each crystallise in 2 distinct forms which occur naturally in minerals, but each form of the arsenic compound is isomorphous with the corresponding form of the antimony compound. Thus,  $As_2O_3$  in arsenolite (cubic), in claudetite (orthorhombic);

$\text{Sb}_2\text{O}_3$  in senarmonite (cubic), in valentinite (orthorhombic), A and S are isomorphous, so also are C and V. Again, calcium carbonite is dimorphous, crystallising as calcite and aragonite. Lead carbonate (in the mineral cerussite) is isomorphous with aragonite, but no form is known which is similar to calcite. Crystals of calcite often contain, however, carbonate of lead (plumbocalcite), which shows that this latter may also crystallise in the same form as calcite, although as yet it has not been discovered as a distinct mineral. Calcium and lead carbonates may thus be said to be isodimorphous.

**Isodorus** of Miletus (6th cent. AD), Gk architect, completed S. Sophia at Constantinople, designed by Anthemius (q.v.).

**Isotetes**, single genus of the family Isoëtaceae, which flourishes in temperate and tropical lands and consists of 50 aquatic or semi-aquatic plants. Sev. of the species are known as quillworts on account of their grass-like appearance, and *I. lacustris* is known in Britain as Merlin's grass. *I. echinospora* and *I. hystrix* are also found in Britain.

**Isogonic**, see ISOCENTRIC.

**Isola**, fishing port of the Free Ter. of Trieste (q.v.), in the Yugoslav zone, 9 m. SW. of Trieste. It stands in the Gulf of Trieste, on an is. linked to the mainland, has a cathedral, and is known for its wine. Pop. 7000.

**Isola Bella and Isola Madre**, see BORROMEAN ISLANDS.

**Isola del Liri**, It. tn, in Lazio (q.v.), on the Liri, 11 m. ENE. of Frosinone (q.v.). It has paper and woollen mills. Pop. 5000.

**Isolationism**, see UNITED STATES OF AMERICA, History.

**Isolator**, a switch, usually hand-operated, for separating a section of a network for repair or resetting of circuit-breakers, to ensure that all parts of the section are 'dead' and remain so until inspection of all parts has proved that all is in order for reconnection to supply.

**Isomerism**, term introduced by Berzelius (q.v.) to denote the phenomenon of the existence of 2 or more different substances whose molecules consist of the same number of the same atoms. There are 2 compounds, ethyl alcohol and dimethyl ether, which both have molecules consisting of 2 carbon atoms, 6 hydrogen atoms, and 1 oxygen atom. The existence of isomers is explained by the different ways in which the atoms are arranged in the molecules. Ethyl alcohol is  $\text{CH}_3\text{CH}_2\cdot\text{OH}$ , while dimethyl ether is  $\text{CH}_3\cdot\text{O}\cdot\text{CH}_3$ . The first case observed was that of ammonium cyanate and urea (Wöhler, 1828), both of which have the formula  $\text{CON}_2\text{H}_4$ ; the former compound, however, is of the structure  $\text{NH}_4\text{—O—C}\equiv\text{N}$ , while the structure of urea is  $\text{O}=\text{C}(\text{NH}_2)_2$ . **Stereoisomerism** is I. which cannot be explained on the usual plane formulae, but necessitates consideration of all 3 dimensions of the molecule. **Dynamic isomerism** or **tautomerism** (q.v.) is the name given to the reversible chemical trans-

formation of one isomer into another. See DIPOLES.

**Isomorphism** (Gk *isos*, equal; *morphe*, form). Two substances are said to be truly isomorphous when their crystalline forms and chemical compositions are similar. Mitscherlich discovered that the phosphates and arsenates of sodium crystallise in the same form, and from this and other observations he formulated, in 1821, his 'law of I.', which states that substances of similar chemical composition exhibit the same crystalline form. Since, however, a large number of similarly constituted substances are now known which crystallise in distinct forms, the statement requires modification. Among truly isomorphous substances may be mentioned the following: the alums, zinc sulphate,  $\text{ZnSO}_4\cdot 7\text{H}_2\text{O}$ ; and magnesium sulphate,  $\text{MgSO}_4\cdot 7\text{H}_2\text{O}$ ; ammonium chloride,  $\text{NH}_4\text{Cl}$  (in which the group  $\text{NH}_4$  behaves as a metallic radicle); and potassium chloride,  $\text{KCl}$ , etc. The converse of Mitscherlich's law by no means holds. Thus we find the diamond, C; magnetite,  $\text{Fe}_3\text{O}_4$ ; and the alums, which exhibit no chemical analogy, crystallising in octahedra. These substances are not truly isomorphous, but are said to be isogonous. The power to form 'mixed crystals' or 'overgrowths' is generally accepted as a criterion of I. Thus, magnesium and zinc sulphates crystallise together in all proportions in the same form as a crystal of either constituent, and if a crystal of chrome alum be immersed in a solution of common alum, the new layer of the latter will be deposited regularly on the old crystal of the former. The law of I. is the most important generalisation in the science of crystallography (q.v.), and has proved of much use in settling the atomic weights of sev. elements.

**Isonitriles**, see ISOCYANIDES and NITRILES.

**Isonzo** (anct. Sontius), riv. of Yugoslavia and Italy, which rises at Monte Terglou in the Julian Alps (see ALPS), and flows on a winding course S., past Gorizia (q.v.), to the Gulf of Trieste (see VENICE, GULF OF). Shortly before entering the sea it unites with the Iudrio. It is 78 m. in length, is deep and rapid, and waters a rich alluvial plain; at Gorizia it is about 140 ft above sea level. Odoacer (q.v.) was defeated on its banks by Theodoric the Great (q.v.) in AD 493. In the First World War, being in what was then Austrian ter., it was early the objective of the Italians, whose armies reached it in 1915, their aim being mainly directed to the achievement of their traditional irredentist dreams. But this was all they were destined to accomplish for some time, for in 1916 the Austrians weakened the It. hold on the I. valley by a determined advance in the Trentino. The Italians, however, aided by Brusilov's drive on the E. front (see BRUSILOV, ALEXEI ALEXEIEVICH and RUSSIAN FRONT (FIRST WORLD WAR)), launched a strong counter-offensive along the riv., and on 4 Aug. the first day of the move against Gorizia, carried the heights on the W. bank overlooking the tn,

storming the summit of Monte San Michele and, after sev. more days' fighting, capturing all the heights W. of the riv., together with Gorizia. They were now appreciably nearer their goal of emancipating Trieste; but thereafter Cadorna, under whom these successes had been won, suffered his historic defeat at Caporetto (see CADORNA and CAPORETTO). No further fighting of decisive importance took place on the I., the issue being decided on the Piave.

**Isopoda**, name of an order of Malacostracan crustaceans, characterised by a broad, flattened body, with no carapace, and by lamellar legs, whose inner rami serve as branchiae, situated on the abdomen. They have many features in common with the Amphipoda, as, for instance, the sessile eyes and the firm, calcareous covering of the body, but the abdomen of I. is usually much shortened and the heart is situated posteriorly. Some of the larger species inhabit the bed of the sea,

called 'thickness lines' (see METEOROLOGY). They are used to determine the thermal component of the upper winds and for predicting the direction of travel of depressions and anticyclones.

**Isotope**, a word introduced by Soddy (q.v.) to embrace those instances where 2 or more individuals of different atomic weight occupy the same position in the Periodic Table. I.s have identical atomic numbers, the number and distribution of electrons outside each nucleus being the same. For practical purposes, their chemical and physical properties agree. Though in the case of the I.s of hydrogen, viz. hydrogen itself (atomic weight 1), deuterium (atomic weight 2), and tritium (atomic weight 3), the chemical and possibly physiological properties are noticeably different.

Ordinary lead (atomic weight 207.2; atomic number 82) is isotopic with radium G (atomic weight 206.05), a disintegration

POSITIVE RAY SPECTROSCOPE

others are inhabitants of fresh waters, and many are parasitic on the bodies of fishes and crustaceans. I. are divided into 2 sections; under I. Genuina are grouped Oniscoidea, wood-lice, the only terrestrial forms, Asciota, Phreatoidea, Valvifera, Flabellifera, and Eupicaria.

**Isoprene**, or Methyl- butadiene ( $\text{CH}_2\text{CMe} \cdot \text{CH} \cdot \text{CH}_2$ ), liquid which boils at  $36-37^\circ \text{C}$ . It is a member of the olefine series of hydrocarbons, and can be obtained by the distillation of caoutchouc or synthetically from isomyl alcohol (which is present in fusel oil). I. has attracted much attention because it may readily be converted into substances resembling rubber, but synthetic rubber as hitherto made is generally inferior to, and more expensive than, the natural product.

**Isopyre**, greyish or black mineral, consisting of silicates of lime, iron, and alumina. It has a vitreous lustre like obsidian.

**Isoquinoline**, see LEUCOL.

**Isothermal Lines** (from Gk *isos*, equal; *thermos*, heat), also called **Isotherm**, connect places on a map where the temp. on the earth's surface is the same at any given time at the sea level. Isothermal charts afford a ready means of studying relative temps. and may be drawn to indicate the average monthly, seasonal, or ann. temps. In modern upper-air forecasting, isotherms of mean temp. for specified layers of the atmosphere are

product of uranium; with radium D (atomic weight 210), a product of the disintegration of radium; and with thorium D (atomic weight 208). Richards obtained the value 206.08 for the atomic weight of lead associated with the mineral cleveite, whilst Hönigschmid reported 207.9 for lead from thorite deposits. During radioactive changes (see RADIOACTIVITY) the effect of an element losing a  $\beta$ -particle (an electron of negligible mass) is to shift it 1 place to the right in the Periodic Table, whilst the loss of an  $\alpha$ -particle (identical with the helium nucleus of 4 protons and 2 electrons) shifts the element 2 places to the left. Thus if an element loses 2  $\beta$ -particles and 1  $\alpha$ -particle, a new element is formed occupying the same position in the Periodic Table (an I.). Again, an atom of uranium (atomic weight 238) can lose 8  $\beta$ -particles and 6  $\alpha$ -particles, giving an element of atomic weight  $238 - 4 \times 6 = 206$ .

The positive ray spectroscopy (Aston, 1919) has been invaluable for the discovery of I.s of very general occurrence. The elementary gas to be examined is subjected to an electrical discharge (see DISCHARGE TUBES) under high vacuum, whereby some rays carrying positive charge result. These rays are allowed to pass through a slit in the cathode to an observation chamber beyond (see Fig. above). The diaphragm D selects rays

which have been deflected by the electrical field imposed by the oppositely charged plate  $PP'$ , and they are then brought to a focus on the photographic plate  $N$  by the operation of a magnetic field introduced by the electro-magnet  $M$ . A *mass spectrum* depending on mass alone is obtained at  $N$ . Each  $I$ . gives a record of its presence, and its atomic mass can be found. Thus, chlorine contains 2  $I$ s. of atomic masses 35 and 37 mixed in such a ratio that the average atomic weight is 35.46. Tin has 11  $I$ s. The atomic masses of all  $I$ s. examined are whole numbers (within 1 part in 1000) except hydrogen (1.008). Aston later made a more powerful apparatus, and has obtained small differences from whole numbers which give information about the packing inside the nucleus.

*Separation of the isotopes.* Chemical methods in general are unsuitable, but other methods, such as distillation, evaporation, diffusion, effusion, and centrifugalisation, have been more successful; in particular cases—e.g. uranium 238 and uranium 235—separation has been effected on a comparatively large scale.

Most elements have isotopic forms, and some (e.g. xenon, tin, and cadmium) have sev. See PHYSICAL CONSTANTS.

*Isotropy*, condition of having uniform characters throughout. The term is especially applied, in physics, in connection with substances or media in which elastic stresses are propagated uniformly in all directions. Such substances are termed *isotropic*, and the possession of the quality supposes that the molecular structure of the medium is homogeneous throughout its substance. Non-homogeneous media, on the other hand, are known as *anisotropic* or *heterotropic*. In crystallography  $I$ . is a property possessed by certain crystals of the cubic system which have only 1 index of refraction for rays of the same wave-length. They have, therefore, no action on polarised light apart from normal absorption.  $I$ ., in embryology, is applied by Pflüger to that condition where there are no predetermined axes.

*Ispahan*, see ISFAHAN.

*Ispiresou, Petre* (1830–87), Rumanian writer and collector of folk stories. Four are trans. in Kunos's *Turkish Fairy Tales*, 1896.

**Israel** (God fighteth), name given to the patriarch Jacob (Gen. xxxii), and also to the 12 tribes of the Hebrews as the children of  $I$ . Later the name was restricted to the N. kingdom, while the S. kingdom was known as Judah (q.v.). The accounts of their origin, contained in the early books of the Bible, are based upon genuine tradition. Their ancestor, Abraham, migrated some time between 2000 and 1700 BC from Haran in Mesopotamia into the land of Canaan. Here his descendants lived a pastoral life, and ultimately, in the time of Jacob, a famine in the land of Canaan led to a fresh migration into Egypt. Here they obtained leave from Pharaoh to dwell in the land of Goshen, and they soon multiplied, so that under a later Pharaoh (probably Rameses II,

1300–1233) they were subjected to repressive measures. Then there arose the figure of Moses, the great developer of both the religion and the law of  $I$ . Moses was the son-in-law of a priest of Midian, and at Horeb (i.e. Sinai), the mt of God, he heard the call of Yahweh to deliver  $I$ . from the bondage of Egypt. With much difficulty the work was accomplished. Moses led the Israelites to Mt Sinai, and here a covenant was solemnly made with Yahweh. From Sinai they passed to the work of conquering Canaan for which they had set out. An attempt made at Kadesh on the S. frontier was unsuccessful, and they returned to the wilderness for 40 years. During this time Moses *d.*, and it was under Joshua that the entry into Palestine was finally made. Details of this are given in the Book of Joshua.

The Israelites now settled down to an agric. and commercial life, entering in many cases into treaties of friendship with and adopting the religious practices of their Canaanite neighbours. This weakened the bonds of union between the various tribes and might well have led to the ultimate fusion of the races. This was prevented by the rise from time to time of the *shafetim*, or Judges, who roused the dying ardour of the tribes. Fifteen such heroes are named in the Book of Judges. The most famous are Deborah, the prophetess, Barak, Gideon, Jephthah, Samson, and the prophet Samuel. Their conflicts were with their own kinsmen, the Moabites, Ammonites, and the Midianites. The Philistines were among the most powerful opponents of  $I$ ., and after suffering defeat from this race the Jews cried for a king, so that more headway might be made against the oppressors and that they might be like 'all the other nations.' Samuel the prophet, their leader, reluctantly consented, and chose as their king Saul, the son of Kish.

*From the foundation of the monarchy* (c. 1020 BC) to the *exile*. Saul soon proved his fitness for the new position first by the raising of the siege of Jabesh-Gilead, after which he was solemnly proclaimed king at Gilgal, and then by a decisive victory over the Philistines at Micmash. Here the victory was due chiefly to the bravery of Saul's son Jonathan and 600 Benjamites who accompanied Saul, a member of their tribe. Saul's next campaign was against the Amalekites, who had long been troubling Judah. He was, however, given to fits of melancholy, and to soothe him in these, David, the son of Jesse the Bethlehemite, a 'cunning player on the harp,' was brought in to play to him. His presence, however, had a bad effect on Saul, and this was increased by David's rapid rise in popularity.

David had already attracted the attention of Samuel, now estranged from Saul, and had been marked out by him as a future king of  $I$ . He had also gained great renown as the slayer of a Philistine champion. His courage and success in war had led Saul to make him his armour-bearer, and his intimate friendship with Jonathan, the king's son, rendered his

position such as to cause Saul's jealousy. Moreover, he was the king's son-in-law. Saul decided to kill David, who fled and became an outlaw, ultimately having his centre of operations at Ziklag. He resolutely refused to enter into operations against I., and events were so shaping themselves that it was possible for him to return in power on Saul's defeat and death in battle against the Philistines at Mt. Gilboa. David, on hearing of it, immediately went up to Hebron with his followers and was anointed King of Judah. Meanwhile Abner, Saul's leading general, had taken Saul's son, Ishbaal (Ishbosheth), and had him crowned as King of I. War in consequence broke out between I. and Judah, in which the S. kingdom was steadily victorious. On the death of Abner and Ishbaal, the crown of I. was offered to David. He transferred his cap. to Jebus (Jerusalem), the great hill fortress of the Jebusites, and thither he brought the ark. In a succession of violent conflicts David secured the freedom of his kingdom from the Philistines and pushed its boundaries in the N. to Dan, S. to Beersheba, and W. to the Phœnician frontier. David's great work, however, was in the consolidation of the kingdom, and his internal administration. To him, too, the idea of the Jerusalem Temple owed its inception. His high poetic and religious faculty is attested by his psalms and by those of the school named from him. The crown passed from David to his son, Solomon, whose name is associated by tradition with power, wisdom, and wealth.

Now for the first time I. took a prominent place among the great nations of the E., though it is probable that it was in some degree dependent on Pharaoh, whose daughter Solomon had married. Commercial treaties were entered into with such neighbouring monarchs as Hiram of Tyre, in union with whom ships were sent as far as Tarshish (Spain) and Ophir (S. Arabia?). Solomon now led the life of the ordinary E. despot. His court was more splendid than any other of which we read in the hist. of I., but such magnificence could be sustained only by a heavy taxation. Matters reached a crisis on the death of Solomon (c. 933 BC). A deputation, headed by Jeroboam, came to Solomon's son, Rehoboam, to implore relief from the burdens which his father had laid upon the country. He refused, and there was a revolt of the 10 tribes of I. under Jeroboam, the son of Nebat. Judah and Benjamin alone were left to Rehoboam, while I., the N. kingdom, made Jeroboam its king.

When Jeroboam instituted his new kingdom, one of his initial acts was to forbid the Israelites to keep the ann. festivals at the Temple. He did this by instituting sanctuaries at Bethel and Dan, where he set up golden calves as symbols of Yahweh, and instituted a new priesthood. For this retrograde step he was condemned by the later prophets.

During the 2 cents. that elapsed between the death of Solomon and the

conquest of I. by Shalmanezzer, King of Assyria, 19 kings reigned in the kingdom. These 19 kings may be regarded as covering 4 periods. The first period (c. 933-885 BC) is occupied in attempts to establish a dynasty and in wars with Judah. It ended in civil strife, from which ultimately emerges the new dynasty of Omri, which gives us the second period from 885 to 841. Its kings, after Omri himself, were Ahab, Ahaziah, and Jehoram. The reverses which Omri suffered at the hands of the Syrians were compensated by Ahab. This king was a great statesman, though the injury his idolatry did to I. is well shown in the biblical narrative. He formed an alliance with Jehoshaphat, King of Judah, the alliance being cemented by the marriage of Jehoshaphat's son, Jehoram, to Athaliah, daughter of Ahab. The 2 nations then took united action against the Syrians, with whom, after the defeat of Benhadad II., a treaty was formed. Ahab d. in battle at Ramoth Gilead, and in the reign of Jehoram an attempt was made in union with Ahaziah, King of Judah, to retake this bn. Now occurred the rebellion of Jehu ben Nimshi, in which Jehoram and Ahaziah both perished. Jehu founded his dynasty (which forms the third period, 841-747) in a sea of blood. Down to the time of Jehu, the sovereignty of Judah had remained in the possession of the house of David (6 kings), but on the death of Ahaziah an attempt was made by Athaliah to exterminate this dynasty. Joash, however, escaped, and after 6 years was proclaimed king by Jehoiada, the chief priest. Athaliah was slain and the Davidic dynasty restored. A fresh attack now came from Hazael, King of Syria, who was bought off by Joash. There now succeeded for Judah a time of comparative prosperity and quiet. Matters changed with the accession of Tiglath-Pileser III to the throne of Assyria in 745 BC. At this time a general confederacy of Syrian states against Assyria was being promoted, but Ahaz, King of Judah, refused to join it. He relied instead in opposition to the prophet Isaiah, upon friendship with Assyria. Hence the Syrians and Israelites opened a campaign against him, in which they then were joined by the Edomites. Tiglath-Pileser entered N. Israel in support of Ahaz, and deported into Assyria the leading inhab. of Galilee and the dist. around. He also extinguished the Syrian monarchy, and set up Hoshea as vassal king in I.

For some years Hoshea remained submissive, but he was then persuaded to revolt by So, King of Egypt. Hence Shalmanezzer IV marched against him, and for 3 years besieged him in Samaria. The city was eventually taken by Sargon (722 BC), and the chief inhab. of I. to the number of 27,290 were taken into Mesopotamia and Media. They were replaced by Assyrian colonists, and these, intermixing with the inhab. of the country, formed the mixed race known as Samaritans. The kingdom of Judah had, after all, survived its more powerful neighbour.

Here Ahaz was still king, but he was succeeded a few years later by his son, Hezekiah, who attempted a reform in the religion of the country, which had been much debased under the preceding kings. He inaugurated a campaign against local sanctuaries and strove to restrict worship to the Temple. In this he was assisted by Isaiah. Judah was still subject to Assyria, and Hezekiah's friendship with Egypt, opposed by the great prophet Isaiah, brought him into danger of punishment from Sennacherib. An Assyrian army was indeed approaching Jerusalem when it was arrested by a plague. Egypt was moreover prepared to support Hezekiah, and so Sennacherib retired. On the death of Hezekiah the succeeding princes encouraged the heathen cults in their worst forms, but another and greater reform came on the accession of Josiah (621 BC), connected especially with the finding of the book of the law (see DEUTERONOMY) by Hilkiah the priest.

Meanwhile the Assyrian empire was breaking up, and Judah came into collision with Pharaoh Necho II, who was desirous of pushing the interests of Egypt. In conflict with him Josiah fell at Megiddo (608), while Jehoahaz, his younger son and heir to the throne, was carried into Egypt while Necho set Josiah's eldest son, Jehoiachin, on the throne of Judah. In 605 Egypt became subject to Babylon, and Judah became subject to Nebuchadnezzar II before 600 BC. In 598 an attempt to regain his independence was made by Jehoiachin, and Jerusalem was besieged. Jehoiachin, the boy-king who had succeeded his father, was taken prisoner, and in the following year (597), from which Ezekiel reckons the years of the captivity, the greatest and noblest of the Jews were deported to Babylon, while Zedekiah was appointed king over those that remained. In 586 a fresh revolt led to the sack of Jerusalem by Nebuchadnezzar and fresh deportations. There was still no peace, however, for Gedaliah, the Babylonian governor left in charge, was assassinated, but the remnants of the Jews fled into Egypt, taking with them the prophet Jeremiah.

*From the exile to the revolt of the Maccabees.* The exile was a formative period in I's religious development. It saw the prophetic ministry of Ezekiel and of Deutero-Isaiah. The synagogue was now instituted and the general conception of the after-life was developed. But although those Jews whose minds were fixed chiefly on commerce found themselves better off in Babylon than in their own country, the idea of absence from the Temple was intolerable to the religious. It was not long before attempts were made to secure a return to Jerusalem. Nothing more is known of the hist. of the return from exile until the reign of Artaxerxes Longimanus (462-425), when a band of some 6000 exiles, under the leadership of Ezra the scribe, arrived in Jerusalem. In 446 the city of Jerusalem was refortified, and the Temple worship reinstituted. To this period belongs

the final split between the Jews and the Samaritans, made by the estab. by the latter of a rival sanctuary on Mt Gerizim.

Palestine was affected by Alexander the Great's march through the E., and, on the defeat of the Persians at Issus in 333, it became subject to Gk rulers. A large number of Jews were deported to form part of the pop. of Alexandria. On the subdiv. of the kingdom on Alexander's death, Palestine fell to the lot of the Ptolemies, under whom still larger numbers of Jews passed into N. Africa. The lot of Palestine was, on the whole, fortunate until the reign of Ptolemy Philopater, when the Jews were much oppressed. After the defeat of the Egyptians, Antiochus III incorporated Palestine with the dominions of the Seleucidae (197). A deliberate attempt was made under the next sovereign, Antiochus Epiphanes, to stamp out the Jewish religion. Its peculiar rites, such as circumcision and the observances of the Sabbath, were strictly forbidden, while the Temple was dedicated to Zeus, and sacrifices offered there. Thousands suffered death rather than give way to such coercion, but ultimately a deliverer arose, who inaugurated one of the greatest and most heroic periods in Jewish hist.

*From the Maccabees to the destruction of the Temple.* Hitherto the resistance of the Jews had been mainly passive. Active resistance came from the family of Mattathias, an aged priest of the vil. of Modein. He slew a Jew who was offering sacrifice to heathen deities, and slew also the Syrian officer who was supervising. Then, taking with him his 5 sons, he fled eastward, and gathered round him in the wilderness a great company who would with him take aggressive measures, fighting if need be even upon the Sabbath itself. The act was a desperate one, and a measure of success was rendered possible only by the internecine struggle for the throne which distracted the Syrians themselves. Mattathias, who was an old man when he commenced the revolt, soon d., handing on the leadership to his son Judas, surnamed *Maccabeus*, 'the hammerer', from which his whole family has received the name of 'the Maccabees.' Judas was a great warrior and a fervent believer in his cause. He defeated Apollonius, a prominent Syrian general, and finally Lysias, the viceroy himself, at Beth-zur. Being now master of the country around the cap. Judas decided to make Jerusalem the centre of his operations, and hence the Temple was fortified and rededicated. After being besieged in the Temple by the Syrians, in 162 BC, permission was granted them to exercise their religion freely.

But the Maccabees resolved to continue the struggle for political freedom. The secular struggle was to be less successful than the religious. It began well, with the defeat and death of Nicanor near Beth-horon, but this was almost immediately followed by an overwhelming victory for the Syrians at Eleasa, in which Judas himself was slain. The leadership

of the party, which was now scattered far and wide, fell to Jonathan, the brother of Judas, who was able by skillful diplomacy to secure peace on favourable terms, ultimately being himself made high-priest in 153. In 143 Jonathan was slain in the quarrels for the throne of the Seleucidae, and Simon, his brother, became leader of the Maccabean party. He fortunately espoused the cause of Demetrius II, from whom he secured a recognition of Palestine's independence (142). So famous a year was this that it was considered the beginning of a new Jewish era, and from it dates were counted and coins were dated. Simon, who was made high-priest in 141, was a wise and prudent ruler, and under him the country enjoyed comparative quiet, and in the one important conflict, that with Antiochus Sidetes, Simon was victorious.

But there was still much scheming and party strife. Ptolemy, Simon's son-in-law, was striving to secure the supremacy, and as a step to this Simon was assassinated. But the crime gained Ptolemy nothing, for the power fell into the hands of Simon's ambitious third son, John Hyrcanus, who assumed the high-priesthood in 134 BC, and with it the sovereignty. The reign of John Hyrcanus was outwardly most prosperous, though at the beginning he was hard pressed by Antiochus. Later in his reign (134-104) he extended the Jewish dominions considerably in all directions. The Samaritans were reduced and the 'Temple' on Mt Gerizim was destroyed. He further subdued the Galileans and Idumaeans. During his reign, however, there is visible the rise into political prominence of the Pharisees and Sadducees. John was led to throw in his lot with the latter of these on account of that opposition of the Pharisees to his family which was to continue throughout the period of the Hasmonean dynasty. On his death his son, Aristobulus I, succeeded to the throne by the murder of his brother, and reigned but 1 year, during which he reduced the Ituraeans. He was followed by Alexander Jannaeus, a warrior prince who almost entirely neglected his sacerdotal position, his chief aim being the extension of his ters. He met his death (76 BC) in a campaign against the Arabians.

After him the high priesthood fell to Hyrcanus, Alexander's eldest son, but all power remained in the hands of his mother Alexandra, who accorded a much greater share in public affairs to the Pharisees. But Hyrcanus's younger brother, the energetic Aristobulus II, angry at his exclusion from a share in the gov., raised an army and deposed Hyrcanus. Then, as the supporter of Hyrcanus, there arose Antipater the Idumaeen. This man induced Hyrcanus to place himself under the protection of Aretas, King of the Nabataeans, by whose aid Aristobulus was defeated. The Romans now took a hand in the struggle, and Pompey, in 65 BC, sent his legate, Scourus, to settle matters, which he did in favour of Aristobulus. This decision was reversed 2 years later

by Pompey himself. Hyrcanus was made high priest, but the gov. of Judaea was attached to the Rom. prov. of Syria. In 57 an attempt was made to set Alexander, the eldest son of Aristobulus, on the throne. Alexander was taken prisoner by Gabinius, governor of Syria, and in order to break up what unity remained among the Jews the land was divided into 5 administrative dists. Aristobulus, who had been taken by Pompey to Rome, now escaped and raised a second ineffectual revolt in 56, and this was followed in 55 by a last attempt under Alexander, which was put down by Gabinius. On the death of Pompey, however, Hyrcanus made his submission to Caesar. Antipater the Idumaeen then secured for himself the post of procurator of Judaea (47 BC), while to Hyrcanus was left only the high priesthood.

Thus ended the Hasmonean dynasty. Antipater also succeeded in making his eldest son, Phasaël, governor of Jerusalem, and his other son, Herod, governor of Galilee. But the patriotic Jews viewed with horror this estab. of an Idumaeen dynasty, and set up Aristobulus's last remaining son, Antigonus, as his rival. Antipater was poisoned and Phasaël committed suicide in prison, but Herod invoked the aid of the Romans, and in 37 secured Jerusalem. Antigonus was put to death in the same year. Herod carried on the difficult task of ruling Judaea by the aid of the Romans, and with the utmost cruelty. On his death the kingdom was divided into tetrarchies, ruled respectively by his sons Antipas, Philip, and Archelaus, the last-named ruling Judaea and Samaria. His rule, however, was so cruel and despotic that in the year AD 6 Augustus deprived him of his power and sent him into exile. His tetrarchy was then attached to the prov. of Syria. Henceforward, except for the brief period from AD 41 to 44, Judaea was under Rom. procurators. During these few years it was ruled by Herod Agrippa, whose favour with Claudius secured to him all the ters. over which his grandfather had ruled. On his death there was a period of dreadful anarchy and internecine strife between the inlab. of Palestine, which was increased rather than lessened by the actions of the procurators, many of whom were in league with the worst elements of the pop. From the chaos there rose a fanatical party known as Zealots or Sicarii (Assassins). A general revolt broke out in the year 66, and a bloody struggle ensued, terminated only by that bloodiest of all scenes, the destruction of Jerusalem by Titus (AD 70). See also HEBREW LANGUAGE AND LITERATURE; JEWS; PENTATEUCH.

Israel, State of (Heb. *Medinat Yisrael*), Jewish rep. in Palestine. (For the hist. of the anct Heb. nation see preceding

article.) I. is bounded by the Mediterranean on the W., by Egypt and the Red Sea on the S., by Jordan on the E., and by Syria and Lebanon on the N. The state of war between I. and her neighbours has not been terminated and so the area of the country cannot officially be determined, but from 1949 down to the resumption of hostilities with Egypt in Oct. 1956 it remained at 7993 sq. m. The land borders total 589 m. (Lebanon 49 m., Syria 47 m., Jordan 329 m., Egypt 164 m.). The Mediterranean coast is 117 m., that

single-chamber assembly elected for 4 years by a system of pure proportional representation. The leading party has been the *Mapai* (Labour) with about a third of the seats, and it shares the ministries with a coalition of *Mapam-Achdut Avodah* (Extreme Socialists) and *Mizrachi-Hapoel Hamizrachi* (Religious). Other main parties are *Herut* (Nationalist), General Zionists (Conservative), and Communist (mainly Arab). The official language is Hebrew, but Arabic is also used in the *Knesset*, in public documents,

of the Red Sea 6 m., and of the Dead Sea 35 m. Pop. approx. 1,800,000 of whom 1,800,000 are Jews, 140,000 are Muslims, 50,000 Christians, and 16,000 Druses. The cap. is Jerusalem (I. sector, 160,000); the other main towns are Tel-Aviv-Jaffa (400,000), Haifa (160,000), Netanya (30,000), Nazareth (22,000), Ramle (21,000), and Lydda (18,000). I. is a member of the U.N. and of other international bodies.

I. is a democratic rep. without any written constitution, but with a number of fundamental laws. These relate to the presidency (Itzhak Ben Zvi, succeeding Dr Chaim Weizmann (q.v.), elected 8 Dec. 1952), the Law of Return, giving every Jew the right to immigrate, compulsory education, and sex-equality. The President is elected by the *Knesset* (Parliament) for a 5-year term. The *Knesset* is a

coins, and stamps. Immigration 1948-55 totalled 800,000, the bulk having entered between 1948 and 1951. I. is highly militarised, the army being recruited by compulsory service of 2½ years and estimated at 250,000. Women are subject to conscription. There is a small navy and an air force. There is no state religion, but the Jewish dietary laws and the Sabbath and holidays are publicly observed (e.g. cessation of railroad and other public transport and closure of places of entertainment). Religious courts have jurisdiction over matters of personal status. There is a ministry of religions which also deals with Muslim and Christian affairs and with the maintenance of the Holy Places. There are sev. institutions of higher education, including the Heb. univ. at Jerusalem, the recently founded religious Bar-Ilan Univ. at Tel-Aviv, the

Institute of Technology at Haifa, and the Weizmann Institute of Scientific Research at Rehovot.

**Agriculture, industry, trade, finance, and communications.** Although Palestine had a reputation for fertility in the O.T., cents. of war and misrule reduced large areas to desert and swamp. Under the Brit. mandate and subsequently the trend was reversed by the enthusiastic efforts of Jewish immigrants, most of whom had no previous experience of agric. work. There are 4 main regions: (1) *Galilee*—cereals, mixed farming, olives, and tobacco. (2) *The Emek*—varied crops; high intensity of cropping; bananas, and fish-breeding. (3) *Coastal plain*—citrus fruits, vegetables, mixed farming, and poultry keeping. (4) *The Negev*—mixed farming, subject to irrigation, and ground-nuts. About a quarter of the agric. workers belong to collective farms (*Kibbutzim*). Industry began under Brit. rule. By 1939 there were 23,000 industrial workers. The Second World War gave an impetus to industrial development because of the demands made by the allied armies. Heavy industry is mainly concentrated in the Haifa area and there is some light industry around Tel-Aviv. A wide range of products is manuf., including chemicals, metal products, textiles, plastics, leather goods, glass, ceramics, building materials, tools, precision instruments, polished diamonds, and electrical goods. The main mineral resources are in the Dead Sea, with a factory at Sodom on the SW. coast. Potash, phosphates, bromine, and salt deposits are worked. In 1955 oil was struck at Heletz in the N. Negev, and about 7000 barrels a day are produced. The trade union movement is extremely powerful, controlling much of the economy through various enterprises and co-operatives. Nearly all the workers are affiliated to the General Federation of Jewish Labour (*Histadrut*), which operates a social security scheme and a health service. There is also an Arab trades union council. Although the export trade is strongly encouraged, there is a heavy adverse trade balance, the imports in 1955 at £120 million exceeding exports by £20 million. The deficit is made up by dollar loans, by Ger. reparations, and by contributions from overseas Jewish communities. The Israeli £ has had to be devalued and stood in 1956 at £5.04 to the £ sterling. Before the completion of the line to Beersheba in 1956, the railway system had 230 m. of track. New roads have been built to Beersheba, Sodom, and Elat (the Red Sea port). In 1955 the merchant fleet had 30 vessels of 108,000 tons. I. National Airlines (*El Al*) run services to Europe, England, the U.S.A., and S. Africa. The main airports are at Lydda.

**History.** (For events leading to the estab. of I. see PALESTINE and ZIONISM.) Although the Brit. mandate did not end until 15 May 1948, there was a virtual state of war from Mar. between the unofficial Jewish forces (*Haganah* and *Irgun*) and local Arab bands as well as the Transjordan Arab Legion. The main

fighting was for the control of the road between Tel-Aviv and Jerusalem, which the Jews succeeded in keeping open at great cost. On the other hand, a group of Jewish settlements S. of Jerusalem was destroyed by the Legion. The Jews gained complete control in Haifa, Jaffa, Safed, and Tiberias. On 14 May the state of I. was proclaimed and recognised by the U.S.A. and the U.S.S.R. There followed nearly 4 weeks of fighting between I. and Egypt, Transjordan, Iraq, Syria, and Lebanon, until a 4 weeks' truce was arranged by the U.N. on 11 June. The Egyptian advance on Tel-Aviv and Jerusalem had been halted on a line from Ashdod to Bethlehem. In Jerusalem there was heavy fighting—the Jews lost their foothold in the walled city, but retained the Arab suburbs in the S. and W. A Jewish force was isolated on Mt. Scopus. Along the road to Tel-Aviv the Arab Legion could not be dislodged from Latrun, but the Jews built a new road and water pipe-line to supply Jerusalem. The Iraqi, Syrian, and Lebanese invasions failed.

With the resumption of fighting on 9 July, it was seen that the Israeli forces had been reorganised and re-equipped with help from Czechoslovakia. Lydda and Ramle were captured from the Legion and central Galilee from a mixed Arab force. The truce was renewed on 18 July, but in spasmodic fighting down to 7 Jan. 1949 I. captured the rest of Galilee and the whole Negev (making an incursion into Sinai as far as El Arish). Unavailing efforts at a settlement had been made by the U.N. mediator, Count Bernadotte. He was murdered in the Jewish sector of Jerusalem on 17 Sept. 1948. His successor, Dr Bunche, was able to procure armistice agreements between I. and the Arab states (except Iraq, which withdrew its troops from Palestine). The mandatory boundary became the frontier between I., Syria, and Lebanon. Palestine was effectively partitioned between Egypt, Jordan (Transjordan), and I. Egypt held a narrow strip between Gaza and the old border; Jordan took Samaria (the 'triangle') and part of Judea; the remaining four-fifths of Palestine was retained by the victorious Israelis. The armistice agreements, the last of which was concluded with Syria on 20 July 1949, left unsolved most of the problems occasioned by the estab. of I. The Arab states refused to recognise the existence of I. and imposed an effective economic boycott. Egypt in particular closed the Suez Canal to I. shipping, and blockaded Elat. The oil pipe-line from Iraq to the Haifa oil refineries remained cut. Incursions into I. across the long frontiers by infiltrators and saboteurs made peaceful life impossible, but the savage reprisals undertaken by I. in no way discouraged these attacks. In Oct. 1956, after the union of the military commands of Egypt, Jordan, and Syria, I. invaded Egypt and conquered the whole Sinai peninsula and the Gaza strip. This resulted in Anglo-Fr. armed intervention, followed by the

arrival of a U.N. force in the area. By Jan. 1957 I. had withdrawn from much of the ter. conquered in Oct.-Nov., but she was insisting that guarantees safeguarding her navigation rights through the Suez Canal and in the Gulf of Akaba must precede any complete withdrawal.

Among the sad effects of war was the flight or expulsion of a large number of Arabs from their homes in I. Their numbers have been variously estimated, probably about 700,000. Most of them are in Jordan or at Gaza, supported by a U.N. relief grant. Their places have been taken by an even larger number of Jews.

socialism has in practice been accepted by all the parties, whatever their theoretical views. Internal controversy has centred mainly on religious matters. Although the religious political parties have never polled more than 15 per cent of the votes in a general election, they represent a majority of the religious Jews in the country. By adroit manoeuvring, the religious parties have succeeded in gaining a considerable victory over secular Zionism as their price for remaining in the coalition, and have secured the public observance of Judaism in all aspects of state activity. On the other hand, many

*State of Israel: Government Press Division*  
COMMUNAL HOUSES IN NORTH TEL-AVIV

In the process of immigration almost the entire Jewish communities of Bulgaria, Yemen, and Iraq were brought to I., and large numbers came from N. Africa and E. Europe. The physical and moral problems of integration have taxed to the full the resources of I., but it is realised that the only hope of continued survival of the state rests in the building up of the pop. As a result of the new immigration, the predominance of the European Jews must eventually be lost, but so far the leading positions in the state have been occupied by the better-educated W. elements. In the Cabinet, which has, with one short break, been headed by D. Ben-Gurion, only one oriental Jew has held office. The amalgamation of the scattered people of I. will be one of the most remarkable features of this cent.

In view of the gravity of the political and economic situation, state-controlled

of the leading personalities in I. are not observant Jews. They have often expressed impatience with the slowness of Orthodoxy to grapple with the problems of a modern state. Liberal and Reform Judaism, which is popular in some W. countries, has scarcely obtained a foothold in I., where the Orthodox rabbinate remains unchallenged. The non-Jewish communities in I. enjoy complete religious freedom.

The present position of I. is extremely precarious. Surrounded by hostile nations, growing ever stronger in their determination to destroy her, I. has few friends in the world and no alliances. Quite apart from the Arab group, most of Asia regards I. as a W. intruder. The U.S.S.R. originally supported the estab. of I. in order to embarrass Britain, but now encourages the Arab states to destroy I. in exchange for prestige and power in the Middle E. The

W. powers cannot support I. without endangering their oil supplies and passage through the Suez Canal.

See G. de Gaury, *The New State of Israel*, 1952; H. Sacher, *Israel: the Establishment of a State*, 1952; *The Israel Year Book: The Jewish Year Book*.

**Israëls, Josef** (1824-1911), Dutch painter, b. Groningen of Jewish parentage. For 2 years he worked in Paris under Picot, and soon afterwards he settled down at The Hague, where he made his home for life. It was during a convalescence passed in the fishing tn of Zandvoort that the poignancy of the poor's suffering and the tragedy of life were first vividly revealed to him: henceforth his pictures 'were painted with gloom and suffering,' and became a sensitive and artistic expression of his compassion for the toiler. I. has truly been called the Dutch Millet, although he emphasised the shadow rather than the light. Among his masterpieces are 'The Zandvoort Fisherman,' 'Village Poor,' 'Shipwrecked,' 'Cradle,' 'When We grow Old,' 'The Widow,' 'The Bric-à-brac Seller,' and 'Between the Fields and the Seashore.' See J. Veth, *Josef Israëls*, 1904.

**Israfil, or Israfeel**, according to the Mohammedan belief, will sound the last trump from the Temple rock at Jerusalem, calling men to judgment.

**Issoire, Fr. tn**, cap. of an arron., in the dept of Puy-de-Dôme, near the confluence of the Couze and Allier. It was sacked by the League during the religious wars of 1574-7. There is a beautiful Romanesque church. Lace, cotton goods, and machinery are manuf. Pop. 7100.

**Issoudun, Fr. tn**, cap. of an arron., in the dept of Indre. It has copper foundries, tanneries, manufs. of agric. implements and manures, and quarries of lithographic stone. Pop. 12,600.

**Issue:** 1. In law, offspring or lineal descendants of any degree. In Eng. law the term is peculiarly appropriate to the descent (see INHERITANCE) or grant (q.v.) of real property, whether by deed or will. Before the Wills Act, 1837, a devise (i.e. grant by will) 'to A and his heirs, but if A die without issue, then to B and his heirs' was construed to mean that A's estate (q.v.) should descend to A's I. in tail (see ENTAIL), i.e. as long as I. remained, when the gift went over to B and his heirs. But the Wills Act expressly enacts that the words 'die without issue' should be construed to mean die without I. living at the death (i.e. of A in the above example) and not an indefinite failure of I. The Settled Land Act, 1882, made a further change, the effect of which is that as to testators dying after 1882, any child of A who has attained 21 is free to retain or sell the land at his pleasure.

2. In the language of pleading means some definite proposition of law or fact asserted by one party and denied or 'confessed and avoided' (see CONFESSION AND AVOIDANCE) by the other, concisely setting forth the points on which both

parties desire the verdict of a jury or the judgment of a court. To 'join issue' means in effect to deny or traverse a proposition in the other party's pleading, upon which joinder no further pleading is necessary. Where the parties are agreed as to the questions of fact to be decided between them, they may, before judgment, by mutual consent, obtain an order from a master to go to trial upon such questions without formal pleadings, the question being stated in what is technically termed 'an issue.' The meaning of I. in Scots pleadings is not dissimilar.

**Issus** (modern Aïsse), tn in Cilicia, near where that prov. adjoins Syria. Here, in 333 bc, Alexander the Great inflicted a crushing defeat on the Persians under Darius Codomannus. Vast treasure and the royal family fell into the conqueror's hands.

**Issy-les-Moulineaux, Fr. tn** in the dept of Seine, a SW. suburb of Paris. A building in the rue Ernest-Renan has connections with Fénelon, Bossuet, and Ernest Renan (qq.v.), and stands on the site of the château where Margaret of Valois (q.v.) d. There are chemical, textile, and cement manufs., and breweries. Pop. 40,000.

**Issyk-kul', or Issikul** (Kirgiz 'warm lake'), lake in Russian Central Asia, in the I. Region of the Kirgiz S.S.R., is 5000 ft above sea level, and covers an area of 2300 sq. m. It is fed by many streams, but the surface is becoming smaller. The water is salt, and contains a large quantity of fish. On the S. shore stands the tn of Przhnevsk (Karakul).

**Istakhr**, see PERSKPOLIS.

**Istanbul** (formerly Constantinople, anct Gk *Kōnstantīnopolis*, 'the city of Constantine'), until 13 Oct. 1923 cap. of Turkey, when it was superseded by Ankara. The city stands on a hilly promontory of triangular shape, having the Sea of Marmora and the Bosphorus on the S. and E., and on the N. the Golden Horn, an arm of the Bosphorus. It is thus surrounded by water on all sides but the W., where a strong wall shuts the city off from the mainland. Like Rome, I. is a city built on 7 hills, 6 of them being separated portions of 1 long ridge. In 330 I. was erected by Constantine the Great on the site of the anct Byzantium, which dated from the 7th cent. bc. For 7 cents. it remained as the cap. of the Rom. Empire in the E. As 'New Rome' it was early important, and on the partition of the empire in 395 it became the seat of the E. emperors. Even before this time the new city had had to withstand assault, for in ad 378, after the defeat of Valens, the Goths had attacked it. Henceforth it was to do so on many occasions. Twice, in 616 and 626, it sustained onslaughts from the Persians, and twice again, in 668-75 and 717, the Arabs furiously but unsuccessfully attacked it. In 1203, and again in 1204, it was taken by the Crusaders, whose conduct on this last occasion brand them with disgrace. From 1396 to 1401 it was unsuccessfully besieged by the Turks under

Sultan Bajazet. Sultan Murad II attacked it once again in 1422, and it held out with the greatest difficulty. The end was near, and in 1453, after a long and heroic defence against great odds, the city of Constantine fell. As in the case of all great cities, I. has spread far beyond its original bounds, and may be said to include two originally quite separate from itself. The name I. is generally reserved for the part built on the promontory above described, and the suburbs are considered separately. These are: to the N. of the Golden Horn, Galata and Pera, with Tophane; to the E. of the Bosphorus, in Asia, Scutari and Kadikoi. Galata, of which

people has changed in the same direction. The streets are generally dull in appearance, almost all animation being concentrated in the bazaars.

Almost all the important architectural and antiquarian monuments of I. are to be found in the city proper. First and foremost among these comes the church of St Sophia (*Hagia Sophia*, Holy Wisdom), erected by Constantine, and rebuilt with additional magnificence by Theodosius (415) and Justinian (538-68). Though necessary repairs have been executed, it is the church of Justinian that we now have. The exterior appearance of the church is disappointing, but inside it is the most magnificent creation of Byzantine art. The architects were Anthemius (q.v.) and Isidorus of Miletus. The great oval-ended nave is 260 ft long by 107 ft wide, the central square being bounded by 4 huge piers, each 25 ft square. These are connected by semicircular arches, and support a dome 107 ft in diameter. E. and W. are other great semicircular spaces, each crowned with a dome. The ornament is extravagant in its beauty. Marbles of various hues are arranged to form intricate patterns, and mosaics appear here and there uniting the marbles. After the capture of I. by the Turks, 1453, St Sophia was turned into a mosque, and its Christian ornaments removed or covered up. Later it was converted into a museum. From St Sophia many other mosques were imitated, and it may be said to inaugurate a fresh type of architecture for these buildings. The greatest of the imitations is the mosque of Solymani the Magnificent, of which the effect has been said to be more imposing than that of the original. Of the 200 or more mosques scattered throughout the city those of Ahmet, Bajazet, and Mehmet II may be mentioned. An important monument of the ancient city is furnished by the remains of the Hippodrome, the centre of the Rom. life of the city. Here are to be found the obelisk of Thothmes III, brought from On in the reign of Theodosius, and the triple serpents column, once in the Temple of Delphi and brought to I. by Constantine. In 1453 the conquering sultan threw his mace at the 3 talisman serpents in the Hippodrome, which were supposed to protect I. against serpents, and broke the lower jaw of one, but refrained from doing further damage when he learned that the city would probably be devastated by an invasion of serpents if its protectors were destroyed. The chief Turkish antiquity is the Old Seraglio, occupying the whole SE. corner of the city. It was formerly the palace of the Sultan. It has 3 spacious courts, and around them are arranged the ancient buildings, one the church of St Irene, and one the old treasury, still containing vestments and arms of tremendous value. It is in the bazaars that the oriental spirit is strongest. These are arranged in rows, well furnished with most kinds of wares, but without any particular architectural features. The city is now easily accessible by rail and air, and there is good

W. F. Mansell

#### ST SOPHIA, ISTANBUL

the chief ornament is a lighthouse, is the great shipping, mercantile, and banking quarter, and was not united to I. until after 1453. Pera is the European residential quarter. Tophane is, or was, important for the cannon foundry from which it derives its name. Scutari (q.v.) is an important commercial and industrial centre. The city of I. is excellently situated, more advantageously perhaps than any European city but Naples. From the outside its appearance is most picturesque and imposing. At the taking of I. most of the churches were destroyed, and mosques were erected in the most prominent situations. Cupolas and minarets, with graceful curves and soaring spires, combine with lofty cypresses to give the city an air of unique grace, and to invest it with the mysterious glamour of the oriental world. Within, however, the appearance is not so pleasing. The streets form a labyrinth of dirty, crooked, and ill-paved alleys, while most of the houses are low and are built of wood or rough stone. During the last 70 years the aspect of things has become much more European. The streets, under W. influence, have been widened and improved, and a European style of building has been introduced. The dress of the

communication with the rest of the Continent. It is connected with the central European railway system via Belgrade and Sofia. Exports are chiefly cereals, carpets, silk, wool, hides, and all kinds of refuse and waste materials such as horns, hoofs, skins, bones, old iron, etc. The manufs. of I. have all taken their rise during comparatively recent times, and only that of cloth-making has made any headway. During the years 1899 and 1900, handsome new quays were built on both sides of the Golden Horn, thus making an excellent harbour. Ships of the largest class find safe anchorage here, and there are fine graving and dry-docks. I. was the centre of the Islamic faith throughout the world, being the seat of the caliph until the office was abolished on 2 Mar. 1924. The climate of the city is generally healthy, but it is very damp, and liable to great and sudden changes of temp. The city was originally very unhealthy through inefficient sanitation, but this is now improved. There are electric trams in I. and its suburbs. The pop. is varied, presenting a most remarkable mixture of races, nationalities, faiths, and languages. In 1905 (1955) totals 1,215,000. See BALKAN WAR and TURKEY. See G. J. Grelot, *A Late Voyage to Constantinople* (trans. by Phillips), 1683; C. du F. Du Cange, *Constantinopolis Christiana* (new ed.), 1825, and *Histoire de Constantinople sous les empereurs français*, 1826; W. J. Brodrick and W. Besant, *Constantinople*, 1879; E. Pears, *The Fall of Constantinople*, 1885; W. R. Lethaby and H. Swainson, *Church of Saint Sophia*, 1894; W. H. Hutton, *Constantinople*, 1900; W. Istankeui, see Cos.

Isthmian Games, one of the 4 great pan-Hellenic festivals of antc Greece, dating from 581 BC, and held on the Isthmus near Corinth (q.v.) in spring of the second and fourth years of each Olympiad (see OLYMPIC GAMES). The I. G. were celebrated in honour of Poseidon (q.v.); owing to the attractions of the neighbouring city they were the most popular of such gatherings. The chief prize was a crown of wild celery, and some of the victors are commemorated in the fourth book of Pindar's *Epinikeia* (see PINDAR). See also NEMEAN GAMES and PYTHIAN GAMES.

Isthmus (Gk *isthmos*, neck), term used in geography to describe a narrow neck of land joining 2 larger portions otherwise separated by water. Thus the I. of Suez links together Asia and Africa at the head of the Red Sea; that of Panama connects N. and S. America; and that of Corinth the Peloponnesus with N. Greece.

Istib, see STIP.

Istrati, Panait (1884-1935), Fr. author of Rumanian origin. He travelled widely, working his way in considerable poverty. Encouraged by Romain Rolland (q.v.) he started to write. His first novel was pub. in 1923. Most of his novels have a

Rumanian setting and most have been trans. into English.

Istres, Fr. tn in the dept of Bouches-du-Rhône, on the W. shore of the Etang de Berre, 25 m. NW. of Marseilles. It has a naval flying school, and salt and soda works. Pop. 5700.

Istria, Dora d', see GHKA, HELENA.

Istria, peninsula in Croatia, Yugoslavia, between the Gulf of Trieste (q.v.) and the Bay of Kvarner (q.v.). It was acquired by Austria from Venice in 1797. At the end of the First World War the greater part of it was incorporated in Venezia Giulia (q.v.), Italy. The It. peace treaty

Yugoslav Embassy

GIRLS OF ISTRIA

of 1947, at the end of the Second World War, gave the peninsula, except for the free ter. of Trieste (q.v.), to Yugoslavia. It is hilly, and the coast is rocky and much-indented. The chief products are cereals, oil, wine, and live-stock, and there are fishing and boat-building industries. Two-thirds of the inhab. are Slavs, and the rest Italians. The prin. tns are Rijeka and Pula (qq.v.). Sev. is. off the coast are usually included in the term 'I.' among them Krk and Cres (qq.v.). Area about 1500 sq. m.; pop. 362,000. See T. G. Jackson, *Dalmatia, the Quarnero, and Istria*, 1887.

Istros, see DANUBE.

Iswar (Ishwar), Chandra (Vidyasagar) (1820-91), Indian author and social reformer, belonged to a Kulin Brahmin family of Bengal. One of the finest Bengali prose writers, he revealed the charm and beauty of his language in *The Exile of Sita* (1862). Soon after 1851 he became principal of the Sanskrit College of Calcutta. The Act of 1856, permitting

the remarriage of Hindu widows, was largely the outcome of his exertions.

Isyllus, Gk poet, whose name occurs in an inscription in the temple of Asclepius in Epidaurus. Probably lived at the time of the Gk invasion of Sparta after Chaeronea (338 BC). The inscription (which consists of a prose dedication and 72 lines of verse in sev. metres) was ed. by P. Kavvadias (1885).

Itacolomite, or Flexible Sandstone, yellow sandstone of a porous nature found in Brazil. In the form of thin slabs it is slightly flexible; a bar of it, when supported at its ends, sags visibly, but returns to the straight when laid flat. This is supposed to be due to the sand grains which form the rock not being firmly cemented together. In England beds of flexible sandstone are found associated with the magnesian limestone of Durham.

Itagaki, Taisuke, Count (1837-1919), Jap. statesman, was prominent in the progressive movement which led to the overthrow of a feudalism long since antiquated. In Kochiken, Shikoku, he opened a school (the 'Risshisha') where he taught his advanced and enlightened political views. The party of patriots, 'Aikoku Kō-tō,' acknowledged him as their leader, and he directed the policy of the 'Jyūto,' whose watchwords were 'liberty' and 'reform,' 1881-1900.

Itajaí, riv. in Brazil, flows through Santa Catarina, and enters the Atlantic at I., a small port for the Ger. colony of Blumenau. It. exports pine and mahogany. There is an airfield. Pop. 34,000.

Italian Architecture was the most important in Europe, and indeed in the world, during the first 3 cents. of the Christian era; and again during the Renaissance, from c. 1450 to c. 1650. It was also notable in some stages of the Romanesque period, but It. Gothic architecture is inferior in quality and quantity to that of France or England. Although Rome may have been founded in 753 BC, the earliest surviving buildings of any size are of the 1st cent. BC, and anything older is now generally described as 'Etruscan' (see ARCHITECTURE, 3). During those cents., however, a great deal of building was done in the various Gk colonies (collectively known as 'Magna Graecia') around the coasts of Sicily and S. Italy, where one can still see the ruins of many Gk Doric temples (see ARCHITECTURE, 2), all erected between c. 575 BC and c. 430 BC. In Sicily these include 3 unimportant temples at Syracuse, 6 at Selinus, 4 at Agriguntum; on the mainland there are 3 at Paestum, and 1 each at Metapontum, Locri, and Pompeii. This last example was erected c. 550 BC, but most of the other public buildings of Pompeii, including the large theatre, the basilica, the Stabian baths, and the temples of Apollo and Isis, are of the 2nd cent. BC, though the small theatre and the amphitheatre are of the following cent. By that time classical Gk or 'Hellenic' architecture had given place to 'Hellenistic' or 'Greco-Rom.' architecture, i.e. Gk architecture as modified and practised after c. 300 BC.

In AD 79 the tns. of Pompeii and Herculaneum were overwhelmed by an eruption of Vesuvius; but excavation of both sites during modern times has revealed the high standard of domestic life in these Greco-Rom. tns. and the delicacy of their decorations. The nature of Rom. architecture is described elsewhere (see ARCHITECTURE, 3) and its prin. examples are noted in the articles on the architecture of individual countries; so here it will suffice to mention only the prin. Rom. buildings surviving in Italy. Excluding Rome and its neighbourhood, they are: the theatre at Aosta, c. 40 BC; the Arch of Augustus at Rimini, 27 BC; the triumphal arches at Ancona, AD 113, and at Beneventum, AD 114-17; the amphitheatres at Verona, 290, Capua, and Pozzuoli; as well as that at Pompeii already mentioned.

This is a very short list, and one finds a similar concentration of surviving examples when one reaches the next period (see ARCHITECTURE, 4); for most of the early basilican churches were in Rome itself. They included the basilicas of St Peter (AD 330, completely rebuilt in the 16th cent.), St John Lateran (330, altered out of all recognition), St Agnes without the Walls (324, but rebuilt 625-38), St Paul without the Walls (380, destroyed by fire 1823, then rebuilt precisely as before); St Lorenzo without the Walls (a double church—one part built 432, the other rebuilt 578); the lower church of S. Clemente (4th cent.); S. Sabina (425). Most of these were originally founded soon after the Emperor Constantine's recognition of Christianity in 313, and all were of basilican type: consisting of an oblong aisled nave, usually with an E. apse and a W. narthex or vestibule. Besides this essentially Rom. 'basilican' type, there were a few circular churches, including S. Stefano Rotondo (470), the Baptistery of Constantine (430-40), S. Costanza (330), all in Rome; as well as the Baptistery at Nocera (350). This latter type of plan, with a central dome, came to be typical of Byzantine architecture. There are other examples at Ravenna, viz. the Tomb of Theodoric (530, not strictly a dome) and the remarkable church of S. Vitale (526-47) with its fine mosaics. At Ravenna, however, there are also 2 basilican churches: S. Apollinare Nuovo (493-525) and S. Apollinare in Classe (534-9). From 404 to 476 Ravenna, not Rome, was the cap. of the (W.) Empire. After a period of rule by Theodoric the Goth, it became the cap. again.

Then came the Lombard kingdom, during which 'Early Romanesque' or 'Lombard' architecture made its appearance. Originating in N. Italy, especially in Milan and Lombardy, it soon spread into Germany, Scandinavia, and elsewhere. Lombard churches are basilican in plan—usually with a crypt. They have round arches, a good deal of arcading used as external ornament, rather flat sloping roofs, picturesque *campanili* (q.v.), and often stone barrel-vaulting over the aisles. Following are the prin. Lombard and

Romanesque churches in Italy, up to the advent of the Gothic style, c. 1240: S. Pietro, Toscanella, 739; S. Maria in Cosmedin, Rome, 772-95; S. Ambrogio, Milan, 789-824 (but much altered since); S. Giorgio in Velabro, Rome, 827-49; Torcello Cathedral, 864; St Mark's, Venice, begun 976 (*see also* CAMPANILE); Pisa Cathedral, 1006-1113; S. Miniato, Florence, 1013; Modena Cathedral, 1089-1184; SS. Giovanni e Paolo, Rome, 12th cent.; S. Zeno, Verona, 1138; the Baptistery, Pisa, begun 1153; the Campanile,

derived from further E.; other features are of 'Saracenic' origin.

Following are the prin. It. examples. In Venice: the churches of SS. Giovanni e Paolo, 1234 onwards, and of the Frari, 1250-80; the Doge's Palace, 1309-1424, and the Ca d'Oro, Foscari, and Pisani palaces on the Grand Canal. In Florence (*see* ARNOLFO): the cathedral, 1292 onwards; the Campanile, 1334-87, by Giotto; S. Maria Novella, 1278-1350; S. Croce, 1294-1442; Or S. Michele, 1356-1404; the Bigallo loggia, 1352-8; the Loggia

A typical basilican interior.

E.N.A.

Pisa, begun 1173; the beautiful cloisters of St Paul without the Walls and of St John Lateran, both in Rome and both late 12th cent.; the W. front of Lucca Cathedral, 1204. In southern Italy and Sicily: the Abbey of S. Niccolò, Bari, 1087-1197; the collegiate church at Barletta; the cathedrals of Bari, Bitonto, Cefalù, Giovinnazzo, Messina (destroyed by earthquake, 1908), Molfetta, Palermo, and especially Monreale in Sicily, built by the Normans 1174-82. In Italy, the home of the Rom. tradition, Gothic architecture never reached the standard of grace or grandeur that it attained in France and England, especially as regards boldness and logic in buttressing and vaulting; but it was certainly picturesque in its way, as Ruskin convinced his Victorian disciples. Some of its cathedrals (e.g. Siena, Orvieto) have zebra stripes of black or red and white marble, a fashion

del Lanzi, 1376; the Palazzo Vecchio, 1298; the Palazzo del Podestà, 1255. In Assisi: S. Francesco, 1228-53. In Milan: the cathedral, 1385-1435. In Orvieto: the cathedral, 1280-1310. In Siena: the cathedral, 1245-1380. In Pisa: the Campo Santo, 1278-83, and the beautiful S. Maria della Spina, 1323. In Bologna: S. Petronio, 1390-1437. In Padua: S. Antonio, 1237-1307. In Pavia: the Certosa, 1396-1481. The town halls of Siena, 1288, and Perugia, 1281. In Verona: S. Anastasia, 1261. The only old Gothic church in Rome is S. Maria sopra Minerva, 1280.

As explained elsewhere (*see* ARCHITECTURE, 7) the Renaissance of (Rom.) architecture began in Italy early in the 15th cent., and spread thence into other countries of Europe. Its 2 chief centres of origin were Florence, at that time the most enlightened culturally of It. cities,

and Rome, where most of the prin. monuments of antiquity were to be found. The leaders of the new movement in Italy are dealt with in separate articles, in which their various buildings are mentioned. For the 15th cent. see BRUNELLESCHI, ALBERTI, A. DA SANGALLO, senior, and A. SANSOVINO (Florence); BRAMANTE (Rome and Lombardy); GIOCONDO (Vernona). For the 16th cent., besides some of those mentioned above, see AGNOLO, MICHELANGELO, A. DA SANGALLO, junior (Florence and Rome); PERUZZI (Rome,

Croce, and the 'Spanish Steps'—all of the 18th cent.—are on the border-line between Baroque and Rococo (q.v.).

After c. 1780 a marked decline ensued in the quality as well as the quantity of I. A. Neither the Gk nor the Gothic Revival had much effect in Italy. Among many ornate buildings erected during the latter part of the 19th cent., the most bombastic was the overpowering marble monument to King Vittorio Emanuele in Rome (1885-1911) by G. Sacconi. Under Mussolini's brief rule between the 2 world

Bologna, Siena); VIGNOLA, FONTANA (Rome); SANMICHELE, SANSOVINO (Venice); PALLADIO (Vicenza, Venice).

Towards the middle of the 16th cent. books on architecture began to appear, compiled by Vignola, Palladio, and Serlio (q.v.), in which rules of design according to the anc. Rom. Orders (see ORDERS OF ARCHITECTURE) were formulated. Concurrently with this trend towards regulated design, a more picturesque form of architecture was being evolved by Michelangelo, which resulted in the Baroque style (q.v.). For the chief Baroque buildings of Rome see BERNINI and BORROMINI. In Venice the finest Baroque building is the church of S. Maria della Salute (1631) by Longhena. There are other examples in Milan, and many in Turin (mainly by GUARINI and JUvara). Sev. other buildings in Rome, including the Fountain of Trevi, the façade of S.

wars, although many excellent new ones were laid out in the Campagna, and although the historical monuments of Rome were judiciously restored and isolated from the mean shacks which had grown over them like a fungus, some grandiose schemes in the city—such as the Foro Mussolini and the Exhibition S. of Rome—were vulgar as well as gigantic. In recent years the most important buildings have been the new Central Railway Station (1918) and the univ. (1930)—both in Rome; also the numerous fine blocks of flats in Rome and Milan, a branch of architecture in which Italy stands high among the European nations.

**Italian Art.** In the dawn of Christian art in the 4th cent. a common style was sought in architecture, sculpture, and painting, so as to give a common expression to the new religious ideas. The hist.

of the development of Gothic architecture in Italy establishes very clearly the gradual transition from Rom. ideas to Romanesque and Byzantine and ultimately to Gothic. See ARCHITECTURE, 5 and 6; BYZANTINE ARCHITECTURE; ITALIAN ARCHITECTURE.

**Sculpture and painting.** Until the great revival of plastic art took place in the mid 13th cent., the sculpture of Italy was decidedly inferior to that of more N. countries and much of it was actually the work of N. sculptors. Unlike the sculpture of the Pisani and later artists, the early figures are purely secondary to the architecture they are intended to decorate and they are the work of men who were primarily architects. Following the end of the 13th cent. the reverse was more often the case—as is exemplified by the sculptured decorations at the W. end of Orvieto cathedral. But during the 14th cent. Florence and neighbouring cities were the chief centres of It. sculpture, and in the succeeding cent. Florence had become the aesthetic cap. of the world, having attained a pitch of artistic wealth and perfection rivalled only by that of anc. Athens, and indeed there is some similarity between Florentine plastic art of this period and that of 4th- or 5th-cent. Athens.

Niccolò Pisano's (q.v.) statuary is reminiscent of the mighty constructions of anc. Etruria and Rome and marks a break-away from Romanesque art. It heralds the reform in sculpture continued by Giovanni Pisano (q.v.), in whose hands the representation of the human figure attains a completeness which It. painting could not acquire till a cent. later. In Niccolò's baptistery at Pisa sculpture is subordinated to architectural framework, but in the pulpit at Siena, made by him in collaboration with Giovanni Pisano, the sculptural effect is richer and more varied. In the fountain at Perugia, the finest flower of Giovanni's brilliant imagination, the influence of Niccolò has all but vanished and 'grave tranquillity has yielded to excited rhythm,' and these qualities are to be found in the followers of Giovanni Pisano—Giotto (q.v.), Andrea Pisano (q.v.), Orcagna (q.v.), who was famed as a goldsmith and painter as well as a sculptor, and Nino Pisano—sculptors of the 13th and 14 cents. Another of the most inspired creations of Giovanni Pisano is the 'Massacre of the Innocents' in one of the reliefs of the baptistery of Pisa. Well has it been said that this 'impassioned contemporary of Dante never created a greater or more dramatic work of art than these convulsed groups of mothers and children.' Andrea Pisano, originally an obscure goldsmith, became famous for his bronze bas-reliefs in the Florentine baptistery. In it he shows a mastery of the representation of movement and a regard for the unity and interrelationship of the varied scenes of a story which introduce a fundamental reform in composition in which he was forestalled only by Giotto in his paintings. The later half of the *trecento* also exhibits

a nascent tendency towards reality, a tendency exemplified amongst the Veronese sculptors and particularly in the Venetians, Jacobello and Pier Paolo delle Masegne.

Great names in painting in the *trecento* are those of Pietro Cavallini (q.v.), Giotto, and Cimabue (q.v.), the last-named, as Dante records, being the first famous name in Florentine art. Cavallini was the herald of the *stil nuovo* in It. painting and it was he who inspired Giotto. He was a master of the 'Roman school' and the greatest exponent of the classical style at the end of the 13th cent. Some of his finest work is to be seen in the mosaics of Santa Maria in Trastevere, Rome, notably in the panel of the 'Birth of the Virgin' and in his frescoes in the convent of Santa Cecilia, Rome. Giotto, who with Duccio di Buoninsegna (q.v.), was a pioneer in liberating the arts from the rigid medieval tradition, reveals the profound tranquillity, the dignity of the spirit of this first renaissance of poetry and painting. His figures, far from imitating the silhouettes of contemporary sculpture, recall the massive simplicity of primitive monuments, and their simplicity is enhanced by a corresponding simplicity of scenic background. His greatest paintings were destroyed, but in the Scrovegni chapel his frescoes reveal his power of capturing life, his sense of human character, and his keen dramatic instinct. Cimabue the Florentine continues the Romanesque tradition as may be seen in his work in the Uffizi Gallery, Florence, and the frescoes at Assisi. Other names of the 14th cent. are those of Simone Martini (q.v.), an artist with a rare sense of beauty of line, of colour, of graceful movement, and of human expression, Lippo Memmi and Ambrogio and Pietro Lorenzetti (q.v.) of the 'Sienese school,' a 'sort of aesthetic Lotus-land of painters.'

The Gothic style characterises the work of many It. painters at the beginning of the 15th cent. Among them may be mentioned Gentile da Fabriano (q.v.), whose most celebrated work is the 'Adoration of the Magi' in the Uffizi Gallery. He was not a great artist, but he inherited much of the Siena school's feeling for beauty of person, of line, and of colour, enhanced by a lively fancy which filled his compositions with jewels and flowers, rich brocades, and gentle laughing faces so representative of the court art of his time. Antonio Pisano (Pisanello) (q.v.) is, however, the greatest painter of this artistic movement. He displays a child-like pleasure in the minute presentation of natural objects. Other painters of this cent. were Fra Angelico, Masaccio, Paolo Uccello, Andrea del Castagno, Piero della Francesca, Melozzo da Forlì, Luca Signorelli, Antonio Pollaiuolo, Andrea Verrocchio, Filippo Lippi, Domenico Ghirlandajo, Giovanni di Paolo, Pinturicchio, Perugino, Botticelli, Mantegna, Cosimo Tura—a pioneer of the Ferrarese school—C. Crivelli, Francesco del Cossa—also of the Ferrarese school—Borgognone, Bramantino, Ercole de' Roberti, Antonello

da Messina, Cima da Conegliano, Giovanni Bellini, Gentile Bellini, and Carpaccio. These are the masters of those great artists who were to invest the succeeding cent. with the full splendour of I. A.—thus Leonardo da Vinci (q.v.) derives descent from Verrocchio (q.v.), who perfected the art of shading figures and endowing them with spiritual refinement; Raphael (q.v.) derives from Perugino (q.v.) and Piero della Francesca; Michelangelo (q.v.) from Bertoldo and Signorelli (q.v.), both, especially the latter, remarkable for energy and vigour in their treatment of the human figure and their reaction from impassiveness; Correggio (Allegri) (q.v.) from Mantegna, the founder of humanistic painting in N. Italy, Giorgione (q.v.) and Titian from Giovanni Bellini (q.v.), whose faces are invested with the clear light of innate goodness and calm. Fra Angelico's supreme quality is that of colour, and no other painter of the time employed tones of such purity. He has been described as 'the chief prophet in Italy of the beauty of holiness.' His designs are always exquisite, and sometimes, as in the Florentine frescoes, 'The Transfiguration' and 'The Marys at the Sepulchre,' they attain extraordinary grandeur. Masaccio (q.v.), who *d.* prematurely, assimilated scientific principles with the same natural ease with which he mastered the general construction and appearance of the human figure. In his fresco 'The Tribute Money' there is a mt range which, in Ruskin's judgment, was the first piece of real mt drawing in anct art. Uccello (q.v.) was a great craftsman, but he combined science with art to such an extent that it seemed to Vasari the art was overbalanced. Grandeur characterises the few surviving works of Andrea del Castagno (q.v.) as may be seen in the small 'Crucifixion' in the National Gallery. Of the Florentines of the 15th cent. Filippo Lippi (q.v.) is noted for his gift of colour in the grand manner. Portraiture assumes a more prominent place with Ghirlandaio, a pupil of Baldovinetti (q.v.). Perugino, like Pinturicchio, has an eye for undulating airy distances which seem to add an importance to his figures which they might not otherwise possess, as is exemplified by his 'Virgin with S. Bernard.' Piero della Francesca, a Florentine by choice, is the link between the old and new generations. His sense of spacious design was unrivalled by his contemporaries and make him a greater pioneer of landscape than Perugino. As a portrait painter he has no contemporary superior. In 'Baptism' and 'Nativity' the National Gallery has 2 of his best panel paintings. Signorelli was one of the most original masters of his time, whose energy found its outlet in the robust treatment of the nude, which he handled with a solid power only surpassed by Michelangelo himself. Antonio Pollaiuolo made a close study of artistic anatomy, as may be seen in the 'Martyrdom of S. Sebastian' in London. His 'Apollo and Daphne,' also in the National Gallery, proves him an admirable artist. Verrocchio's name survives chiefly as a sculptor, though he was also a

musician and goldsmith as well as painter, but we are never certain how far paintings ascribed to him are wholly his work and not sometimes the work of his great pupil Leonardo da Vinci. Botticelli, the great artist of linear design, is world famous for the languorous poetic beauty of his feminine types, but beneath this beauty lies a vigorous artistic energy. In all his best work he 'uses line with a sense of rhythmical quality which makes it seem a living thing' (Holmes). Leonardo da Vinci also had this quality but is inclined to confuse it with scientific considerations, whereas Botticelli uses rhythms for the sheer delight of creating them. His celebrated allegories 'Primavera' and 'The Birth of Venus' exhibit these qualities in their highest degree. Mantegna seeks the glamour of anct Rome in statues and reliefs, and most of his paintings have been described 'as a kind of coloured sculpture in the flat.' Typical examples are 'Triumph of Scipio' and 'Samson and Delilah' in the National Gallery. Material splendours are apparent in the work of Carlo Crivelli, many of whose paintings are in the National Gallery. Giovanni Bellini shows a wonderful and tender sympathy between man and nature, allied, however, to great artistic powers. Within the range of his devotional studies he shows so remarkable a variety of design, sense of form, and gifts as a colourist that his example 'dominated Venice for a quarter of a cent' (Holmes) and his translucent colour effects are the peculiar glory of the Venetian school. In Carpaccio (q.v.) of the same school the Venetian delight in pageantry found its most complete expression.

Pisa's dominance in sculpture ended with the 14th cent. and, as we have seen, passed to Florence. The moment of transition from Gothic to Renaissance art can be studied in the work of Lorenzo Ghiberti (q.v.), who vanquished Brunelleschi in the competition in 1402 for the decoration of the second door of the Florentine baptistery. Jacopo della Quercia (q.v.) of Siena, a near contemporary of Ghiberti, is a bolder innovator in his love for strong relief and vigour of subject. The last traces of the Gothic tradition of sculpture are abolished by Donatello (q.v.), who for half a cent. imposes his own art on Italy as a national art. His equestrian statue of the Gattamelata at Padua is one of the noblest in the world and only rivalled by the statue of Colleoni at Venice by Verrocchio and Leopardi. In bas-relief he creates almost impressionistic effects of Bacchic movement. He has no rival in representing the ebb and flow of a crowd. Other sculptors of this cent. include Luca della Robbia (q.v.), a maker of statuettes in Tuscany; Desiderio da Settignano, with a faculty for carving graceful aristocratic figures; Francesco di Giorgio Martini, who was architect, painter, and sculptor; and 3 Florentine artists, Bertoldo, Antonio del Pollaiuolo, and Andrea Verrocchio (already mentioned as painters) who almost outdo Donatello in attacking the problem of

vital movement, the passion of the Florentine Renaissance.

Among the 16th-century sculptors, Michelangelo dominates the field. He raised the sculpture of the modern world to its zenith of glory, yet at the same time he sowed the seeds of a rapidly approaching decline; for his imitators, such as Baccio Bandinelli (q.v.), Giacomo della Porta, Ammanati (q.v.), and others, copied and exaggerated his faults without the saving grace of a scintilla of his genius. 'The Lupitids and Centaurs' and 2 figures of 'Slaves' in the Louvre may be mentioned as examples of Michelangelo's power of dynamic expression through the nude human figure. Subtlety and refinement inform his splendid 'Pietà' group of figures in St. Peter's. As a sculptor Benvenuto Cellini (q.v.) strives after size, but with him, as with Sansovino and Alessandro Vittoria, the art of Michelangelo is reduced in grandeur, though it is not devoid of grace. The tomb of Giovanni Galeazzo Visconti, completed c. 1560, is a sumptuous example of the style of the Renaissance grown flabby from excess of richness and through abandonment of the simple purity of 15th-cent. art. The 16th cent., indeed, was one of transition to the state of degradation; yet it produced many sculptors of high ability, such as Giovanni da Bologna (q.v.), whose bronze statue of 'Mercury' in the Uffizi is a triumph of movement; while another of his works is the great fountain at Bologna.

In N. Italy in the 14th to 16th cent. terra cotta was adapted to the most elaborate architectural purposes. But the most important application of terra cotta in medieval Italy was to statuary—reliefs, busts, and groups of life-sized figures of the 15th and 16th cents. Some of the Florentine terra cotta sculpture of the 15th cent. is the most beautiful plastic work known in any medium, particularly that by Jacopo della Quercia and Donatello. The portrait busts in terra cotta are perfect models of Ionic sculpture. Groups in realistic style in the 16th cent. were produced by Caradosso (Ambrogio Foppa) for S. Satiro at Milan, and by Guido Mazzoni for churches in Modena.

The 16th cent. in It. painting was rendered glorious by a constellation of supreme artists whose names are headed by those of Leonardo da Vinci, Michelangelo, and Raphael, and include Titian, Giorgione, Allegri (Correggio), Veronese (Caliari), Sebastiano del Piombo, Jacopo Tintoretto, Giambattista Moroni, and Caravaggio (see individual articles). It is true enough to say of Leonardo that 'his influence was so extraordinary that it is difficult to treat of any painter of his time without mentioning his name.' His interpretation of chiaroscuro and his solution of the problems of form and movement proclaim the scientific visionary looking into the heart of nature. Yet the dominion of 16th-cent. art properly belongs to Michelangelo, the artist of the prologue to the hist. of man in the Sistine Chapel, rather than to Leonardo. The

masterly power of his art can be comprehended only by long study, the study of all that the progressive Florentine artists had been striving to achieve since the time of Masaccio but was attained only by Michelangelo.

Raphael embodies the highest aspirations and finest culture of the Renaissance. He made a study of the frescoes of Masaccio and the reliefs of Donatello and of Michelangelo's sculpture and the work of Mantegna, and, next to Michelangelo, he was the most representative artist of his age. His frescoes in the Vatican are remarkable for a solemn grandeur of composition, wonderful portraiture, and great

LEONARDO'S 'GIOCONDA'

depth and richness of colour. Michelangelo, it is said, availed himself of the powers of Sebastiano del Piombo as a colourist for his own designs for a Pietà group at Viterbo in order to out rival Raphael. Titian, who was a pupil of Giorgione, reaches the heights of sensuous beauty and as a colourist is unrivalled; but spiritual beauty is often wanting; he was a realist and, as Ruskin says, no ascetic. His women's portraits have a rare charm and as a portrait painter he is admitted to be of the first rank. One of his most famous portraits is 'Homme au Gant' (in the Louvre). In this craft he undoubtedly influenced Velazquez. Classical myths and romantic idylls were the stuff of Titian's genius. Famous among the last named are 'Sacred and Profane Love' in the Borghese Gallery. In his later works he approaches nearer the classical Greek than does any other master of the Renaissance, while yet revealing a note of yearning that was alien to the Gk

conception. His celebrated Bacchanal 'Bacchus and Ariadne,' in the National Gallery, is one of the supreme masterpieces of all time. The mood of Giorgione, at once sensuous and contemplative, is distinct from Titian's, though he shares the Venetian richness of colour. Veronese (Caliari), as may be seen from his famous 'Marriage at Cana' in the Louvre, delights in the gorgeous in style and conception. Pomp and splendour of earthly pagantry, the vainglory of humankind, are manifestly the most obvious features of his typical banqueting scenes. Tintoretto's fame, apart from his power of portraiture, rests upon his vast imaginative compositions, with their wonderful conception of movement in depth. His Christ before Pilate is both massive and dramatic. Caravaggio led the reaction from the Eclectics—a naturalistic reaction from conventionalism and academic idealism analogous to the revolt in France under Manet and Courbet. Typical of Caravaggio's style are 'The Death of the Virgin' in the Louvre and the 'Flight into Egypt' in the Doria Gallery, Rome. His new realism and emotional lighting were of signal effect on the whole course of European painting. Notable painters of the Ferrarese school were Francesco Bianchi (q.v.) (Giovanni di Niccolò Luteri), Dosso and Battista Dosso (q.v.), and Benvenuto Tisi (called Garofalo, q.v.). Garofalo was strongly influenced by Raphael and by Dosso Dosso. His religious compositions, if monotonous and wearisome, are of high technical quality and his classical myths are somewhat too conventional, but his 'Mars and Venus' (Dresden Gallery) has charm.

Seventeenth-cent. Bolognese painting finds its chief representatives in the Caracci (q.v.), who founded the school of the Eclectics at Bologna, Barbieri (called Guercino, q.v.), Guido Reni (q.v.), and Sassoferrato; but the leading school of the cent. was at Naples, as illustrated by Giovanni Caracciolo, Mattia Preti, Salvatore Rosa (q.v.), the painter of rugged landscape, Luca Giordano (q.v.), and Cavallino. Bernardo Strozzi is amongst the best portrait painters of the time. Gian Battista Tiepolo (q.v.), in the 18th cent., is noted for his transparent atmospheric effects. In conception he derives from his contemporary Piazzetta his power of invention and decoration as revealed in the frescoes of 'Antony and Cleopatra' in the Palazzo Labia, Venice. Also of the 18th cent. is Canaletto (Antonio Canale, q.v.) the painter of the Venetian canals, and his fellow Venetian Guardi (q.v.). After the 18th cent. the arts in Italy entered on a less brilliant period. Antonio Canova (q.v.) was one of the neoclassicists who attempted to give renewed life to the art of sculpture, restoring it to that standard from which it had deteriorated when the instinct for classical beauty and austerity, of titanic invention and well-nigh superhuman energy, as embodied in the superlative genius of Michelangelo, had yielded to the exuberant mannerisms of the 17th and 18th

cents. In painting, Italy had ceded foremost place to France, though the talent of Giovanni Segantini may be noted.

Early in the 20th cent. It. artists made a striking new effort in the Futurist movement launched by Marinetti (q.v.). Its foremost adherent, Umberto Boccioni (d. 1916) expounded its creed in his *Estetica e Arte Futurista*. Futurism welcomed the swift movement and mechanical devices of the 20th cent. and was indeed an attempt to escape from the overwhelming prestige of Italy's past. The Metaphysical school which followed was short-lived. Its aims were set forth by Carlo Carrà in *Pittura Metafisica*, and its prin. exponents were Carrà and de Chirico. Chirico's pictures are a poetic product of the modern effort. Amadeo Modigliani (1884–1920) is internationally famous in portrait and figure painting.

The next outstanding figure is Giorgio Morandi (1890– ). Though at first influenced by the Metaphysical painters, he has remained aloof from all movements. He is conservative without being reactionary, a fine technician whose work, however, lacks movement and employs subdued colouring to express his predominant sadness. Chirico and the Futurist Gino Severini (1883– ) have diverged from their earlier course, the latter being known for large-scale mural decorations in Switzerland and Italy. A dominant personality in It. painting to-day is Renato Guttuso (1912– ), a Sicilian. He, like his companions of the Rom. school, is concerned not with philosophical theories but with human experience in his own day. Guttuso's fierce realism is best seen in 4 works painted in 1948: 'The Mechanic,' 'The Washerwoman,' 'The Seamstresses,' and 'The Water-melon Stall.' In sculpture the 3 most interesting figures are Manzu (1908– ), whose 'Cardinal' is in the Tate Gallery, the Sicilian Pietro Consagra, and Marino Marini (1901– ), who has been described as 'probably the best of the younger sculptors in Europe to-day.' All 3 belong to the Realist school. See also ITALIAN ARCHITECTURE.

**Italian East Africa.** Name given by Italy in 1936, after her conquest of Ethiopia, to the terr. in It. occupation in E. Africa. They then comprised the former colonies of Eritrea (q.v.) and It. Somaliland (see SOMALILAND), and were divided into 5 provs., Eritrea, Amhara,

Galla, Harrar, and Somalia, the cap., Addis Ababa, being a separate dist. not included in any prov. The total area was 660,000 sq. m., and the pop. was estimated at 7,000,000. The whole of this colonial empire was lost in the Second World War in 1940-1.

**Italian East Africa, Campaign in (1940-1941).** The conquest of It. E. Africa—Eritrea, It. Somaliland, and Ethiopia, besides the recapture of Brit. Somaliland—was one of the most remarkable campaigns in the annals of African warfare. The lessons of mechanised warfare had been taken to heart; great distances over difficult mountainous country were covered with spectacular ease; the co-operation of the R.A.F. was effective to a degree; while the co-ordination of all the forces, operating from a dozen different directions, pointed to a highly creditable staff organisation. Imperial forces, comprising S. Africans, S. Rhodesians, Sudanese troops, the King's African Rifles, and the Royal W. African Frontier Force, together with Ethiopian patriot forces, all took part and, in the denouement, following the conquest of Eritrea some 3 forces were all advancing at great speed on Addis Ababa where the Italians had hoped to hold out long enough for the rains to save them. Yet for long, not the least important function of the Brit. forces was themselves to play a similar role and to hold in check large It. armies, while Wavell's forces were advancing on Cyrenaica (*see AFRICA, NORTH, SECOND WORLD WAR, CAMPAIGNS IN*). This accomplished, all the forces were set in motion, some advancing from the Sudan into N. Ethiopia and into Eritrea, others northward from Kenya and into S. Ethiopia, others across Ogaden and to Harrar, while yet others penetrated W. and SW. Ethiopia.

At first, however, following the fall of France, the Brit. forces, for lack of resources, were unable to do more than hold frontier posts, yielding them only after stubborn resistance; while Brit. Somaliland had to be evacuated, and it even seemed to many somewhat doubtful whether the British would ever be able to counter the main It. thrust against Alexandria and the Suez, the fall of which would have multiplied the difficulties of a campaign in It. E. Africa beyond conjecture.

The Italians began operations by bombing Berbera, cap. of Brit. Somaliland, and by attacking Brit. Moyale just inside the Kenya border, and, crossing the Ethiopian-Sudanese frontier, occupied more Brit. frontier posts. On 3 Aug. the Italians invaded Brit. Somaliland from Ethiopia. The colony was defended only by mobile motorised units of the Somaliland Camel Corps. On 11 Aug. the Italians made a general attack on positions covering Jugargan Pass. The Brit. staff decided that it was impracticable to defend Brit. Somaliland and more advantageous to make the enemy use up his supplies in what was, strategically, a wasteful enterprise—a policy which later

proved justified. The Italians were using 2 divs., complete with artillery and armoured fighting vehicles, originally intended to oppose the Fr. forces in Fr. Somaliland. The Brit. forces, although unreinforced, continued to resist with great determination all the way to Berbera. Eventually, however, the Brit. troops were evacuated from the colony.

On 19 Aug. R.A.F. bombers raided Addis Ababa for the first time. All through the campaigns against the Italians, whether in Cyrenaica or in E. Africa, the Brit. command adopted the sound course of bombing the enemy's planes on the ground or fighting them out of the skies, so that ultimately, when the Brit. turn came to advance, the Italians were hampered from lack of aircraft and of undamaged aerodromes, and indeed the process of destruction of machines continued right through the campaign, Brit. losses in planes and pilots being relatively slight.

There was now a lull in operations. Numerically the enemy was in a formidably superior position. But he met stout Brit. resistance, and where by sheer weight of numbers and metal he forced a way through, it was only to encounter a dogged opponent, who contested literally every foot of ground.

Over 2 months later Eden, Brit. secretary of state for war, toured the Middle E., while Smuts toured E. Africa, to inspect the Brit. defences. This was the preliminary to the turning of the tide, which began with the capture of Gallabat, on the Ethiopian-Sudanese border, which important position had been taken by the enemy in June. This capture was made by Brit. and Indian troops, with tanks and artillery, and with the co-operation of the R.A.F., the enemy being taken by surprise. At this period (Nov. 1940-Jan. 1941) the focus of interest was the battle of the W. Desert, Wavell's spectacular advance to Benghazi being facilitated by the fact that Cunningham's operations in It. E. Africa prevented the Duke of Aosta, Commander-in-Chief in It. E. Africa, from rendering Graziani any help.

On 14 Jan. Haile Selassie (q.v.), who was now in Khartoum, announced that he would soon cross the Ethiopian frontier and lead an Ethiopian army against the Italians. The revolt, fomented by the British in that country, was now making great headway. The Imperial standard had been raised at Gijjama by Ras Mungasha and the war drums were rallying the Ethiopian patriots.

By now Brit. troops were successfully advancing into Eritrea, while Indian troops were marching over the Sudan frontier. A contingent of regular troops of a newly formed Ethiopian army went into action on the 22nd in the Sudanese-Eritrean war zone. Haile Selassie had actually crossed the frontier a week earlier, hoisting the flag of Ethiopia on his native soil in the presence of Brit. and Ethiopian troops. Keru and Aiota, together with 600 It. prisoners and 2 guns, fell to the Brit. forces on 29 Jan. From

Kenya patrols had crossed the frontier at numerous points without meeting with the enemy. In Eritrea the Brit. attack was now concentrated on the Agordat-Barentu area. By the end of the month operations were developing on all African fronts—the Sudan-Ethiopian frontier, Kenya-Ethiopian frontier, Eritrea, and It. Somaliland—while revolt was spreading in Ethiopia. Agordat fell on 1 Feb., giving the British a junction of considerable strategic importance on the Red Sea railway. Throughout Feb. the enemy in Ethiopia, Eritrea, and It. Somaliland was

the head of an important motor road to Addis Ababa. Later in the month the imperial forces made a remarkably rapid advance in It. Somaliland. They took Mogadishu, the cap., on the 25th after a march more rapid even than that of the army of the Nile in Cyrenaica. This gave them the centre of a good road system and so demoralised the enemy that over 9000 of them surrendered. On the Kenya-Ethiopian border Ethiopian irregulars drove the Italians from their last footholds in the Brit. colony by taking both Brit. and It. Moyale, positions which had

A British officer studies Italian defensive positions seven miles away.

always in retreat save at Keren, a stronghold on which every device of military engineering skill had been lavished.

The imperial troops now laid siege to Keren. It was to prove the most costly operation of the whole campaign, but by 7 Feb. over 3500 prisoners had been taken, and wherever the enemy gave ground war material littered his track. There were now in simultaneous operation some 5 movements: the penetration of It. Somaliland by S. African troops; an advance in S. Ethiopia by S. Africans; an advance through the N. part of Ethiopia a patriot advance from the W. into Ethiopia and in SW. Ethiopia; and the attack by mixed troops on Keren. The important port of Kismayu (It. Somaliland) fell to the S. Africans on 15 Feb. Five days later the troops were across the Juba R., while other troops from that dominion took Mega in S. Ethiopia, an It. air base some 6500 ft above sea level and

proved almost as stubborn as that of Keren. On the first day of Mar. an important pass covering the approach to Keren was captured by an Anglo-Fr. force advancing from the N., the Fr. troops being Senegalese who had trekked across the continent to Port Sudan to help the cause of Free Frenchmen. Dagga Bur, 600 m. N. of Mogadishu, fell to the victorious imperial troops on 10 Mar., Harrar being their next objective. It. losses since the opening of the Somaliland offensive had now reached 30,000 prisoners, while practically the whole of It. Somaliland, a great part of Eritrea, and enormous supplies of water material had fallen to the Brit. forces.

Penetration into Ethiopia was now in progress on 12 fronts, including a thrust on Gondar in the N., a drive by patriot forces towards Debra Markos, the next goal after Burye; a Brit. advance on Harrar from It. Somaliland; a thrust from

the Sudan to Afodu; and other penetrations in the Blue Nile region of SW. Ethiopia. But time was nonetheless an essential factor in the general plans of the Brit. authorities. The longer Keren held out the greater the possibility of the rains saving the Italians. On 16 Mar., however, Brit., Indian, and Sudanese forces, strongly supported by the R.A.F., made a most determined attack on precipitous positions covering Keren and stormed 3 important heights 3000 ft high, under cover of well-directed gun fire and bombing. Reverting to the earlier days of Mar., the position was that the Brit. All-Africa column (Gold Coast and S. African forces) and Brit. and patriot Ethiopian forces were all converging on Addis Ababa. For the first 14 days of the month the All-Africa column averaged over 40 m. a day across rising uplands on Ethiopia's E. threshold. Other forces around Lake Tana were then nearer Addis Ababa, but the formidable barrier of the deeply canyoned Blue Nile retarded their progress. The Imperial Army from Eritrea was fighting at the immensely strong It. position of Keren, the biggest battle of the campaign. A trail of abandoned ammunition and material along the modern tarmac road marked the headlong flight of It. soldiers. The All-Africa column was cleaving 2 disorganised enemy divs, which were desperately trying to find a way back across the desolate Ogaden landscape. By mid Mar. the strategic position of Jijiga, 50 m. E. of Harrar, lay ahead of the All-Africa column. The question was whether the Italians would make a stand there or in the hills round Harrar.

Meanwhile on 18 Mar. Berbera was retaken as the result of a combined sea, land, and air operation by imperial forces. Soon the whole of Brit. Somaliland was recaptured, the It. occupation having thus lasted some 7 months. The significance of the rapid advance to Dagga Bur (600 m. N. of Mogadishu), towards Jijiga and Harrar, was that in this neighbourhood existed one of the chief passages into the great mountainous plateau known as the Ethiopian Highlands. The Italians hoped to retire to this mt fortress and hold the limited number of practicable inlets in the expectation that the coming rains would restrict Brit. operations to comparatively small columns. The series of operations in E. Africa was in its way as brilliant as the campaign of the W. Desert. If the army of the Duke of Aosta was less formidable than that of Graziani the natural difficulties of the terrain were greater. If the pace was slower, except for the rapid advance northward from the Webbi Shibell in the direction of Jijiga and Harrar, the size of the ters, which formed the objective was far greater.

By 27 Mar., however, the road to Asmara was open to the victorious troops of the Imperial Army of the Sudan. The final attack was delivered after 14 days of fierce fighting, an attack which battered down the last remnant of enemy resistance and carried the Brit. troops

triumphantly into the tn. Harrar fell at the same time, and with this double success the British obtained possession of three-quarters of Eritrea and practically sealed the fate of the It. force left in what remained of Mussolini's E. African empire.

At the beginning of April more than half Ethiopia was in Brit. hands. From Asmara Platt's troops were clambering down mts 5000 ft high to capture Massawa, while another column was reaching up the road to Adowa. In the central part of the front Cunningham's troops were marching from Harrar and Dire Dawa along the 2 roads that converge at Mersa, 150 m. from Addis Ababa. In the S. the It. garrison at Soroppa, near Lake Rudolf, was surrounded by African troops and surrendered. The sole port now left securely in the hands of the Italians was Assab, for already Massawa was threatened, and the navy were closely watching it. The only considerable tns held by the enemy in the interior were Dessie, Gondar, and Addis Ababa. Gondar was all but cut off by Ethiopian patriots, who were pressing on round Lake Tana and the sources of the Blue Nile. Dessie was filling with retreating soldiers from Eritrea, who while streaming through the Green valley were subjected to a major bombing attack by the S. Africans. Revolt was now sweeping the country behind the It. lines.

The historic battlefield of Adowa now fell into Brit. hands and then the holy city of Axum, and on 9 April Massawah capitulated. In the whole country there were now left only more or less disorganised bodies of troops, groping their way towards Dessie, Gondar, and Jimma. Fierce fighting in the Kombolcia Pass, 14 m. S. of Dessie, was the prelude to the Brit. capture of this mt stronghold in the last days of April. But there was still a strong force of the enemy under the Duke of Aosta, at Amba Alagi, another mt stronghold. Here the Italians held out for nearly 3 weeks. By 14 May the enemy had been driven back by the S. Africans to the peak of Mt Alagi, where they had tunnelled galleries into the cliff faces and cut gun emplacements out of the rock. But there was one weakness in this almost impregnable stronghold. The long-prepared defences were intended to meet an attack from the N., and the S. Africans were piercing the vulnerable S. side. The siege of Amba Alagi reached its grimmest stage on 14 May when a terrible artillery bombardment almost wiped out the It. forces. Some 10 days later the Duke of Aosta formally surrendered, together with some 19,000 prisoners. Thereafter there remained only small pockets of hopeless resistance. In only 4 months a well-equipped force of 125,000 Italians and 200,000 native troops of which 170,000 were infantry, with a considerable air force and 212 aerodromes, under an able commander, had been smashed and scattered. Of this great host the Brit. forces under Cunningham had captured about 190,000; 125,000 had deserted, leaving nothing remaining in

military formation, apart from one or two small bodies, numbering altogether 6000, who were soon to be rounded up. At no time did the Brit. forces on all the fronts in E. Africa, even after the arrival of reinforcements from India and W. Africa, approach the strength of the combined It. metropolitan and native armies. Yet in 4 months the imperial forces under Cunningham had conquered 3 countries and reconquered a fourth, totalling some 700,000 sq. m., captured 120,000 prisoners, 800 heavy guns, and 150 tanks, as well as thousands of motor vehicles, thousands of machine guns, and millions of rounds of ammunition. Most preconceived ideas of colonial warfare were abandoned. In this remarkable campaign sheer speed broke the Italians.

It. resistance did not end entirely with the surrender of the Duke of Aosta. The disorganised garrisons of scattered strongholds, particularly at Jimma, Debrî Tabor, and Gondar in N. Ethiopia, protected by the seasonal tropic rains, held out for some weeks. The It. commander of the garrison at Debrî Tabor, 60 m. E. of Lake Tana, surrendered early in July (1941), not long after the fall of Jimma, and with his surrender the sole important remaining garrison was that at Gondar, a strong natural position almost comparable with Keren. In the 'Battle of the Lakes,' the operations which virtually ended with the capture of Jimma on 20 June, and resulted in the elimination of It. resistance from a vast area SW. of Addis Ababa, the Brit. forces took over 30,000 prisoners and more than 100 guns. See *Abyssinian Campaigns: Official Story of the Conquest of Italian East Africa* (H.M.S.O.), 1943, and Christine Sandford, *The Lion of Judah hath prevailed*, 1955.

**Italian Front, First World War Campaign** on, Italy declared war on Austria-Hungary on 23 May 1915, but war was not declared against Germany until 23 Aug. 1915. On 25 May It. forces penetrated Austrian ter. in S. Tirol and the NE. corner of Venetia and along the Isonzo (q.v.). Gradisca was occupied within a few days and the crossing of the Isonzo promptly followed. On the W. flank progress was being made in the Trentino. Austrian posts on the Alps were taken by the Italians in rapid succession. At the end of May the frontier was crossed at Lake Garda at Riva (N. end of the lake). During the first week of June there was a stiffening of the whole line, and fighting became more serious. On 20 July the Italians gained a victory in an all-day fight on the Lower Isonzo. This developed into a series of conflicts on the Carso (q.v.). In Oct. the W. flank was improved by securing Mt Nodice which gave the Italians command of the Ledro valley. During the winter of 1915-16 the Austrians were preparing a counter-offensive in the Trentino under the command of Archduke Charles, with Field-Marshal von Hoetzendorf as his chief-of-staff. The attack was launched on 14 May and by 19 May the Italians were in retreat on the whole Trentino front and

the Austrians reached It. soil. In 10 days they had captured 24,000 prisoners and 250 guns. Asiago (q.v.) fell to the Austrians on 29 May, and although their flanks were held, their centre continued to advance. The Italians counter-attacked, and by 26 June had recovered a good deal of ground. Cadorna (q.v.), the It. commander-in-chief, launched an offensive on the Isonzo on 6 Aug. 1916, and captured the bridgehead at Gorizia, with 10,000 prisoners. Further progress westward continued throughout the month. On 16 Sept. the Italians advanced their right flank on the Carso, and throughout Oct. and Nov. continued to press the Austrians back on their NE. flank. In May 1917 a great offensive on the Isonzo was launched, progress being made chiefly N. of Gorizia, and with the help of Brit. guns a serious threat was made to the Austrians on the Julian front. Brit. monitors also fired on the rear of the Austrians from the Gulf of Trieste. In June the Italians made some progress in the Trentino. On 19 Aug. they resumed the Isonzo offensive mainly across the Carso, and by the end of the month the high ground SE. of Madoni was in their hands. About this time Ger. troops, under the command of Otto von Bulow, were being transferred to the Isonzo front, and attacked the Italians on 24 Oct 1917; the Italians were thrust back at Caporetto (q.v.), and the rout continued, until the Germans captured Udine on 29 Oct. This exposed the Italians on the Carso to the danger of envelopment, and a hasty withdrawal was made to the Tagliamento; but here the Germans forced a passage and the situation became critical. At this time 5 divs. of Brit. troops under Plumer arrived on the It. front. In Nov. 1917 Cadorna was succeeded by Diaz. The Italians defeated all attempts of the enemy to pierce the Piave front, so they turned their attention to the mt sector further N. Here they gained some points, but the presence of Brit. and Fr. troops prevented any serious loss. In May 1918 Lord Cavan succeeded Plumer in command of the Brit. troops. On 15 June 1918 the Austrians launched their final assault. They attacked on a 90-m. front with 40 divs. from Asiago to the sea. The Piave was crossed at Montello, and Venice also was threatened, but the sector held by the British stood firm against all attacks. Before the end of the month the Italians counter-attacked with the result that the Austrians were soon in full retreat. On 26 Oct. a great offensive was launched against the Austrians which turned the retreat into a rout and ultimate surrender. See L. Villari, *War on the Italian Front*, 1932, and G. L. McEntee, *Italy's part in winning the World War*, 1934.

**Italian Front, Second World War Campaigns** of. For the events leading up to this campaign see AFRICA, NORTH, SECOND WORLD WAR.

*Fall of Pantelleria, Lampedusa, and other small Italian islands.* Pantelleria, which, after 1937, was strongly fortified

as a naval and air base, surrendered to allied forces on 10 June 1943. This surrender was the first instance where a strongly defended enemy bastion, its garrison numbering 10,000, had been conquered from the air. The air attack began 13 days previously and by 10 June had swelled to a terrifying climax. Flying Fortresses, in greater numbers than ever previously used by the NW. African Air Forces, made repeated sorties throughout the offensive, which lasted from dawn to dusk. The air bombardment was supported by a naval bombardment. Lampedusa and the still smaller is. of Linosa, both in the Pelagic group just over 100 m. SW. of Sicily, held out only a very short time after the surrender of Pantelleria. Lampedusa was subdued after a naval bombardment followed by a heavy air attack and Linosa surrendered without a fight.

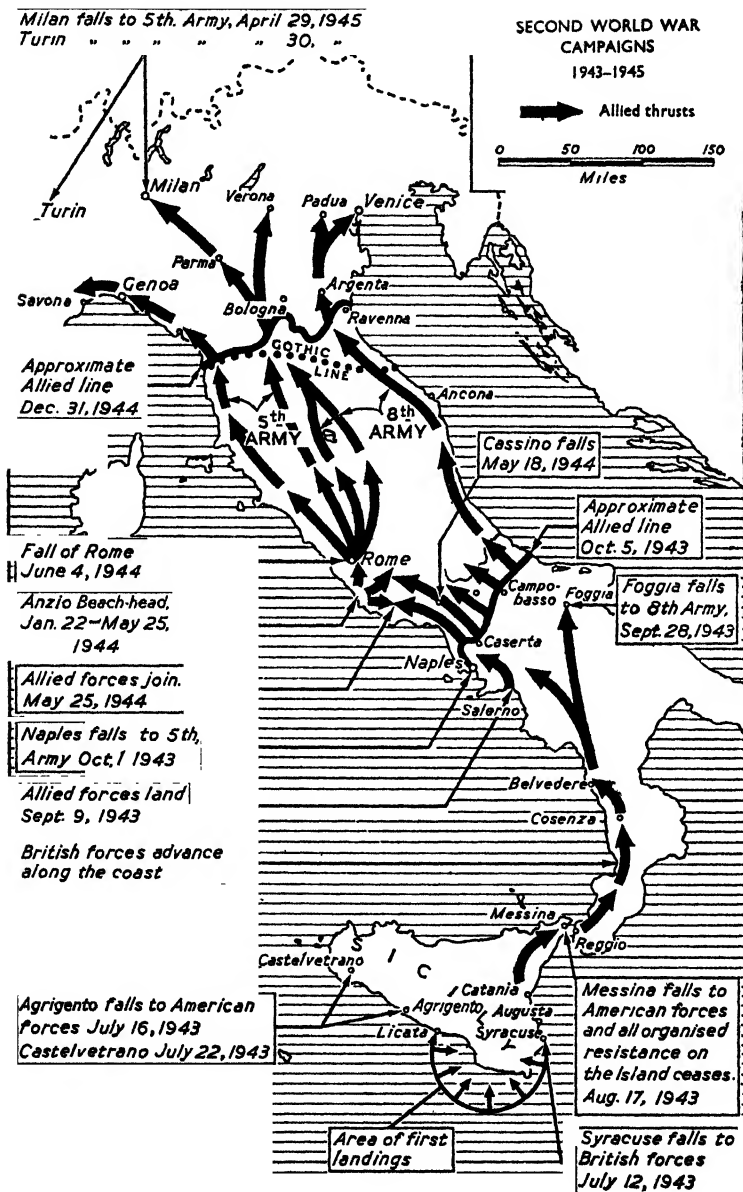

*The battle of Sicily (July-August 1943).* Anglo-Amer. forces under Alexander (q.v.) as deputy commander-in-chief, with Montgomery (q.v.) as commander-in-chief of the Brit. forces, in an armada of nearly 3000 vessels, invaded Sicily early in July 1943. The first stage of the invasion started on 10 July, soon after the occupation of Pantelleria and Lampedusa, when the allied air forces crippled the Axis air bases in Sicily. This was so effective that the second stage, the estab. of bridgeheads in the is., was easily accomplished and the landings, preceded and accompanied by terrific air assaults and broadsides of warships commanded by Adm.-of-the-Fleet Sir Andrew Cunningham, on a 100-m.-wide stretch of the coast from S. of Catania to Gela, met with only negligible resistance. The core of the invasion consisted of the seasoned troops of the Brit. Eighth Army, the Amer. Seventh Army, and Canadian forces (1st Canadian Infantry Div. and the 1st Canadian Army Tank Brigade). In the initial operations a large part was played by the troop-carrier command of the NW. African Air Force and by paratroops, American and British. Allied air forces acted throughout in close co-ordination with the sea and ground forces. Heavy day-bombing attacks were made on Gerbini, Trapani, Milo, and Sciacca. Brit. raids were made at night on Syracuse and Catania. The Americans took all the beaches assigned to them within 3 hrs of their first landing. The strongest opposition was met in the Cape Passero area by Brit. and Canadian forces. The landings generally were less costly in casualties than had been expected. The next task was to secure the possession of the harbours and centres of communication on the coast and close behind it. By 12 July Montgomery, with the Canadians on his left flank, seized the road and railway SW. to Pozallo in the extreme S. of the is., together with the port of Syracuse. In the other zone of operations—the Bay of Gela—the Americans, under Patton, seized Gela, Licata, and other places along the Syracuse-Pozallo road. Ragusa, Florida, and Augusta fell on 13 July and 2 thrusts

were now made from Syracuse and Augusta, northwards towards Catania and S.-westwards to the Palazzolo heights which dominate the plain of Catania. Most resistance came from 2 Ger. panzer divs., one facing the British in the E., the other the Americans in the S. The Allies soon penetrated in some sectors to a depth of 20 m. from the coast. By 14 July the Brit. Eighth Army was within 15 m. of Catania, but resistance was now obviously stiffening. Though the allied advance was speedy it was recognised by the commanders that, until the Catania plain and the Gerbini airfields were in their hands, resistance would be protracted, particularly in the mountainous regions of the NE. and around Etna. Considerable gains, however, were made on 15-16 July, the Eighth Army advancing sev. m. beyond Augusta, and its spearheads striking into advance units of a powerful Ger. force. Heavy losses were inflicted on the Axis forces in the W. sector, where the Americans advanced sev. m. across difficult country. Simultaneously with these operations, the heaviest combined air assault theretofore launched from N. Africa was made on Naples (17 July) by more than 500 aircraft, mostly from the NW. Amer. Air Force, part of the Neapolitan royal arsenal being destroyed. Agrigento and Torre Empedocle fell on 16 July. The following day Caltanissetta, on the railway linking Agrigento and SW. Sicily with Catania and Messina, was taken by Patton's troops, 20 m. to the E.; the Canadians took Piazza Armerina and both Americans and Canadians were now advancing on Enna, the most important junction in the is. The Eighth Army, which had the hardest task in the campaign, was now some 3 m. from Catania. On 19 July Rome was raided for the first time, when Amer. bombers attacked marshalling yards and railways. On 21 July Enna fell and Amer. and Canadian forces were now threatening to turn the whole enemy line. With the Eighth Army's estab. on 19 July of a bridgehead S. of Catania, the Axis forces now began a general though orderly retreat towards Messina. In the area S. of Catania, about 6 m. in width and 4 m. in depth, the Germans launched frequent counter-attacks despite mounting casualties. Casualties to Brit. forces were lower than had been anticipated. The allied advance in the W. half of the is. continued with great rapidity. Castelvetro, with its important airfield, originally built for patrolling the Sicilian channel, fell on 22 July. Marsala was then abandoned by the Axis troops. The threat to Palermo was accentuated, allied troops being now only 25 m. away, while other troops of the Seventh Army were nearing the Bay of Termini on the N. coast. Palermo fell to the Seventh Army on 23 July, the enemy being completely surprised by a rapid thrust by advanced troops of highly mobile forces. By this time the Seventh Army had taken 27,000 prisoners, 250 guns, and 10,000,000 rounds of ammunition. At this stage Mussolini resigned and the King of Italy

assumed supreme command of the It. armed forces, with Badoglio as the new prime minister. By the end of July the number of prisoners was 75,000, three-fourths of this total being taken by the Americans, and it was now clear that the battle of Sicily had entered its culminating phase—the struggle for Catania and Messina. The general offensive for these positions began to develop in Aug. following a week of intensive preparation during which large reinforcements of men and guns had been moved up to the front. The Brit. 78th Div. captured Centuripe after some very bitter street-fighting. The 51st (Highland) Div. advanced on their right. To the left the Canadians captured Regalbuto where the opposition was especially fierce. Further N. the Seventh Army captured Troina (2 Aug.), Cerami, and Capizzi. On the coast road the advance continued in the face of extensive enemy demolition. Brit. forces entered Catania early on the morning of 5 Aug. Following on the capture of the town of Bronte the immediate objective of the allied forces was Randazzo, on the NW. side of Etna and the key to the whole Axis defence. Ger. resistance had now, however, become more tenacious than ever. The enemy tactics relied above all on demolitions and minefields protected with well-sited machine guns, their hopes being to evacuate the bulk of their armies under cover of rearguard actions to the It. mainland. Randazzo eventually fell (13 Aug.) to the steady concerted allied pressure. The enemy had already been driven from most points N. of Randazzo, and Giarre and Riposto on the E. coast had been occupied. The Axis line in Sicily now collapsed and their forces were in full retreat. Messina fell on 17th Aug. to the Americans, who made contact there with the Brit. Eighth Army later on the same day. All organised resistance in Sicily now ceased. The Sicilian campaign had thus ended after 38 days and the allied forces stood 3½ m. from the It. mainland. Owing to the proximity of the mainland the Germans were able to run the gauntlet of air bombardment in the straits and to bring a large part of their troops away. The conquest of Sicily finally sealed the mastery of the narrow seas to the S. The total Axis casualties were 165,000. Of the 70,000 to 75,000 Germans on the Is. at least 30,000 were lost. The total allied casualties were about 25,000—about 14,000 British and 11,000 American.

*Allied invasion of Italy—battle of Salerno—battle of Naples.* Prior to the actual landing on It. soil, Brit. and Amer. warships shelled roads, power stations, railways, and other objectives, particularly in Calabria. Stromboli and the Lipari Is. surrendered to Amer. naval forces at the same time. Some days later the Allies directed a great air offensive against the It. railway system to sever its S. arteries. The Brit. Eighth Army landed near Reggio di Calabria and advanced, without encountering much opposition, on Palmi. Then allied air

forces, operating in great strength, made a prolonged attack on the Naples area, the main effort being against airfields. All these formidable attacks, coupled with invasion, quickly had political repercussions, for on 8 Sept. Eisenhower announced that the It. Gov. had surrendered its forces unconditionally and an armistice was granted. The Fifth Army under the Amer. gen., Clark, including a Brit. corps, landed near Naples at 4 a.m. on 9 Sept. Soon 3 allied forces were advancing inland from each corner of a great triangle to seize the whole of the foot of Italy. The Fifth Army met intense Ger. opposition on the Salerno beaches in a struggle which was developing into a great battle for Naples. Part of Montgomery's Eighth Army was advancing northwards in Calabria. Other elements of the Eighth Army, having taken Brindisi and Taranto, were following retreating Ger. forces to the N. of those towns. The most desperate fighting occurred for the Salerno bridgeheads, the town itself having quickly fallen. The Germans hoped to hurl back the invaders into the sea and, holding the high ground overlooking the allied positions, were able to subject the Allies to a devastating fire from well-sited guns. But the bridgeheads from Salerno to Agropoli held firm, while ever more reinforcements in men and material poured into the beaches and also into more southerly ports, covered by naval and air forces. The enemy had the advantage in the air; for whereas the allied fighter planes of the NW. African Air Force had to fly from a great distance, the Ger. fighters could operate from near bases. Allied air forces, however, flew over 800 sorties on 13 Sept. to support the infantry and gunners who were fighting on the open crescent of the plain of Salerno without cover of vegetation or terrain against an enemy skilled in the defensive use of hills dominating almost every point of the bridgeheads. Meanwhile the Eighth Army, having seized Bari, Cosenza, and Belvedere, were making forced, if unopposed, marches to link up with the Fifth, from which they were now separated by 70 m. Throwing a powerful mobile force across the Apulian plain, they then captured the important air base of Foggia (28 Sept.), considerable casualties being inflicted on the Germans in the advance. At the same time Castelluovo was taken by the Fifth Army, whose tank spearheads were thrusting across the plain towards shattered Naples, while other forces were pressing on through difficult mountainous country N. of Salerno. It took the Fifth Army 6 days to pierce the Ger. defensive ring in the wild mts separating Naples Plain from the Gulf of Salerno. Shortly afterwards the naval base at Castellammare, 14 m. across the bay from Naples, fell, and the whole Sorrento peninsula was in allied hands. Naples fell on 1 Oct. to Clark's army. Bombing and Ger. demolitions had left deep scars on the city. The Germans had evacuated it in order to take up a very strong defensive position on the Volturno

R., and on the line of that riv. bitter fighting lasted for some time. Meanwhile, against growing resistance, the Eighth Army pushed W. from Termoli on the Adriatic coast. The Fifth and Eighth Armies were now in contact with each other, and the allied line ran from Naples through Caserta, Campobasso, and S. Martino to Termoli. By capturing the tn of Capua early in Oct. the Fifth Army at length won a bridgehead on the Volturno R. But though they advanced to the entire W. course of the riv. in a single day, progress in the difficult country of the Apennines was slow. Towards the end of the month there was a general advance on the whole of the allied line, except at its extremities. It was evident that the line from Vasto on the Adriatic to Mondragone on the Tyrrhenian Sea, by way of Isernia and Venafro, would be strenuously defended by the enemy, for it represented the strongest position that could be held S. of Rome, and all roads now led to the cap.

Isernia, pivotal point in the Ger. defence and centre of their lateral communications, was captured by the Eighth Army on 4 Nov. The Germans were also driven off Monte Massico in the S., the allied armies making a substantial advance along the whole line from the Tyrrhenian coast to the knot of the Montagna de Matese in the centre of the Ger. line. Almost simultaneously the Eighth Army struck across the Trigno R. on the section of the front near the Adriatic coast; but there were strong prepared Ger. defences across the riv. 5 m. behind and much bitter fighting lay immediately ahead. Vasto, on the coast, was taken on 7 Nov. without a fight. Though unimportant as a harbour, it gave command of most of the road running SW. to Castiglione. Meanwhile the Amer. Fifth Army had advanced past Venafro in the centre and, on the extreme left, their patrols crossed the Garigliano riv. Casalbordino fell to the Eighth the next day, but only after heavy fighting, which, however, brought Montgomery's forces to the banks of the Sangro. Desperate Ger. counter-attacks to drive the Amer. troops N. of Venafro into the Volturno valley failed. The capture of Castiglione on 10 Nov. gave to the Eighth Army control of the whole road from Vasto to this important supply point in the Apennines. The flying of the swastika over the vil. of Castelforte, on the N. side of the now swollen Garigliano, symbolised the Ger. command's long obvious determination to stand and fight along the magnificent defensive positions on which it had now been thrown back. This defensive line is not a single line nor yet even a series of lines; rather is it a mass of easily defended hills or mts 36 m. in depth. The Fifth Army was now only on the approaches of these positions. Savage counter-attacks were launched to meet virtually every allied improvement of position. It was evident to the Allied Command that, in view of the enemy's defensive strength, even local attacks and breaches might require long planning for

what seemed to be disproportionate effort.

The Germans were, in fact, well placed in Italy. They now had 10 divs. on the central front facing the Fifth and Eighth Armies along the Garigliano-Sangro line, stretching across the narrowest part of Italy. Its centre, the central massif of the Apennines, is the highest and wildest country in the whole range. The Ger. hope was that, even if Montgomery broke the Sangro line and threatened Rome from the NE., they could at least hold him for a time in the mts between the 2 fronts. Altogether the Germans now had at this time (19 Nov.) nearly 50 divs. in Italy and the Balkans, an increase of from 10 to 15 divs. in the past month and obvious evidence of their realisation of the allied threat to the whole S. and SE. of Europe.

On 29 Nov. Montgomery, after a period of heavy rain and bogged conditions, began a new offensive across the Sangro, his attack being preceded by a demoralising air and artillery bombardment. Allied mastery of the air was so complete that in its initial attack the Eighth Army managed to gain positions along the outer edge of the Germans winter defence line. On 1 Dec. the Eighth Army made a general advance along its whole right flank and shattered the most important part of the Germans winter line in Italy. Lanciano, Castel di Frentano, and Casoli, on the lateral road from the Adriatic to the centre of Italy, had now fallen to Montgomery, whose advance was aided by the Tactical Air Force's devastating assault on Ger. positions and transport and their close support of the attacking troops. The Germans were now falling back in the Sangro sector, but the pursuit was hampered by the bad weather. In the ensuing days, in the W., Clark's Amer. and Brit. forces, in a desperate struggle in rainy weather and across waterlogged country, slowly but surely drove the enemy from his strongly fortified positions on and around Monte Magliore and Monte Camino. But the Germans fought grimly to defend their vital defences along the road to Rome. In the E. the Eighth Army, despite a deluge of rain, crossed the Moro R., Canadian troops securing positions N. of it, including Ortona.

*Battle of the Garigliano crossing.* Thereafter, for 5 weeks, there were no marked changes in the respective positions of the opposed forces. But on 13 Jan. Brit. troops of the Fifth Army eventually crossed the Garigliano in the Tyrrhenian coastal strip in face of fierce yet ineffective Ger. resistance. On the next day very hard fighting developed, particularly round Minturno, Castelforte, and Suio vils. The destruction of bridges and the sowing of innumerable landmines hampered progress. In the attack on a 7-m. front from Minturno and Castelforte cruisers and destroyers of the Royal Navy bombarded shore positions in the Gulf of Gaeta. Initially successful seaborne landings were made on 22 Jan. by Fifth Army troops S. of Rome near Nettuno

and Anzio only 32 m. from Rome, the troops advancing well inland before meeting any resistance. The Germans, far from expecting such a move, had sent strong reinforcements, including their best motorised Panzer Grenadier divs. from the Rome area, S. to the Fifth Army front, where by then they were believed to have 100,000 men. The simultaneous Allied air offensive was directed against the ring of airfields round Rome and then on rail and road communications radiating northwards from the cap. Along the

the flank of the Ger. position on the Cassino front and cut the lines of communication to Rome. When, therefore, in the first few days hardly any opposition was met, it seemed possible that the Ger. commander, Kesselring, must begin a general withdrawal. Alexander, however, found it necessary first to consolidate his position on shore, but before he could do so the Germans had found time to concentrate a powerful army in the Alban hills overlooking the beachhead, bringing substantial reinforcements from great

ANZIO: MEN OF THE 2ND INFANTRY BRIGADE LEAVING LANDING CRAFT, 22 JAN. 1944

Garigliano valley advancing Brit. forces repulsed heavy Ger. counter-attacks between Castelforte and Minturno (22 Jan.). Even by the 25th no effective resistance to the landings had been met and still more troops and supplies poured into Nettuno. But to the S. the Germans launched still more violent counter-attacks against the Fifth Army's main front in the Garigliano and Rapido Rts. area, most of these onslaughts being hurled back with heavy loss to the enemy, particularly around Minturno. There were also violent struggles for the commanding position of Monte Croce, N. of the important and hotly contested tn of Cassino. By 29 Jan. the Amer. forces had crossed the Rapido.

*Battle of Anzio.* After the Anzio-Nettuno landing had been successfully made, it seemed that sea power, despite the loss of 2 cruisers and 2 landing craft, had intervened with decisive effect to turn

distances. An allied advance across the Applan Way met with stiff resistance, and on 3 Feb. the Germans opened their first major attack on the beachhead. About 12 Feb. the initiative passed for a brief space to the Allies when Brit. troops advanced near Carroceto; but 4 days later Kesselring resumed the assault with a furious attack on a narrow front along the Anzio-Albano road. Deep penetrations were made in the Allies' position, but after some days of exceptionally bitter fighting this second Ger. attack also commenced to falter. In the ensuing week of bad weather Kesselring regrouped his divs. and prepared to deliver his third attack. This was shorter than either of the first two, but it exceeded both in intensity. The main blow fell directly on the 3rd Amer. Infantry Div. The Americans were forced to yield some ground before the impetus of so tremendous a weight of

men and armour, but their counter-attack was soon launched, and by the next day they had regained all the ground won by the Germans. Meanwhile the line as a whole had held at the other points attacked so that by 1 Mar. the Germans were everywhere back at their starting-points, having inflicted heavy casualties, but having themselves also suffered very severe losses.

*General Alexander's attack on the 'Gustav' and 'Hitler' lines—fall of Cassino.* On the night of 11-12 May Alexander launched a new offensive on the grand scale. This offensive was really the opening of the general assault on Hitler's fortress of Europe, it being the Allies' intention to invade France within a month and Stalin's to attack along the entire E. front almost at the same time, so as to embarrass the Ger. High Command with simultaneous offensives in the W., S., and E. Alexander's offensive was delivered after an intricate regrouping of armies, the main weight of the Eighth having been brought across to the W. side while the reconstituted Royal It. Army (Corpo Italiano di Liberazione) took over the Adriatic sector. Having crossed the Rs. Rapido and Garigliano, where these formed part of the Ger. 'Gustav' line, the allied forces were soon assaulting the whole line with irresistible force. In their victorious advance they were given tremendous air support. Fr. forces made a spectacular advance on Ansonia and the vicinity, capturing Monte Majo, and opening a dangerous breach in the Gustav line, and disorganised the whole system of defences in this part of the enemy's line. The French were helped by a corresponding Amer. advance to the S. Meanwhile Brit. forces were advancing through the mouth of the Liri valley and threatening the Via Cassina and the Cassino position, while Polish troops had secured dominating positions NW. of the Abbey (Monte Cassino). San Giorgio was carried by storm. Meanwhile the Americans were pushing over further along the Applan Way and the W. coast. At the same time, with the capture of Pignataro by Indian troops of the Eighth Army, a substantial bridgehead was estab. on the N. bank of the Liri, and the Ger. grip on Cassino, the Via Cassina, and the Abbey was relaxing. Cassino tn eventually fell on 18 May to Brit. troops and the Abbey was captured by the Poles (see CASSINO, BATTLE OF). With the fall of these famous positions the Gustav line S. of the Apennines had ceased to exist. Farther S. the French captured Esperia, and the Americans, who had seized Formia, were now overrunning the Gaeta peninsula. So far some two-fifths of the Ger. Tenth Army, which was holding the main front, had been almost destroyed. The Aquino-Pontecorvo position was now the lynch-pin of Kesselring's defences, for it was the centre of vital road communications, which, if lost, would mean that the Allies might turn the whole N. part of the Hitler line. Hence Ger. resistance stiffened considerably and there were counter attacks against both the British and the French.

*Battle and capture of Rome.* A new turn was now given to the campaign by the sudden launching of a strong offensive by the Anglo-Amer. forces of the more or less dormant Anzio beachhead. This was in fact the second phase of Alexander's general offensive. The struggle now grew most intense; Fr., Polish, and Brit. troops were wrestling successfully with the dense and intricate Ger. defences of the Liri valley centred on Pontecorvo and facing repeated and desperate counter-attacks; while the Americans, meeting with slighter resistance, were overrunning the trackless mass of the Volscian Mts to the S. Near Borgo Grappa, on the coastal highway between Terracina and Anzio, the beach-head forces at length linked up with the main Fifth Army front, so that a single allied front now stretched right across Italy, separated from Rome by only 25 m. The whole of the Applan Way was now in the hands of the Allies. Allied tanks, supported by infantry, soon wiped out the last Ger. resistance in the centre of the heavily damaged tn of Cisterna, and Brit. troops broke through the defences about the railway station on 25 May. On the same day that Cisterna fell Pontecorvo was taken by Canadian armoured cars. That memorable day saw the whole original Ger. defence line shattered. Allied tanks were now massing with other strong concentrations in the coastal plain for a powerful thrust from the Applan Way to Highway Six (Via Cassina), Kesselring's supply route. All through this day tanks and infantry poured through the gap in the Hitler line near Pontecorvo, forcing the enemy to evacuate the tn and to swing back their line pivoting on the Aquino defences so that it now ran insecurely E. and W. on the S. side of Highway Six. The Ger. hold on the Via Cassina was now so precarious that the withdrawal of their divs. from the Liri valley was made due northwards instead of in the direction of Rome. Kesselring's forces were virtually split in two, one body retiring into the Apennines, the other into the Alban Hills, which latter constituted the last naturally defensible positions protecting the cap. from the S. Yet the Germans continued to make a stout, if ill-organised, resistance. Kesselring, in the endeavour to retain Rome, staked everything on the defence of the strongholds of Velletri and Valmontone, the two bastions of the Alban Hills. The last battle for Rome now began. Fierce fighting raged in the Alban foothills, with desperate counter-attacks by the Hermann Goering Div., succeeded in temporarily checking the Americans. S. of Campo Leone the Brit. forces made a substantial advance. NW. of Cassino New Zealanders were pressing onward to the important stronghold of Avezzano, through which ran Kesselring's vital escape route. Velletri was surrounded by 2 June after the Americans had taken Monte Artemisio. Velletri and Valmontone fell to the Fifth Army that day and the fall of Rome was imminent. The Fifth Army entered Rome, which

had suffered little damage, on 4 June, after some heavy fighting in the outskirts. The main objective of Alexander was, however, not the occupation of Rome; it was the destruction of the Ger. armies. Leading elements of the Fifth Army passed through Rome on 5 June and crossed the Tiber. Hundreds of heavy bombers joined the fighter-bombers in continuous attacks on the retreating enemy. Eighth Army infantry and tanks advanced along the whole line of attack. Civita Vecchia, the naval base 40 m. N.W. of Rome, fell on 7 June, Viterbo and Tarquinia on the 9th. Further and further the Germans were being forced back E. of the Tiber. The advance on the right was slower, but the terrain was much more mountainous; but by the capture of Avezzano the Eighth Army gained control of the central Apennine sector, while on the coast Indian troops entered Pescara. Kesselring's line was now moving back across the whole width of Italy, swiftly in the W., slowly and steadily in the centre, and rapidly on the Adriatic.

After troops of the 7th Indian Div. had crossed the Pescara, and the town of Pescara had fallen, resistance on the Adriatic coastal sector grew less stiff; there was, however, greater resistance in the W., especially at Grosseto and in the centre around Terni. By now Ger. strength in Italy had been halved by Alexander's offensive. But Kesselring still had the equivalent of 12 and a half divs. left to fight, 3 of them fresh, including the 4th Parachute Div. About 70,000 men, or the remains of 8 and a half divs., were now (23 June) deployed on a line across Italy which ran through Chiesi, S. of Lake Trasimeno, N. of Perugia, and to the Adriatic about 30 m. S. of Ancona. Heavy rains had given the Germans a respite and enabled them to recover equilibrium. Eighth Army forces on each side of Perugia were engaged in very heavy fighting, and it was apparent that the Germans had no intention of withdrawing from their strong positions between Lakes Trasimeno and Chiusi without an attack in force.

A Fr. force landed on Elba on 18 June and, with the support of allied aircraft and ships, soon occupied a large part of the is., which was important to the Germans as a submarine base. By noon on the next day resistance ceased, nearly 2000 Germans being captured.

*The Allied advance to the 'Gothic' Line.* The advance of the Allies to the so-called Gothic line involved sharp fighting in difficult mt. country, but by early July the Eighth Army had broken through the Ger. defences to the W. of Lake Trasimeno and in the direction of Arezzo, 20 m. N. of the lake. The Gothic line ran from Pisa on the Tyrrhenian coast to Rimini on the Adriatic; it had been powerfully fortified for a year past, because it was the penultimate line of natural defence before the valley of the Po, and if the Allies broke it Kesselring's only remaining substantial line was the curve of the Apennines ESE. of Genoa. The Fr. corps now took Siena,

an important point on the W. approach, by the Via Cassia, to the Gothic line. A fortnight later Polish troops took Ancona and the Americans entered Leghorn. The enemy, however, maintained a very stubborn defence along the high ground facing the Eighth Army in front of Florence, the outskirts of which the Eighth reached soon after the capture of Arezzo. By the end of the first week of Aug. Brit. troops held that part of Florence which lies S. of the Arno. At the end of Aug., however, the Germans had been forced back into the Gothic line and Polish troops were in Pesaro on the Adriatic and engaged in bitter fighting against the Ger. 1st Parachute Div. Eighth Army infantry and tanks had now crossed the R. Foglia and were strongly attacking the Gothic line. The campaign entered a new and significant phase in the opening days of Sept. with the Gothic line broken along a 20-m. front in the Adriatic sector, a general advance of the Eighth Army's front, the capture of Pisa, and an advance by the Fifth Army across the Arno.

*The capture of Rimini—the 'Gothic' line overcome.* Rimini, E. pivot of Kesselring's position, fell to the Eighth Army on 22 Sept. after one of the stiffest battles that army had had to fight in the course of its long advance from Egypt. The battle of the Gothic line and of the Apennines ended when the 1st Gk Mt. Brigade and Canadian tanks captured the deserted and ancient city of Ravenna, while the Brit. forces further inland were driving over the last foothills of the Apennines to reach the Marecchith R., which runs from Arezzo to Rimini, and thereby to render the city untenable. In front of the Allies now lay the Lombardy Plain, with the Po valley stretching out beyond. The Eighth Army were now within striking distance of the Via Emilia, historic road along the Po valley to Bologna and Piacenza. In these operations 2 Ger. divs. had lost most of their effective strength, while losses far heavier than those they had suffered at Cassino had been inflicted on the 1st and 4th Parachute and 4 other divs., including the crack 26th Panzer Div.

Ten days' relentless attack against the Gothic line defences in the central sector had left those defences a shattered mass of rubble and battered fortifications. The Gothic line could have been the most formidable artificial defensive system the British had so far encountered. But its defects were that it was overlooked from the S. and lacked depth. Moreover many individual works were badly sited and their construction incomplete or shoddy.

*Ravenna and Faenza captured by Allies—Savio, Senio, and Santerno Rivers crossed.* After this series of successes there followed a long lull, broken a month later when the Eighth Army advanced between the Via Emilia and the coast, driving the Germans back to the Savio R. Six weeks later Ravenna was entered by the Eighth. Then 12 days later, on 17 Dec., the Eighth Army captured Faenza and carried the

allied line nearer Bologna. But the lull was resumed and 4 months elapsed before the Allies struck again in Italy, though in the meantime they rendered valuable service in holding down 25 well-equipped Ger. divs. at a time when the Allies were carrying out their great attacks on the W. and E. fronts. From the allied viewpoint the main difficulty in Italy lay in the nature of the country. The Fifth and Eighth Armies had advanced northwards over mts. across rivs., and through defiles in terrain peculiarly adapted for defence, and they had never at any time had a

*The final allied offensive launched—Fall of Bologna and Modena—Po crossed.* The allied offensive was soon extended to the Fifth Army under Clark S. of Bologna. His attack, like that of the Eighth Army, was preceded by air blows on a formidable scale by both strategic and tactical air forces. The offensive was led by the 10th Amer. Mt Div., which was fresh and well equipped for its arduous task of overcoming this rugged Apennine sector. The Eighth had now crossed the Sillaro R. which runs parallel with the Santerno, bridgeheads being

*Canadian Army Photo*

A CANADIAN SKI TRAIN IN THE ITALIAN MOUNTAINS

sufficient superiority in numbers and equipment to enable them to achieve a decisive success. For, as the demands of other fronts grew, the It. theatre of war had to take a subordinate place and for about 4 months, owing to wintry conditions, it had been quiescent. The co-ordinated attack on Germany from the S. may be said to have begun on 10 April 1945, with the opening of the allied offensive on the It. front to compass the destruction of the Ger. Army of the Po and drive it away from the industrial area of N. Italy, and eventually to link up with the Allies in Yugoslavia and Austria.

The Senio R. was crossed on a wide front in the vicinity of Lugo, N. of the Rimini-Bologna highway. A day later troops of the Eighth Army, now under McCreery, were across the R. Santerno in strength and at once encountered strong resistance. Other troops landed from Lake Comacchio in the rear of the enemy positions.

won on both sides of the Ravenna-Bologna road. The Germans brought up reinforcements and there was heavy fighting at Bastia, a key position on the Ravenna-Ferrara road. They made desperate efforts to hold the vital Argenta gap, but the Brit. forces pressed on and estab. another bridgehead across the Sillaro. Huge allied bombing raids were made on a score of targets S. of Bologna in support of both the Fifth and Eighth armies. Castel san Pietro, on the Via Emilia, was strongly defended, but Brit. troops entered the tn on 17 April and pushed on NW. towards Bologna, bypassing Argenta. Next day the Argenta gap, providing the sole practicable route for mobile forces W. of Lake Comacchio, was brought under Brit. control with the capture of Argenta on the evening of 18 April and the advance of the Brit. troops towards Boccaccone and Ferrara. From Boccaccone to Lake Comacchio the Germans had their last and toughest defence

line. Following a week of heavy fighting through mountainous country SW. of Bologna, Amer. troops entered the Po valley W. of Bologna on 20 April, cutting the Via Emilia between Bologna and Modena. Bologna fell to S. Africans of the Fifth and Poles of the Eighth armies on 21 April, Amer. forces advancing 20 m. beyond in pursuit of disorganised Ger. formations. Bologna was the first great objective of the allied spring offensive. Thus the Allies now stood inside the gateway to the Po plain. With Fifth Army troops closing on Modena, and those of the Eighth closer to Ferrara the full power of the Mediterranean Allied Tactical Air Force was turned on the Germans retreating across the Po valley, with devastating effect, and on 23 April the allied armies reached the Po. A ceaseless attack was maintained throughout the night against enemy columns on the roads and against ferry and pontoon crossings of the Po from Mantua eastward to the Adriatic. Allied troops stormed across the Po less than 24 hrs after they had reached the riv. (24 April). At the same time 3 great cities of N. Italy fell to them: Spezia, Modena, and Ferrara.

*Americans capture Verona and Genoa.* With the Americans well across the Po the Germans became thoroughly disorganised and their resistance sporadic. Verona, heavily damaged, fell on 26 April to the Americans who then crossed the Adige near the city. Genoa was occupied by Amer. Nisei troops on 27 April, It. partisans having previously seized control of a large part of the city and facilitated the entry of the troops. The patriots in fact now controlled much of N. Italy. Amer. armour advancing along the Via Emilia from Parma captured Piacenza midway between Parma and Milan.

*Mussolini executed by Italian partisans—Milan entered.* At Lecco, in the hills above Como, Mussolini was arrested on the same day by customs guards while he was trying to escape into Switzerland. Next day the ex-Duce, his mistress Clara Petrucci, and 13 members of his Fascist Cabinet were executed by It. partisans, who carried their bodies to Milan for public display just before the Fifth Army entered the city (29 April).

*London troops in Venice—Eighth Army across the Adige near Padua.* Troops of the 56th (London) Div. entered Venice on the evening of 29 April. The allied advance now swept rapidly across the N. of Italy. In this swift movement the Fifth and Eighth Armies drove through the enemy's strong defensive Adige line, forcing the Germans back to the E. side of the Brenta. Negotiations were in progress for the surrender of the Ligurian army commanded by Graziani, now a prisoner in allied hands.

*German armies disorganised—Turin entered.* By the end of April the liberation of all Italy was nearing completion. The Ger. armies were so broken and disorganised that they had virtually ceased to exist as a military force. This destruction had all been accomplished in an

offensive lasting only 20 days for the Eighth and 15 days for most of the Fifth Army. Twenty-five Ger. divs., some of which had been the best in the Ger. Army, had been torn to pieces and were no longer able to resist the Allies. Thousands of vehicles, tremendous quantities of arms and equipment, and over 120,000 prisoners had been captured. The military power of Germany and Italy had practically ceased, even though scattered fighting might continue as remnants of the retreating enemy were mopped up.

Turin was entered by Amer. infantry on 30 April, having been captured a short while previously by It. partisans. On the other side of N. Italy Treviso was taken by the 6th S. African Armoured Div. The Americans seized crossings over the Ticino and advanced across the Brenta. Tito's Yugoslav troops broke into Trieste and were fighting in the area of Fiume. Troops of the 2nd New Zealand Div., after crossing the R. Isonzo, reached Monfalcone and made contact with forces of Tito's Yugoslav Army (1 May). The 6th Brit. Armoured Div. entered Udine on the same date. Other Eighth Army troops passed through Vittorio Veneto, scene of a great allied victory in the First World War, and reached Belluno. The Fifth Army continued to advance along the Gulf of Genoa and occupied Savona.

*Italian partisans in control of northern industrial region.* The efforts of It. partisan forces which, in Turin and Milan, did not wait to be liberated but struck timely and powerful blows against the Nazi and Fascist forces, greatly contributed to the enemy's defeat and disorganisation. The liberation of Milan by the combined efforts of the Committee of National Liberation and partisans represented the culminating effort of the resistance movement, which during the previous year had been organised to a high degree of efficiency; and what happened in Milan and Turin happened also in Genoa and in nearly all the big cities of Lombardy and Piedmont. The result was that the greater part of the industrial equipment of N. Italy—factories, foundries, power stations, and hydro-electric plants—were preserved intact in so far as it was undamaged by allied bombing. These events were the prelude to the total collapse of Ger. and Fascist resistance in Italy and their unconditional surrender to Alexander.

*Unconditional surrender of German and Fascist Armies.* Long negotiations preceded the unconditional surrender of the Ger. and Fascist forces in Italy. On 19 Mar. there was a conference near Locarno in Switzerland between 2 representatives of Alexander's staff and Gen. Karl Wolff, senior S.S. officer of the Ger. forces in N. Italy, at which the allied officers told the Ger. general that Alexander was interested only in getting authorised Ger. representatives to Caserta to offer unconditional surrender. Eventually, on 27 April, Wolff and 2 Ger. plenipotentiaries arrived in Switzerland and were brought by allied aircraft to Caserta next

day. On the morning of 29 April the Germans were told that either they must surrender unconditionally or the negotiations, which had been begun the previous day, would end without further delay. The Germans then accepted the allied terms for the surrender of their entire forces under von Vietinghoff-Schoel's command to Alexander, Allied Supreme Commander, Mediterranean. The instrument of surrender was signed in Caserta Palace, near Naples, on 29 April, the terms to be effective from noon, 2 May. The terms of the Ger. 'South-West Command' included all N. Italy to the Isonzo R. in the N.E. and the Austrian provs. of Vorarlberg, Tirol, and Salzburg, and portions of Carinthia and Styria. The enemy's total forces surrendered numbered over 900,000, the combatant troops of which included the remnants of 22 Ger. and 6 It. Fascist divs. The terms involved the unconditional surrender by the Ger. commander of all forces under his command or control on land, sea, or in the air and the immediate immobilisation and disarmament of enemy forces. It was also provided that the instrument would be superseded by any general instrument of surrender imposed by the U.N. and applicable to Germany and the Ger. armed forces as a whole. The surrender of so much territory, which allowed the Allies to advance without opposition to within 10 m. of Berchtesgaden, hopelessly compromised the so-called 'south redoubt' founded on Bavaria, to which the Germans on the W. and E. fronts intended to fall back after their forces had been split in two by the junction of the W. Allies and the Russians on the Elbe (see also WESTERN FRONT IN THE SECOND WORLD WAR). The total number of Ger. prisoners taken by the Allies on the It. front before the end of hostilities was 230,000.

The New Zealand Div. occupied Trieste on 2 May, Gen. Freyberg accepting the surrender of the Ger. garrison. New Zealand forces also occupied Gorizia. The presence of Tito's and other Yugoslav troops in part of Trieste and elsewhere within Italy's E. borders was, however, provocative of awkward territorial and political questions. Troops of the Eighth Army on 7 May crossed the It. frontier into Austria at a point N. of Udine. This movement of the Eighth Army was now linked up along almost its entire course from N. to S. with the line of the Russians' movement to the W. By the creation of this line a boundary was set up which marked the limit of Brit. and Russian operations. This line ran from Liezen, half way between Klagenfurt and Linz, through Judenburg, Köflach, 15 m. W. of Graz, and thence due S. to the Yugoslav frontier. See C. Italian Greyhound, see GREYHOUND.  
 Italian Language and Literature. *Language*. Italian is one of the Romance or Neo-Lat. languages, and is a sister tongue of French, Spanish, Portuguese, Rumanian, and Provençal. It is naturally more closely connected than any of these with Latin, the influence of the written speech of Virgil, Cicero, and Horace lingering for long in the peninsula. Its grammar is a simplification of Lat. grammar, but the popular spoken Latin of the rustic played a very important part in the evolution of the It. vocabulary. Italian is divided into very many dialects; indeed It. dialects differ more among themselves and from the standard language than those of any other country. These dialects can be divided into 6 groups: (1) Gallo-Italian; (2) Venetian; (3) Tuscan; (4) Corsican and Sardinian; (5) Central Italian; and (6) Southern. The standard literary and political speech is the Tuscan dialect which became the It. literary language during the 14th cent., when it was employed by Dante and his contemporaries.

*Literature*. No very early documents of It. literature exist, for the tradition of writing in Latin lingered long, and, moreover, Latin did not differ so much from the vulgar speech as to be unintelligible. The influence of the Teutonic invaders upon the speech of the race they subjected does not appear to have been very great. A much more powerful and lasting influence was that of the Fr. and Provençal troubadours who wandered across the Alps as early as the 11th cent. and sang their songs of love and war throughout the peninsula. In the early 13th cent. there grew up round the court of Frederick II (1194-1250) in Sicily an It. school of poets who closely imitated the Provençal lyrics both in style and matter. Chief among them were Frederick himself, and his son Enzo (d. 1272), Piero delle Vigne (d. 1249), and Giacomo da Lentini. But their art was wholly imitative, conventional, artificial, and consequently short lived. In the latter part of the 13th cent. the Tuscan tongue came into prominence. Tuscany had this advantage over the rest that its *lingua volgare*, the familiar speech of the rustic, was more generally polished so as to resemble the poetic diction of other dialects. The Siculo-Provençal poetry was initiated by a small Tuscan school, which, with Guittono d'Arezzo (1215-94) at its head, included the humorists and satirists Folgore of San Gimignano, Cene della Chitarra, and Rustico di Filippo. Guittono abandoned the Provençal chivalric forms, and wrote political and didactic poems. His great pupil, Guido Guinicelli (d. 1276), wrote philosophical lyrics, which are intellectual rather than imaginative, but mark a great development in the hist. of It. poetry. A contemporary of his was Brunetto Latini (d. 1294), the friend and master of Dante. His *Tesoretto* was obviously influenced by allegorical poems,

such as *Le Roman de la Rose*. Under the same influence was Francesco de Barberino (1264-1348). In Umbria the development of poetry was largely due to the religious movement brought about by the establishment of the Franciscan and Dominican orders. To St. Francis of Assisi (1182-1226) has been attributed the *Cantico del Sole*, a hymn written in rhythmical prose. The greatest exponents of religious poetry at this time were Jacopo dei Benedetti da Todi and Raniero Fasani. Fasani's *Laudi* and similar liturgical compositions are the earliest form of lit. religious drama. The earliest specimen of lit. prose, *Cento Novelle Antiche*, was written in the middle of the 13th cent., probably by a Florentine. It is a collection of short tales drawn from oriental, Gk, Trojan, and medieval sources. Francesco Barberino included similar stories in his *Del Reggimento e dei costumi delle donne*. The letters of Fra Guittone d'Arezzo, on moral and religious subjects, are interesting specimens of the *lingua volgare*. In addition we have a number of trans. and adaptations of Fr. romances and Lat. historical ascetic treatises; an original scientific work on astronomy and geography called *Composizione del mondo*, by Ristoro d'Arezzo; and treatises on gov., *De regimine principum*, by Egidio Colonna, who wrote in the Venetian dialect.

The 14th cent., called *Trecento*, is the age of a mighty trio—Dante, Petrarch, and Boccaccio. Hitherto, poets and writers had experimented in various dialects, and Tuscan had been proved to surpass the others. The great writers of the 14th cent. were all Tuscans, and by their use of it made the Tuscan dialect the acknowledged literary medium of speech in Italy for all time. Dante's immediate predecessors in lyric poetry were Guido Cavalcanti, whose *Sulla natura d'amore* is a poem on the metaphysics of love, Cino da Pistoja, and Lapo Gianni. To this school belonged Dante Alighieri himself (1265-1321). His work culminated in the *Divina Commedia*, a transcendental poem of incomparable beauty (see DANTE). Francesco Petrarca (1304-74) was at the time regarded as the dictator of literature, and his love for Laura has remained as an inspiration to all succeeding poets of every nationality (see PETRARCH). But he must be studied not only as the writer of beautiful love lyrics, but also as the first humanist in Italy, the forerunner of the revival distinguished by an enthusiastic study of ancient classic literature. Giovanni Boccaccio (1313-75) had the same zeal for research into the works of antiquity, as is testified by his encyclopaedic works in Latin. His fame rests mainly on the *Decamerone*, a collection of 100 *novelle* which are arranged and told with the skill of an artist who is at the same time an observant and sympathetic man of the world (see BOCCACCIO).

These 3 great writers had many imitators. Among Dante's followers must be numbered Francesco Stabile, called Cecco d'Ascoli (1269-1327; *L'Acerba*), Fazio

degli Uberti (*Dittamando*), and Federigo Frezzi (*Quadriregio*), whose works are chiefly of historical interest to the student. Novel writing had already attained great popularity in France and other countries. The example set by Boccaccio was now closely followed by Giovanni Fiorentino (*Pecorone*, 1378), Franco Sacchetti (d. 1399), a moral writer on immoral subjects, and Giovanni Lercambi of Lucca (1347-1424). The prose literature of the time is chiefly represented by the tales and novels of these and other men, and chronicle is very important as being the first attempt at historical writing. The greatest historian of the time was undoubtedly Giovanni Villani, who wrote a chronicle of his native city, Florence, including a review of the world's hist. from the Tower of Babel down to 1348. Travel literature is represented by the *Travels of Marco Polo*, and the religious and mystic sentiment of the time is expressed in the letters of St. Catherine of Siena (1347-80) and in the *Piochetti*, a collection of the words and deeds of St. Francis. During the period succeeding the death of Dante, Petrarch, and Boccaccio, there was a dearth of great writers. This may be accounted for partly by the overestimation of ancient Gk and Lat. writers and the consequent underestimation of works in the vulgar tongue. Among those who ventured still to write in Italian rather than in Latin must be numbered Leon Battista Alberti (1407-72), with his *Della Famiglia*, and Matteo Palmieri (1406-75), with his *Della Vita Civile*. Works of a more popular kind were the prose romances *I reali di Francia* and *Guerino il Meschino* of Andrea Barberino (1372-1431), the burlesque topical *sonetti caudati* of the Florentine, Domenico di Giovanni (d. 1448), surnamed *Il Burchiello*, and the *rappresentazioni sacre*, or religious dramas, which corresponded in some ways to the miracle and mystery plays of England.

In the middle of the 15th cent. 2 great events occurred which were of vast importance in the literary hist. of every European country. One was the fall of Constantinople in 1453, which drove many Gk scholars into W. Europe; the other was the invention of printing, which did not affect Italy till 1464. In 1447 the erudite founder of the Vatican Library was made Pope Nicholas V, an election which gave great impetus to the study of antiquity. Another event which influenced lit. literary hist. was the foundation of the Rom. Academy and the Florentine Platonic Academy, the latter of which made the important declaration that Italian was equal in literary merit to Latin. Moreover, in the great centres of literary activity there were growing up young men of genius who became zealous advocates of maintaining the literary traditions of the country. One of these was Lorenzo de' Medici (1448-92), prince, poet, and patron of literature. His works include *Ambrà*, an Ovidian allegory, *La Caccia col Falcone*, *La Zeucia di Barberino*, the *Canti Carnascialeschi*, carnival songs of a somewhat licentious character, a number of

elegant love poems, besides pastorals and satires. He not merely encouraged, by his personal example, the use of popular literary forms, but he infused into them the culture of the Renaissance. The most distinguished of the men of letters who frequented Lorenzo's court in Florence were Luigi Pulci (1431-87) and Angelo Ambrogini (1454-92), commonly known as Politian. To the former we are indebted for the *Morgante Maggiore*, a humorous epic in ottava rima, which contains a curious mixture of flippant and irreverent buffoonery, lofty sentiment, and religious fervour. Politian, who was a brilliant classical scholar and philologist as well as a poet, wrote the lyric tragedy *Orfeo*; *Giostra*, a poem on the tournament; and some exquisite *Stanze per la giostra*. Other protégés of Lorenzo were Antonio Manetti (1423-97) and the famous Girolamo Savonarola (1452-98). The Renaissance of aet culture was similarly fostered by Ferdinand I at Naples. Jacopo Sannazaro (1458-1530) was the first to show that excellent It. prose could be written outside of Tuscany. His *Arcadia*, a pastoral romance, foreshadowed by Boccaccio's *Ameto*, is classical in its construction of sentences as well as in its setting. It set the fashion for writing in studied poetical prose, and prescribed the rule for all future pastoral romances. A fellow townsman of his was Giovanni Pontano (1426-1503), the founder and head of the Neapolitan Academy and the author of many graceful lyrics and lively satires, which are unfortunately written in Latin. In Ferrara, the literary centre of the N., Matteo Maria Bolardo, Count of Scandiano (d. 1494), enjoyed great popularity as the author of an unfinished poem, *Orlando Innamorato*, which celebrates deeds famous in old Fr. cycles. The story is original, though the characters are real people, but the style and diction are lacking in refinement.

The romantic epic, thus for the first time handled with any success by Bolardo, was perfected by Lodovico Ariosto (1474-1533). (See ARIOSTO.) His *Orlando Furioso* is a sequel to the *Orlando Innamorato*. The works of Ariosto open a new period in the hist. of It. literature, a glorious period called by Italians the *Cinquecento*, which is in many respects equal to that of Dante, Petrarch, and Boccaccio. Another epic writer of the second period of the Renaissance was Giovanni Giorgio Trissino (1478-1550), a native of Vicenza. His *Italia liberata da' Goti* (pub. 1547-8) is also of interest as the first attempt to write It. epic poetry in blank verse, but it lacks inspiration and falls far behind his tragedy *Sophonisba* (1515). Both Bernardo Tasso (1493-1569) in his *Amadigi* and Luigi Alamanni in *Orione il Cortese* owed much to *Orlando Furioso*. The high seriousness of these poets is even more prominent in the didactic work of Giovanni Rucellai (1475-1525) and Erasmo da Valvasone (1523-93). Side by side with these didactic poets there developed a school of burlesque writers, the chief of whom were Francesco Berni (1497-1535) and Antonio

Francesco Grazzini, surnamed Il Lasca (1503-84). The cynicism and lack of morality that was characteristic of the time is prominent in the work of that crafty but far-sighted statesman, Niccolò Machiavelli (1469-1527). Second to him as an historian is Francesco Guicciardini (1483-1540), who, besides writing of the hist. and gov. of Florence, made a collection of aphorisms for statesmen called *Ricordi politici e civili*. The 2 chief novelists of the 16th cent. were Matteo Bandello and Anton Francesco Grazzini. Although the former was a Dominican friar, his works reflect the loose manners of

LUDOVICO ARIOSTO

the time as much as any of those of his contemporaries. The licentiousness of the It. courts was embodied in the infamous Pietro Aretino (1492-1557), whose letters, pub. in Paris in 6 vols. (1609), are an index to the life of the times. His comedies are lively and satiric sketches of contemporary manners. Other comedy writers of high merit are Giovan Maria Cecchi, Machiavelli, and Ariosto, but the greater number of It. playwrights adopted the conventional methods employed by aet writers of Lat. comedy. During the latter part of the Renaissance a literary controversy took place with regard to the introduction of dialect forms in literature. In the end the 'purists', who maintained the Tuscan of the 14th cent. to be the literary tongue, prevailed. Chief among them was the erudite Cardinal Bembo (1470-1547), who came to be regarded as the dictator in all matters of literary taste. Other writers of pure and elegant prose were the Mantuan Castiglione (1478-1529) and the Tuscan della Casa (1503-56).

The work of Torquato Tasso (1544-95) brings this period to a close, and forms a link between it and the next. His life work was the *Gerusalemme Liberata*, a poem on a heroic scale, in which is expressed the profundity of his feeling and

the deep melancholy of his soul. (See TASSO.)

The period of decadence which followed the glorious era of the Renaissance may be traced back to the middle of the 16th cent. The writers of the *Seicentismo* were devoid of imagination, of passion, of sentiment. The inspiration of the Revival of Letters left them cold and barren, and their work is distinguished by its exaggeration, bombast, and artificiality. The fashion for this rapid manner of writing was set by Giovan Battista Marini (1569-1625), who, in spite of his far-fetched conceits and extravagant metaphors, showed a vigorous imagination in his poem, *L'Adone*. His manner was mimicked by lesser men, and the style which came into vogue was called after him *Marinismo*. Another characteristic of the *Seicentismo* is seen in Gabriello Chiabrera of Savona (1552-1637) and his followers, Fulvio Testi of Ferrara (1598-1648), Francesco Redi of Arezzo (1626-88), and Alessandro Guidi, who imitated Pindaric and other classical metres, and showed themselves possessed of a real lyric gift. The pastoral drama, essentially an artificial production, became extremely popular, the chief examples of the kind being the *Pastor Fido* of Guarini (1537-1612), and the *Dafne* of Rinuccini, which was set to music by Peri and Caccini. Vincenzo Filicaja (1642-1707) is noteworthy as being one of the few writers of this age with real sentiment. His songs have a true patriotic ring, but even they are expressed in an exaggerated form. A reaction against the extravagance of metaphor and the affectation of an exuberant, passionate style became evident, and took definite form in the estab. by Giovan Maria Crescimbeni and Gian Vincenzo Gravina of the 'Academy of Arcadia' (1690), which advocated a return to pastoral simplicity. The most noted of the 'Arcadians' were Innocenzo Frugoni, Felice Zappi, and Paolo Rolli. But these would-be reformers only escaped one affectation to fall into another; the effeminacy of their madrigals is no better than the hyperbole of Marini. A healthy sign of revolt against *Marinismo* and *Arcadia* is seen in the satires of Salvator Rosa (1615-73), a Neapolitan artist and musician, and a forerunner of the 18th-cent. patriots, and in the mock-herosics of Alessandro Tassoni (1565-1638), the author of *La Secchia Rapita* and *Filippiche*. But the most durable work of the *Seicentismo* was done by scientists like Galileo Galilei and Fra Paolo Sarpi, and thinkers like Giordano Bruno and Tommaso Campanella. The prose of Galileo is distinguished by its precision and virility.

The *Risorgimento*, or Age of Revival, was also prepared by Giambattista Vico, who, in his *Scienza nuova*, investigated the universal laws of hist. which had governed the progress of the human race. Lodovico Antonio Muratori, Scipione Maffei of Verona, and Apostolo Zeno applied themselves industriously to historical research, and Count Giovanni Maria Mazzuchelli of

Brescia and Girolamo Tiraboschi showed an interest in the sources and development of literature. Independent criticism found a public platform in the reviews recently estab. on the model of the Eng. *Spectator* and *Tatler*. Chief of these were the *Osservatore* and *Gazzetta veneta* of Gaspare Gozzi (1713-86) and the *Frusta letteraria*, in which Giuseppe Baretti of Turin (1719-1789) gave vent to his satirical humour. Most conspicuous among the literary reformers of the *Risorgimento* was Giuseppe Parini (1729-99), a Lombard poet, who ridiculed the frivolity and self-indulgence of the society of the time in *Del Giorno*. Carlo Goldini (1707-93) may be regarded as the dramatic reformer of the 18th cent. With Molière as his master, he studied the people living about him and supplanted the *commedia dell' arte* by comedies of character.

The educ. classes in Italy were at this time filled with a hope of freedom from the foreign yoke. The idea of liberty they found best expressed in the writings of anct Gk and Lat. writers on whose style they tried to model their own. Vittorio Alfieri (1749-1803) made a determined effort to establish a national drama. His tragedies, which are almost invariably based on incidents in Gk or Rom. hist., may lack artistic finish, but they are inspired by a noble patriotic spirit. The chief literary fighters for national liberty at this time followed Alfieri in a return to classic models. Ugo Foscolo (1778-1827) passionately advocated the political cause in *Lettere di Jacopo Ortis*, *Sepolcri*, and *Ortis*, which are somewhat marred by his Gargantuan rhetoric. Foscolo should also be noted as a literary critic of high merit. His most important work as such is *Dell' origine e dell' ufficio della letteratura*; he also wrote textual criticisms of Dante and Boccaccio. Other classicists of note are Vincenzo Monti (1754-1828), who attacked the papacy in *Superstizione* and *Fanatismo*, and expressed his fears for his country in *Bassvilliana* and *Feroniade*; Giambattista B. Niccolini (1782-1861), who wrote tragedies on political subjects, as, for example, *Antonio Foscari*; and Lodovico il Moro; Ippolito Pindemonte (1753-1828), a dramatic poet; and Leopardi (1798-1837), the greatest lyricist since the *Trecento*. Indignation against Napoleon's aggressive policy roused Carlo Botta (1766-1837) to write a hist. of his country during the years 1789-1814. Other historians like him, distinguished by their patriotism and by their classic methods, are Cesare Balbo (1789-1853) and Gino Capponi (1792-1876).

The modern literature of Italy may be said to have arisen out of the romantic movement which started in Milan towards the end of the 18th cent. The chief characteristics of the new movement were a renewed study in the *aurei trecentisti*, the classic writers of the 14th cent. and in all medieval things, and a keen interest in the works of such men as Goethe and Byron, who represented a similar movement in Germany and England. The organ of the new school was the *Conciliatore*, a

jour. estab. in Milan in 1818, and its leader was Alessandro Manzoni (1785-1873), the author of a great historical novel, *I Promessi Sposi*, which owes much to Sir Walter Scott. Domenico Guerazzi (1804-74) and Massimo d'Azeglio (1798-1865) were successful exponents of the historical novel. Giuseppe Giusti (1809-1850), a Tuscan, won great popularity with his clever, epigrammatic satires. Among the political revolutionists, who were at the same time powerful literary advocates of the cause of liberty, should be noted: Vincenzo Gioberti (1801-52), who is also known by his philosophical work, *Primato morale e civile degli Italiani*; Niccolò Tommaseo (1802-74); and Giuseppe Mazzini (1808-72).

Since 1850 politics have had less influence on It. literature. The transition between the Age of Revival, which, roughly speaking, covered the years 1750-1850, and the age of King Humbert is marked by the patriotic poems, *stornelli politici*, of Francesco dall' Ongaro (1808-1873). The traditions of the romantic school were maintained in the poems of Giovanni Prati (1815-84), but the greatest It. poet of the post-Risorgimento, Giosuè Carducci, set on one side the outworn methods of the Romantics, and sought his inspiration in the national literature of an earlier time. The chief followers of his classical manner are Guido Mazzoni and Giovanni Marradi. Other poets of distinction are Giovanni Pascoli, Arturo Graf, Olinde Guerrini, and Enrico Panzacchi. The drama, on the whole, became more realistic, the chief exponent of modern methods being Gerolamo Rovetta and Giuseppe Giacosa. Antonio Fogazzaro (1842-1910) won a great reputation as a writer of mystic and philosophical novels with an historical setting. The influence of the realistic movement is seen in the novels of Giovanni Verga. Edmondo de Amicis (1846-1908), known by his novels and travels, is one of the most popular of writers. The chief women novelists are Grazia Deledda and Matilde Serao, while Vittoria Aganoor, Annie Vivanti, and Ada Negri are women poets of repute. Gabriele d'Annunzio is a brilliant and versatile writer—a dramatist, poet, novelist, and critic. His genius is undeniable, but many critics complain of the licentiousness and pessimism of his thought. (See D'ANNUNZIO.) Futurism in literature was linked to that in painting, and indeed showed Fr. influence. Its leader was Marinetti, together with Soffici, Papini, and Ungaretti. In criticism and philosophy the outstanding figures were Benedetto Croce and Giovanni Gentile, while Pasquale Villari's books on Machiavelli and Savonarola have become classics. Croce's work has been the direct cause of the revival of aesthetic criticism throughout Europe, and he was also a philosopher and historian. With the dramatist, Bracco, he was one of the few prominent It. authors who were out of sympathy with the Fascist ideals. But there was among younger people an inevitable reaction against Croce's charac-

teristic optimism, a reaction which often took the shape of *esistenzialismo* (Existentialism) and homage to Sartre (q.v.). More specifically post-1918 literature showed a tendency to exploit It. life and the local scene in novel and story—in, for instance, the Sardinian novel of Grazia Deledda, Nobel prize-winner in 1927, or in the sarcastic but humorous work of Ugo Ojetti, or of Panzini, Brocchi, Raffaello Calzini, and Marino Moretti, who is also a poet of distinction. Other important writers are the novelist Zucca, Riccardo Bacchelli, whose long novel, *Il Diavolo al Pontelungo*, is descriptive of the It. anarchist movement, and Prof. Borgese, who besides being a literary critic, has written a novel, *Rube*, reflecting the decadence of life after the First World War. Bacchelli's work is linked in a personal and direct way with the traditions of the 19th cent. He is the most complex and widely cultivated among contemporary It. novelists. His *Il Pianto del Figlio di Laish* ('The Lament of the Son of Laish') is an achievement equal if not superior to the work of Thomas Mann in that kind. Bontempelli is interesting for having inaugurated a movement for abandoning the pure It. classicism for an art more general and worldly. This is offset, however, by the enthusiastic Rom. revival, encouraged by Fascism and finding expression in such a work as Corradini's drama, *Giulio Cesare*, acted in the Gk theatre at Taormina in 1928.

With the exception of Croce, the It. writer of the greatest European importance is Luigi Pirandello, who exploited a psychological world of half-reality. He was a prolific short-story writer as well as playwright (see PIRANDELLO). The Fascist regime, while not seriously deflecting the careers of the older estab. writers such as Pirandello or Panzini, did not produce any notable literature of its own. The best writing was produced in exile, and the It. Socialist, Ignazio Silone, gained European fame with his novel *Fontamara* in 1930. He also wrote a *History of Fascism* in 1934. He returned to Italy in 1945.

Since the Second World War important poetical works have been written by Eugenio Montale, Umberto Saba, Salvatore Quasimodo, and Rocco Scotellaro. Ungaretti, who issued a trans. of Shakespeare's sonnets, is the most notable poet of the previous generation. Alberto Moravia is one of the It. novelists best known outside his own country. *Agostino*, reputed to be his best book, relates to the disturbance and anxiety with which the discovery of sex afflicts the adolescent—a hackneyed theme which, however, Moravia treats with a kind of lucidity. Equally ruthless is Guido Piovene's *Pietà contro Pietà* ('Pity against Pity'), 1946, a novel of contemporary life, crude and subjective.

known in Italy. Among contemporary short-story writers the best known are Vitalino Brancati, whose *Il vecchio cogli stivali* ('The Old Man with the Boots'), 1945, is a description of prov. Sicilian life

under the Fascists, Carlo Cassola, and Guglielmo Petroni. The It. Resistance movement, unlike that in France, did not result in any typical literature, though mention may be made of the novel *Uomini e no* ('Men and Not Men') by Elvio Vittorini, 1945, whose later work, however, has reverted to the manner of Saroyan; and of the autobiographical sketch, *Il Mio granello* ('My Grain of Sand'), 1946, by Luciano Boris. Carlo Levi (1902- ), well known by his novels *Cristo si è fermato ad Eboli*, 1945, *L'Orologio*, 1950, and *Le parole sono pietre*, 1955, is a great admirer of the natural and uncorrupted people of S. Italy. Luigi Bartolini's *Ladri di biciclette*, 1948, a story about the Rom. black market, was typical of the realistic trend which gathered a considerable number of followers in the 1950's. Young successful post-war novelists of realism are Vasco Pratolini (1913- ), Giuseppe Berto (1914- ), and Carlo Coccioli (1920-). The revival of the It. theatre since Pirandello's death (1936) is characterised by the recent works of Ugo Betti (1892-1953), Diego Fabbri (1911- ), and Turi Vasile (1922- ).

In another sphere It. writing to-day shows intense vigour: historical research, philosophy, art criticism, and philology are flourishing, and works of this kind are the chief merit of It. culture of to-day.

Italian Music. (For early developments connected with Rome as seat of the Catholic Church, which are not specifically Italian, see the article MUSIC.) Not Italy but France was the centre of the *ars antiqua* of the 12th-14th cents. (see FRENCH MUSIC), and It. musicians were influenced by the Notre-Dame school. No individual composer's name stands out in a period during which it was painting

and sculpture, not music, that flourished most gloriously in Italy; and even during the 15th cent., when the influence of the *ars nova* had supervened, the only great It. name is that of the Florentine organist and composer Squarcialupi. The *caccia* (= Eng. 'catch'), which was in canon form, and the narrative *ballata* were the chief vocal representatives of *ars nova*, and there were also instrumental dances. Between the death of Squarcialupi in 1480 and the birth of Palestrina about 1525, some half-dozen important composers of the future were born, but before 1. M. reached its 16th-cent. supremacy, it went through a period of powerful Flem. influence. Masters from the Netherlands, Willaert, Cyprien de Rore, Arcadelt, and others, settled at Venice, Florence, or Rome and directly or indirectly taught the next generation of Italians, whose elaborately polyphonic church music took over Flem. devices. But in the hands of masters like Festa, Animuccia, and especially Palestrina, counterpoint was used less mathematically and more artistically. Meanwhile a more independently It. secular vocal music developed in the *frottola* and the *villanella*, both lightly polyphonic song forms with the tune in the top part, the lower parts being performable at will by instruments instead of voices; and the *laudi spirituali*, sacred songs of a rather similar kind that had originated at Florence in the 13th cent. and found their greatest exponent in the 14th-cent. master Francesco Landini, led to the later motet forms as the secular songs led to the madrigal. This combined polyphonic writing with a perfect balance between words and music. Although the madrigal in Italy was at first cultivated by the Flem. settlers, it found great It. masters in Marenzio and Monteverdi, and a daringly modern experimenter in Gesualdo, Prince of Venosa. A later and lighter madrigal form was the *balloetto*, the most characteristic exponent of which is Gastoldi.

The madrigal and ballet found imitators in other countries, especially in Elizabethan England, where they became wholly naturalized; but a curious offshoot that remained entirely Italian was the so-called madrigal-opera, a dramatic form with music in madrigal style, most perfectly represented by Orazio Vecchi's *L'Amfiparnaso* of 1594, which was anticipated by Striggio and imitated by Banchieri and others. Although performed without action and always sung by sev. voices, even where a single character was supposed to be speaking, this species of madrigal undoubtedly contributed to the origin of opera. So too did the sacred or allegorical music-drama, which the medieval Church had already cultivated with plain-song melodies, and which culminated in Emilio de' Cavalieri's famous *Rappresentazione di anima e di corpo*, performed in 1600, very shortly before the first opera, in the modern sense of the term, appeared, although it also led to another new 17th-cent. form, the oratorio.

The bp. of opera was Florence, where

the music-loving Counts Bardi and Corsi patronised the musicians Vincenzo Galilei, Caccini, Cavalieri, and Peri, and the poet Rinuccini. The latter wrote the libretto of *Euridice*, which was set by both Peri and Caccini, the former's opera being produced in 1600 and the latter's in 1602. The notion of the Florentine *camerata* was not to originate a new form of art, but to revive classical Greek drama, which they imagined to have been sung throughout, and they invented a dry declamatory style due partly to this idea and partly to their limited inspiration and technique. It was not till a much greater master, Monteverdi, took to opera, at Mantua at first and afterwards at Venice, that it was safely launched as a great composite form of art and one of the most important phenomena of music. His *Farola d'Orfeo* was produced at the ducal court of Mantua in 1607, and he wrote many other works for the stage, of which only two and a fragment of a third survive. Monteverdi was the next great Italian master after the death of Palestrina, and his church music and madrigals are as important as his operas. Instrumental music, however, developed in the hands of others, though its centre, too, like Monteverdi's, was Venice, which, as the bp. of music-printing, became the hub of European musical life in the 16th cent.

The earliest surviving lute books, consisting of transcriptions, dances, and fantasies, date from 1507-9. The *canzona* and *ricercare*, originating in transcriptions of Flem. motets, were cultivated by Andrea Gabrieli and Claudio Merulo, and developed by Giovanni Gabrieli, Andrea's nephew, into independent compositions for organ. Another new instrumental form was the *toccata*, originally intended as a piece to try out (touch) the quality of the instrument or the player's skill, and thus evolving a genuine keyboard technique. The allied form of the *ricercare*, which had a polyphonic opening and then developed more freely, the outstanding organ master of which was Frescobaldi, eventually developed into the modern fugue. The Gabriellis were also church composers, attached to St Mark's in Venice, the shape of which, with its 2 organs on opposite sides, favoured the use of voices and instruments in antiphonal groups. The rich instrumental background of Venetian church music was not adopted in Rome, where the brothers Anerio, the brothers Nanini, and others continued to use the *a cappella* style. But an orchestral style was developed by Monteverdi in his operas, where he used a rich assortment of instruments, for which, however, no detailed score was as yet fully written down, mainly because the choice of instruments was not in every particular dictated by the composer, but by what happened to be available.

As the 17th cent. progressed, the habit of abbreviated scoring was further encouraged by the rise of the figured bass, or thorough-bass, which enabled the composer to confine himself to writing down the melodic material and the bass line

only and to indicate the harmonic filling by a system of shorthand. The figures shown under the bass were amplified by the *continuo* player on a keyboard instrument, in simple block harmony or with figuration or even some polyphonic elaboration, according to his skill; but inevitably music thus became more purely harmonic and less contrapuntal. Figured bass, being an instrumental device in itself, though used also with vocal music, such as the chamber duets of Steffani, did much to further the progress of music for combined instruments. But a vocal type almost as important as opera, the oratorio, from which it differed in its sacred subjects rather than in musical style, also owes its evolution to 17th-cent. Italy. The chief difference, apart from the absence of stage action, was the retention of the chorus as an important component, as in the oratorios of the outstanding master of the form, Carissimi. Opera, on the other hand, especially the spectacular baroque Venetian opera of Cavalli, Cesti, and others, dropped the chorus, as did the next great master, Alessandro Scarlatti, whose operas appeared mainly in Rome and Naples. In his works the operatic overture, the *da capo* aria, and the 2 types of recitative (*secco* and *stromentato*) reached a maturity that, except for the overture, foretold an early decay. The figured bass was also destined to decline, rather later, because of the handicap it imposed on the composer's resources.

Instrumental music became more important in the 18th cent. The sonata matured in the 2 forms of *sonata da chiesa* and *sonata da camera*, both usually for 2 violins with a keyboard instrument, the former in 4 movements alternately slow and fast, the latter is sev., mainly in dance forms and thus the forerunner of the suite. A school of violinist-composers arose, with Corelli as its chief figure, Vitali, Geminiani, Veracini, and Tartini, all b. before the end of the 17th cent., Giardini, Nardini, Pugnani, and others following. They are all much alike in style and quality, but a great, extremely original, varied, and fertile master is Vivaldi, who, besides operas and church music, wrote a vast number of concertos for all sorts of instruments. The *concerto grosso*, for (usually) 3 solo instruments, string orchestra, and *continuo*, arose at this time. Music for the harpsichord alone was provided by the even more strikingly individual Domenico Scarlatti in the form of over five hundred exercises, now called sonatas and indeed making a direct approach to the full development of that form. G. B. Sammartini a little later laid the foundations for the symphony, to be built on in Germany, and after the middle of the cent. Boccherini wrote chamber music, much as Haydn and Mozart did farther north.

These masters had many important contemporaries who cannot be named here; but some attention must be given to another school that characterises early 18th-cent. Italy, that of *opera buffa*, which flourished especially at Naples in the hands

of Leonardo Leo, Logroscino, Guglielmi, Piccini, and others, and was quite distinct from the type of *opera seria* for which Zeno and Metastasio were now the chief librettists; indeed it took its rise from the comic *intermezzi* performed between the acts of serious operas. It dealt with real human beings instead of gods and heroes, and its music began to make use of concerted singing, duets and set numbers for sev. voices often taking the place of solo arias. The most famous surviving *intermezzo* is *La serva padrona* by Pergolesi, who also wrote serious operas, a *Stabat Mater* and other church music, and instrumental works, but d. too early (aged 26) to achieve real greatness. *Opera seria* was nobly represented by Italians like Jommelli, Traetta, and Maio, as well as by the Spaniard Terradellas and the Austro-Bohemian Gluck, who both before and after his 'reform' operas set librettos of the formal Metastasian type. Comic opera gradually became more highly organised in the hands of Sarti, Paisiello, Gazzaniga, and Cimarosa, whose amiable works pale only before the formidable rivalry of Mozart. Eighteenth-cent. church music was upheld in the old tradition by Martini, but later this weakened in the hands of Jannacconi, Insanguine, and their like. Its decline was to continue during the next cent. until it reached the weak sentimentality of Perosi.

As that cent. approached, It. composers took to settling and working abroad: Rauzzini and Clementi in England, Salieri in Vienna, Cherubini in Paris, Viotti there and in London, Paer at Dresden and Paris, Spontini in Paris and Berlin, and so on. The last two, as well as Cherubini, favoured the new type of Fr. grand opera, and indeed contributed to it; Clementi did much to cultivate the new keyboard instrument—the pianoforte—while Paganini performed unheard-of feats on the violin and wrote for it almost as individually as D. Scarlatti had done for the harpsichord.

We now come to a phase of I. M. during which it is almost entirely dominated by opera, a state that was to last into the 20th cent., though lonely idealists like Sgambati and Martucci did their best to uphold absolute music. Mercadante and Pacini wrote good, solid operas, but it was their slightly older and slightly younger contemporaries, Rossini and Donizetti, who scored enormous successes with both serious and comic works, Bellini making a less sensational appeal with his gentle lyrical talent. All three were spontaneous melodists whose tunes were instantly remembered by a vast public. But they are put in the shade by Verdi's middle-period operas, if not by his earliest works, which were influenced by them, and almost wholly blotted out by the vigour, nobility, and inventive richness of his last operas, especially *Aida*, *Otello*, and *Falstaff*, in the last of which he even reached, in his old age, what he had not conspicuously shown before—great harmonic and orchestral subtlety as well as flawless

refinement. Meanwhile the Ricci brothers and Ponchielli made an approach towards a more realistic and cruder manner, known as *verismo*, intended to appeal to the emotion by frontal assault. It was developed with an easy success by Leoncavallo and brought to the height of popularity and the greatest depth of vulgarity by Mascagni and Giordano. Puccini worked on the same lines, but with genius instead of mere talent, and although he liked sensational plots and musical effects, his work is saved by originality and an unflinching dramatic sense. At the end, in *Turandot*, he showed that he was quite capable of using modern resources with superior mastery.

The only later composer who is predominantly operatic is Pizzetti, but he is by no means exclusively so, and his operas are nobly austere. Respighi wrote operas, but also cultivated orchestral and chamber music. Malipiero and Casella experimented in a great variety of media, and Castelnuovo-Tedesco did the same less enterprisingly, while Ghedini shows neo-classical tendencies. Among the composers b. in the 20th cent. Dallapiccola and Petracchi stand out as the most interesting. See L. Torchi, *L'arte musicale italiana*, 1897; G. Roncaglia, *La rivoluzione musicale italiana*, 1928; see also under composers' names mentioned.

**Italic Dialects, see LATIN LANGUAGE.**

**Italic, see SEVILLA.**

**Italics**, letters of It. origin, said to have been an imitation of the handwriting of Petrarch (q.v.). They were introduced by Aldus Manutius (q.v.) of Venice in 1500 for the purpose of printing his small ed. of the classics. The cutting was entrusted to Francesco Griffo of Bologna. The capitals were square Rom. letters, but the small letters, sloping to the right, were designed to imitate handwriting, even containing a large number of tied letters. Although I. are not joined to each other in modern printing, the ligatures or connecting lines at the beginning and end of each letter are a prominent feature. I. were introduced into England in 1528 by Wynkyn de Worde, and are used to distinguish words, sentences, or sometimes such portions as introductions and prefaces which do not properly belong to the work. They are generally used for unassimilated foreign words occurring in Eng. text, for quotations, for words requiring special emphasis, for titles of books, plays, etc., for names of ships, and for botanical names.

**Italo-Ethiopian (Abyssinian) War.** This war (1935-6) was essentially a war of aggression perpetrated by the It. dictator Mussolini with complete cynicism and in defiance of the League of Nations and world-wide opprobrium. Not least of the consequences was the encouragement given to other militant powers, i.e. Japan and Germany, who realised that aggression would apparently go unchecked excepting by oral condemnation. In an attempt to bring It. industry to a standstill and otherwise cripple her war effort, sanctions were employed by member

states of the League of Nations. The results were fatuous and served only to hasten the demise of the League. The resources of Ethiopia have yet to be fully appreciated; but the Italians were aware of some of the country's potentialities as a source of mineral and agric. wealth. There was an undisguised intention to conquer and colonise Ethiopia and to gear her economy to that of Italy. Italy had an additional motive; one of national prestige, i.e. to avenge her ignominious defeat by Ethiopia under the Emperor Menelik at Adowa in 1896.

After building up overwhelming military forces in Eritrea in the N., and in It. Somaliland to the S., the Italians launched their invasion on 3 Oct. 1935. The *casus belli* was a spurious claim by Italy to the ownership of wells at Wal Wal. The It. advance from Eritrea overcame great physical obstacles in some of the world's most difficult mountainous terrain; their engineering feats were prodigious. The defeat of 1896 was avenged within a few days when Adowa was entered by Gen. de Bono. He advanced on 2 other fronts at the same time as Gen. Graziani advanced from the S. through the Ogaden to threaten the Harar plateau through which runs the vital railway from Jibuti, in Fr. Somaliland, to Addis Ababa. Graziani met with difficulties and was held up for 4 months, but the Ethiopians failed to take full advantage of this opportunity.

In the N. the invasion had not proceeded at the pace hoped for by Mussolini, and de Bono was replaced by Marshal Badoglio, Chief of the It. general staff. Badoglio and Graziani resorted to more ruthless measures than de Bono. The Italians resorted to widespread use of mustard gas sprayed from aeroplanes, which greatly demoralised the Ethiopians. The French held up shipments of arms, fearful of It. threats to bomb the Fr.-owned railway. Despite defections in the Ethiopian Army, especially among irregulars, the Ethiopians resisted stoutly and at great cost in lives; but such actions were spasmodic and their successes few. The Ethiopians, although masters at guerrilla tactics, did not exploit their natural advantages as they might have done, particularly when much of the It. heavy transport was bogged down during the rains.

The Ethiopians, as an organised force, were no match for the Italians, despite the heroic personal example shown by the emperor, Haile Selassie, who literally courted death at the head of his Imperial Guard. All the odds were against the Ethiopians: their army was untrained in modern warfare and their equipment was inadequate and insufficient to combat even a moderately well-armed enemy. Long after defeat appeared inevitable, the emperor made his way to Jibuti with a few faithful friends and joined his family. From Jibuti they sailed for Palestine in a Brit. warship, and later came to England where they were given sanctuary. Five years later, in a brilliant military campaign, in which Ethiopian

troops played an honourable part, Ethiopia was liberated by Brit., Indian, and S. African troops (1940-1).

As a matter of policy the Italians used Eritrean conscripts and Somaliland Libyan mercenaries. Any hand-to-hand fighting was as far as possible spared the It. troops, and as a consequence, the It. casualties killed were under 1400; a further 1000 d. of disease and 453 It. workmen must be added to this deathroll. It. troops of the African race killed in action numbered 1593. There are no accurate records of the number of Ethiopian troops and civilians killed, but it was many thousands, and massacres of civilians in the cities were on a large scale. Throughout the disgraceful episode, only one public gesture reflected the degree of shame felt by civilised world opinion. This was the resignation of the Brit. foreign secretary, Mr (now Sir) Anthony Eden, following the pub. of the Laval-Hoare pact, which called upon Ethiopia to abandon her sovereignty in favour of Italy. Eden's act of honourable indignation, the hospitality shown to the exiled emperor, and the final part played by Brit. and commonwealth forces in the defeat of the Italians in Ethiopia, did much to assuage Ethiopia's anger against W. nations, including the U.S.A., who connived by their failure to support a fellow member of the League of Nations against just the sort of attack envisaged but outlawed by the League. See further under ITALIAN EAST AFRICA, CAMPAIGN IN (1940-1) and WORLD WAR, SECOND.

Italy (It. Italia), rep. (*Repubblica Italiana*) of S. Europe, comprising the long, narrow, boot-shaped peninsula which extends southwards from the Alps (q.v.) into the Mediterranean Sea, together with the is. of Sicily, Sardinia, and Elba (qq.v.), and some smaller is. The Alps form a semicircular barrier separating I. from France on the NW. and Switzerland and Austria on the N. In the NE. the Julian Alps, at the N. of Istria (q.v.), provide a less clearly defined boundary with Yugoslavia, and it is here that the hitherto troubled ter. of Trieste (q.v.) is situated. On the W. I. is bounded by the Ligurian and Tyrrhenian Seas (qq.v.), on the E. by the Adriatic Sea (q.v.), and on the SE. by the Ionian Sea (q.v.). At the Strait of Otranto (q.v.) the 'heel' of I. approaches to within 60 m. of the coast of Albania. The greatest length of the peninsula, measuring in a straight line from NW. to SE., is 710 m., and its breadth ranges from 354 m. to 20 m., the average breadth being

about 90 m. Area 116,304 sq. m. The cap. is Rome (q.v.).

**Geography.** N. I. is set off from the rest of the peninsula by the Apennines (q.v.), which branch off from the Maritime Alps E. of Nice, and run in a S.E. direction from the Gulf of Genoa to the Adriatic coast. The range then turns more to the S. near Urbino and extends as far as Cape Spartivento, at the extremity of the 'toe' of I., thus forming the backbone of Central and S. I. It is convenient to consider the physical features of the country under these 3 divs.: N., Central,

of the Po), including the Adige, Adda, Brenta, Tagliamento, Ticino, and Piave (qq.v.). Along the coast of the Adriatic, N. and S. of the Po delta, there are many large lagoons, in a flat and marshy dist. They are separated from the sea by narrow banks of sand in which are inlets, so that the lagoons serve as harbours; the chief of these is that on which Venice (q.v.) is situated. The SW. coastline of N. I. is formed by a narrow strip of land, closed in by the steep, abrupt rocks of the Apennines; it is known as the 'Riviera' (q.v.).

#### GATHERING ITALIAN TOMATOES

and S. N. I. embraces the regions of Piedmont, Valle d'Aosta, Liguria, Lombardy, Veneto, Trentino-Alto Adige, Friuli-Venezia Giulia, and Emilia-Romagna (qq.v.). Lying between the Alps and the upper Apennines is the wide plain which forms the basin of the Po (q.v.). This is shut in all round from Menton to the Gulf of Trieste by the towering Alpine wall; the different ranges, from W. to E., being the Maritime, Cottian, Graian, Pennine, Helvetian, Rhaetian, and Carnic Alps. The highest Alpine peak entirely within I. is the Gran Paradiso (13,323 ft), a peak of the Graian Alps. To the S. of the Alps, in the N. of Lombardy and Veneto, lie the beautiful lakes Garda, Maggiore, Como, Lugano, and Iseo (qq.v.). The great fertile plain of the Po valley is watered also by sev. other important rvs. (sev. of them tribs.

The geography of Central and S. I. is mainly determined by the Apennines; in Central I. these are broken up into many short ranges, particularly in Tuscany. The culminating peak of the whole range is Monte Corno (9580 ft) in the Gran Sasso d'Italia (q.v.). Central I., according to the general div., comprises the regions of Tuscany, Le Marche, Umbria, Lazio, and Abruzzi e Molise (qq.v.). The most important riv. is the Tiber (q.v.), the riv. on which Rome stands, and another riv. of importance is the Arno (q.v.). The chief lake of the area is Trasimeno (q.v.), while other lakes (including Bolsena and Bracciano, qq.v.) occupy the craters of extinct volcanoes. The volcanic tract extends from Monte Amiata (5690 ft) in Tuscany to Vesuvius (q.v.) in Campania. On the W. the Apennines slope down to the Pontine Marshes and the Campagna

di Roma (q.v.), and on the E. to the broad plains of Apulia. The regions of S. I. are Campania, Basilicata, Apulia, and Calabria (q.v.). Sicily and Sardinia are also counted as regions of S. I. The main ridge of the Apennines is continued due S. by the Monte della Maddalena, culminating in the Monte Pollino (7375 ft). The low hills N. of the Gulf of Taranto (q.v.), between the 'heel' and the 'toe' of I., are of Pliocene formation, while the Calabrian hills are a broken limestone range where the height rises to 6000 ft in the wooded, granite Sila Mts, the highest peak being Aspromonte (q.v.). The rivers of S. I. are not of great importance.

The Adriatic coastline is practically unbroken except for the promontory of Gargano (q.v.). The chief harbours on the Adriatic side are Venice, Ancona, Brindisi, Barletta, and Bari (q.v.); the large harbours belong to the cities of the W. shore—Genoa, La Spezia, Leghorn, Civitavecchia, and Naples (q.v.); and in the S. I. is the fine harbour of Taranto (q.v.).

**Climate.** The climate of I. is in general hot, but the peninsula is to a great extent preserved from extremes of heat and cold by the long coastline; it is also screened from the cold N. winds by the Alps. Nevertheless, there are wide variations in climate according to the proximity of sea or mts. In the Alps the winter is hard. In the Po valley the winter is also severe, with frequent fogs. The Riviera enjoys a sunny, mild climate all the year round, as do Naples and Sicily. The Adriatic coast is exposed to biting NE. winds, but the greater portion of the W. half of the peninsula enjoys a mild winter and a hot summer. Rainfall is not very great (except in autumn), and varies between 35.5 in. in the N. and 24 in. in Sicily. In recent times the gov. has made strenuous efforts to reduce the incidence of malaria, a disease which afflicted many parts of the country, particularly in the W.

**Flora.** The vegetation of the country is as varied as the climate. In the Alps and Apennines the chief trees are the fir, larch, oak, and chestnut. On the Riviera coast, in Sicily, and on the shores of the great lakes the flora is subtropical. Palms, olives, and oleanders are found in profusion, as well as orange-groves and vineyards.

**Agriculture, etc.** Agriculture is the basis of the It. economy. Nearly 92 per cent of the land of the country is exploited for agric. or forestry purposes, and 50 per cent of the working pop. are engaged in agric. or forestry pursuits. In 1956 the agric. acreage was utilised as follows: cereals, 17,520,000 ac.; leguminous plants, 2,950,000 ac.; industrial plants, 1,062,000 ac.; garden produce, 1,915,000 ac.; vines, 2,655,000 ac.; olives, 2,205,000 ac.; forests, 14,402,000 ac.; forage and pasture, 24,080,000 ac.

The land reform of 31 Mar. 1953 provided for the expropriation and re-allotment of some 1,800,000 ac. of land. By the end of 1955 over 730,000 ac. of land thus sequestered had been allocated to peasants.

Vineyards are scattered throughout the country. In the Alpine dists. forests, orchards, and pasture lands are of primary importance; in the Po valley cereals and fodder; and on the hills of the centre and S. cereals, olives, and vines. Drainage and irrigation works are widely developed. In 1955, 147,397 farm tractors were in use. The chief items of export are vegetables, rice, fruits, oil, and wine. Large quantities of wheat, and other agric. produce, are imported.

The production figures for the chief crops in 1955 were (in metric quintals): wheat, 95,040,000; barley, 2,917,000; oats, 5,234,000; rye, 1,232,000; maize, 32,040,000; beet, 92,074,000; potatoes, 33,817,000; tomatoes, 16,489,000; rice, 8,589,000; olive oil, 1,809,000; hemp, 341,000. In 1955, also, the fruit crop was (in metric tons): oranges, 623,460; tangerines, 103,900; lemons, 313,290; other citrus fruits, 29,210.

58,411,000 hectolitres of wine were produced in 1955, and 723,163 quintals of tobacco.

The numbers of live-stock in the country in 1955 were: cattle, 8,669,600; pigs, 3,760,200; sheep and goats, 10,771,800; horses, 617,100; mules, 378,600.

**Resources and industry.** The early geological formation of the country has left I. with very few natural resources. Only sulphur and mercury are found in quantities sufficient to allow of export in any bulk. The chief mining areas are in Sicily (Caltanissetta), Sardinia (Cagliari, Sassari, and Iglesias), Tuscany (Arezzo, Grosseto, and Florence), Piedmont, and Lombardy.

Production figures for 1955 were (in metric tons): coal, etc., 1,608,326; petroleum, 204,317; iron pyrites, 1,317,008; iron ore, 1,393,691; sulphur, 1,762,592; zinc, 246,619; bauxite, 327,171; lead, 78,115; manganese, 56,866; cast iron, 1,624,192; raw steel, 5,394,639; rolled iron, 3,990,681.

Hydro-electric power is greatly developed. In 1955, 38,124,000,000 kWh of electricity were generated, of which over 30,000,000,000 kWh were from hydro-electric plants.

Industrial undertakings are largely concentrated in the N., but a planned increase is taking place in the industrial productivity of the S. The textile industry is the largest and most important. The output figures for 1955 were (in metric tons): raw silk, 1,555; artificial silk, 143,090; cotton yarns, 146,330; cotton fabrics, 98,273; jute yarns, 51,057; woollen yarns, 41,063.

In 1955 the chemical industry produced (in metric tons): sulphuric acid, 3,056,790; superphosphate, 1,975,740; copper sulphate, 99,632.

Sugar output in 1955 was 1,077,484 metric tons. In the same year 243,020 motor-cars were manuf., of which 68,662 were exported.

Other manufs. of importance are rolling-stock, wireless sets, typewriters, agric. machinery, motor-bicycles and bicycles, and foodstuffs.

**Foreign trade.** The value of foreign trade in 1956 was (in lire): imports, 1,980,695 million; exports, 1,348,016 million. The most important imports, by value, were (1954): coffee, cotton, wool, coal, crude oil, machinery, and chemicals. The most important exports were: fruit, cotton yarn and fabrics, woollen yarn and fabrics, artificial textiles, machinery, motor vehicles, and chemicals.

The countries to which I. chiefly exports (in order of value) are: Germany, U.S.A., Switzerland, France, U.K., Argentina, Yugoslavia, Turkey, and Poland. The chief countries from which imports are received are: U.S.A., Germany, U.K., France, Switzerland, Argentina, Yugoslavia, and Turkey.

Trade between I. and the U.K. in 1956 amounted to (in £ sterling): imports to U.K., 57,636,820; exports from U.K., 59,542,090; re-exports from U.K., 4,579,616.

**Communications.** The construction of railways dates from 1839, when a line was opened from Naples to Portici (8 m.). Now there are 2 main lines running the entire length of I. along both sides of the Apennines, and connected with the lines of the N. plain and with numerous minor lines. The total length of railway track in 1956 was 13,624 m., of which about 75 per cent were state-owned, and of which 3,845 m. were electrified. In 1955 the state railways carried 385,771,000 passengers and 59,398,000 metric tons of goods. In 1956 there were 108,900 m. of roads, of which 15,425 m. were state roads and 26,800 m. prov. roads. At the end of 1955 there were 879,313 motor-cars, 356,287 commercial vehicles, 2,648,077 motor-cycles, and 10,365 motor-buses in the country.

The It. mercantile marine in 1956 consisted of 4,079 vessels of 4,442,416 gross

tons; 3968 of these vessels (4,440,375 gross tons) were steam or motor driven, and 111 were sailing vessels.

The It. airlines, Alitalia and L.A.I., operate services to the countries of Europe and Africa, Israel, Persia, and N. and S. America. In 1955, 241,883 passengers were carried, as well as 6932 metric tons of freight.

**Population.** At the first general census (1871) taken after the unification of I., the pop. was 27,577,640 (present boundaries, excluding Trieste). In 1911 the pop. was 35,694,582, and in 1936, 42,302,680. The 1955 pop. was 48,675,000.

The pops. of the regions in 1955 were: Piedmont, 3,602,000; Valle d'Aosta, 97,000; Liguria, 1,602,000; Lombardy, 6,722,000; Veneto, 3,911,000; Trentino-Alto Adige, 750,000; Friuli-Venezia Giulia, 429,000; Emilia-Romagna, 3,587,000; Tuscany, 3,209,000; Le Marche, 1,370,000; Umbria, 814,000; Lazio, 3,502,000; Abruzzi e Molise, 1,699,000; Campania, 4,509,000; Basilicata, 647,000; Apulia, 3,340,000; Calabria, 2,104,000; Sicily, 4,624,000; Sardinia, 1,343,000.

The pops. of the chief tns in 1955 were: Rome, 1,751,000; Milan, 1,303,000; Naples, 1,059,000; Turin, 783,000; Genoa, 680,000; Palermo, 528,000; Florence, 393,000; Bologna, 364,000; Venice, 328,000; Catania, 321,000; Bari, 288,000; Trieste, 271,000; Messina, 232,000; Verona, 187,000; Taranto, 180,000; Padua, 177,000; Cagliari, 149,000; Leghorn, 148,000; Brescia, 147,000; Reggio di Calabria, 144,000; Ferrara, 140,000; Parma, 122,000; Modena, 116,000; La Spezia, 109,000; Reggio nell' Emilia, 109,000; Bergamo, 108,000. The number of emigrants from I. to oversea countries in 1955 was 145,614.

The ter. of I. is subdivided into regions and provs. as under (see separate articles):

<b>Piedmont</b>	Venezia	Pistola	<b>Basilicata</b>
Alessandria	Verona	Siena	Potenza
Asti	Vicenza	<b>Le Marche</b>	Matera
Cuneo	<b>Trentino-Alto Adige</b>	Pesaro-Urbino	<b>Apulia</b>
Novara	Trento	Ancona	Bari
Turin	Bolzano	Macerata	Foggia
Vercelli	<b>Friuli-Venezia Giulia</b>	Ascoli Piceno	Lecce
<b>Valle d'Aosta</b>		<b>Umbria</b>	Brindisi
<b>Liguria</b>	Gorizia	Perugia	Ionio (Taranto)
Genoa	Udine	Terni	<b>Calabria</b>
Imperia	Trieste	<b>Lazio</b>	Catanzaro
La Spezia	<b>Emilia-Romagna</b>	Viterbo	Cosenza
Savona	Bologna	Rieti	Reggio/Calabria
<b>Lombardy</b>	Ferrara	Roma	<b>Sicily</b>
Bergamo	Forlì	Frosinone	Agrigento
Brescia	Modena	Latina	Caltanissetta
Como	Parma	<b>Abruzzi e Molise</b>	Catania
Cremona	Piacenza	L'Aquila	Enna
Mantua	Ravenna	Chieti	Messina
Milan	Reggio/Emilia	Pescara	Palermo
Pavia	<b>Tuscany</b>	Téramo	Ragusa
Sondrio	Massa e Carrara	Campobasso	Syracuse
Varese	Arezzo	<b>Campania</b>	Trapani
<b>Veneto</b>	Florence	Avellino	<b>Sardinia</b>
Belluno	Grosseto	Benevento	Cagliari
Padua	Leghorn	Naples	Nùoro
Rovigo	Lucca	Salerno	Sàssari
Treviso	Pisa	Caserta	

**Religion.** By the Lateran Treaty (q.v.) of 1929 the dispute between the Papacy and the It. Gov., which began in 1870 at the time of the unification of I., was terminated. In the summer of 1931 there was another rupture between Church and State over the nature of the *Azione Cattolica*, but an agreement was arrived at on 2 Sept. During the debates on the constitution in the post-Second World War Constituent Assembly the question of the relations between Church and State arose again. Article 3 of the draft Constitution, formally reaffirming the provisions of the Lateran Treaty, occasioned a long debate, but was finally accepted by 350 votes to 149.

The Catholic Apostolic Rom. religion is recognised as the official religion of the State, and is professed by 99 per cent of the pop. Other creeds are permitted, provided that they do not profess principles, or follow rites, contrary to public order and moral behaviour. The profession of such creeds is free, and discussion of religious matters is freely permitted. Catholic religious instruction is given in elementary and intermediate schools. Marriages may be solemnised before a Catholic clergyman in accordance with the rules of canon law, or before a clergyman of any other religion admitted by the State. Article 23 of the new constitution permits civil divorce.

The Pope is the Primate of I. There are 53 archbishops, and there is a Patriarch in Venice.

Four Protestant Churches are united in a Federal Council of Evangelical Churches in I.; they have a total membership of about 50,000. There are some 35,000 Jews.

**Education.** Under the Fascist regime the educational theories of Giovanni Gentile (q.v.) were put into practice, educational programmes were laid down, but teachers were free to arrive at the results therein determined by their own methods. There was, however, no departure from Fascist principles, which were further inculcated through the youth organisations, the *Balilla* for boys from the ages of 5 to 15, and the *Aran-guardisti* from 15 to 18. The subservience of education to the regime was completed by the so-called School Charter (*Carta della Scuola*) of 1939; education of women was discouraged, and co-education was forbidden. With the overthrow of Mussolini education was permitted to return to its liberal principles.

All children between the ages of 6 and 14 are obliged to attend school. Primary education is given in 3 stages: free kindergarten, from the ages of 3 to 5; lower for 3 years; and higher for 2 years.

Secondary education is given in the elementary or middle schools, by the classical schools, the science schools, and the institute for teachers. There are also secondary technical institutes, and agric., industrial, commercial, and nautical schools. In the year 1953-4 there were 14,344 kindergarten schools, 35,462 public elementary schools, 2379 private

elementary schools, and 566 private recognised schools. There were 4129 secondary schools of various types.

Univs. are situated at (date of foundation given in brackets): Bari (1924), Bologna (1200), Cagliari (1626), Camerino (1727), Catania (1434), Ferrara (1391), Florence (1321), Genoa (1243), Macerata (1290), Messina (1549), Milan (1924), Modena (1678), Naples (1224), Padua (1222), Palermo (1805), Parma (1502), Pavia (1390), Perugia (1276), Pisa (1338), Rome (1303), Salerno (1944), Sassari (1677), Siena (1300), Turin (1404), Trieste (1924), Urbino (1564), and Venice (1868).

**Justice.** There is a court of cassation in Rome. The country is divided into 23 appeal court dists. (with one detached section), subdivided into 154 tribunals, which are in turn divided into *mandamenti*, each with a magistracy (*pretura*). There are also 91 assize courts of first degree, and 24 assize courts of appeal. In addition, there are *conciliatori* with jurisdiction in petty civil cases. In 1955 there were 901 pre-trial jails, 84 penal jails, and 22 preventive institutions.

**Finance.** Revenue and expenditure for the fiscal years ending 30 June are given as (in lire):

	Revenue millions	Expenditure millions
1955-6	2,509,900	2,809,900
1956-7	2,650,191	2,921,452
1957-8	2,849,000	3,053,000

The public debt at 30 June 1956 was 4,257,390 million lire.

The standard coin is the *lira* of 100 *centesimi*. The exchange rate of the £ sterling was fixed in 1946 on the dollar basis (£1 = \$2.80). The official rate of exchange from 2 Aug. 1947 is 1 million lire = \$2850.

According to the law of 6 May 1926 there is only one bank of issue for currency the Banca d'Italia. The State has, however, issued 100-, 50-, 10-, 5-, 2-lire, and 1-lira notes not included in the note circulation figures. Since 1936 all credit institutions have been under the control of an 'Inspectorate of Credit,' and the Bank of I. has been converted into a public institution, the capital of which is held exclusively by public corporations.

By a decree of 29 April 1923 life-assurance business is carried on only by the National Insurance Institute, and by such other institutions as are authorised by the gov.

**Defence.** Under the Fascist regime military service was compulsory and universal for men between the ages of 21 and 55. The army was divided between the Metropolitan army with a normal peace-time estab. of 260,000, and the Colonial troops. At the beginning of the Second World War 1,500,000 men were mobilised, including 132 battalions of the Black Shirt Militia, normally part of the Voluntary Militia for the National Security (M.V.S.N.). The *Carabinieri*,

or military police, numbered over 50,000 in 1939. The navy, with a personnel of 4000 officers and 75,000 men, consisted in 1939 of 6 battleships, 20 cruisers, 52 destroyers, 65 torpedo boats, and 90 submarines. The air force, including army co-operation units and the naval air arm, mustered 2000 first-line aircraft in 1939, with 400 reserves.

Most of the restrictions imposed upon I. in Part IV of the peace treaty of 1947 were repudiated by the signatories on 21 Dec. 1951, only the U.S.S.R. objecting.

The new army is composed of 10 infantry divs., 3 armoured divs., and 5 Alpini brigades.

1959. In 1950 the U.N. decided that Eritrea was to be given its freedom in a federation with Ethiopia, to become effective in 1952. Libya (comprising Tripolitania, Cyrenaica, and Fezzan) obtained its independence at the end of 1951 (q.q.v.).

**Political parties.** The prin. political parties are: (1) *Partito Democrazia Cristiana* (D.C.), a Christian Democratic party of the Centre, which is the successor to the pre-Fascist Popular party. It is militantly anti-Communist. (2) *Partito Comunista Italiano* (P.C.I.), founded 1921, is the largest Communist party in W. Europe. It opposes the Atlantic Alliance

Canadian Pacific

THE DOME OF ST PETER'S AND (RIGHT) CASTEL SANT ANGELO (TOMB OF HADRIAN)

The coastline of the country is divided into naval zones, with H.Q. at La Spezia, Naples, Taranto, and Venice. There are also naval bases at Brindisi, Genoa, Leghorn, Ancona, and Augusta. In 1957 the navy consisted of 41,000 officers and ratings and the following ships: 3 cruisers, 2 large destroyers, 2 destroyers, 3 anti-submarine frigates, 14 frigates, 5 submarines, 26 corvettes, 4 fast mine-sweepers, 16 mine-sweeping trawlers, 3 mine-sweepers, 50 coastal mine-sweepers, 20 inshore mine-sweepers, 30 motor torpedo boats, 2 motor gunboats, 22 anti-submarine patrol boats, 6 landing-support gunboats, and various other craft.

In 1957 the It. Air Force comprised 5 fighter brigades, 1 reconnaissance brigade, 1 transport brigade, 2 anti-submarine groups, and supporting forces.

**Overseas possessions.** In the peace treaty of 1947 I. renounced claim to her former overseas possessions. The concession of Tientsin (q.v.) was restored to China, and the islet of Saseno to Albania. It. Somaliland became (1950) an It. trusteeship under the U.N., to expire in

and favours co-operation with the countries of E. Europe. (3) *Partito Socialista Italiano* (P.S.I.), co-operates with the Communist party since 1946. It was expelled from the Socialist International in May 1949 for advocating a policy of maximum collaboration with the Communists. It believes that I. should remain independent of any power bloc, and appeals mainly to manual and white-collar workers. (4) *Partito Socialista Democratico Italiano* (P.S.D.I.), is a Socialist party (formed in 1951 by the merger of 2 previous parties, the P.S.L.I. and the P.S.U.) belonging to the Socialist International. (5) *Partito Repubblicano Italiano* (P.R.I.), follows the political principles of the Mazzinian school (see GIUSEPPE MAZZINI). (6) *Partito Liberale Italiano* (P.L.I.), the It. Liberal party. There are also 2 monarchist parties (*Partito Nazionale Monarchico* and *Partito Popolare Monarchico*) and a right-wing party called *Movimento Sociale Italiano*.

**Constitution and government.** I. became a rep. on 10 June 1946, on the announcement of the Court of Cassation that a

majority of the voters in the referendum held on 2 June had voted for a rep. 54.3 per cent of the votes cast were for a rep., and 45.7 per cent for the retention of the monarchy. 89.1 per cent of the electorate voted. On 18 June the Provisional gov. issued an 'Order of the Day' proclaiming that all court verdicts in future should be handed down 'in the name of the Italian people,' and that all references to the monarchy should be deleted from legal and governmental statements.

The new constitution was passed by the Constituent Assembly on 22 Dec. 1947, by 453 votes to 62, and it came into force on 1 Jan. 1948. I. is described as 'a democratic republic founded on work,' and emphasises the constitutional sovereignty of the people. The rep. recognises and guarantees the rights of man, either as an individual or in community, and it expects devotion to duty and the fulfilment of political, economic, and social obligations. All citizens enjoy equal status and are regarded as equal before the law, without distinction of sex, race, language, or religion, and without regard to their political opinions or their personal or social standing. Any citizen of a foreign country who is deprived of democratic liberty such as is guaranteed under the constitution has the right of asylum within the ter. of the rep. I. repudiates war as an instrument of offence against the liberty of other nations and as a means of resolving international disputes. Freedom of religious practice, of thought, speech, and writing is guaranteed. The press is entirely free of control or censorship, and no person may be deprived of civic or legal rights on political grounds. The death penalty is not allowed, except under martial law. An accused is deemed 'not guilty' unless otherwise proven, and punishment shall be humanitarian and directed towards the re-education of criminals.

Parliament consists of a Chamber of Deputies and a Senate. The Chamber is elected for 5 years by universal and direct suffrage, on the basis of 1 deputy for each 80,000 inhab. Deputies must be at least 25 years of age. The Senate is elected on a regional basis, each region having at least 6 senators, 1 for each 200,000 inhab. (the Valle d'Aosta has 1 senator only). The President of the Rep., who is himself a senator for life, can nominate 5 senators for life from eminent men in the spheres of social, scientific, artistic, and literary life. The President is elected by a joint session of the Chamber and the Senate, to which are added 3 delegates from each regional council (1 from the Valle d'Aosta). A two-thirds majority is required for the election, but after a third indecisive scrutiny an absolute majority is sufficient. The President must be at least 50 years of age, and his term of office lasts for 7 years. His deputy is the president of the Senate. The President can dissolve the Houses of Parliament, except during the last 6 months of his term of office.

The Cabinet can be forced to resign only

on a motivated motion of censure. The defeat of a gov. bill does not necessarily involve the resignation of the gov. A constitutional court, consisting of 15 judges appointed (5 each) by the President, Parliament (in joint session), and the highest law and administrative courts, can decide on the constitutionality of laws and decrees. It also defines the powers of the State and the regions, and judges conflicts between the State and the regions, or between the regions themselves. The President and the ministers may be tried by it.

The reorganisation of the Fascist party is forbidden. Direct male descendants of King Victor Emmanuel are excluded from all public offices, are banned from It. ter., and have no right to vote or to be elected. Their estates are forfeit to the State. Titles of nobility are no longer recognised, but those existing before 28 Oct. 1922 may be incorporated as part of the personal name.

*National flag and anthem, etc.* The national flag consists of vertical bands of green, white, and red. The national anthem is *Fratelli d'Italia* (words by G. Mameli; tune by M. Novaro, 1847). The metric system of weights and measures is in general use.

*History.* The name I. was used by the Greeks first to the extreme S. or 'toe' of the peninsula. They afterwards extended it to the country S. of a line drawn from Poseidonia (Paestum) on the W. to Tarentum on the E. Following the Rom. conquest of Tarentum and the S. part of the peninsula (c. 272 BC) the name I. signified the whole ter. northward from the straits of Messina to the R.s Arno and Rubicon. The country beyond these rivs. continued to be called Gallia Cisalpina and Liguria until the reign of Augustus. The early hist. of I. is inseparable from that of Rome (see ROMAN HISTORY). The present section of this article is intended only as a broad survey; for further particulars see also EUROPE, History; HOLY ROMAN EMPIRE; RENAISSANCE, etc.; and articles on individuals and events mentioned here.

Rom. rule endured until AD 476, when Odoacer, leader of the Herulian mercenaries, deposed the young Romulus, last Augustus of the W. empire, and placed the kingdom under the rule of Zeno, the Byzantine emperor. Odoacer (q.v.), who had been pronounced 'patrician' by the emperor and 'king' by his soldiers, ruled in I. until he himself was conquered and deposed in 493 by Theodoric, King of the Ostrogoths (q.v.). At his death (526), Belisarius and Narses, sent by Justinian, invaded and reconquered the country. In 568 the Lombards, who had been employed by Narses as mercenaries, swept down upon I. from the N. under the leadership of their King Alboin. Pavia was captured after a 3 years' siege, and made the cap. of the new kingdom. The Lombards spread S., and formed the 2 duchies of Spoleto and Benevento, but lacked the strength to occupy Rome, Ravenna, Venice, the Is. of Sicily, Sardinia, and

Corsica, and the important sea-ports. Gregory the Great (590-604) converted them to orthodoxy and estab. Rome as the rallying point of the whole nation. In 756 the Lombards were defeated by Pepin the Frank who captured Ravenna, Pentapolis and sev. cities in Romagna, and Spoleto, which he yielded to the Pope, thus founding the temporal sovereignty of the Rom. Church. The conquest of the Lombards was completed by Charlemagne, Pepin's son, who deposed his father-in-law, Desiderius, the last Lombard king,

About this time, when I. was a divided country, governed by foreigners from a distance, the Lombard cities of Milan, Pisa, Genoa, Venice, and Florence began to rise in power and to gain some degree of independence. The Saxon emperor encouraged this spirit of municipal independence, which crushed the power of the turbulent counts. His son and grandson, Otto II and Otto III, however, had not his powers of discipline, and on the death of the latter in 1002 Ardoni, Marquis of Ivrea, claimed the crown and was

in 774, and was crowned emperor of the Romans in 800 by Pope Leo III.

The cities and Sicily still remained under the rule of the E. emperor, and were undisturbed by the Frankish conquest of the N. The Carolingian line ended in 887 with the deposition of Charles the Fat. The following 74 years was a period of misrule and anarchy. Before the end of the 9th cent., hordes of Saracens began to overrun Sicily, Calabria, and Apulia, while in the 10th cent. the plains of Lombardy were laid waste by the invasions of Magyars and Northmen. The Ger. King of Saxony, Otto I the Great (q.v.), was called in by the enemies of Berengar, who was forced to pay tribute and acknowledge Otto as his overlord. After this the It. king was more impotent than ever, and in 961 was deposed, I. being now considered as a fief of the Ger. empire.

supported by Lombardy and Pavia. The Saxon dynasty, however, continued in Henry of Bavaria, who gained the alliance of Milan, and crushed her rival, Pavia. On Henry's death in 1024, Aubert, Archbishop of Milan, offered the crown to Conrad, the Franconian King of Germany. During this cent. the power of the *commune*, a word first used in connection with Milan, the citizens of which city had united in a *parlamento*, gradually increased.

The Saxon policy of interference in the papal election was followed by Conrad's successor Henry III, who, finding 3 popes in Rome, abolished them all, and bestowed the see on a Ger. bishop of his own choosing. During the minority of his son, Henry IV (q.v.), who succeeded him in 1056, Archdeacon Hildebrand of Soana, afterwards Pope Gregory VII (q.v.)

threw his energies into strengthening the power of the papacy. He was determined to throw off the yoke of the Ger. Emperor and the Tusculan counts and to purify the Church morally by enforcing the celibacy of the clergy, by abolishing the investiture of ecclesiastics by secular authority, and by vesting the papal election in the hands of the Rom. people under the guidance of the clergy. During the ensuing struggle between Pope and emperor, Gregory was supported by Robert Guiscard and his son Roger, Norman adventurers who had occupied Apulia, Calabria, and Sicily, and had strengthened their hold on these dominions by obtaining papal investiture of lands which they agreed to hold as fiefs of the Holy See. In 1084, Henry IV seized Rome, but, after his death (1106), the War of Investitures was continued by his successors, and ended in the compromise Concordat of Worms (1122).

During the ensuing 3 decades the N. cities were each a single rep.; the bishops were superseded by consuls, who, assisted by a council of burghers, administered the law. Rome shook off for a time the temporal rule of the Pope, and under Arnold of Brescia (q.v.) estab. a short-lived rep. On the death of Conrad, his nephew Frederick I (q.v.), surnamed Barbarossa, was elected emperor. Under his rule the feud between emperor and Pope was renewed. He crossed the Alps in 1154, determined to exercise his imperial rights and to put an end to the warfare of the cities. Milan at once rose up in arms against him, but Frederick, after laying waste some smaller cities, marched on Rome and was crowned by Adrian IV (q.v.), the only Pope of Eng. birth. He marched upon Milan and forced it to surrender. But in 1159 Milan was again in revolt, and after a lengthy siege was laid waste (1161). Later, united in a league, called the League of Lombardy, the N. cities, in alliance with the papacy in 1176 inflicted a crushing defeat upon Frederick at the battle of Legnano. In 1177 the emperor made terms with the Pope for a 8 years' truce, and in 1183 a permanent peace was ratified by the treaty of Constance, which granted to the Lombard tns the right of war and self-gov. During the short reign of Frederick's successor, Henry VI, the strife between Guelphs and Ghibellines (q.v.) broke out in I. In Germany it had stood for a quarrel between 2 rival dynasties, but in I. the Guelphs represented the papal party, i.e. Rome and the League of Lombardy, while the Ghibellines stood for the imperial party. On Frederick's death (1190), Henry laid claim to the whole of I. and the 2 Sicilies, his claim being acknowledged in 1194. During his son Frederick II's long minority, the power of the Pope extended as far as Constantinople at the time of the fourth Crusade (1200-4). The spoils of war were shared with Venice, who thus became estab. as one of the most powerful commercial cities of the Mediterranean. In 1220 Frederick II was crowned king and emperor, the virtual ruler of Germany,

I., the Sicilies, and Jerusalem. He made a determined effort to crush the league and subdue the Pope, but the powers pitted against him were too strong. Pope Gregory IX excommunicated him in 1237, and Innocent IV declared him dethroned at the council of Lyons in 1245. The Hohenstaufen line ended in 1268 and in 1273 Rudolf I (q.v.) of Hapsburg was crowned emperor by the Pope, and 5 years later made a public recognition of the Pope's temporal sovereignty in the papal states. The Guelph party was now supreme in the N., but lost much of their influence in the S. when Sicily rebelled against Charles of Anjou and placed itself under Aragonese rule (1282). At the end of the cent. the Guelphs of Florence were divided into 2 factions—the Neri and the Bianci. In 1300 Boniface VIII called in Charles of Valois, who banished the latter faction and then undertook to manage the affairs of the rep. In 1309, the Pope, Clement V, being a Frenchman, the seat of the papacy was transferred to Avignon, where it remained till 1377.

This period of nearly 70 years was marked by great commercial prosperity. The N. tns still made war upon one another, but the burghers paid companies of adventurers, *condottieri*, to do the fighting. The rural counts lost their power and became citizens of the tns, and the office of *podestà* was now practically that of a judge. In many tns his place was taken by a new functionary, the *captain of the people*, who was a leader of Guelphs or Ghibellines, whichever party was in the ascendant, and whose powers, being ill-defined, tended to become unlimited. In the N. the popes lost their prestige as lt. princes by the removal of the Holy See to Avignon. Rome nominally obeyed her bishops, but the temper of the times was shown in the brief rep. (1347-54) set up in the city by Rienzi on semi-classical, semi-feudal lines. The duchy of Milan was governed by the powerful Visconti (q.v.) dynasty till 1447. Under the powerful Gian Visconti (d. 1354) the duchy conquered Genoa and a large portion of N. I. But in 1450 Filippo Visconti's son-in-law and general, Francesco Sforza, seized the Visconti's possessions with the aid of his Florentine ally, Cosimo de' Medici, and proved himself to be a wise and liberal-minded ruler. Until 1343 Florence had been subject to an adventurous foreigner, Walter of Brienne, Duke of Athens. For the following 100 years, with the exception of a short-lived revolution of artisans, the city was governed by an oligarchy headed by the Albizzi family. During this period Florence achieved the subjection of Pisa and extended her domains in Tuscany. But the oligarchy was opposed to the wealthy and democratic family of Medici (q.v.). In 1434 Cosimo de' Medici estab. a rep. of which he assumed the presidency. He strengthened his position by making the alliance with Francesco Sforza mentioned above. The presidency maintained by Cosimo became a dictatorship under his grandson, Lorenzo the Magnificent. The hist. of Venice was very different from

that of the other great It. states. In the 11th cent. the administration lay in the hands of the popular representative, the doge (q.v.). After a series of revolutions, however, the oligarchical principle was estab., and in 1310 the Council of Ten was formed. In the middle of the 14th cent. she began her struggle for maritime supremacy, which ended in victory (1381). In 1406 Venice added Verona, Vicenza, and Padua to her It. possessions, and during the long dogeship of Francesco Foscari (1423-57) extended her dominions in the mainland. I. was now divided into a number of commonwealths. Every one of them was governed by an oligarchy or an It. prince, but the individual enjoyed considerable liberty, and much encouragement was given to literature and art. It was the age of the It. Renaissance (q.v.).

Peace lasted till 1494, when a new age opened for I. Throughout the following cent. the country was a battlefield on which France and Spain fought out their quarrels and strove for new conquests. In 1494 Charles VIII of France invaded I. at the request of Lodovico Sforza, who was anxious to become Duke of Milan. Charles, after having the Medici expelled from Florence, marched S. and was crowned in Naples. In the meantime Lodovico assassinated his nephew, Gian Galeazzo, and raised Lombardy against Charles, who with difficulty made good his retreat to France. The way was now opened to other invaders, and Spain soon estab. a firm foothold in S. I. In 1499 Louis XII, the successor of Charles, seized Milan, and in 1504 invited the Emperor Maximilian to assist him in the conquest of Venice. In 1508 was formed the League of Cambrai with France, Spain, and Germany against Venice. But in 1512 the army under Gaston de Foix fought a fierce battle against the combined Sp., Venetian, and papal troops on the banks of the Ronco about 2 m. from Ravenna. The French were victorious but Gaston fell in the act of pursuing the enemy. The French returned in a few years. In 1515, their new king, Francis I. was victorious at the battle of Marignano, and entered Milan, but was later expelled by the troops of Emperor Charles V. These devastating wars ended in the peace of Cambrai (1529), by which Charles V. was left in possession of I. In 1537 the French took possession of the ters. of the dukes of Savoy, but these were ceded to Philip, the son of Charles V. by the treaty of Cateau-Cambresis (1559). Venice, Genoa, Lucca, and San Marino were allowed to retain their independence.

Until the end of the 18th cent. I. ceased to have a hist. of her own. Wars in which she had no interest, but was the unfortunate sufferer, continued to be fought on her soil. Venice regained some of her lost power by the conquest of the Peloponnesus (1684), but this was recaptured by the Turks in 1715. Piedmont was ceded by Spain to Emmanuel Filibert, who regained Savoy and Nice. The war of the Sp. Succession (1701-13) led to a redistribution of It. land. By the treaty of

Utrecht (1713) Austria succeeded to the Sp. dominions, and Sicily was given to Victor Amadeus, Duke of Savoy, with the title of king. In 1720 he had to yield that is. to Austria in exchange for the kingdom of Sardinia. I. was subjected to a further rediv. at the end of the war of the Austrian Succession. By the treaty of Aix-la-Chapelle (1748), Milan, which had been captured by Austrians in 1713, was ceded with Tuscany to the House of Austria; the Bourbon, Charles III., was confirmed in his kingdom of the 2 Sicilies; his brother, Don Philip, was given the duchy of Parma; Piedmont and Sardinia remained in the hands of the House of Savoy; and Modena and Genoa were placed under the protection of France, to whom the Genoese sold Corsica in 1768.

For 44 years I. enjoyed peace. Tuscany was ruled by lieutenants until the death of Francis I in 1765, when his second son, afterwards Emperor Leopold II (1790), was made grand duke. His rule was characterised by its agric. improvements, suppression of the Inquisition, and liberal reforms. The rule of Maria Theresa in Lombardy was also remembered as a period of internal peace.

The chief event after the treaty of Aix-la-Chapelle was the invasion of I. by the Fr. Republican armies in 1796. In the following year the Emperor, Francis II, was forced to sign the treaty of Campo Formio, by which Venice and the ters. N. of the Adige were given to Austria, and the rest of N. and Central I. was divided up into reps., such as the Cisalpine, Tiberine, Ligurian, Cispadane, and Parthenopæan reps. The great cities soon discovered that their freedom was but nominal under the presidency of Napoleon Bonaparte. In 1799 the Russian troops gained a victory at Trebia, and in 1800 Napoleon crossed the Alps and confirmed his previous victories at the battle of Marengo. The Cisalpine rep. was declared the *Italian* rep. in 1802, and Napoleon crowned himself King of I. at Milan in 1805, and in the following year he made his brother Joseph King of Naples. But at the overthrow of Napoleon in Paris (1814) the kingdom of I. crumbled to pieces, and at the Congress of Vienna (1815) the allies redistributed the country among themselves, but the Pope being left in possession of the Papal States.

After the Napoleonic invasion of I. the rule of the restored petty princes was more oppressive than ever; but national pride had been aroused and had given birth to a great hope for the future unity and self-gov. of the whole country. Secret societies, the most important of which was the Carbonari (q.v.), flourished among the educ. classes; risings broke out in the S. (1820); and in 1832 the fiery young patriot, Giuseppe Mazzini (q.v.), organised a political society called *Giovane Italia* (Young I.) for the unification of his country. Mazzini came to London, from where, by means of literature, he actively propagated his republican theories among his countrymen. In 1848, the year of revolutions, insurrections broke out in

Lombardy, but the Austrians won the battle of Custoza, and placed the country under martial law. Pius IX, who since 1846 had passed certain measures of reform, was torn between his desire to support It. freedom and his fear of making war on Catholic Austria. His authority, in consequence, weakened daily; he fled to Gaeta. Mazzini hurried back to Rome, and a rep. was set up with himself and 2 others as triumvirs. In 1849 Charles Albert received a crushing defeat from the Austrians under Radetzky, and abdicated at Novara, leaving his son, Victor Emmanuel II, to make the terms

resulted in the outbreak of a Franco-Austrian war (1859). In the same year the Austrians were defeated at Montebello, Palestro, Magenta, and Solferino; provisional govs. were estab. in Florence and Modena; and an insurrection broke out in the Papal States. S. I. rebelled against Francis II, the son of Ferdinand, and was assisted by Garibaldi, who won victories at Calatiffimi and Melazzo. Assuming the title of dictator, he entered Naples in Sept. 1860, Francis having fled. The united troops of Garibaldi and Cavour defeated the Papal States at Castelfidardo, and the Neapolitans at the Volturno.

of treaty. Lombardy reverted to Austria, and a part of the Piedmontese ter. was also ceded. France decided to restore Rome to the Pope and sent Gen. Oudinot to besiege the city. He was defeated at Civita Vecchia by Garibaldi (q.v.), recently returned from exile in S. America. The Neapolitans, augmented by Sp. soldiers, marched northwards, and were also defeated by Garibaldi at Palestrina and Velletri, but in spite of these successes the Fr. troops succeeded in entering Rome, and the Pope returned in 1850.

At this time of despair, Cavour (q.v.) came into prominence as the champion of the national movement. In 1852 Victor Emmanuel appointed him prime minister. The Società Nazionale was formed with the motto 'Unity, Independence, and Victor Emmanuel.' The king and Cavour secretly encouraged the movement, though their only avowed aim was to expel the foreigner. In 1858 Cavour entered upon negotiations with Napoleon III which

Sicily and Naples were annexed to Sardinia in Oct., and Garibaldi hailed Victor Emmanuel as 'King of I.' In 1861, at the assembly of the first It. parliament in Turin, Victor Emmanuel was decreed King of I. In this same year Cavour died. Rome was still held by the Pope and the Austrians were in possession of Venice. In 1862 Garibaldi, on his own initiative, raised troops to liberate Rome, but was defeated at Aspromonte. Fr. troops had garrisoned Rome since 1849. By the Franco-It. Convention of 1864, the French agreed to evacuate Rome within 2 years, on condition that the Papal States were recognised, and the cap. of I. was moved from Turin to Florence. In 1867, in spite of the agreement of 1864, Garibaldi made another attack on Rome and consequently Napoleon sent back his troops, who defeated the Garibaldians at Mentana. Rome continued to be controlled by France until 1870, when, during the Franco-Prussian war, the It. army

under Cadorna, after a brief resistance entered the city. In 1871 Rome was inaugurated as the cap. of the kingdom, but the Pope, Pius IX, refused to abandon his temporal sovereignty, and withdrew as a voluntary prisoner to his own domains, which were allowed the privilege of extraterritoriality.

The consolidation of I. was slow and difficult, owing to the great social differences between N. and S. In 1878 Victor Emmanuel died and was succeeded by Umberto I, Pius IX being succeeded by Leo XIII in the same year. Umberto's reign was characterised by electoral reform (1881) and foreign colonisation. Somaliland, along the N.E. coast of Africa, was acquired between 1880 and 1890, and the dependency of Eritrea was founded in 1882. I.'s claims upon Abyssinia (see ETHIOPIA) led to war, which ended in an It. defeat at Adowa (1896), and the restoration of all land to Abyssinia by the treaty of Addis Ababa (1896). In 1882 I. joined Germany and Austria, forming the Triple Alliance, largely owing to her distrust of France, though it implied a renunciation of her irredentist claims in the N. and along the Adriatic. In 1900 Umberto was assassinated and was succeeded by his only son, Victor Emmanuel III (q.v.). At the beginning of the new cent. I. entered upon more friendly relations with France, the Triple Alliance being still maintained. In the dissensions in Morocco in 1906-11 she gave her support to France against Germany, while France acquiesced in It. ambitions in Tripoli. In Sept. 1911 war broke out between I. and Turkey in connection with the rights and privileges of It. subjects in Tripoli. In Nov. of the same year the It. Gov. formally proclaimed the annexation of Tripoli and Cyrenaea, which was ratified by Turkey in the treaty of Ouchy in Oct. 1912. Meanwhile, at home, the industrialisation of I. was giving rise to acute problems of social reform, and led to the rise of left-wing political groups, centred in the N. There was a serious outbreak of strikes and rioting in 1914. After the declaration of war between the Entente and the Central Powers in Aug. 1914, I. at first maintained her neutrality. As the price of continued neutrality, I. demanded concessions from Austria in the Trentino, Istria, Dalmatia, and Albania. Although Germany favoured these claims, Austria rejected all but a small extension of the It. frontier. Sonnino (q.v.), now It. foreign minister, then opened negotiations with the Entente, and finally, on 26 April 1915, the secret treaty of London was signed, by which fulfilment of I.'s territorial claims was promised together with an immediate loan of £50,000,000. On 23 May 1915 I. declared war on Austria-Hungary. The It. Army was poorly equipped, while for the main offensive launched on the Isonzo and for the operations in the Trentino only some 400,000 men were available. (See ISONZO; ITALIAN FRONT, FIRST WORLD WAR CAMPAIGN ON; WORLD WAR, FIRST.) Not until 1916 did

I. become actively at war with Germany. As a result of Sonnino's foreign policy the unity and independence of Albania were proclaimed under the protection of I., while in April 1917 the treaty of St Jean-de-Maurienne was concluded with France and England, delimiting I.'s share in the partition of Asia Minor. In autumn 1917 an offensive was started on the It. front which resulted in the disaster of Caporetto (q.v.) in Oct. This defeat stiffened It. resistance and in June 1918 the reorganised It. army defeated the Austrians at the battle of the Piave, and in Oct. Austria sued for an armistice. At the end of the struggle the resources of I. were exhausted, her losses in men amounted to half a million, and her great effort had reduced the country to a worse state than that of her allies. The fact, however, that for I. the war ended with a military victory encouraged a Nationalist movement, opposed to more moderate opinion in favour of an entente between I. and the succession states. The Nationalists demanded Fiume as well as the territorial gains promised in the treaty of London. (See FIUME.) The Adriatic problem (see ADRIATIC QUESTION) was unsolved and It. dissatisfaction with the Peace Treaty caused the resignation of Orlando, who was succeeded by Nitti. Domestic unrest in I. was heightened by the feeling aroused over the allied intervention in Fiume, following the *coup d'état* of D'Annunzio (q.v.) who on 12 Sept. 1919 occupied the city. The Adriatic Question was settled tentatively by the treaty of Rapallo, whereby I. surrendered the Dalmatian coast but secured sovereignty over Zara (Zadar), while Fiume was made an independent state. It remained for Mussolini to reach a definitive settlement, known as the treaty of Rome, Jan. 1924, whereby Yugoslavia exercised control over Port Barco and the Delta, and I. over Fiume. There also followed the Nettuno Commercial Agreements, but these were not ratified by the Yugoslav Gov. until 1928.

Benito Mussolini (q.v.) came into power in 1922 from being the leader of the *Fasci di Combattimento*, first organised by him in 1919 (see FASCISM). In the belief that I.'s ills were due to left-wing propaganda, the Fascist organisation was created for the purpose of suppressing Communism, and between it and the various leftist organisations a ruthless struggle began. In 1921 the Fascists were reorganised into a political party and now returned 30 members to Parliament, allying themselves with the Nationalists. A conflict with the gov. became inevitable. In 1922, taking advantage of the weak gov. leadership and the continuing social unrest throughout the country, which rallied much moderate opinion to their support, Mussolini organised the Fascist march on Rome. The Fascist columns advanced on Rome on 28 Oct., and 2 days later Mussolini arrived from Milan in response to a royal summons. He at once formed a cabinet in which he combined the premiership with the ministries

of foreign affairs and the interior. At the elections held in April 1924 the Fascists gained an absolute majority. Mussolini retained the form of parl. gov. for some time, and there was, at first, an organised opposition which hoped to oust Mussolini on the strength of the anti-Fascist feeling aroused by the murder of the Socialist, Matteotti. But Mussolini's policy of social reform, and the apparent internal peace he had estab., rallied the mass of the people to him, and he was soon able to suppress any remaining opposition without difficulty or fuss. Any prominent political opponents still left, e.g. Sforza (q.v.), went abroad or into prolonged political retirement. In domestic affairs the Fascist Gov. set the country to work, re-estab. the 8-hr day, and developed the policy of organising labour into syndicates, which were a species of trade unions, including both employers and workers, and under state supervision. An agreement with the Pope, and subsequent moderation by Mussolini on religious questions, gave him at least passive support from many devout Catholics who never became active Fascists.

In foreign affairs I. successfully encountered many difficulties—with Yugoslavia over Fiume (see above), with Greece over the murder of Gen. Tollini of the Albanian Frontier Commission, followed by the It. occupation of Corfu; with France over the treatment of It. minorities in France and Tunisia; with Turkey over Turkish fears of an It. annexation of Anatolia. I. was also a signatory to the Locarno treaties.

A rapid increase in pop., coupled with a dearth of war materials, led I. along the road of imperialism. Fascist policy tended to even greater aggressiveness, notably in rivalry with France, both in naval construction and in agitation for the revision of the Versailles Treaty. But partly owing to France's then dominating position in Europe, and Mussolini's dispute with the Vatican over jurisdiction in the educational sphere, the dictator was obliged to play the role of protagonist in the movement for a limitation of armaments and European security. But 5 years later Mussolini's aggressive policy towards Abyssinia sowed the seeds of a new European conflagration, besides menacing the whole existence of the League of Nations. Notwithstanding the existence of various treaties and conventions guaranteeing the integrity of Abyssinia, Mussolini announced his intention of annexing the country, and by May 1936 the It. forces were in occupation of the Abyssinian cap. (see ITALO-ABYSSINIAN WAR, 1935-6). Thus, in addition to the great ters. conquered in 1911, vast new regions were added in 1936; yet the number of Italians settled in E. Africa scarcely ever exceeded 30,000. The League of Nations considered collective action against I., but the idea was eventually abandoned. As a consequence the various European nations agreed to recognise officially the It. conquest of Abyssinia, and in 1938 as a prerequisite to recog-

nition Great Britain entered into an agreement with I., designed to prevent It. aspiration in Africa and It. support of Gen. Franco in the Sp. Civil War (q.v.) from becoming a source of open contention between the 2 countries. The agreement was not, however, put into effect until after the Munich Pact when Mussolini's prestige rose considerably as a result of his part in the settlement (see EUROPE, History). This event strengthened the ties between I. and Germany (already strong: the Axis was formed, Oct. 1936), even though the Ger. annexation of Austria earlier in 1938 had appeared to frustrate Mussolini's ambition of achieving a dominant position in SE. Europe. I.'s acquiescence in the annexation nullified the Franco-It. Pact of 1935 which was designed not only to regulate relations in Africa but also to preserve the independence of Austria. Later in the year (1938) the pact was formally denounced as a hostile gesture towards France whilst It. claims were launched for Djibuti, Tunis, Corsica, and Nice. Mussolini's aggressive intentions became more manifest, while at home his autocratic position was strengthened by the abolition of the Chamber of Deputies. In its place a Chamber of Fasci and Corporations was set up, having 800 members from the National Council of the Fascist party and the National Council of Corporations, nominated by Mussolini. The gov. had the right to promulgate decrees with the force of law, which were then placed before the chamber. The chamber dealt with constitutional laws, budget estimates, and also any matters previously authorised by Mussolini to be so dealt with. The real ruling authority was the *Gran Consiglio del Fascismo* (Fascist Grand Council), which was composed of the quadrumviri of the March on Rome, appointed for an indefinite period, a certain number of members (ministers and other high dignitaries) appointed for as long as they held their offices, and an indeterminate number of members appointed for 3 years by the head of the gov.

In April 1939 It. troops invaded Albania. King Zog fled, and the country was occupied, Victor Emmanuel III becoming also King of Albania. In May I. and Nazi Germany signed a treaty of alliance.

On the outbreak of the Second World War in 1939, I. was at first neutral, though obviously friendly to Germany. Nevertheless the following year, with the decline of allied fortunes in the W., Mussolini became convinced of Germany's victory, and on 10 June I. declared war on France and Great Britain. But, contrary to Mussolini's probable belief, the collapse of France did not bring the war to an end, and I. gained few territorial benefits. Economic conditions in I. became increasingly more serious. In Oct. I. launched an attack on Greece, but the stout resistance maintained by the Greeks caused the campaign to linger on through the winter with catastrophic results for the Italians. Moreover the It. Navy was

severely crippled by the attack which the R.A.F. made on the naval base of Taranto (Nov. 1940). Other events parallel with the lack of success in Albania, where an It. army was routed by the Greeks in Mar. 1941, were the loss of the prov. of Cyrenaica (see AFRICA, NORTH, SECOND WORLD WAR CAMPAIGNS IN) and the successful revolt of the Ethiopians which, aided by Brit. arms, resulted in the loss of Eritrea (Mar.) and the fall of Addis Ababa (April) (see ITALIAN EAST AFRICA, SECOND WORLD WAR CAMPAIGNS IN). Germany, however, succeeded in retrieving It. fortunes in both N. Africa and the Balkans,

excluding sev. leading members from the gov. Dissension within the Fascist party, however, broke into open revolt when Mussolini, after 2 meetings with Hitler in July, was unable to obtain a promise of adequate Ger. support against the coming invasion. By order of the king Mussolini was arrested, and Badoglio (q.v.) was called upon to form a gov. He at once put out peace feelers while at the same time publicly proclaiming the continuation of the war. A secret armistice was agreed while the Germans, in anticipation of some such move, tightened their grip in N. I. and also occupied the Rome airfields.

NAPLES AND VESUVIUS

and the reflected prestige helped to maintain the Fascist regime in I. which fell more and more under the control of Germany.

I. was associated with Germany in the defeat of Yugoslavia, and gained some ter. on the Dalmatian coast. I. also provided an occupying force for Greece. By June I. was at war with Russia and by the end of the year with the U.S.A. I.'s economic situation deteriorated still further, and her industry was entirely tied to Germany's war machine. With Ger. help, efforts were made to strengthen the hold of the Fascist party. At the end of the year I. occupied Nice and Corsica at the same time as the Germans moved into S. France.

The year 1943 (see ITALIAN FRONT, SECOND WORLD WAR CAMPAIGNS ON) saw the fall of Mussolini and an It. surrender to the Allies. After the allied invasion of Sicily Mussolini made a last bid to prepare the mainland of I. against invasion and to ensure the loyalty of the Fascist party by

On 8 Sept. following the allied landing at Salerno the armistice was declared. Badoglio set up his gov. in Brit. occupied ter., and on 11 Oct. I. declared war on Germany. The king was likewise maintained by allied authority, though his long association with Fascism had produced an anti-monarchical reaction in I. as a whole. In the N., on the other hand, Mussolini having been rescued from allied hands by Hitler's emissaries attempted to set up a republican Fascist régime. He revenged himself on those of his former supporters who had betrayed him but were now in his power. Among them were Ciano and de Bono who were tried and shot (Jan. 1944).

In June 1944 the allied armies entered Rome, and Victor Emmanuel retired in favour of his son, Prince Umberto. He did not, however, abdicate. Badoglio resigned, and Bonomi (q.v.), an elder statesman from the days before Fascism, formed a new gov. With an It. Gov. in Rome most of the occupied areas of S. I. were

handed over to It. control, and the gov. was recognised diplomatically by the U.N.

On 28 April 1945 Mussolini, with his mistress and 12 of his cabinet, was shot by members of the Partisan Movement which was resisting the Fascists in N. I. A few days later, 2 May, the Ger. Army in I. surrendered, and the liberation of I. was completed (see ITALIAN FRONT, SECOND WORLD WAR CAMPAIGNS ON). Bonomi, who considered his interim task now at an end, resigned, and was succeeded by Parri, a leader of the Partisans, who formed a coalition gov. with the Socialist leader, Nenni, and the Liberal leader, Brosio, as vice-premiers while Togliatti became minister of justice. A consultative assembly was set up, and local elections were held at the end of the year. Parri resigned in Nov., and a new gov. comprising 6 parties was formed by de Gasperi (q.v.). By this time the Allied Military Gov. had handed over to the It. Gov. the control of all ter. except Venezia Giulia and the Udine prov., while the economic situation was eased by supplies which reached I. from foreign sources through U.N.R.R.A.

On 9 May 1946 Victor Emmanuel formally abdicated and his son was proclaimed king as Umberto II (q.v.). But a referendum on the future of the monarchy held in June resulted in a majority in favour of a rep., and Umberto subsequently went into exile in Portugal. Elections were held for the Constituent Assembly under a new system of proportional representation which resulted in a gain of 207 seats for the Christian Democratic party, 115 for the Socialists, and 104 for the Communists out of a total of 556. The Constituent Assembly met on 25 June and proclaimed a rep., electing de Nicola as provisional president. De Gasperi continued as premier of a re-constructed coalition gov., the first for 25 years to consist of deputies freely elected. But the multiplication of small party groups, the wide divergencies among different sections of the Christian Democrats and the Socialists, and the fact that no single party had a working majority boded ill for the future political stability of the country.

The first event which confronted the new gov. was the peace treaty with the Allies, signed on 10 Feb. 1947. The It. Gov. at the time of signing registered a protest at the terms of the treaty while affirming that they would be loyally met. The treaty was an occasion of national mourning, and the terms whereby Istria, Fiume, and ter. E. of the Isonzo were ceded to Yugoslavia (with the exception of the newly created Free Ter. of Trieste) were considered a sad blow to I. and they did not satisfy Yugoslav ambitions. The chief among other conditions were that the Tenda-Briga area in the Maritime Alps was ceded to France and the Dodecanese Is. to Greece, while I. also lost her colonies in Africa and agreed to respect the independence of Ethiopia. (Since 1950, however, I. has administered the former It.

Somaliland on behalf of U.N. as a trusteeship ter.) I. agreed to pay substantial reparations over 7 years. Provisions were also made for the demilitarisation of frontiers and of is. in the Mediterranean, and for the limitation of armed forces. De Gasperi, at the head of a new coalition gov. (22 Jan. 1947), weathered the storm created by the peace treaty. Further unrest was being caused by the shortages of raw materials and other economic difficulties. The withdrawal of left-wing support overthrew the coalition gov. in May, but the following month de Gasperi formed a further gov. dependent mainly on the Christian Democrats. The Constituent Assembly, due to dissolve on 24 June, prolonged its own life until the end of the year, thus automatically postponing further elections, and it was in conditions of considerable political uncertainty that the Assembly addressed itself to its prime task of framing a constitution, which was passed Dec. 1947, and became law on 1 Jan. 1948 (see *Constitution* above). In May 1948 Luigi Einaudi was elected President of I. for a 7-year term.

The administration survived the critical period 1947-8 with relative ease. Strong Communist influence in the industrial N. was also beginning to affect the traditionally monarchist S. of I.; but here there remained powerful pockets of neo-Fascist influence. Neo-Fascism and monarchism also had some influence on the right-wing fringes of the Christian Democratic party. The general election of 1948 estab. the Christian Democrats as the major party of the right, though generally progressive in character. The successive de Gasperi administrations (he headed 8 between 1945 and 1953) always had to rely on support from other parties, latterly more and more on the right-wing Socialists and the Liberals, for, though the Christian Democrats were the largest single party in Parliament, they never had an overwhelming majority over all other parties combined. As time went by the leftish elements in the coalitions became increasingly dissatisfied with the gov.'s internal policy, which they regarded as insufficiently progressive. Considerable social reform was, however, carried out by de Gasperi and his successors, notably in the sphere of land reform, which especially affected S. I. But post-war I. has had to struggle continually against the poverty and unemployment irritated by her dense pop. and the lack of emigration facilities to drain off the surplus labour pool which undoubtedly exists. De Gasperi's foreign policy brought I. into N.A.T.O. (1949), and in the same year she became a founder member of the Council of Europe. His moderate influence soon re-estab. I.'s status in W. European politics: his alliances with the W. were bitterly opposed by the Communists. In 1952 I. entered the European Coal and Steel Community (q.v.). She had also planned to be a member of the European Defence Community (q.v.).

The Christian Democrats lost ground in the general election in 1953. In July de

Gasperi formed his eighth and last ministry. Only his own party members joined it, and it only lasted for a few days. De Gasperi's resignation marked the end of an era of relative political stability in I. Since July 1953 I. has been governed by a series of coalitions, though all under different Christian Democrat premiers; but generally its policy has lacked the continuity it had under de Gasperi. The year 1953 was one of considerable industrial unrest, which partly explains the leftist gains in the elections. In the following year the Montesi scandal became public, was exploited by the left, and for a time threatened the gov. It was alleged that a girl named Montesi, whose body was found in the sea at Ostia in 1953, had not died naturally by drowning but as a result of a drug orgy in which the son of the foreign minister, Piccioni, was involved; and that the true facts had been suppressed by the police on political grounds. The gov. survived, but Piccioni, one of the ablest members of it, resigned; and the case continued to disturb It. politics until 1957, when the trial of Piccioni's son and 2 others allegedly involved in the case opened.

In Oct. 1954 I. and Yugoslavia finally reached agreement over the Trieste problem, thus settling a 9-year dispute. Under it, I. obtained an area including Trieste city, and Yugoslavia the area around it, where the pop. was mainly non-Italian. Trieste was to remain a free port. Although the decision displeased the It. extremists, who had wanted the entire Trieste ter. to be returned to I., it was on the whole a solution more favourable than I. could have envisaged at the end of the war. On the failure to ratify E.D.C., I. was a party to the London and Paris Agreements (q.v.) which estab. a permanent defensive organisation in W. Europe, and she is a member of W. Union (q.v.). In 1955 Gronchi succeeded Einaudi as president of the rep. During 1956 the prestige of the It. Communists declined as the result of the risings in Hungary and Poland, and of the fluctuations in Soviet statements on party philosophy. By 1957 the alliance between the Communists and left-wing Socialists under Nenni had been broken. But Communism remains an extremely powerful force in I., though the influence of the Catholic Church is an important counter to this, even in the industrial N., as well as the considerable social reforms effected in the past 12 years by the more right-wing parties. Since the Second World War a notable feature of It. foreign policy, apart from the W. alliance, has been the stress on friendship with the Arab states, an attitude shown strikingly at the time of the Suez crisis in 1956.

**Minority problem.** I. has (1957) about 200,000 inhab. who have no love for I. These are the Ger.-speaking people who live in the northernmost prov. of Bolzano, bordering on Switzerland and Austria. Petitions demanding a severance of the ties with I. were sent to the Paris conference of 1946. Some of the petitioners

hoped for an independent Tirolean State, others called for reunion with Austria. In the result Grüber, the Austrian foreign minister, and de Gasperi, the It. Prime Minister, signed an agreement between themselves at Paris, Grüber acknowledging the Brenner frontier, de Gasperi, in return, promising local self-gov. or autonomy within the framework of the It. State for the prov. of Bolzano and the few mixed-language coms. in the S. prov. of Trento. This agreement was highly unpopular in both I. and Austria, both the signatories being accused of signing away a national birthright. Since that date there has been continued agitation among the Ger.-speaking minority for a severance of the ties with I., and some ill-judged disciplinary actions by the It. authorities have given colour to allegations that the It. administration does not always act fairly towards the minority in this area.

**Italy, British Army in (First World War).** The disastrous It. defeat at Caporetto (q.v.) occurred in Nov. 1917, but before the close of the year the Brit. Gov. sent out 5 divs. These reinforcements were a vital moral influence in restoring what seemed a desperate situation. In Mar. 1918 two of these divs. were, however, sent to France in view of the impending Ger. attack on the W. Front. When the Austrian offensive of May 1918 opened the Brit. forces, under the command of the Earl of Cavan, were disposed on the Asiago Plateau. While the Italians were repulsing the enemy in the Adamello passes the British repulsed them on the plateau and both allies took many prisoners and guns. On 15 June the Austrians

launched a heavy offensive from Aslago to the sea with 600,000 men, crossing the Piave the same day at Montello and near the mouth. The Brit. forces assisted in hurling the Austrians across the riv. again and involving them in the tremendous defeat of the early autumn, which ended in the armistice with them being signed on 4 Nov.

**Italy Star**, Brit. military decoration, instituted in 1945 for entry into operational service on land in Sicily or in Italy at any time during the campaign there from the capture of Pantellaria on 11 June 1943 until 8 May 1945. The ribbon is in lt. colours, green, white, and red.

**Itch**, any irritating skin disease. The commonest form is scabies, a disease caused by the animal parasite, *Sarcoptes scabiei*, which burrows under the skin and causes intense irritation leading to scratching on the part of the patient with resulting rawness, scabs, and eczematous conditions. It may occur on any part of the body, but rarely on the scalp and often between the fingers. The treatment is application of sulphur ointment. **Barber's I.** is caused by a fungus and affects the hair follicles, particularly those of the beard. The inflammation set up leads to the formation of pustules at the root of each hair affected. **Cuban I.**, an irritating skin disease introduced by soldiers from Cuba; it is supposed to be a mild variety of smallpox. **Coochie I.**, a skin inflammation common amongst field workers in Assam and other tropical countries. It is caused by the larvae of *uncinaria duodenalis*, and the eruptions are confined to the surface of the lower extremities.

**Itch-mite**, name given to the species of Sarcoptinae, a subfamily of arachnids which are parasitic on the skin of mammals, birds, and insects. *Notodres*, *Protopodectes*, *Sarcoptes*, and *Chorioptes* are among the commonest genera. *S. scabiei* attacks the skin of man, and produces the disease known as scabies (see ITCH).

**Iteso**, or **Itesot**, see **TESO**.

**Ithaca**: 1. Colloquially called **Thiaki**, one of the Ionian Isles, and lies E. of Cephalonia. It has an area of 40 sq. m., and is mountainous. Wine and olive oil are the chief productions. The chief tn is I. or Vathy (pop. about 3200). This is. is noteworthy as having been the home of Ulysses. Pop. about 7250.

2. Tn, cap. of Tompkins co., New York, U.S.A., on Cayuga Lake. Cornell Univ. is situated here. I. manufs. firearms, business machines, salt, fertilisers, cement, clay and wood products, clothing, and electric clocks. Pop. 29,257.

**Ithome**, name of a fortress and mt in Messenia, anct Greece. The fortress played an important part in the Messenian wars waged against Sparta during the 8th, 7th and 5th cents. BC.

**Itil**, cap. of the medieval Khazar Khanate (see **KHAZARS**), was situated on the lower Volga near the present Astrakhan.

**Itinerary** (Lat. *iter*, a journey), name applied by the Romans to a list of the

stopping-places, or halts, with the distances from one to another, between 2 places of importance. The I. was generally divided into 2 classes, one having the character of a book, and the other being a kind of travelling map. Of the former, the most important are the *Itineraria Antonini* and *Hierosolymitanum*. Of the latter only one great example remains, viz. the famous *Tabula Peutingeriana*. The first of the 2 I.s named above gives the stations and distances along the imperial highways; it dates from the reign of Diocletian (AD 285-305). The second, made by an anonymous pilgrim to Jerusalem (AD 333), gives the stations and distances along the road from Bordeaux to the Holy City and from there to Milan via Valona and Rome. Neither was an official compilation. The *Tabula*, likewise a private document, is a copy made in the 12th cent. AD from the 4th-cent. map of Castorius. See R. Miller, *Itineraria Romana*, 1916.

**Ito Hirobumi**, Prince (1838-1909), Jap. statesman. In 1863 he worked his way before the mast to London, and joined others of his nation who had come to Europe to study W. civilisation. He returned to Japan in 1865, and took an active part in the social and political reorganisation of the country. From being minister of public works he rose to the rank of Prime Minister in 1880, which office he held 4 times. He was selected by the Mikado to study the various forms of constitutional gov. in Europe, and was the author of the Jap. constitution of 1889, which in many respects was more liberal than that of sev. European countries. He was made prince in 1907, and appointed Resident-General of Korea after the Russo-Jap. war, meeting his death at the hands of a Korean at Kharbin.

**Itri**, It. tn in Lazio (q.v.), 36 m. SE. of Latina (q.v.). It was severely damaged during the Second World War. Fra Diavolo (q.v.) was b. here. Pop. 3000.

**Itú**, tn in Brazil, at 2000 ft, on the R. Tietê, 45 m. WNW. of São Paulo. It is the centre of a great cotton, sugar, and coffee producing dist., and has cotton factories and iron and bronze foundries. There is an airport. Pop. 38,000, including suburbs.

**Iturbide**, Agustín de (1783-1824), for 10 months Emperor of Mexico, was a Creole of Basque parentage. In early life he much distinguished himself as a soldier in the Royalist cause, which was then endangered by Hidalgo's and Morelos's rebellions. On 18 May 1822 he accepted from his devoted soldiers the title of Emperor Agustín I, for the Sp. Cortes refused to recognise the virtual independence of Mexico as set forth in the treaty of Córdoba. After a compulsory abdication (1823), the result of his arrogance and despotism, he went into exile on the Continent and in London, and on returning was met and shot. See M. André, *La Fin de l'Empire espagnol de l'Amérique*, 1922; W. S. Robertson, *Iturbide of Mexico*, 1952.

**Iturea**, dist. in anct Syria, between

Damascus in the S. and the Lake of Tiberias in the NE. Before the time of Augustus it was ruled by native princes; but that emperor gave it to the family of Herod.

**Itzehoe**, Ger. tn in the *Land* of Schleswig-Holstein (q.v.), on the Stör, 37 m. SW. of Kiel (q.v.). It grew up around a fortress built by Charlemagne (q.v.). During the Thirty Years War it was the H.Q. of Wallenstein (q.v.), and in 1657 it was razed by the Swedes. There is an abbey (13th-17th-cents.), and a fine baroque church. Cement, pumps, nets, and paper are manuf. Pop. 35,000.

**Iudrio**, see **ISONZO**.

**Iuka**, tn in Mississippi, U.S.A., co. seat of Tishomingo co., is 22 m. SE. of Corinth. Here the Federals under Gen. Rosecrans defeated the Confederates under Gen. Price in 1862. Pop. 1300.

**Iulus**, see **ASCANIUS**.

**Iulus**, see **JULUS**.

**Ivan**, name of 6 rulers of Moscow and Russia, of whom the following played particularly important roles:

**Ivan I** (1301-40), prince of Moscow 1305, grand prince 1328. He was nicknamed 'Kalita' or 'Money-Bag.' Cunning and economical, he began the process of consolidating Russian ters. Under him Moscow became the metropolitan see of the Russian Church in place of Vladimir.

**Ivan III** (1440-1505), sometimes called 'the Great,' grand prince 1462. He greatly extended the Muscovite ter., absorbing the Novgorod rep., Tver, and sev. other principalities. He married a niece of the Byzantine Emperor Constantine IV Paleolog. He finally freed Russia from the Tartar yoke by stopping the payment of tribute to the Golden Horde (q.v.), 1480. He subsequently claimed the title of Tsar, i.e. Caesar. He introduced a legal code, 1497.

**Ivan IV** (1530-84), called 'the Terrible,' Tsar of Moscow and 'all Russia.' He succeeded to the throne in 1533 and was crowned Tsar at the age of 17. From 1547 to 1560 he ruled with the aid of a group of good advisers from among the clergy and boyars, called a Zemskiy Sobor (Assembly of the Land) (q.v.); he introduced a new code of law (1551), conquered Kazan' and Astrakhan, and estab. diplomatic and commercial relations with England. From 1560 to the end of his life, however, he became almost insanely tyrannical and was responsible for a number of ruthless massacres. Under him Siberia was conquered in 1582. He was married 7 times.

**Ivanov, Nicholas** (c. 1858-1918), Russian soldier; son of a common soldier accidentally killed when I. was 12 years old at a military review in the presence of Alexander II, who had I. admitted to a military school and helped his advancement. In the First World War he commanded one of the armies operating in Galicia; won much distinction, capturing Lemberg and Przemyśl. In 1915, after the Russian retreat, he resigned his command, but was retained at H.Q. by the tsar—who telegraphed to him when the revolution

threatened. I. thereupon made a dash for the cap.; but when he learned that he would be totally unsupported there, he desisted. On 16 Feb. 1918 it was reported at Petrograd that I. had been killed in action at Kiev.

**Ivanovo**: 1. Oblast in central Russia, NE. of Moscow, situated on a level plain and partly covered with mixed forests. There are peat deposits. It has an extensive textile industry, an engineering industry, and old handicrafts are practised. Agric. produce consists largely of potatoes and other vegetables and dairy products. The prin. tns are 1., Kineshma, and Shuya. Area 9500 sq. m.; pop. 1,500,000 (Russian).

2. (1871-1932, **Ivanovo-Voznessensk**) Cap., economic and cultural centre of the above, 145 m. NE. of Moscow. It is the second largest textile industry centre in the country (after Moscow); it also has engineering (textile and peat-working machines) and food industries, and there are 2 peat-fed power stations. I. dates from the 14th cent.; since the early 17th cent. it has been known as a commercial and manufacturing centre, though it remained a vil. until 1871. Prior to 1861 most workers and factory owners were serfs. From the 1880's it was a centre of the labour movement, and in 1905 was the seat of the first Soviet of Workers' Deputies. It was one of the main strongholds of the Bolsheviks, both before 1917 and during the period of 'proletarian dictatorship' (1917-30). Pop. (1956) 319,000 (1871, 18,000; c. 1914, 168,000; 1926, 111,500; 1932, 182,000; 1939, 285,000).

**Iveagh, Edward Cecil Guinness, 1st Earl** of (1847-1927), philanthropist, b. Clontarf, co. Dublin; third son of Sir Benjamin Lee Guinness, M.P., 1st Baron. Educ. at Trinity College, Dublin. From 1886 he was chairman of the limited company then formed to take over the business of Guinness's brewery, but he retired from active work on the board in 1889. His first charitable donation was a quarter of a million to be spent in building homes for the poorest workmen of London and Dublin. This fund is now controlled by the London and Dublin Guinness Trusts for Housing the Poor. Guinness became a peer in 1891, and soon afterwards embarked on a scheme for clearing and replanning 7 ac. of slum in Dublin city. Here he arranged for labourers' dwellings, a public pleasure garden, swimming baths, and a concert hall. Although a Unionist, he was offered the Lord-Mayoralty of Dublin in 1909. In 1919 he was made an earl.

Ken Wood Mansion, Hampstead, together with its pictures and furniture, was bequeathed in 1927 by I. for the benefit of the public, together with an endowment fund of £50,000. He also bequeathed the grounds and park of some 74 ac. to the public. The grounds and park are controlled by the L.C.C.; the mansion and its contents and the endowment fund are controlled by trustees. There are 68 paintings, including representative pictures by Boucher, Crome, Cuyp, Gainsborough, Frans Hals, Hoppner, Landseer,

Lawrence, Morland, Van Ostade, Raeburn, Rembrandt, Reynolds, Romney, Rubens, Turner, Van Dyck, and Vermeer. See *Dictionary of National Biography*, 1922-30.

**Ivel**, trib. of the Great Ouse, flowing N.E. and N. through Beds, England. The confluence is at Tempsford. Length 30 m.

**Iverna**, see **IRELAND**.

**Ives, Frederic Eugene** (1856-1937), Amer. photographic inventor. At the age of 18 he was put in charge of the photographic laboratory of Cornell Univ.; so remained till 1878, when he invented the first half-tone process; invented current process in 1886. He also invented in 1894 the photo-chromoscope, a device by which a single positive image in natural colours is produced by a combination of 3 negative ones. The reader is referred to I.'s own pubs. for the best account of his work. These include *Isochromatic Photography*, 1886, and *A New Principle in Heliochromy*, 1889.

**Ivinghoe**, vil. of Bucks, England, 9 m. from Aylesbury. It has a fine 15th-cent. church. **I. Beacon** (762 ft) and Ringshall or **I. Common** were acquired by the National Trust in 1926. **I. mill**, between **I.** and Pitstone, 3 m. N. of Tring, Herts, is probably one of the oldest remaining post-mills in England. It is preserved as an historic landmark. Pop. 807.

**Iviza**, see **IBIZA**.

**Ivory**, term properly given only to the material which forms the tusks of elephants; it is that modification of dentine, or tooth-substance, which in transverse sections or fractures shows lines of different colours, or striae, proceeding in the arc of a circle, and forming by their decussations minute curvilinear lozenge-shaped spaces' (Sir Richard Owen, *Lectures*, 1856). These tusks are sometimes of tremendous size, a single specimen occasionally weighing 200 lb., and are distinguished from the teeth of most animals in that they are imbedded in semi-solid vascular pulp, and continue to grow in size during the whole life of the elephant. The term **ivory** is often extended to a similar substance obtained from the walrus, narwhal, hippopotamus, etc. The **I.** from the African elephant is the most esteemed on account of its superior density and whiteness, but a certain amount is also obtained from India, Ceylon, Burma, and the is. of the E. Archipelago. In African elephants both the males and females have tusks, although those of the males are larger, but in the Indian species the females are practically tuskless. The 'fossil' **I.** obtained from the extinct mammoth in Siberia is too brittle to be of much value. Antwerp is the chief market for **I.** **I.** is valued according to the size and soundness of the tusks. The natives have discovered the superior value of newly obtained tusks, and palm off a large quantity of 'dead' **I.**, which has been buried for cents., upon unwary traders. The special qualities of **I.**, its beautiful texture and tints, its perfect elasticity and adaptability to the carver's tools, have been recognised from the earliest times, and examples of carved **I.** dating from the

time of Moses are still in existence. **Vegetable I.** is the name given to 'Corozo Nut', the hard, white, potato-like endosperm contained in the seeds of the palm-like tree (*Phytelphus macrocarpa*) which grows in the low, hot valleys of the Andes. It is valued at about £10 a ton, and is used for buttons, etc. For another substitute for **I.** see **CELLULOID**. See **IVORY CARVING**. See also **A. Maskell, Ivories**, 1906.

**Ivory, Vegetable**, see **IVORY**.

**Ivory Carving**. Since earliest times ivory has been used either alone or in conjunction with silver and bronze as a decorative material. It has been a feature of the decoration of palaces, and the Romans sent an ivory throne to Persena, while in the 19th cent. an Indian prince sent one to Queen Victoria. Ivory has also been used a great deal for religious purposes in such things as crucifixes, the heads of pastoral staves, liturgical combs, and even altar-pieces. Secular works of art in which ivory has been employed include seals, hunting-horns, knick-knacks, snuff-boxes, toilet combs, mirror cases, chess-men, and draughts. Prehistoric man used pieces of bone, horn, and ivory for his sketch-book, and scratched on them drawings of animals. The ancient Egyptians and Assyrians used ivory for domestic purposes and for the decoration of furniture, and Egyptian ivory statuettes have also been found. The ivory sculpture of the medieval African empire of Benin is remarkable. The Greeks used ivory for the decorations on the trappings of their horses and for the bosses of their shields and for small boxes and caskets. Ivory was sometimes used by Greek sculptors in combination with the precious metals, as in the celebrated chryselephantine figures of Athena in the Parthenon (q.v.) and that of Zeus at Olympia, both by Phidias (q.v.).

Of Rom. ivories we possess numerous consular diptychs, often from writing tablets and plaques which are beautifully carved in relief. The subjects of these carvings were usually classical myths or images of Rom. gods. The earliest Christian ivories in existence date from the time of Constantine and among these we have pyxes carved from ivory tusks, plaques, and book-covers. Byzantine ivories have survived in considerable numbers and share with the mosaics the austere ideals of their age. Up to the end of the 14th cent. **I. Cs.** were usually of religious subjects, although often used for secular purposes, but after this date hunting scenes, deeds of chivalry, and pictures of tournaments were depicted, the sculptures being influenced by the romantic literature of the period. In India, ivory has been much used for caskets, many of which are extremely elaborate. Chinese ivories, often ingeniously trivial, frequently use the natural curve of the tusk to great advantage in figure carving. Jap. **I. Cs.** are liable to be niggling in detail and tortuous in form. They illustrate a wide range of legend and folklore, notably in *netesuke* (q.v.). In both ancient and modern times ivory has been used for sculpture, either

alone or in conjunction with bronze and jewels. Modern examples of ivory sculpture that may be mentioned are the 'Lamia' of George Frampton and the 'St Elizabeth' of Alfred Gilbert. See A. Maskell, *Ivories*, 1906.

**Ivory Coast**, Fr. colony on the W. coast of Africa, bounded on the S. by the Gulf of Guinea, W. by Liberia and Fr. Guinea, N. by Upper Senegal and Niger, E. by Ghana. Coastal plains extend inland about 40 m., beyond which the ground rises from a general height of about 1000 ft to the plateau of the Kong ter. (4757 ft), which is largely covered with almost impenetrable, primeval forest, interspersed with

French and 1893 foreigners. See T. J. Clozet, *Dix ans à la Côte d'Ivoire*, 1906; G. Hanotaux, *L'Empire colonial français*, 1929.

**Ivrea**, It. tn in Piedmont (q.v.), 34 m. NE. of Turin (q.v.), on the Dora Baltea. It dates from Rom. times, and has an 11th-cent. cathedral, a 14th-cent. castle, and other anct buildings. Typewriters and textiles are manuf. Pop. (tn) 11,400; (com.) 17,400.

**Ivry-la-Bataille**, Fr. vil. in the dept of Eure, on the Eure. Henry IV (q.v.) defeated an army of the League (q.v.) here in 1590. Musical instruments are manuf. Pop. 1300.

#### JAPANESE IVORY CARVERS

patches of savannah. The rivs. are of little importance, and all drain into the Gulf of Guinea. The chief products are maize, plantains, rice, bananas, pine-apples, and ground-nuts, all of which are cultivated by the natives; and rubber, coco-nuts, cocoa, the production of which is fostered by the French for export trade. There are also mahogany forests. Main exports are palm oil and kernels, mahogany, bananas, and cocoa. Chief imports are tobacco, wines, machinery, textiles, and motor fuel. There are 494 m. of railway and 3565 m. of motor roads, most of which feed the railway. The cap., Abidjan (pop. 117,000 Africans, 8000 Europeans), could be made into a first-rate port. There is some gold, and considerable deposits of manganese have been found. I. C. is represented in the Fr. National Assembly by 2 deputies, in the Council of the Rep. by 3 councillors, and in the Assembly of the Fr. Union by 4 delegates. Area approximately 180,000 sq. m.; pop. 2,447,961, including 15,000

Ivry-sur-Seine, Fr. tn in the dept of Seine, a SE. suburb of Paris. It has a hospice for incurables. There are breweries, earthenware, and engineering works. Pop. 42,400.

**Ivy**, or *Hedera helix*, family Araliaceae. It is an old-world plant, which climbs by means of aerial roots, bears 2 forms of leaves, and has small flowers which secrete a great deal of honey and are therefore pollinated by insects. The ground-ivy, or *Nepeta hederacea*, is a species of Labiatae unallied to the common I.

**Ivybridge**, small tn of Devon, England. It is situated in the valley of the Erue, about 10 m. NE. of Plymouth, and has paper mills. Pop. 2039 (1954).

**Ixelles** (Flém. *Elsene*), suburb of Brussels, Belgium, in the SE. of the city. It has manufs. of furniture, porcelain, pottery, organs, and chemicals. On its ter. are the restored abbey of the Cambre, occupied now by the Belgian Cartographic Institute, and the modern building of the National Radio Institute. Pop. 92,300.

**Ixia**, family Iridaceae, genus of about 30 S. African, cormous plants, of which *I. odorata*, *I. paniculata*, *I. patens*, and *I. viridiflora*, etc., are grown for their spikes of beautiful flowers.

**Ixiolirion**, genus of amaryllidaceous plants, of W. Asia. There are 3 species, and of these *I. kolpakowskianum* and *I. montanum* are cultivated in Britain.

**Ixion**, legendary king of Thessaly, son of Phlegyas, and husband of Dia. All men shunned him when he murdered his father-in-law, but Zeus in pity bore him to Olympus. I., however, abused the god's hospitality, and strove to seduce his wife. Embracing a cloud, which he believed to be Hera, he became father to the Centaurs. Zeus punished him in Tartarus by binding him to a fiery wheel in perpetual motion. There are variations of the legend.

IVY

**Ixodidae**, see TICKS.

**Ixora**, family Rubiaceae, genus of about 150 species of tropical shrubs or trees, of which *I. coccinea* and varieties, *I. chinensis*, and *I. lutea* are popular stove flowering plants in Britain.

**Ixtaccihuatl** (Aztec 'white woman'), extinct volcano SE. of Mexico City. Altitude 17,342 ft. It is joined by a ridge to Popocatepetl (q.v.).

**Iyar**, or **Yiar**, eighth month of the Jewish year (April-May).

**Izabal**: 1. Dept. of E. Guatemala, Central America, on the Caribbean coast. It is low and unhealthy, with extensive forests. Bananas are grown and lumbering carried on. The cap. is Puerto Barrios. Area 3489 sq. m.; pop. 56,000.

2. The former cap. of the above prov., situated on the S. shore of Lake I. Pop. 100.

**Izamal**, agric. tn of Yucatán, Mexico, 50 m. E. of Mérida, with which it is connected by rail. It has many anct ruins, which are visited by Indian pilgrims. Pop. 6000.

**Izard**, see CHAMOIS.

**Izdubar**, name given to the hero in a Babylonian epic, who is now known as Gilgamesh (q.v.).

**Izegem**, tn in the prov. of W. Flanders, Belgium, 20 m. S. of Bruges. It is engaged in agriculture and manuf. of linen, footwear, woollen goods, lace, chicory, bristles, and chocolate. There is an active wholesale trade in flax. Pop. 16,800.

**Izhevsk**, city in Russia, cap., economic and cultural centre of the Udmurt Autonomous Rep. (q.v.). It is an important centre for engineering (motor-cycles, small arms) and ferrous metallurgy. It was founded in 1760 as an iron foundry, destroyed by Pugachév (q.v.) in 1774, and has been a tn since 1918. I. workers overthrew the Communists in the tn in Aug. 1918 and formed the 'Izhevsk division', which fought on the side of the Whites. Pop. (1956) 252,000 (1920, 45,000; 1939, 176,000), mostly Russians.

**Izmail** (Rumanian **Ismail**), tn in Besarabia, of Odessa Oblast, Ukraine. It is a port on the Danube, and seat of the Soviet Danube Shipping Administration. Pop. (1956) 43,000 (1892, 31,000). Known since 16th cent. as Turkish fortress. Stormed by Suvorov, 1790. From 1944 to 1955 cap. of I. Oblast, now abolished.

**Izmir** (Smyrna), cap. of an il of its own name, Asiatic Turkey, occupies the site of a former city on the slopes of a hill at the head of the Bay of I. It is one of the most important and flourishing seaports of the Levant, and the second port of Turkey, carrying on a large trade in silk, cotton, carpets, wool, opium, madder, copper, olive oil, drugs, gums, figs, sponges, valonia, and raisins. The harbour is large, and ships of heavy tonnage can anchor close to the quays. Three-fifths of I. was destroyed by fire in 1922; the rebuilt tn is modern and spacious, and is an important railway and commercial centre, with machine shops, foundries, tanneries, perfumeries, cotton-spinning, carpet-making, and many minor industries. I. is served by an electric tramway, and has railway connection with Kassaba and Aydin. I. was founded by Greeks probably about 1000 bc, and 300 years later it formed part of the Ionian League. The first city was situated about 3 m. N. of the modern city, and was destroyed by Alyattes, the Lydian king, in 630 bc. The second city was built by Antigonos and many magnificent buildings were erected by Lysimachus. Earthquakes, fire, and plagues have ravaged the city at various times; it was besieged and practically ruined by Timur in 1402, and 22 years later it fell into the hands of the Turks, who have retained possession of it. By the treaty of Sévres, 1920, I. and the ter. surrounding it were placed under the administration of Greece for 5 years, Turkey retaining the sovereignty. This gave rise to much dissatisfaction. Greece had already, 1919, occupied the city, and fighting occurred between the Greeks and the Turks, who, under Mustafa Kemal, took I. in 1922. By the treaty of Lausanne (q.v.) I. was returned to Turkey. The Armenian and Gk pop. was deported. Pop. (tn) 286,310; (il) 898,400.

Izmit, tn in Turkish il of Kocaeli at the head of the gulf of the same name. It was the anct Nicomedia (q.v.) and was the seat of the kings of Bithynia. It is the centre of a rich tobacco dist. and a naval base. Pop. 56,702.

Izu-schichi-to (the 7 is. of Izu) lie S. of Tokyo Bay, Japan. They are volcanic is.; 3 craters are active, and Izu-no-Oshima has a well-known smoking volcano (Mihara, 2500 ft). The is. were used as convict settlements.

'Izvestiya' (Russian 'news'), Russian daily newspaper pub. by the Presidium of the Supreme Soviet (*see* SOVIET) of the U.S.S.R. It was founded after the Feb. Revolution (q.v.), 1917, as the organ of the Petrograd Soviet. From Aug. 1917 it was pub. jointly by the Central Executive Committee of Soviets and the Petrograd Soviet. After the seizure of power by the Bolsheviks (*see* OCTOBER REVOLUTION) I. became editorially a replica of *Pravda* (q.v.). It was transferred to Moscow, 1918.

**J**, tenth letter of the Eng. alphabet, is one of the few permanent additions of the Middle Ages to the Semitic-Gk-Lat. alphabet. In exact terms it was not an addition, but a differentiation from an existing letter. *I* in Latin, besides being a vowel, had the consonant value of *y*, as in *index* and *major*. The symbols *i* and *j*, a lengthened form of *i* with a curve to the left, were used in the early Middle Ages indifferently for both the consonant and the vowel sound, the sign *j* being used in hands current at this time. At a later stage, from the 14th cent. onwards, the symbol *j* was used for distinctive purposes, particularly when *i* had to be written initially or in conjunction with another *i*. The sound *j* (*dzh*) came into English through French, where it had changed in sound from *y* to *zh*, cf. Fr. *juge* which became Eng. 'judge,' but the Lat. value of *j* as *y* may still be found in words of Hebrew or other origin, as *hallelujah*, *junker*, and so forth. In French the sound *zh* was also represented by *g*. Consequently, such words, in passing into English, by analogy with words like 'judge,' have an alternative spelling of *g* and *j*; for example, M.E. *geste*, *Gives*; Mod. E. 'jest,' 'Jews.' This accounts for variations in the spelling of words like 'gaol'—'jail'; 'gibe'—'jibe'; 'Geoffrey'—'Jeffrey'; 'serjeant'—'sergoant.' See ALPHABET.

**Jabal**, see JUBAL.

**Jabalpur**, or **Jubbulpore**, tn of Madhya Pradesh state, India, 150 m. N.E. of Nagpur, near the Nerbudda R. Formerly the Great Indian Peninsular railway ended here, and the E. Indian railway system began; but between 1920 and 1930 the Great Indian Peninsular railway took over the railway between J. and Allahabad and the junction of these lines is now at the latter tn. J. is a fine tn with many good public buildings. It was largely from J. that Col. Sleeman directed his operations against the Thugs (q.v.). The jungles near by are famous for tiger shooting.

**Jabbok** (Nar-oz-Zerka), mt stream of Gilead, one of the prin. tribs. of the Jordan. It rises in Jebel Hauran and enters the Jordan 30 m. above the Dead Sea. It has many scriptural associations, and is first mentioned in connection with the meeting of Jacob and Esau. Its length is 110 m.

**Jabea**, see JAVEA.

**Jabesh-Gilead**, city of Gilead in Palestine E. of the Jordan, where Saul and his 3 sons were buried. They were Benjamites and so had tribal connections with the city (Judges xxi). According to Josephus J.-G. was the metropolis of the Gileadites. The site is now uncertain.

**Jabiru**, or **Mycteria**, genus of birds belonging to the Stork family (Ciconiidae). The Amer. J., which is found from the Argentine northward to Mexico, stands

sometimes as much as 5 ft high, has pure white plumage except for a black neck and head, and massive, slightly upturned bill. Other species occur in India, Australia, and Africa.

**Jablonec nad Nisou** (Ger. Gablonz), Czechoslovak tn in the region of Liberec (q.v.). It is well known for artificial gems and glassware, and also manufs. textiles and paper. Pop. 23,300.

**Jablonica**, or **Jablonitz**, Pass, in the Carpathian Mts, due W. of Czernowitz (Cernauti). During the First World War the Russian S. Army captured this important pass in Aug. 1916. The pass is now in the Ukrainian S.S.R.

**Jabne** (**Jamnia**), Israel, near Ashdod, 3 m. from the Mediterranean, was an anct Philistine stronghold. It was taken by the Israelites and played an important part in Jewish hist. It was conquered by the Maccabees and became the centre of Jewish scholarship. The sittings of the Sanhedrin were held here after the destruction of Jerusalem. Near the modern vil., Yabna, built on the anct site, are the remains of a fortress built by the Crusaders.

**Jaborandi**, native Brazilian name for a number of drugs prepared from several rutaceous plants, but particularly from the leaflets of *Pilocarpus pennatifolius*. The leaflets, when dried, are valuable for their sialogogue and diaphoretic actions. They contain 2 alkaloids, pilocarpine and jaborine, a volatile oil and a bitter substance. The effect of J. is to produce muscular relaxation, salivation, and perspiration. J. is now seldom used in medicine.

**Jaca**, Sp. tn in the prov. of Huesca, on the Aragón, with a fine Romanesque cathedral, probably the oldest in Spain, and a massive citadel. Pop. 9,500.

**Jacamars**, little-known species of birds, found in the dense tropical forests of S. America, E. of the Andes, and classed in the family of the Galbulidae. The golden, bronze, and steely lustre of their brilliant plumage, and the length and sharpness of their straight bills, are their chief characteristics. They are usually seen sitting motionless on trees from where they fly out to catch insects on the wing. The largest species is the *Jacamerops grandis*.

**Jacana**, bird of the family Jacanidae whose most striking feature is the length of their toes and claws, which enables them to travel on the flat leaves of water-lilies and other riv. plants. Their eggs are a rich olive-brown, usually streaked with dark lines. The common J. (*Parra jacana*) of Brazil is black with green plumage on the wings and a warm-brown neck. In habit it resembles a water hen. The *Hydrophasianus*, or pheasant-tailed J., frequents the marshes and lagoons of India and China and is the largest of all the genera. (See illustration, p. 256.)

**Jacaranda**, genus of Bignoniaceae,

pub. *Great Frozen Land*, 1895, *A Thousand Days in the Arctic*, 1899, and *Lure of Unknown Lands*, 1935.

**Jackson, Helen Hunt** (1830-85), Amer. novelist, *b.* Amherst, Massachusetts, daughter of a prof. of classics, her maiden name being Helen Maria Fiske. In 1852 she married E. B. Hunt, and soon after his death in 1863 she turned to writing. In 1875 she married Wm S. J. Her works include 2 books championing the cause of the Red Indians, *A Century of Dishonour*, 1881, and *Ramona*, 1884, a novel. Another of her novels, *Mary Philbrick's Choice*, 1876, is based on the character of Emily Dickinson (q.v.), with whom she was at school. See study by R. Odell, 1939.

**Jackson, Holbrook** (1874-1948), literary historian, *b.* Liverpool. He started earning a livelihood in commerce at the age of 15. He had, however, determined on a writer's career and entered journalism in 1907, becoming joint-editor with A. R. Orage of the *New Age*. He also contributed as a freelance writer to most of the leading periodicals of the day. In 1910 he was associated with T. P. O'Connor in the latter's pub., and became editor of *T.P.'s Magazine* (1911-12) and of *T.P.'s Weekly* (1911-14). From 1917 to 1923 he was both owner and editor of a literary jour., *To-day*. In addition to his interest in literature and book-collecting he was from 1917 until his death editorial director of the National Trade Press. He was also chairman of the Brit. Colour Council, 1933-4, having interested himself in fashions in colour and their introduction. His first pub. book was an essay on Edward Fitzgerald with a bibliography (1899). He was the first to write a full-length study of Bernard Shaw (1907) and also wrote a biography of Wm Morris (1908). His book *Eighteen Nineties*, 1913, is a standard work on the period. An authority on book production, he collaborated in *A Brief Survey of Printing*, 1923, and was author of *The Printing of Books*, 1938. His vast knowledge, technical, literary, and antiquarian, his love and care of books were the resources out of which he wrote his *Anatomy of Bibliomania* (2 vols.), 1930-1, a work modelled on Burton's *Anatomy of Melancholy*. His pub. vols. of essays include *Southward Ho!*, 1914, *Occasions*, 1922, *Essays of To-day and Yesterday*, 1923, and *Maxims of Books and Reading*, 1934. His *Dreamers of Dreams*, 1948, contains studies of a number of Eng. and Amer. writers of the 19th cent.

**Jackson, John** (1769-1845), pugilist, son of a London builder. Fought only 3 fights, defeating Fewterel, at Croydon, in 1788, in the presence of the Prince of Wales; defeated by Ingleson at Ingatstone, 1789, through breaking bones in a fall; defeated Mendoza at Hornchurch, 1795. Champion of England till retirement in 1803. Known as 'Gentleman Jackson.'

**Jackson, Sir Thomas Graham, Bart., R.A.** (1835-1924), architect, *b.* London. After a brilliant career at Oxford, entered

the office of Sir George Gilbert Scott (q.v.) in 1858, and began practice in London in 1862. His work consisted mainly of scholastic and eccles. buildings. For the former he favoured a Jacobean style. His prin. works were, in Oxford: the New Examination Schools; High School for Girls; restoration of St Mary's Church; extensions to Balliol, Brasenose, Corpus Christi, and Lincoln Colleges; at Cambridge: Sedgwick Museum; Law Library; Archaeological Museum; Physiological Laboratories; in London: alterations to Drapers' Hall and the Inner Temple; elsewhere: Giggleswick School chapel, sundry school buildings at Eton, Harrow, Rugby, and Winchester; important restorations at Winchester Cathedral, Bath Abbey, Great Malvern Priory Church, Christchurch Priory, Hospital of St Cross, Longleat, etc. He produced a remarkable series of books, including *Byzantine and Romanesque Architecture* (2 vols.), 1913, *Gothic Architecture* (2 vols.), 1915, *The Renaissance of Roman Architecture* (3 vols.), 1921-3, and many others. He was awarded the R.I.B.A. Royal Gold Medal in 1910, and was created a baronet in 1913.

**Jackson (Stonewall), or Jackson, Thomas Jonathan** (1824-63), Amer. Confederate general, *b.* Harrison co., Virginia. Of mixed Scottish and Irish descent, he was essentially the type of man who formed the backbone of the people of the middle states of America. Educ. at a small prov. school, he was severely handicapped when he entered W. Point Academy; but he overcame the limitations of his early schooling by pertinacity. He began his military career as an artillery lieutenant, and soon distinguished himself in the war against the Mexicans, serving in Magruder's Battery and being breveted captain for his gallantry at Contreras and at Churubusco (q.v.). But after this war he resigned his commission and took the post of prof. of military science and mathematics at the Virginia Military Institute. His participation in the civil war is easily explained by his sturdy advocacy of state rights, involving the support of Virginia's slave laws and her right to secede from the Union. Hence when the war broke out between the Federal and Confederate States J. was given a command in the S. Army, and at once proved himself to be an efficient and enterprising officer. At the first battle of Bull Run he commanded a brigade, and the dour defence made by him and his troops earned him the celebrated sobriquet of 'Stonewall' (1861). In the course of the famous Shenandoah Valley campaign (1862) he succeeded in defeating the 3 Federal detachments under Banks, Frémont, and McDowell, and later in inflicting a second defeat on Banks at Cedar Run, near Culpeper, Virginia. During the Maryland campaign he obliged 11,000 Federals to surrender in Harper's Ferry, and his corps at the tough fight of Antietam rendered yeoman service to the embarrassed Lee. Fredericksburg and Chancellorsville (1863) were his last 2 battles. At the latter he was thrice

wounded and shortly afterwards died. To his soldiers he was a very Napoleon, but with his rare gift for inspiring popularity was combined the intense religious fervour of Cromwell. *Stonewall Jackson, The Good Soldier*, by Allan Tate, 1930, is a critical study of his generalship.

**Jackson, William** (1730-1803), musical composer, studied music under the organist of Exeter Cathedral and later under Travers, then organist of the Chapel Royal, London. His part-songs and the opera *The Lord of the Manor* (performed at Drury Lane in 1780) enjoyed great popularity for some time, but he is now remembered only by a *Te Deum*, still much used in the Anglican Church.

**Jackson:** 1. City, co. seat of Jackson co., Michigan, U.S.A., in an agric. area on the Grand R., 68 m. W. of Detroit. It is a railway centre, and manufs. automobile and aeroplane parts, metal, wood, and food products, radios, and chemicals. A state prison is here. Pop. 51,100.

2. Co. seat of Madison co., Tennessee, 75 m. N.E. of Memphis, on the Forked Deer R. It is the seat of Lane College, Union Univ., and Lambuth College, and an industrial and shipping centre for a timber and agric. area. Pop. 30,207.

3. Cap. of Mississippi, on the Pearl R., 45 m. E. of Vicksburg. It contains fine public buildings, including the state house with its valuable library, and sev. charitable and technical institutions. Manufs. of machinery and agric. implements are carried on. Pop. 98,300.

**Jacksonville:** 1. Cap. of Duval co., Florida, U.S.A. It has a deepwater port on St Johns R. It is one of the chief S. commercial centres on the Atlantic coast, with extensive rail, air, and highway connections; it is also a port of entry and popular year-round tourist resort. J. has many wood- and metal-processing industries; it also manufs. cigars, concrete blocks, glassware, fertilisers, feeds, and meat products. Boat-building, fishing, and citrus-fruit canning and packing are carried on. It exports lumber, naval stores, fruit, and machinery. Pop. 204,517.

2. City, cap. of Morgan co., Illinois, U.S.A., in a grain-growing, dairying, and live-stock area, 31 m. W. of Springfield. J. manufs. clothing, shoes, steel products, and cigars. It is the seat of Illinois College, MacMurray College, and state schools for the deaf and the blind and a hospital for the insane. Pop. 20,400.

**Jacmel**, seaport of Haiti, situated on the S. coast, 24 m. SW. of Port-au-Prince. The vessels here anchor about half a mile away from the shore. Exports coffee, cotton, and logwood. Pop. 8600.

**Jacob**, also called Israel, son of Isaac and Rebekah, one of the 3 great Heb. patriarchs (Gen. xxi-xlix). The story of J. is one of the most human and instructive in the O.T. J.'s faults are obvious. His trickery, cunning, and sharp dealing were probably admired by the nomadic people, but they have troubled Christians who wonder why God preferred him.

But J. had qualities of spiritual sensitivity, faith, and devotion, and a desire for spiritual things that made him a better man than Esau, who sold his birthright for a mess of pottage. His vision at Bethel of the ladder set up to heaven (a type of the Incarnation), his wrestling with an angel at Peniel, and his love for Rachel and her children, Joseph and Benjamin, give us an insight into his spiritual and moral qualities. Our Lord contrasts his guile with the simplicity of Nathanael, and refers to his vision, in John i. 47f. His 12 sons were the eponymous ancestors of the 12 tribes, collectively known as the Children of Israel (modern Israelis). J. d. in Egypt, whence he was carried to Hebron for burial. See also PATRIARCHS.

**Jacob, Sir Claud William** (1863-1948), soldier, son of Maj.-Gen. Wm J., educ. at Sherborne School and Royal Military College, Sandhurst. Entered the army in Worcestershire Regiment in 1882 and transferred to the Indian Army in 1884. Promoted colonel, 1911, major-general, 1916, lieutenant-general, 1917, general, 1920, and field-marshal, 1920. First experience of active service was with the Zhoob Valley Expedition, 1890. NW. Frontier campaign, 1901-2. At the outbreak of the First World War he went to France with the Moerut Div. and was the only Indian army officer of the corps to rise to high command there. In 1915 he led the Dehra Dun Brigade at Neuve Chapelle and at Aubers Ridge. Commanded II Corps for the remainder of the war: during the Somme battles, 1916, when he took Thiepval (q.v.) by a well-planned assault; at the Amiens operations and the pursuit of the Germans to the Hindenburg Line, 1917, and at the third battle of Ypres; and in Flanders in the final allied advance to victory in 1918. In 1920 he returned to India on his appointment as chief of the general staff. In 1924 he was given the N. Command in India. From 1926 to 1930 he was military secretary at the India Office. In 1927 he was appointed colonel of the Worcestershire Regiment. From 1916 to 1933 he was colonel of the 1st/4th Hazara Pioneers, which body he had formed in 1904 for work on the NW. Frontier communications. His last official post was constable of the Tower of London, 1937-43.

**Jacob, Gordon** (1895- ), composer, b. London, where he studied at the Royal College of Music, whose teaching staff he joined in 1926. He is an eminent specialist in orchestration, and as a composer has been prolific in music always ideally suited to the chosen medium. It includes ballet and film music, 2 symphonies, 3 suites, variations, and other works for orchestra, concertos for various instruments, chamber music, etc.

**Jacob, Naomi Ellington** (1889- ), novelist, b. Ripon, Yorks. Educ. at Middlesbrough High School, she became a teacher at 15. During the First World War she worked in a munition factory, and after that went on the stage with considerable success. Her first novel, *Jacob Ussher*,

appeared in 1926. In 1930 she was ordered S. for her health and made her home at Sirmione on Lake Garda. Later novels include *The Loaded Stick*, 1935, *Barren Metal*, 1937, *Straus in Amber*, 1938, *The Cap of Youth*, 1941, *White Wool*, 1944, *Passage Perilous*, 1948, and *Morning Will Come*, 1953. She also wrote a life of Marie Lloyd, 1936, and a long series of autobiographical books, including *Me: a Chronicle About Other People*, 1933, *Me—Again*, 1937, *Me and the Mediterranean*, 1945, *Me—Looking Back*, 1950, and *Me—Yesterday and Today*, 1957.

**Jacob, Violet** (1863–1946), poetess and novelist, b. Montrose, her maiden name being Kennedy-Erskine. She married Major A. O. J. and they spent some years in India. Her novels include *The Sheep-Stealers*, 1902, *The Interloper*, 1904, *The History of Aylhan Waring*, 1908, and *Flemington*, 1911. Vols. of her poems, many of them in the Angus dialect, are *Songs of Angus*, 2 series, 1916, 1918, *Bonnie Joann*, 1922, and *Northern Lights*, 1927. Her *Scottish Poems* were collected in 1944. *The Lairds of Dun*, 1931, is a study in the landed hist. of her own dist. In 1936 she was made an honorary LL.D. of Edinburgh Univ.

**Jacobabad**, tn in W. Pakistan, close to the border between Sind and Baluchistan on the railway to Quetta. It has the distinction of regularly showing the highest temps. in the Indian subcontinent during the hot weather.

**Jacobean**, term applied to architecture and furniture of the reigns of the Stuarts (1603–88), though strictly only to those of the time of James I. J. furniture is generally of heavy oak, skillfully carved. Panelling is characteristic of the interior of the typical J. house.

**Jacobi, Friedrich Heinrich** (1743–1819), Ger. philosopher, b. Düsseldorf, studied at Frankfurt and Geneva. From 1805 to 1812 he was prof. of philosophy at Munich, where he died. His philosophical work was not original in nature, but consisted in keen criticism of the system promulgated by others. He was largely responsible for drawing attention to the philosophy of Spinoza by his letters to Mendelssohn, *Briefe über die Lehre Spinozas*, 1785, and compared Hume with Kant in his work *David Hume über den Glauben, oder Idealismus und Realismus*, 1787. He also expounded Schelling's philosophy in *Von den göttlichen Dingen und ihre Offenbarung*, 1811. Apart from these he wrote philosophical romances, including *Woldemar*, 1779. His collected works were pub. at Leipzig in 1812–25 in 6 vols. See G. Fricke, *Friedrich Heinrich Jacobi*, 1943.

**Jacobi, Karl Gustav Jacob** (1804–51), Ger. mathematician, b. Potsdam, prof. of mathematics at Königsberg till 1842. He is remembered specially for his researches on elliptic functions and differential equations, and he helped to formulate the theory of determinants. His most important work is *Fundamenta Nova Theoriæ Functionum Ellipticarum*, 1829. His *Gesammelte Werke* were pub. 1881–91.

See studies by L. Koenigsberger, 1904, and A. Kowalewski, 1917.

**Jacobins**, Fr. political society formed during the Fr. Revolution, of those who originally aimed at constitutional reform of a reasonable kind. They were called J. because they used to meet in a building in the rue St Honoré, Paris, which belonged to the Dominican order, called in France the Jacobin. After 1791 the members grew more extremist and organised the reign of terror; but their power ended in 1794 with the execution of Robespierre. The word 'jacobin' was used in Britain and in Europe generally for the holders of extreme political opinions, and it was to check such views that the *Anti-Jacobin* was launched.

**Jacobites**, the Syrian, monophysite schismatics (see MELCHITES) who, after being suppressed and deprived of their clergy by Justinian, were revived and recovered the episcopate by favour of the Empress Theodora. James (Jacob) Baradaeus was consecrated bishop for them in 541, and their orders all derive from him. They are in communion with the Copts and Ethiopians, and provided a bishop for the Nestorians of Malabar in the 17th cent., since when the latter have been monophysite, and sometimes called Jacobite too, though they are quite independent. See NESTORIUS, *Nestorian Church*.

**Jacobites**, name given to the followers of the Stuart house after the revolution of 1688. The name is derived from the Lat. name Jacobus (James). James II had numerous followers in all the countries of the Brit. Isles, but the later Stuarts, the Old and Young Pretenders, received their main support from the Scots. In 1689 Graham of Claverhouse roused the Highlands for James, fought the battle of Killiecrankie, but died in the moment of victory. In Ireland the Boyne had been fought in 1690 and the Irish defeated (see JAMES II), and Ireland so thoroughly subdued that during the 2 subsequent rebellions she played no active part. The reign of Anne was one of constant intrigue between the leading statesmen and the Old Pretender, and the Jacobite plot at the end of the reign probably failed only because of the too sudden death of the queen. In 1715, the Hanoverians having just been estab. on the throne, an ill-organised Jacobite rebellion took place both in Scotland and in the N. of England. The indecisive battle of Sheriffmuir, the surrender at Preston, and the somewhat depressing presence of the Old Pretender, all contributed to the overthrow of the rebellion. The next serious Jacobite threat came in 1745 when the Young Pretender, 'Bonnie Prince Charlie,' landed at Moldart with 7 followers. He roused the Highlands at once, swept away opposition at Prestonpans, and proclaimed his father James III. He invaded England and reached Derby, but there he commenced to fall back. His march had been conducted in a great arc over some 500 m. from Moldart to the outskirts of Derby, where the decision to turn back

was taken at a point only 130 m. short of London. Charles was finally overwhelmed at Culloden. After numerous adventures he managed to escape, and *d.* on the Continent, a weak, broken, dissolute drunkard. His younger brother Henry (q.v.) became a cardinal of the Rom. Church, and the direct Stuart line ended. After this date Jacobitism became little more than a romantic sentiment. Almost every great statesman of the time had intrigued with the Stuarts, from Sunderland and Marlborough down to Newcastle himself, who in 1746 was uncertain for a time whether or not to go over to Charles. See Sir C. Petrie, *The Jacobite Movement: First Phase, 1688-1716*, 1949, and *The Jacobite Movement: the Last Phase*, 1950.

JACOB'S LADDER

Jacobs, William Wymark (1863-1943), author, *b.* Wapping, E. London. Son of a wharf manager, he was early familiar with the types of longshoremen and sailors whose idiosyncrasies he exploited with much success in his humorous stories. Educ. at private schools, he worked in the Savings Bank dept. of the Civil Service, 1883-99. His earliest literary work was pub. in the *Idler* and *Today*, both ed. by Jerome K. Jerome, who soon recognised the merit of J.'s humour. He became a regular contributor to the *Strand Magazine*. His first vol. of short stories, *Many Cargoes*, was pub. in 1896. This success was followed by *The Skipper's Wooing*, 1897; and after *Sea Urchins*, 1898, he abandoned the Civil Service and thereafter lived entirely by his pen. J. pub. about 20 vols., chiefly collections of short stories, under such titles as *Light Freights*, 1901, *At Sunnyside Port*, 1902, *The Lady of the Barge*, 1902, *Odd Craft*, 1903, *Dialstone Lane*, 1904, *Captains All*, 1905, *Short Cruises*, 1907, *Salthaven*, 1908, *Sailors' Knots*, 1909, *Ship's Company*, 1911, *Night Watches*, 1914, *The Custaways*, 1916, *Deep Waters*, 1919, and *Sea Whispers*, 1926. He also wrote some one-act plays, such as *Establishing Relations* and *Dixon's Return*.

His gruesome story *The Monkey's Paw* marked a departure from his humorous vein; this story and some others were dramatised in collaboration with Louis N. Parker and successfully produced. He also collaborated in *Beauty and the Barge*, a 3-act comedy, 1906.

Jacob's Ladder, or *Polemonium caeruleum*, species of Polemoniaceae found in temperate climates and of rare occurrence in Britain. It is a perennial herb which attains a height of 1 to 2 ft and bears blue or white flowers. The popular name is given to the plant because of the ladder-like arrangement of the leaves.

Jacobsen, Jens Peter (1847-85), Dan. novelist, *b.* Thisted, Jutland. He began as a student of botany and later trans. Darwin into Danish. Under the influence of Brandes he turned towards naturalism and a detailed realistic description of life. He was, however, by temperament a dreamer, and this very contrast, accentuated by his suffering from consumption, gave his novels a highly individualistic style, full of sensitive undertones. His 2 novels, *Maria Grubbe*, 1876, and *Niels Lyhne*, 1880, have gained European fame. He also wrote short stories (*Mogens*, 1882) and some verse. J. may be considered as the chief naturalistic writer in Denmark. See G. Christensen, *J. P. Jacobsen* (2nd ed.), 1924; A. Linck, *J. P. Jacobsen* (2nd ed.), 1926; A. Gustafson, *Six Scandinavian Novelists*, 1940.

Jacobus, gold coin struck in the reign of James I of England (1603-25), and thus named after him, J. being the Lat. equivalent for 'James.' It was of the same value as 25 shillings sterling.

Jacopone da Todi (c. 1230-1306), It. religious poet, *b.* Todi in the Duchy of Spoleto. He was originally an advocate, but about 1268 turned a Franciscan, and wrote poems which display an extreme bent towards asceticism. He is the author of some 90 'laudi,' religious ballads and hymns, which play an important part in the development of It. drama. In 1298 Todi was imprisoned for inveighing against and satirising Pope Boniface VIII, and was not released till the death of Boniface in 1303. The authorship of the *Stabat Mater* has been ascribed to Todi, as also many beautiful Lat. hymns. An ed. of his works appeared at Florence in 1490. See lives by A. D'Ancona, 1884, and Evelyn Underhill, 1919.

Jacotot, Jean Joseph (1770-1840), Fr. educationist and inventor of the 'universal method' of education, *b.* Dijon. He became successively soldier, military secretary, and holder of various professorial chairs. It was while at Louvain that he applied his method of 'universal instruction,' closely resembling that of Hamilton. The principle of his system is that the mental capacities of all men are equal, and he expounded his views in *Enseignement Universel*, 1823. See life by Guillard, 1860, and J. Tourrier's *Intellectual Emancipation: A Treatise on Jacotot's Method of Universal Instruction*, 1852.

Jacquard, Joseph Marie (1752-1834), Fr. mechanician, *b.* Oullions, near Lyons.

He invented the silk-weaving loom called after him (1801-8), a mechanical contrivance capable of being adjusted to any kind of loom, and doing away with the guidance by hand. The silk-weavers offered violent opposition to his machine, and he narrowly escaped with his life on one occasion. His invention, however, revolutionised the art of weaving, and at his death his machine was in almost universal use. Napoleon rewarded him with a small pension.

**Jacquerie**, name given to a revolt of Fr. peasants in 1358, the designation arising from the contemptuous term 'Jacques Bonhomme,' by which the nobles described the peasants. Long standing oppression on the part of the nobility was the cause of the rebellion, which broke out around Beauvais, and received support from the Paris citizens. In June 1358, however, the peasants were defeated and the rising suppressed with great cruelty.

**Jactitation** (Lat. *jactitator*, boaster). The suit *causa jactitationis matrimonii* may be brought against one who falsely gives out that he or she is married to the petitioner. The object of the remedy is to enjoin perpetual silence upon that matter against the jactitator, and apparently this suit is the only remedy available for such an injury. It is a remedy inherited by the Probate, Divorce, and Admiralty div. of the High Court from the old eccles. jurisdiction of the spiritual courts, and the statute conferring that jurisdiction in the Divorce Court is the Matrimonial Causes Act, 1857. Suits of J. are extremely rare, probably because the remedy is not adapted, or because at all events there are no precedents to show that it is adapted, to establishing the validity of the petitioner's marriage to a third person. There is, however, a statutory remedy under the Legitimacy Declaration Act, 1858, for that purpose which is also the appropriate remedy to establish the legitimacy of offspring.

**Jadar**, or **Yadar**, riv. of Yugoslavia, a trib. of the Drina, SW. of Belgrade. During the First World War, the Serbs by their success at the battles of J. (20-2 Aug. 1914) and Sabac (17 Aug.) prevented the junction of the Austrian armies invading Serbia from N. and W., and compelled the Austrians to abandon the invasion. See AUSTRIA and WORLD WAR, FIRST.

**Jade**, ornamental stone, generally of green colour, belonging to 2 distinct species, viz. jadeite and nephrite, often wrongly confounded one with the other. (Hardness 6½-7; sp. gr.: nephrite 3, jadeite 3.3) Jadeite belongs to the pyroxene group, while nephrite is a variety of amphibole. J. is highly prized in the E., especially by the Chinese, and is found in China, Burma, and many parts of S. Asia. It was used by the prehistoric peoples of Mexico, Alaska, New Zealand, and other countries for utensils and carvings, and on many prehistoric sites in Europe, as in the Swiss lake dwellings. J. objects have been frequently discovered. Consult Dr G. F. Kunz (ed.), *Investigations and*

*Studies in Jade*, 1906, for a full and exhaustive description of the stone; also S. C. Nott, *Chinese Jade*, 1936, and S. H. Hansford, *Chinese Jade Carving*, 1950.

**Jadeite**, mineral species related to the pyroxenes and differing markedly from true jade or nephrite. It is a monoclinic aluminium sodium silicate. White or 'camphor' jade is the purest form, though usually specimens are coloured by the presence of metallic oxides, e.g. chromium causes brilliant green patches. Though the hardness of J. differs but little from that of jade, its sp. gr. is higher (3.20 to 3.41). J. is translucent to opaque. It is much more readily fusible than nephrite. Although implements of J. have been found on many prehistoric sites in Europe, it is only recently that the raw material has been found *in situ* in the Alps. Large stores of it have been mined since remote times in S. Asia, etc.

**Jael**, Jewish wife of Heber, the Kenite (Judges iv), who, after the battle on the Kishon, slew the enemy general Sisera when he had taken refuge in her tent.

**Jaén**: 1. Sp. prov., in Andalucía (q.v.). It is inland, is watered by the Guadalquivir (q.v.), the Segura, and other rivers, and is very fertile. There are some mts. Cereals, fruits, wine, and oil are produced, and lead is mined. Area 5205 sq. m.; pop. 753,300.

2. Sp. tn, cap. of the prov. of J., on the Guadalbullón. It was taken from the Moors in 1246, and became the base for the Sp. army that conquered Granada (q.v.) in 1492. Parts of the old walls and a Moorish fort remain; there is a splendid Renaissance cathedral and there are sev. other noteworthy churches. J. was at one time famous for silk, but this industry has died out. Textiles, chemicals, oil, and leather are produced. Pop. 63,500.

**Ja'far Pasha-el-Askeri** (1880-1936), Iraqi statesman, b. Bagdad. Educ. in Constantinople and Germany. Entered Turkish Army, 1902. Promoted captain in Balkan War, 1912. In the First World War he was chosen to organise the troops of the Sheikh-el-Senussi; and, attempting to invade Egypt, was captured by the Dorset Yeomanry at Agagia, 26 Feb. 1916. In an attempt to escape from Cairo citadel he injured himself; and, during incapacitation, he was converted (by his reading) to the Brit. side. Joined Hejaz Army, 1917, and was given the C.M.G. on the recommendation of Gen. Allenby, Governor of Aleppo, 1919. Minister of defence in Iraq, 1920-2, and represented Iraq at Lausanne conference. Prime Minister, Iraq, 1923; diplomatic agent in London, 1925-6. Prime Minister and minister of foreign affairs, 1926-8. Minister in England, 1928-30, and also 1932-4, and called to the Eng. Bar. Iraqi Senator, 1934. Minister of defence, 1935. Assassinated after a coup d'état in Oct. 1936.

**Jaffa** (anc. Japho; Gk. Joppa), tn in Israel, now a suburb of Tel-Aviv (q.v.). In 1947 it had an estimated pop. of 108,000, of which 80,000 were Arabs. The present Arab pop. is about 5000. Its name is to be found on the tower of

Thotmes II at Karnak among the cities mentioned as being overwhelmed by Pharaoh. Later it became a Phoenician city, and then, for a thousand years, Philistine, during which time the logs for Solomon's temple, after being floated down from the ports of Lebanon by Hiram, were landed at J. Under the Maccabees J. became mainly Jewish. From 64 BC J. was within the Rom. prov. of Syria.

Subsequently, it was in the house of Simon the Tanner at J. that St Peter saw the vision recorded in Acts ix. 43. In the Crusades, Baldwin I signed the treaty of J. with the Genoese, whence sprang much strife. The city then became a co.; but in 1187 it was captured and destroyed by the brother of Saladin, and then retaken by Richard Cœur de Lion. In 1267 it was again sacked, this time by Bibars, and in 1799 it was stormed by Napoleon. The strike over Jewish immigration fomented by the Arab political leaders, which developed into grave disorders throughout Palestine in 1936, began in J., which remained a centre of Arab nationalism until its capture by the Jews in May 1948. Most of the Arabs fled. In Oct. 1949 the administration of J. was unified with that of Tel-Aviv. J. is the second largest port in Israel. Citrus fruit is its main export.

**Jaffna**, or **Jaffnapatam**, seaport tn on J. Is., off the N. coast of Ceylon, 116 m. from Trincomalee. It has a ruined Dutch fort, an old Dutch church, and temples. It is the prin. centre of the Tamil-speaking people of Ceylon, often called J. Tamils.

**Jagannath**, see JAGGERNATH.

**Jagdalak**, see JUGDALAK.

**Jagellones**, or **Jagellones**, royal dynasty of Poland, descended from Gedimin of Lithuania (d. 1342), founded by Jagello (c. 1345-1434), afterwards Wladislaw II. This line ruled in Poland from 1386 to 1572, when, with Sigismund Augustus, the male line became extinct. Through his sister's descendants the J. continued on the throne till 1668. Rulers over Lithuania, Hungary, and Bohemia were also chosen from the J.

**Jagersfontein**, vil. of Fauresmith div., Orange Free State, S. Africa, 67 m. WSW. of Bloemfontein. The celebrated Klipfontein diamond mines near by rank next to those of Kimberley. J. is on the railway from Cape Town to Pretoria. Discovery of gold in the vicinity is likely to increase its importance. White pop. 1200.

**Jaggard**, William, see BOOKSELLING.

**Jagger**, Charles Sargeant (1885-1935), sculptor, b. near Sheffield. He was trained at Sheffield School of Art and at the Royal College of Art, S. Kensington. Here he won a travelling scholarship and visited Rome and Venice. In 1914 he won the Rome Scholarship for Sculpture of the Brit. School at Rome. His best known work is the Royal Artillery Memorial, Hyde Park Corner, London, something of a compromise with architects and organising committee but characteristically vigorous in its bronze gunners. The figure on the G.W.R. War Memorial and

that of Sir Ernest Shackleton on the building of the Royal Geographical Society are typical of his style. Elected A.R.A., 1926, and a member of the Royal Mint Advisory Committee on Coins, medals, etc., in 1932. His group in stone for Imperial Chemicals House, Millbank, won him, in 1935, the gold medal of the Royal Society of Brit. Sculptors. He wrote an account of his craft, *Modelling and Sculpture in the Making*, 1933.

**Jagger**, David (1891-1958), portrait painter, b. near Sheffield, brother of Charles J. He was a regular exhibitor at the Royal Academy and London Portrait Society. In 1957 the Welsh Guards commissioned him to paint the Duke of Edinburgh.

**Jaggery** (Hindustani *shakkar*), coarse brown sugar of the E. Indies, chemically the same as cane-sugar. It is made by inspissation from the sap of various palms, such as the J., coco-nut, Palmyra, and date-palms (*Phoenix dactylifera*). The Indian *Phoenix sylvestris* and *Caryota urens* also yield J., as do also the *Nipa fruticans*, *Arenga saccharifera*, and others. The sap or juice by fermentation becomes palm-wine, from which arrack is distilled.

**Jago**, Richard (1715-81), clergyman and poet, b. Beaudesert, Warwickshire. Educ. at Oxford, he held various livings in Warwickshire from 1746, dying at Snitterfield. His *Poems, Moral and Descriptive* were pub. by Hylton in 1784. See F. I. Colville, *Worthies of Warwickshire*, 1869; C. H. Poole, *Warwickshire Poets*, 1914.

**Jaguar** (*Panthera onca*), large Amer. spotted cat of the order Felidae, found in countries ranging from Texas through Central and S. America, to Patagonia. In

form the J. somewhat resembles the leopard, but is more thick set. Its skull resembles that of a lion or tiger. Its movements are rapid and it is very agile. It has a tawny yellow hide, spotted with black, and varies in length from 4 ft to 6 ft 9 in. It is generally found singly, and preys upon deer, capybaras, peccaries,

cattle, and even fresh-water turtles and fishes. It emits terrific roars and cries, particularly during the mating season. From 2 to 4 cubs are produced at birth towards the close of the year. In disposition the J. is ferocious and blood-thirsty, and after having tasted human flesh it occasionally becomes a confirmed 'man-eater.' It submits somewhat grudgingly to captivity, but may become subdued and even docile. It is usually hunted with dogs and poisoned arrows, though sometimes with the lasso, and the skins are imported into Europe in large numbers. The black-furred J. is sometimes regarded as a different species, but the characteristic markings can be detected in certain lights. Amer. naturalists divide the species into a number of forms regarded as distinct, but preferably ranked as subspecies.

**Jahangir**, Mogul emperor of India, succeeded his father, Akbar, in 1605 and reigned till his death in 1627. When he ascended the throne his son Khusrū tried to usurp power and to seize Lahore, whither J. had transferred the seat of gov. Insurrections marked his reign throughout. J. was strongly influenced by his favourite wife, Nūr Mahāl, and the currency was struck in her name, and court intrigues occupied her life. J. favoured the Jesuit missionaries, whose influence was evident in many 17th-cent. buildings in Lahore. The Saman Burj and other parts of the old royal palace and various tombs date from J.'s reign. It was in his time that the Eng. first estab. themselves at Surat and appointed their first embassy to an Indian court. J. was succeeded by his son, Shah-Jehan (q.v.), founder of Delhi, which city was known to Muslims as Jahānābād. In Jehan's reign the Mogul empire reached the peak of its magnificence. His chief city of residence was Agra and his name will ever be associated with the glory of Indian architecture, the Taj Mahal, named after his wife, Mumtaz Mahāl, beside whom he lies buried.

**Jahn, Friedrich Ludwig** (1778-1852), father of gymnastics (q.v.), or *Turnvater*, b. Lanz, Prussia. First served in the Prussian Army, and in 1811 started the first gymnasium in Berlin. His system did much to revive patriotism and attracted the Prussian youth, but in 1818 his gymnasia were closed on account of the political gatherings held there, which were of too liberal a nature to find favour in the eyes of the Prussian Gov. J. was arrested and imprisoned for 6 years (1819-1825) as a demagogue. He wrote *Deutsche Volkstum*, 1810, and *Die deutsche Turnkunst*, 1816. See E. Nevenndorff, *Turnvater Jahn, sein Leben und Werk*, 1928, and F. Eckhard, *Friedrich Ludwig Jahn: Eine Würdigung seines Lebens und Werks* (2nd ed.), 1931.

**Jahn, Otto** (1813-89), Ger. archaeologist and classical editor, b. Kiel. In 1839 he was appointed to the chair of archaeology at Leipzig, where he founded the Archaeological Society. His publs. include works on Gk art, representations of ant life on vases, a masterly life of Mozart, and essays

on music. His letters were ed. by A. Michaelis, 1913.

**Jahrom**, or Jahrum, tn and dist. of Fars prov., Persia, 90 m. SE. of Shiraz. The dist. is famous for its dates and citrus fruits. Pop. of tn 29,100.

**Jahvist** (J), or Yahwist, worshipper of Jahveh or Yahweh. The term is now generally applied to those non-Deuteronomic portions of the Pentateuch which are distinguished by the use of Jahveh, not Elohim, as the name of God.

**Jail**, see PRISONS.

**Jail Delivery**, one of the commissions under which the judges of assize derive their authority (see ASSIZE). The Commission of J. D. is a patent in the nature of a letter from the queen, directed to the judges of assize of each circuit (see CIRCUIT), queen's counsel attending the circuit, clerk of assize, and associate, authorising them to 'deliver his jail at a particular town of the prisoners in it,' i.e. to try every prisoner in the jail committed for trial on any charge whatever. As, under this commission, judges may proceed upon any indictment of felony found before other justices and not determined, their authority differs from that of justices of oyer and terminer (q.v.), who can only proceed on indictments found at the same assizes. The court of queen's bench (q.v.), on account of its status as the highest court of criminal jurisdiction, automatically determines and absorbs by its coming into any co. all former commissions of J. D. and oyer and terminer. This, however, does not apply to the Central Criminal Court. See Harris, *Principles of Criminal Law*, and Russell on *Crimes*.

**Jail Fever** is now recognised as a severe form of typhus fever (q.v.). The disease raged in Eng. prisons from the 16th cent., breaking out at the Black Assize of Oxford in 1577. It was caught by many attending the assizes at the Old Bailey as late as 1750, but owing to the improvements in hygiene and sanitation is now of rare occurrence. See J. Howard, *Account of the State of Prisons*, 1777.

**Jainism**, doctrine of the Jains, a wealthy and influential Hindu sect, mostly found in the W. dists. of Upper India. It is allied in many respects to Buddhism, but appears to have developed from Brahminism at an earlier date than Buddhism did. Its origin is attributed to Vardhamana Mahavira, who lived about the end of the 6th cent. BC. The sect flourished greatly between the 3rd and 8th cents., but subsequently dwindled owing to persecution by the Brahmins. From the 1951 census the number of Jains in India is reckoned at 1,618,406. The Jains, like the Buddhists, deny the divine origin of the Veda (q.v.). They believe in the separate existence of the soul after death, even of animals, and this belief leads them to take great care of animal life. They brush seats before sitting, and drink only water that has been strained, never leaving it uncovered for fear that some insect may be drowned in it. They have to practise liberality, piety, gentleness, and penance, and must make a daily visit to the Jain temple.

Their principle is to suppress the body by abstinence, continence, and silence. During certain seasons they abstain from honey, grapes, fruits, salt, tobacco, and other articles. The members of the religious order of the Jains are called Yatis, those of the secular order Sravakas, the rules for the former being stricter than those for the latter. The Jains are not divided into castes, except in S. India, but they have certain family groups between which marriage is not allowed. Formerly they advocated leaving the body naked, but this practice is now confined to meal times. Their creed is very detailed, and in many respects fantastic. They reverence deified saints, called Jinās, who give the sect its name. These saints are 72 in number, 24 each of the past, present, and future ages respectively, the earlier of them being of gigantic proportions and living enormous lengths of time, while the most recent resemble ordinary humans in these respects. The Jains are responsible for many beautiful temples, notably Mt Abu and Mt Parasnath. Their temples are usually constructed with pseudo-arch and dome, built in horizontal courses and with pointed section.

Consult E. Thomas, *Jainism, or the Early Faith of Asoka*, 1877; J. Fergusson, *Cave Temples of India*, 1880; T. W. Rhys Davids, *Hibbert Lectures*, 1881; J. Burgess, *Buddhist and Jainist Caves* (2 vols.), 1881-3; Jacobi, *Jaina Sutras* (vols. I and II), 1895; J. G. Bühler, *On the Indian Sect of the Jains*, 1904; H. von Glasenapp, *Der Jainismus*, 1925; C. J. Shah, *Jainism in North India*, 800 BC-AD 526, 1932; W. Schubring, *Die Lehre der Jains*, 1935; J. Jaini, *Outlines of Jainism*, 1940.

Jaipur, former Indian state, now part of Rajasthan state. The Maharaja, one of the wealthiest of the Indian princes, is Rajpramukh of Rajasthan. The anct cap. was at Amber (q.v.). J. itself is a fine, walled city where the colouring of many of the buildings adds to the brightness of the clothing of the crowds. It is the H.Q. of Rajasthan, and is noted for its excellent enamel work. It is laid out in 6 rectangular blocks, intersected by wide, straight streets, unlike many Indian cities. See INDIAN PRINCELY STATES.

Jaisalmer, former Indian state, now part of Rajasthan state, NW. of Jodhpur and SW. of Bikaner. Situated in the great Indian desert, J. is very remote, but noted for some fine Jain temples and a handsome fort. See INDIAN PRINCELY STATES.

Jajce, tn in Bosnia-Hercegovina, Yugoslavia, at the confluence of the Pliva and the Vrbas. In the 15th cent. it was the cap. of the kingdom of Bosnia (see BOSNIA-HERCEGOVINA), and here the last king was put to death by the Turks in 1463. In the Second World War J. was a partisan centre. It has many anct buildings. There are leather and textile manufs., and there are hydro-electric installations near by. Pop. 7900.

Jaipur, tn of Orissa state, India, 43 m. from Cuttack. The anct cap. of Orissa,

it contains fine Hindu temples, also a Hindu monument much visited by pilgrims.

Jakarta, formerly Batavia, city of NW. Java on J. Bay, Indonesia, of which it is the cap. It is divided into the old tn and a modern residential garden suburb. The old tn is intersected by canals crossed by drawbridges. There are rail links with Surabaya, etc., and an airport at Kemayoran, 6 m. away. Industries include railroad shops, iron foundries, tanneries, saw-mills, textile mills, printing, and chemical plants. The univ. of Indonesia is at J., which also possesses museums, etc. The city was founded by the Dutch in 1619, and was the H.Q. of the Dutch E. India Co. (q.v.). It was in Brit. occupation from 1811 to 1816. See also JAVA.

Jakutsk, see YAKUTSK.

Jalal ud-Din, or Rumi (1207-73), famous Sufi poet of Persia, b. Balkh in Khorasan and d. in Qonya. He founded the Mevlevi Dervish order in memory of Shams ud-Din Tabrizi from whom he received esoteric teaching. This order is characterised by the mystic dance symbolical of the movement of the spheres and of the soul. His most famous work is his great poem the *Mahnavi-i Ma'navi*, which is commonly called in Persia 'the Qur'an in the Pahlavi (i.e. Persian) language.' It has been trans. in full by R. A. Nicholson and in part by E. H. Palmer in the *Song of the Reed*. The *Diwan-i Shams-i Tabriz* comprises a collection of J.'s lyrical odes (trans. R. A. Nicholson).

Jalalabad, or Jelalabad, tn of Afghanistan, on the road between Kabul and Peshawar, in a fertile plain near Kabul R., close to Khyber Pass. It is noted for the brave resistance made by the British under Sale (1841-2) to the Afghans. Its defences were destroyed on the Brit. evacuation of Afghanistan, 1842. Pop. about 4000.

Jaipur, ruined tn of W. Pakistan, 68 m. SSE. of Rawalpindi. It is identified by Cunningham with Alexander's Bucephala, built in memory of his famous horse.

Jalandhar, see JULLUNDUR.

Jalap, well-known purgative medicine, consisting of the dried root of *Ipomoea purga*, a plant belonging to the Convolvulus family. It is a native of the E. slopes of the Mexican sierras, growing at an altitude of about 6000 ft, and is named from the tn of Jalapa. J.-root contains starch, sugar, lignin, etc., but the active principle is a resin present to the extent of 10 per cent, which may be extracted with alcohol. J., which is administered either as a powder or in alcoholic solution, acts as a hydragogue cathartic, and is used in constipation, renal disease, dropsy, and cerebral affections. The ordinary dose of the powder is from 10 to 30 grains.

Jalapa: 1. Dept. of E. Guatemala, in volcanic region. Cap. J. The chief products are coffee, the sugar-cane, rice, and maize, and chromite from the mines N. of Pop. 75,000.

2. Cap. of Veracruz and 150 m. E. of Mexico City. It is 4465 ft above sea

level and is situated in a picturesque and fertile dist. with a healthy and temperate climate. It is known as the city of flowers. The medicinal plant 'jalap' here grows wild. The church of the Beaterio was originally a Franciscan convent; its buildings have been renovated and modernised. Another notable church is that of St Joseph. The Gov. Building or Palacio de Gobierno is a long, white edifice of colonial type with pillars and archways on the first floor. Paseo del Ayuntamiento (q.v.) is a fine, broad, paved street leading to the Parque Juárez, with its stairways and tall trees. There are other streets called by such names as Street of Jesus Helps You, Street of the Virgin, Street of John the Carbon Burner, Street of the Devil's Pocket, and Street of the Bellringer. Coffee, tobacco, and sugar are grown and processed. Pop. 40,000.

**Jalisco**, state of central Mexico, on the Pacific, with a coastline 280 m. long, and covering an area of 31,152 sq. m. The state is traversed by the Sierra Madre, with its volcanic cones, Colima (12,750 ft) and Nevado (14,240 ft) being the highest. The chief riv. is the Rio Grande de Santiago, flowing out of Lago Chapala, and draining the N. portion of the state. The chief industries are gold, silver, and copper mining, and agriculture. Cotton and woollen goods, paper and tobacco are manu. It is an attractive tourist area. Guadalajara (q.v.) is the cap. Pop. 1,747,100.

**Jalpaiguri**, tn of W. Bengal state, India, on the direct route (via Pakistan) from Calcutta to Darjeeling. It is well known as the centre of a great tea-growing area.

**Jalpan**, tn in Querétaro state, situated about 85 m. from Guanajuato, central Mexico. Tropical fruits are grown. Pop. 1350.

**Jaluit**, or **Jalut**, one of the Marshall Is. in W. central Pacific. It is the administrative centre of the group.

**Jam**, name applied to the preserve formed from fruit boiled with the correct proportion of sugar, which dissolves in the juice of the fruit as the latter is broken. The process of boiling sterilises the entire mixture, and causes the juice to develop the essential 'setting' properties due to the presence of 'pectin bodies' always present in ripe fruits. J., if carefully and well made, can be kept for sev. years, though the quality generally deteriorates after 12 or 18 months, owing to the crystallisation of the sugar, etc. The time requisite for boiling J. varies according to the nature of the fruit used. The heating process should be carried on over a slow fire, in order not to do away with the aromatic and flavouring principles of the fruit. If the boiling is hurried, these are carried away by the steam, and for this reason home-made J. is superior to commercial, the latter usually being boiled for a shorter period than the former. When J. is made from oranges or lemons and such fruits, it is termed 'marmalade.' The peel of these contains a large proportion of aromatic and flavouring matter,

and pectin is included in the preserve in the form of shreds. In fruit jellies, the juice of the fruit only is used, not the pulp as well, this being removed by straining. It is then boiled with sugar until ready to 'jelly.' Fruits are 'preserved' by covering with water in suitable utensils and heating to a high temp., the vessels being closed while hot. In home-made preserves, the actual proportion of sugar averages about 20 per cent; in commercial, from 10 to 50 per cent. See also PRESERVING.

**Jama Masjid**, see DELHI.

**Jamaica**, largest is. in the Brit. W. Indies, forming part of the Greater Antilles. It is situated in the Caribbean Sea, 90 m. S. of E. Cuba. It is 146 m. long, its greatest breadth being 51 m. Area 4411 sq. m. The is. is divided into 3 cos.: Cornwall in the W., Surrey in the E., and Middy in the centre, and 14 pars. J. is traversed by a mt range, running E. and W., which culminates in the Blue Mt Peak (7402 ft) in the E. region. From this ridge flow numerous rivs., which promote luxuriant vegetation, but, with the exception of the Black R., are useless for navigation. Black R. in the SW. is famed for Maggoty Falls and is navigable for 25 mi. The Salt R., and the Cabaritta, are navigable for a few miles. Other notable rivs. are the Rio Grande, Roaring R., with its beautiful falls in St Ann's Par., and Rio Cobre, which empties into Kingston Harbour. There are many excellent harbours—Port Morant, Falmouth, Old Harbour, Port Maria, etc., but the finest is Kingston in the SE. It has an area of about 8 sq. m. of navigable water and a depth, in the navigable portion, of from 7 to 10 fathoms. The harbour is protected by a long spit of sand called the Palisadoes, 7½ m. long, at the extremity of which is Port Royal. The soil is very rich and fertile. The climate of J. is, on the whole, very healthy. By the coast it is warm (mean temp. 80° all the year), but the heat is lessened by cool breezes. The atmosphere is very moist during the 2 rainy seasons in May and Oct. Inland and on the uplands the climate is delightfully mild. The is. is frequently visited by thunderstorms, but the average ann. rainfall is only about 77 in. There are many valuable plantations. The chief trees grown are mahogany, balata, ebony, coconut, palm, lignum vitae, logwood, and cacti. There is a flourishing trade in fruit, chiefly oranges, bananas, pine-apples, mangoes, and grapefruit. Very fine coffee is cultivated, especially in the dist. of the Blue Mts. Maize, Indian corn, Guinea grass, chinchona, tobacco, and ginger are among the products of the soil.

**Industries.** In the old days sugar and rum were supreme, but in the early nineties of last cent. they were supplanted for the first time as the leading industries of J. by fruit, which has been steadily growing in importance since that time. The export of bananas has exceeded 25,000,000 bunches in a single year; the production of citrus fruit is also rapidly expanding, as also of coconuts. In recent

years, however, the banana crops have been much diminished by the Panama and leaf-spot diseases (*see BANANA*). Despite these, and the severe hurricane of 1951, exports reached 11 million stems (approximately) in 1956, the total being made up of 88 per cent Latacan and 12 per cent Gros Michel. J. is famous for its rum, which is still reputed to be the best in the world. Coconuts and copra are grown for export. J. is the chief source for the supply of pimento, or allspice, and for annatto. Other industries include cattle, sheep, horse, and mule breeding, and dairying. Rice-growing is of increasing importance and cocoa is said to have good prospects. The prin. manufs. are rum, oils, mineral waters, matches, and cooking fats. There are cigar and cigarette factories, distilleries, breweries, and cement and textile factories, etc. Bauxite is of increasing importance; total output in 1956 amounted to over 3,500,000 tons, some 600,000 tons of which were locally processed into alumina. There are 3 operating companies, and production is increasing rapidly. Whereas neither bauxite nor alumina was exported up to 1954, in 1955 their combined export value was over £9,900,000. Apart from bauxite and alumina, other exports are sugar, bananas, coffee, cocoa, ginger, cigars, fruit juices, and pimenta. Trade in 1943 and 1944 aggregated only between £11½ million and £13½ million. Total imports, 1943, were £7,311,340, and 1955, £45,673,000; total exports, 1943, were £4,237,431, and 1955, £32,736,000. Imports from the U.K., 1943, were £2,566,302, and 1955, £18,389,000; exports to the U.K., 1943, £738,688, and 1955, £16,685,000. All these figures demonstrate the expected post-war increase. Before the war the large supply of cheap labour, coupled with the steep fall in the world price of sugar—where W. Indian cane-sugar has to compete with beet-sugar—resulted in low wages and a reduced standard of living; there were serious riots in 1938. These, following on riots in Trinidad, led to the sending out of a Royal Commission under Lord Moyne (later Secretary of State for the Colonies) to investigate the W. Indian colonies generally and to the organisation of a variety of development schemes. Much was done to improve conditions in J. by grants and loans under the Colonial Development and Welfare Acts. The Industrial Development Law of 1952 has stimulated manufs. The tourist trade in J. is now growing; in 1956 there were over 160,000 visitors (nearly 40,000 more than in 1955) and the tourist industry is valued at about £8 million a year.

**Communications.** The is. is intersected by good roads, and there are some 203 m. of railway. The J. Gov. railway (gauge 4 ft 8½ in.) starts from Kingston, which it connects with Spanish Town (33 m.), Old Harbour, Porus, and Montego Bay. Another line runs from Spanish Town to Bog Walk and Port Antonio. From Bog Walk, Ewarton is reached by another branch line and another line opens up the Rio Minho valley and Upper Clarendon

from May Pen. Kingston has a service of electric trams, and motor omnibus services cover the is. There are telegraph stations and post offices in every tn and in many vils. In 1954, 1017 vessels of 2,879,341 registered tons entered Jamaican ports. There are airfields at Montego Bay and Palisadoes.

**Chief towns.** The chief tn is Kingston, the seat of gov. and the largest port and tn (q.v.); the next in importance are Spanish Town, Montego Bay, and Port Antonio. Headquarters House, formerly Hibbert's House, where the Legislative Council has met since 1870 (when the seat of gov. was transferred from Spanish

*Elders & Fyffes Ltd*

#### BANANA HARVESTING IN JAMAICA

Town to Kingston), and the colonial secretary's offices are situated in one of the few buildings of note in Kingston which escaped the earthquake and fire in 1907. A notable institution of Kingston is the Institute of J., rebuilt, after the earthquake, in reinforced brick and concrete. It has a large library, especially rich in Jamaican and W. Indian literature. In its hist. gallery are many notable treasures, including the original 'Shark Papers' exploited by Michael Scott (q.v.) in his *Cruise of the Midge*; the bell of the old church of Port Royal; and 2 silver-gilt maces, formerly belonging to the Council and the House of Assembly. The institute also has a museum containing zoological, geological, botanical, and archaeological specimens. King's House, the residence of the governor, is 4 m. from Kingston, in St Andrew, on the Liguanea Plain. Port Royal, at the extremity of the Palisadoes, is of historic interest, having been the H.Q. of the buccaneers, and the mart of their spoils. Prior to the

earthquake of June 1692 it was reputed to be the finest in the W. Indies. In Port Royal is Fort Charles, where Nelson commanded in 1779. The staircase to what is known as 'Nelson's Quarter Deck,' a space on the ramparts by the admiral's old quarters, still stands. Port Royal used to be a notable naval station, but the dockyard was closed in 1905, after an existence of 24 cents. Spanish Town (13 m. from Kingston), the old St Jago de la Vega or St James of the Plain of the Sp. days, was formerly an important tn, and the well-built group of gov. buildings round its central square bears witness to its former grandeur. The most notable of these was the King's House, the former residence of the governors, of which little more than the facade remains. The N. side of the square is ornamented by a stately memorial to Adm. Rodney, victor of the battle of the Saints (q.v.). Near the square is the cathedral, dedicated to St Catherine, whose red brick fabric is in pleasing contrast to the surrounding foliage. It is one of the 3 oldest eccles. buildings in the W. Indies (the others being the cathedrals at Havana and Cartagena). Bog Walk is a vil. close by a noted gorge of the Rio Corbe. Port Antonio, on the N. side of the Is., 75 m. by train from the cap., is situated on the shore of a spacious harbour. Formerly a vil. of modest size, it rose to a position of prosperity through the banana industry, but suffered when the United Fruit Co. moved their H.Q. to Kingston. Montego Bay, second tn of J., is 112 m. by rail from Kingston. When visited by Columbus it was a large Indian vil. and traces of Arawak life have been found in the neighbouring caves. Its par. church is one of the handsomest in the Is. Savanna-la-Mar, the chief tn of Westmoreland, is the port of a sugar, coffee, etc., growing dist. Falmouth (106 m. from Port Antonio) was once a port of some note. Not far from Ewarton are the Roaring R. Falls, the largest waterfalls in J. St Ann's Par. is a favourite place of visit on account of the views from Mt Diablo. Mandeville is a favourite resort of winter visitors to J.

**Population.** The estimated pop. in 1956 was 1,579,620, the natural increase being about 26 per thousand. The European pop. numbers about 16,000, the coloured about 200,000, the Indian and Chinese 30,000, and the rest is mainly African.

**Dependencies of Jamaica.** Under the Gov. of J. are Turks and Caicos Is. (q.v.) and Cayman Is. (q.v.).

**Constitution and administration.** A new constitution for J. came into force in Nov. 1944. The position of J. was unique, because the colony was returning to a form of responsible representative gov. after an interval of 78 years, and because the proposals for reform submitted to the spokesman for organised public opinion were, to all intents and purposes, adopted in their entirety. A bicameral legislature was set up, consisting of a House of Representatives (the lower house) elected on a basis of universal adult suffrage (women

were enfranchised in 1919, but there was then a prohibitive property qualification) and a nominated Legislative Council (the upper house) of official and non-official members. The privy council and an executive council with the governor himself as chairman (with a casting, but not an original, vote) completed the governmental organisation. In Dec. 1944 a general election returned to the House of Representatives 23 Labour members, 4 representing the People's National party, and 5 Independents—these latter closely allied with the J. Labour party led by Alexander Bustamante who became minister of communications. In 1946 serious labour troubles occurred leading to some fatal casualties, and Bustamante and the minister for social welfare were tried on a charge of manslaughter, but were acquitted. The state of the parties after the election in Jan. 1955 was People's National party, 18, and J. Labour party, 14, since changed by by-elections to People's National party, 19 members, J. Labour party, 12, Independents, 1. Following on the J. (Constitution) Order in Council, 1957, in Nov. of that year the Executive Council was replaced by a Council of Ministers of 12 members (10 from the House of Representatives and 2 unofficial members of the Legislative Council), presided over by the chief minister. The governor was given authority to summon special meetings of the Council of Ministers and to preside at them. As before, the chief minister was to be appointed by the governor subject to a vote of confidence from the lower house; other ministers continued to be appointed by the governor on the chief minister's recommendation.

**Education.** In 1946 the Imperial Gov. decided to estab. a W. Indian Univ. College in J. This has been built at Mona, 7 m. from Kingston, and is entirely residential. It awards London Univ. degrees. In 1955-6, 444 students registered, of whom 141 were women. In 1956 the 706 elementary schools had 233,000 registered pupils. There are 29 secondary schools and institutes.

**History.** J. was discovered on 4 May 1494 by Columbus, who called it Sant Jago, but it has retained its Indian name 'Xaymaxa' or Xaymaca, 'land of water.' According to Frank Cundall, J.'s modern historian, the distinction of being the place of his landing appears to be about equally divided between St Ann's Bay and Port Maria. It was not till 9 years later, on his fourth and last voyage, that Columbus again visited the Is. Being caught in a violent storm, he ran his ships aground near St Ann's Bay, on the N. coast. When Columbus d. (1506) his son Diego inherited his property and went out to Hispaniola as governor. On arriving there he found that J. had been partitioned between 2 Spaniards, and in order to estab. his title, he sent Esquivel to found a settlement in J. under his direction. This settlement was founded on the N. side; but in 1534, because the S. coast was healthier and more suited to vessels

sailing to and from Spain, the town of St. Jago de la Vega, now Spanish Town, was founded, and this soon became the chief town. In 1598 the island was attacked by the English under Sir Anthony Shirley, who pillaged Spanish Town. J., however, remained in Sp. hands for 161 years, and it was not until 10 May 1655 that it changed hands, when Adm. Penn and Gen. Venables, having been disastrously defeated on 17 and 25 April off Hispaniola, gave up the attempt on that island and sailed for J. instead. Governor Don Christoval Arnaldo Yassari was forced to capitulate on 17 May. Later, under the auspices of the viceroy of Mexico and the governor of Cuba, a formidable expedition was fitted out with which Don Arnaldo hoped to recover J. But the bravery of the Eng. soldiers dismayed the Sp. commanders at sea and they left the Sp. invading forces in J. to their fate and to the apathy of the Sp. colonists. After this we enter on the constitutional period of Jamaican hist. when civilian governors succeeded military men. The first Eng. governor was Gen. D'Oyley, who may be regarded as the real conqueror of J. In 1661 D'Oyley's military command was changed into a civil governorship and his commission from Cromwell instructed him to govern with the advice of an elected council. The African slaves of the Spaniards, who had been brought into the island after the virtual extermination of the Arawaks, and who were called Maroons, fled to the mt. fastnesses, and they were not finally pacified until the end of the 18th cent. when, following a rebellion, many of them were deported to Nova Scotia. The year 1760 was notable in Jamaican hist. for the insurrection of the Coromantyns in Ballar's valley under a leader called Tacky—certainly one of the most dangerous risings in Jamaican annals. In June 1670 the Brit. occupation of J. was formally recognised by the treaty of Madrid. Colonisation went on and there was a large influx of soldiers and of undesirable refugees, neither of whom made good settlers. Other settlers came from Nevis and other W. Indian islands. J. at this time became one of the hiding places of the buccaneers, freebooters of all nationalities, who were opposed to the rule of Spain. One of the most famous was Henry Morgan (q.v.), whose exploits are narrated by the Dutch buccaneer, Esquemeling, who sailed with him (see John Esquemeling, *Buccaniers of America*, 1684). Morgan eventually became governor of J. as Sir Henry Morgan.

J.'s hist. from the late 1780's until 1834 is the story of the anti-slavery struggle to eventual emancipation. Successive colonial secretaries sought to prevail on the Jamaican legislature to adopt orders in council for the betterment of the condition of the slaves, but the old House of Assembly always proved obstructive. Victor Hugues, the Fr. W. Indian revolutionary and friend of Robespierre, came to J. and tried to work up insurrection and bloodshed, and this it was that led to the rebellion of the Trelawney tribe of

Maroons in 1795. In the critical days of J.'s hist. in the early 1830's, it was fortunate for the island that it had as its governor the Earl of Mulgrave, later Lord Normanby, who was the ideal man to handle a petulant House of Assembly, which was always disposed to dispute the authority of the home gov. and even the royal prerogative. It was largely through his conciliatory bearing and firmness that the Assembly was at length induced to accept the Bill for the abolition of slavery. Edward John Eyre, a most experienced colonial administrator, became governor of J. in 1864. The island fell upon evil times through economic depression and the state of its finances necessitated new taxation. The resulting discontent led to a rising on 11 Oct. 1865, known as the outbreak at St. Thomas in the East. Martial law was proclaimed in the district, and George Wm Gordon, who was said to have incited the people, was taken from Kingston to Morant Bay, tried summarily, and hanged. Gordon was a coloured member of the Legislative Council and a considerable landowner, but he was prone to inflammatory utterances. This may or may not have justified his apprehension; but, by transferring him from Kingston, where martial law had not been declared, to Morant Bay, where it had, Eyre committed a technical blunder. Later an inquiry was begun in England by a hostile committee of which John Stuart Mill was chairman, but a rival committee under Thomas Carlyle and Charles Kingsley defended Eyre (see on this famous case E. B. Underhill, *The Tragedy of Morant Bay*, 1895—a biased work by a man who played a conspicuous part in the transactions he records 30 years later; also controversial, but on the other side, is Lord Olivier's *The Myth of Governor Eyre*, 1933, and see also the judicially minded work *The Sugar Colonies and Governor Eyre*, 1936, by Wm Law Mathieson). This reverberating event was followed in 1866 by a drastic change in the gov. of J. The one-time recalcitrant Assembly, with its charter and large local rights exercised by a very small class, had become of small influence now that the large sugar planter, who, in 1805, numbered nearly 900 were reduced to 300 in 1865. Strong central gov. under the Crown was the only remedy, and so J. was made a crown colony with a gov. and council appointed by the Imperial Gov. (see further under *Constitution and administration* above).

Brown, *Jamaican Journey*, 1949; Peter Abraham, *Jamaica*, 1957.

**Jamb**, in architecture, the side of a doorway, window opening, or fireplace.

**Jambes**, tn in Belgium and S. suburb of Namur, from which it is separated by the Meuse. It is engaged in agriculture and manufs. glass, crystal, lamp-black, dynamite, and asphalt. Pop. (1955) 11,100.

**Jambi**, tn in Sumatra, on the r. b. of the Jambi R., about 125 m. NNW. of Palembang. Many Hindu sculptures have been discovered in its vicinity. Pop. 22,000.

**Jamblichus Chaldeidenus**, see **IAMB-LICHUS**.

**Jamboree**, originally a drinking-bout or merry-making, but now applied by the Boy Scouts' Association to their national and world rallies. In euche (q.v.) it denotes a single hand containing the 5 highest cards.

**Jambu-dvipa**, one of the 7 continents of the world, in the Mahābhārata, embracing the gods' dwelling-place and the mt of Meru with its 'jambu' or 'rose-apple' tree. Mts divide it into 9 countries, Bharata (India) being the chief. Poetry and Buddhistic works give the name to all India. Others apply it to the mt dists. only (NW.), and others to the whole of Asia.

**Jambul**, see **DZHAMBUL**.

**James I** (1394-1437), King of Scotland, the son of Robert III, at an early age was sent to France by his father. He was, however, captured by Eng. sailors on his way there, and was imprisoned in England by Henry IV (1406). In the same year and probably a month later than his capture, his father died and he became nominally King of Scotland. The Gov. of Scotland was conducted by the Duke of Albany, the king's uncle, who showed no desire to ransom his nephew. Henry gave J. an excellent education, and J. grew up the ideal Renaissance prince—handsome, energetic, accomplished in the arts and athletics. After accompanying Henry V to France he was, in 1424, restored to Scotland, the Scots promising a huge ransom. He had married, in the same year, Jane Beaufort, daughter of the Duke of Somerset. He was crowned in 1424 and with his real accession begins constitutional monarchy in Scotland. He caused the overthrow of Murdoch, Duke of Albany, and his son, and proved so powerful a king that he made many enemies. He crushed the turbulent nobility and was finally murdered by Sir Robert Graham, who had been imprisoned by J. and subsequently banished. J. wrote two poems, *The King's Quair* and *Good Counsel*. See A. Mure Mackenzie, *The Rise of the Stewarts, 1329-1513*, 1935, and E. Balfour-Melville, *James I*, 1936.

**James II** (1430-60), King of Scotland, the only surviving son of James I. He was brought up during his minority under the care of his mother, the Earl Douglas acting as regent, and after the second marriage of the queen he passed into the custody of Sir Alexander Livingstone. Almost continual civil war waged during the period of his minority, the prize of

the victors being the custody of the king. In 1449 J. married and assumed the royal power. He immediately proved himself a strong king. He had Livingstone executed and later stabbed Douglas with his own hand. He crushed the power of the great nobles, and was supported by the majority of them, and also by Parliament. He sympathised with the Lancastrian cause in England during the Wars of the Roses, and after their defeat he attacked the Eng. possessions in the S. of Scotland. At the siege of Roxburgh he was killed by the bursting of a cannon. Gov. and justice were improved and reformed during his reign. See A. Mure Mackenzie, *The Rise of the Stewarts, 1329-1513*, 1935.

**James III** (1451-88), King of Scotland, the eldest son of James II. He became king at the age of 9, and his minority from 1465 was spent in the custody of Sir Alexander Boyd. In 1469 he married the daughter of the King of Denmark and assumed power himself. The nobles submitted to him, but within a few years J. had ceased to take any interest in affairs of state, and the country grew increasingly unruly. His brothers plotted against him; both were arrested and one of them d. in prison. The other fled to England and was recognised by Edward IV as King of Scotland. War broke out with England, and the Duke of Albany and Richard, Duke of Gloucester (Richard III), marched on Edinburgh. Peace was made, but again Albany rebelled, but d. in 1485. J.'s slack rule finally resulted in revolt by the nobles. He was defeated at Sauchieburn, where, according to tradition, after the battle he was slain by a soldier in the disguise of a priest who was called in to shrive him. See A. Mure Mackenzie, *The Rise of the Stewarts, 1329-1513*, 1935.

**James IV** (1475-1513) was the eldest son of James III, against whom he was obliged to take the field at Sauchieburn. He was crowned immediately after his father's death, and at once took over the management of the affairs of the realm. He had little or no trouble with his nobles after the frustration of a plot formed at the beginning of his reign to hand him over to the Eng. king (Henry VII), and he was intensely popular with the commons. He supported Perkin Warbeck against Henry VII, but the projected war with England came to nothing, and in 1503 the marriage between Margaret Tudor and J., which was to result in the union of the crowns a hundred years later, took place at Holyrood. He raised Scotland to the highest position she had yet attained in Europe, and during his reign the Scottish court was refined and enlightened. The accession of Henry VIII led to continual bickerings between the 2 countries, and finally in 1513 J. declared war. He gained some successes at first, but was finally overthrown at Flodden. He d. fighting bravely, and with him perished the flower of Scottish nobility. He was a man of generous nature, and an energetic king. See J. Skene, *Memorabilia Scotica, 1475-1612*, 1923, and A. Mure

Mackenzie, *The Rise of the Stewarts, 1329-1513*, 1935.

James V (1513-42), King of Scotland, son of James IV, succeeded his father at the age of 1 year, and between the years 1513-28 the country was in a state of constant turmoil, owing to frequent collisions between the Fr. and the Eng. parties in Scotland. The queen dowager was for a time regent, but finally Albany, at the head of the Fr. party, occupied that position. The king fell into the hands of the Douglasses, who kept him prisoner until the year 1528, when he escaped and began to rule personally. He put down disorder with a firm hand, and proved himself a very capable king, but he was unpopular with the nobles, since he restricted their power too much. He was highly popular with the commons, however, whose rights he preserved. He married in 1538 Mary of Guise. He supported the old form of faith in Scotland, and refused to follow the lead given by his uncle, Henry VIII. This refusal to listen to the advice of Henry VIII led to ill feeling between the 2 countries, which terminated in 1542 in the outbreak of war. The nobles revenged themselves by deserting their king and leaving him to be overwhelmed at Solway Moss. Shortly afterwards he *d.*, learning as he lay on his deathbed that a daughter had been born to him—Mary Queen of Scots.

James I (1566-1625), King of Great Britain and Ireland (James VI of Scotland), only child of Mary Queen of Scots and her second husband, Henry, Lord Darnley, *b.* Edinburgh. He became King of Scotland in 1567 on his mother's enforced abdication, but his effective rule did not begin until 1583. His childhood and adolescence were unhappy, abnormal, and precarious: J. had various guardians, whose treatment of him differed widely. Though he received a thorough education (George Buchanan was one of his tutors), it was one so weighted with rigid Presbyterian and Calvinist political doctrine that it is hardly surprising that a character like J.'s, quick-witted, sensitive, but fundamentally shallow, vain, and exhibitionist, reacted violently against it. He was to turn, for his political philosophy, to the attractive theory of the divine right of kings—a most striking contrast to the practical experience of his own childhood; and in personal matters sought solace in what contemporaries refer to as 'quiet purposes' with extravagant and unsavoury male favourites, who, in his later years, were to have a damaging effect on state affairs.

J.'s rule as King of Scotland is notable for his success in curbing the power of the nobility, and this, if carried through by dubious methods, shows his undoubted political ability to the full. His attempts to limit the authority of the Kirk were less successful. However, the prospect of soon succeeding Elizabeth I of England now diverted J.'s attention from the Scottish domestic scene which he found so distasteful. The Eng. succession became his absorbing obsession, and his shameless bargaining on the subject led

Elizabeth to refer to him derisively as 'that false Scottish urchin.'

In 1603 he became King of England. He had married Anne of Denmark in 1589. He brought to London a train of greedy Scottish favourites who incurred immediate popular dislike. At once he attempted to apply his political theory of divine kingship; but his overriding desire was to maintain his Eng. throne, and therefore, unlike his son, Charles I, he was always prepared to give way on principle whenever it was obvious that its application would be politically dangerous.

Until 1612 J. was content to act mainly on Cecil's advice; but after the latter's death all restraint vanished, and henceforth J. and his favourites were the only policy-makers. His foreign policy, aiming primarily at a *rapprochement* with Spain and a general peace, with England as Europe's arbitrator, though largely dictated by J.'s personal vanity and his desire to avoid a drain on state finances, which would involve a dependence on Parliament, was magnificent in conception, but completely unrealistic at the time. It failed completely, incurring a loss of national confidence and popular prestige which reacted disastrously on J.'s successor. The most lasting monument of J.'s foreign policy, one which he can hardly have contemplated, was the marriage of his daughter Elizabeth to the Elector-Palatine which was to result eventually in the Hanoverian succession to the Brit. throne.

His religious policy was basically little more than a logical continuance of his predecessor's: an assertion of crown supremacy in religious matters, and an intolerance of the forces which militated against it, both Puritan and Catholic. But circumstances were changing: Puritan influence and political awareness were increasing fast among the squirearchy, whose importance J. never appreciated; while his economic opportunism, with its disastrous effects on commerce, alienated city interests, already dissatisfied with his religious policy. The Gunpowder Plot (1605), with its anti-Catholic reaction, gave J. a temporary popularity which soon dissipated.

J.'s willingness to compromise politically, even while continuing to talk in terms of absolutism, largely accounts for the superficial stability of his reign. But the effects of many of his actions were long-term: the economic recession was not fully obvious until after his death, and the religious and constitutional crises took time to mature. Perhaps most serious was the effect of J.'s philosophies, which J. himself was always ready to abandon when they threatened his crown, on the mind of his more sincere, high principled, but far less astute son, Charles. See lives by C. Williams, 1934, and D. Harris Wilson, 1956.

James II (1633-1701), King of Great Britain and Ireland, was the second surviving son of Charles I, and was created Duke of York in 1643. During the Civil war he was captured by Fairfax, but

escaped to Holland in 1648. During the 12 years which elapsed between this date and the Restoration, he proved himself an able soldier, and was commended both by Turenne and Condé. On the restoration he was appointed Lord High Admiral and Warden of the Cinque Ports. He proved himself an able officer and a wise administrator, and gained a great reputation both for ability and courage. His private life was as immoral as his brother's. He married Anne Hyde (q.v.) in 1659. She bore him 2 daughters, Mary and Anne, who both later ascended the throne. His second wife was Mary D'Este of Modena, who in 1688 bore him a son, James

JAMES II

Francis Edward, known as the Old Pretender. J. made no secret of the fact that he was a Rom. Catholic (probably from about 1670), but after the passing of the Test Act, he was forced to give up his offices, and later the agitation caused by the Popish Plot drove him to the Continent for a time. His exclusion from the throne was proposed by the Whigs, but not carried, and in 1680 J. returned to England. He was first made High Commissioner for Scotland, where his persecution of the Covenanters made him hated, and later he was again made Lord High Admiral. He succeeded to the throne in 1685, on the death of Charles II. He promised to defend the Church of England and the laws, and at first seems to have been popular enough. His position was secure enough to ensure that Monmouth's ill-planned rising of 1685 was an utter failure; the unnecessarily savage repression which followed probably marks the beginning of J.'s downfall. His religious zeal is unquestionable, but he was blind to political considerations and seems to have had no idea of the strength of Protestant opinion in England or of the very real political power of the Estab. Church. He introduced Catholics into the army and the univs., and assumed the right of dispensing with and suspending the laws of England. The Declaration of

Indulgence, and the refusal of the bishops to read it in the churches, led to their trial for seditious libel (1688). They were acquitted amidst the applause of the nation and even of the army which J. had gathered at Hounslow to overawe London. The birth of a son to him destroyed Eng. hopes of a Protestant succession, and decided a group of Eng. nobles of both prin. political factions, some of whom had previously supported J., to send an invitation to William of Orange to come and claim the Eng. crown. J. was apparently sublimely unconscious, in spite of repeated warnings, of what was happening. The army went over to William on the latter's arrival in England, and J. fled to France. He tried to recover his throne from Ireland, but was defeated at the Boyne (1690). Two other attempts to restore him (the battle of La Hogue (q.v.) and the 'assassination plot') failed, and J. d. in exile at St Germain in France. See lives by H. Belloc, 1928; F. M. G. Higham, 1934; F. C. Turner, 1948; also J. Marriott, *Crisis of English Liberty*, 1930, and M. Hay, *Winston Churchill and James II*, 1934.

James, David (1839-93), actor, whose real name was Belasco, b. London. He made his first appearance at the Princess's Theatre under Charles Kean, but subsequently appeared at the Royalty in 1863, where he played in Burnand's burlesque of *Isian*, and estab. his reputation in 1870 with his performance of Zekiel Homespun in *The Heir at Law*. His most successful role was Perkyn Middlewick in *Our Boys*. This piece was played over 1000 times, and was claimed as 'the longest run on record,' which title it held for years.

James, George Payne Rainsford (1801-1860), novelist, b. London. Taking to literature early, he attained some success as a writer of miscellaneous articles, and in 1822 produced a *Life of the Black Prince*, followed within the next 30 years by over 100 books, mostly novels, the remainder hist., plays, and verse. Many of his tales are historical, *Richelieu*, 1829, being one of the best. They were very popular, having plenty of adventures told in good English, though the characters are mere lay-figures. His style is parodied by Thackeray in 'Barbazure' in *Novels by Eminent Hands*. Though J.'s hist. are compilations of no great value, he was for some time historiographer-royal to William IV. From 1850 to 1860 he was Brit. consul successively in Massachusetts, Virginia, and finally Venice, where he d.

James, Sir Henry (1803-77), director-general of the Ordnance Survey of Great Britain, b. Cornwall. He was appointed in 1827, and was made director-general in 1854. He was also director of the topographical dept of the War Office in 1857, and was knighted in 1860. He is famous for having applied photolithography to ordnance maps (1859), on which subject he pub. a book entitled *Photolithography and other Photographic Processes employed at the Ordnance Survey Office*.

James, Henry, Lord (of Hereford) (1828-1911), lawyer and statesman, b. Hereford

and educ. at Cheltenham. Called to the Bar in 1852, he became Q.C. in 1869, entering Parliament the same year as Liberal member for Taunton, which seat he retained until 1885. In 1873 he was appointed solicitor-general, afterwards attorney-general, and received a knighthood. Resuming office under Gladstone in 1880, he was offered the lord chancellorship in 1886, but declined it, having broken away from his leader on the Home Rule question. Elected for Bury (Lancs) in 1885, and re-elected in 1886 and 1892, he became a leading Unionist. At the holding of the Parnell Commission he appeared with Sir Richard Webster as counsel for *The Times*, and in 1895 took his seat in the Salisbury cabinet as chancellor of the Duchy of Lancaster with a peerage. A convinced free trader, he strongly opposed the Tariff Reform movement in 1903. He was a good sportsman, and for some time president of the M.C.C.

James, Henry, O.M. (1843-1916), Amer. novelist, b. New York City, son of a theological writer and brother of Wm J. (q.v.). A long visit to Europe in his boyhood laid the foundation of the passion which he had all his life for European culture. After an unsystematic education, which included the study of law at Harvard, in 1865 he began contributing reviews, sketches, and short stories to various periodicals. In 1871 his first novel, *Watch and Ward*, appeared serially, and in 1875 his first vol. of short stories was pub. In the same year he removed to London, where he lived for more than 20 years.

It has been generally said that his work falls into 3 periods, which Philip Guedalla irreverently labelled James I, James II, and the Old Pretender. In the first he was occupied with the impact of Amer. life on the older European civilisation. To this period belong *Roderick Hudson*, 1875, his first successful novel, which marks the end of his apprentice stage, and the still greater *Portrait of a Lady*, 1881; others are *The American*, 1877, *Daisy Miller*, 1879, *The Princess Casamassima*, 1886, and *The Bostonians*, 1886. His middle period, during which he developed purely Eng. themes, begins with *The Tragic Muse*, 1890, and continues with *The Spoils of Poynton*, 1897, *What Maisie Knew*, 1897, and *The Awkward Age*, 1899. In his third period he returned to his original theme of the contrast between Amer. and European character, and concentrated on depicting psychological interplay with the minimum of action, thus bringing the accusation that 'nothing ever happens' in his books. The last 3 novels pub. in his lifetime were *The Wings of a Dove*, 1902, *The Ambassadors*, 1903, and *The Golden Bowl*, 1904. Two long novels, *The Ivory Tower* and *The Sense of the Past*, were left unfinished at his death.

His vols. of short stories include *Terminations*, 1895, *The Two Magics*, 1898, and *The Altar of the Dead*, 1909. Between 1890 and 1894 he tried his hand as a dramatist, but without great success. He also wrote a number of critical works, including *French Poets and Novelists*,

1878, and a study of Hawthorne, 1879. *Portraits of Places*, 1883, *A Little Tour in France*, 1885, and *Essays in London and Elsewhere*, 1893, are descriptive sketches of travel, and *The American Scene*, 1906, relates his impressions on returning to the U.S.A. after 20 years' absence. He also pub. vols. of reminiscences, *A Small Boy and Others*, 1913, *Notes of a Son and Brother*, 1914, and *The Middle Years*, 1917, which is unfinished; his letters were ed. in 1920. He became naturalised as a Brit. subject in 1915, received the Order of Merit at the New Year Honours of 1916, and soon afterwards d. in Chelsea. He was never married. For the collected ed. of his works, begun in 1907, he wrote a series of critical prefaces which summarise his theories of the art of fiction. As a writer he is subtle and fastidious, portraying with delicate psychological nuances the complex characters of ultra-civilised people.

See studies by F. M. Hueffer, 1914; Rebecca West, 1916; J. W. Beach, 1918; P. Edgar, 1927; F. O. Matthiessen, 1944; also Van Wyck Brooks, *Pilgrimage of Henry James*, 1928; F. W. Dupee (ed.), *The Question of Henry James*, 1947; L. Edel, *Henry James: the Untried Years*, 1953.

James, Montague Rhodes, O.M. (1862-1936), bibliographer, palaeographer, and historian of book production, b. Goodnestone, Kent. Educ. at Eton and King's College, Cambridge, he became director of the Fitzwilliam Museum. In 1905 he was elected provost of King's, from 1913 to 1915 was vice-chancellor of Cambridge, and in 1918 became provost of Eton. He pub. the scientific catalogues of the MSS. of every Cambridge college, as well as those of Fitzwilliam Museum (Cambridge), Aberdeen Univ., H. Yates Thompson Library, Eton College, Lambeth Palace, Westminster Abbey, and other important collections. He also did valuable work on the Apocrypha, and ed. sev. illuminated MSS. (copies of the Apocalypse, the Psalter, Bestiaries, and so on). In popular vein were his 2 collections of *Ghost Stories of an Antiquary*, 1905 and 1911. He was elected a fellow of the Brit. Academy in 1903 and in 1930 was awarded the Order of Merit. He also held honorary degrees from Oxford, Cambridge, St Andrews, and Dublin. See memoir by S. G. Lubbock.

James, St: (1) *The son of Zebedee and Salome* (Matt. xxvii. 56; Mark xv. 40), who on one interpretation of John xix. 25 was a sister of the Blessed Virgin, and brother of John, one of the innermost circle of the Twelve. He and John were nicknamed Boanerges (Sons of Thunder) by Jesus (Mark iii. 17). He remained in Jerusalem with the other Apostles after the Ascension, and was the first of them to suffer martyrdom, 44, being slain by Herod Agrippa (Acts xii). Legend tells of his missionary journeys to Spain, whose patron saint he became, but the earliest written record of this is by Notker of St Gall, in the 9th cent. (2) *Another Apostle, called* (Mark iii. 18 and parallels) *the son of*

**Alphæus.** Mark xv. 40 mentions, as standing by the cross, Mary the mother of J. the Little (Less) and Josés. The identification of J. the Little with J., son of Alphæus is generally accepted. In Catholic tradition he is further identified with (3) *James, the Lord's brother*, whom we find in Acts presiding over the infant Church at Jerusalem.

**James, St. The Epistle of,** is placed first among the Catholic epistles. Its title is short, 'James, a servant of God and of the Lord Jesus Christ, to the twelve tribes which are scattered abroad' (this reference to the 12 tribes and the dispersion is figurative and descriptive of the Church on earth). The traditional view identifies this James with James the Just, Bishop of Jerusalem, James, son of Alphæus, and James, the Lord's brother. Those who hold this view place the date of the epistle very early, before the epistle to the Hebrews, probably before St Paul's first missionary journey, and certainly before the Council of Jerusalem (AD 49), the problems of which are not mentioned, though James was prominent in it. The epistle is therefore not to be regarded as a polemical treatise against the Pauline view of faith, but as an independent address to Jewish Christians from a different point of view. The epistle shows such numerous and close resemblances with the Sermon on the Mount as recorded by Matthew that the writer must have known that Gospel (if its priority and early date can be accepted—see MATTHEW) or at least a source of it, written or oral. Though the apparent antithesis between the insistence of Paul on justification by faith and the emphasis which James lays upon works is great, so much so indeed that Luther characterised the epistle as 'an epistle of straw,' the 2 views are not contradictory. The epistle deals with life not with doctrine. There was some difficulty as to its admission into the Canon until the middle of the 3rd cent. There is no real difficulty about accepting the traditional authorship. It is written in good Greek, but Palestine was bilingual and natives of such a land are not necessarily illiterate in either tongue; often they are fluent in both. There are in fact coincidences between the Epistle and the speech of James in Acts xv (e.g. J. ii. 7—R.V. margin). See commentaries by J. H. Ropes, 1916; Chaine, 1927; Dinart (in C. Gore's *New Commentary on Holy Scripture*, 1928); J. Bonsirven, 1948.

**James, William (d. 1827),** naval historian, practised in the Jamaica Supreme Court (1801-13). He was detained prisoner in the U.S.A. in 1812, but escaped to Nova Scotia in 1813. He pub. various pamphlets on the comparative merits of the Eng. and Amer. navies in 1816, but his great work is his *Naval History of Great Britain from the Declaration of War by France in 1793 to the Accession of George IV* (1820). This appeared in 5 vols. in 1822-4, and was reprinted in 6 vols. in 1826.

**James, William (1842-1910),** Amer. philosopher, brother of Henry J., the

novelist (q.v.), took his degree of M.D. at Harvard in 1870, and became lecturer there in anatomy and physiology in 1872. Inheriting from his father a love for subtle reasoning and mental research, together with great power and freshness in expressing his theories, he became assistant prof. of philosophy (1880), prof. (1885), prof. of psychology (1889), and prof. of philosophy (1897-1907). His *Principles of Psychology*, 1890, gave him a wide reputation, and was reprinted in a condensed form in 1892. He wrote also *The Will to Believe*, 1897, *The Varieties of Religious Experience*, 1902, *Pragmatism*, 1907, *A Pluralistic Universe*, 1909, and *The Meaning of Truth*, 1909. His home was at Cambridge, Massachusetts, but he visited Europe on sev. occasions, and was invited to deliver the Gifford lectures on natural religion at Edinburgh (1899-1901) and the Hibbert lectures at Manchester College, Oxford (1908). Honorary degrees were conferred on him by the univs. of Padua, Edinburgh, Princeton, Oxford, Durham, and Geneva. See R. B. Perry, *The Thought and Character of William James* (2 vols.), 1935.

**James Allen's Girls' School,** founded in Dulwich, London, by James Allon, Master of Dulwich College, in 1741, and reconstituted in 1832 under a scheme of the Charity Commissioners. It belongs to the foundation of Alleyn's College of God's Gift.

**James Bay,** inlet in the S. part of Hudson Bay. It received its name from its explorer, Capt. Thomas James. It is about 300 m. long and 150 m. wide and contains a number of is. Moose Factory, at the mouth of the Moose R., is an important trading station of the Hudson's Bay Co.

**James Francis Edward Stuart,** see STUART, JAMES FRANCIS EDWARD.

**James River,** largest riv. in Virginia, U.S.A. It rises in the Allegheny Mts and flows into Chesapeake Bay. It has a length of 340 m., and is navigable for steamboats of deep draught as far as Richmond (i.e. 100 m. from its mouth). The chief tribs. are the Chickahominy and the Appomattox. Jamestown, the first permanent Eng. settlement, was located on this riv.

**Jameson, Anna Brownell (1794-1860),** authoress and art critic, b. Dublin. In 1831 she pub. her first important work, *Memoirs of Female Sovereigns*, followed by *Characteristics of Women*, 1832, *Beauties of the Court of Charles II*, 1833, and *Winter Studies and Summer Rambles*, 1838, the result of her visit to Canada. It was, however, as an art critic that she excelled, and her writings on the subject of art include *Companions to the public and private picture galleries in London*, 1842, *Lives of Early Italian Painters*, 1845, *The House of Titian*, 1846, *Legends of the Monastic Orders*, 1850, *Legends of the Madonna*, 1852. The work upon which her reputation chiefly rests, *Sacred and Legendary Art* (first part pub. in 1848), was completed, after J.'s death, by Lady Eastlake under the title of *The History*

of *Our Lord*, 1864. See memoir by Mrs Macpherson, 1878.

**Jameson, Sir Leander Starr** (1853-1917), politician and administrator, b. Edinburgh, and studied medicine in London (M.D., 1877). Breaking down from overwork in 1878 he went out to S. Africa, settling at Kimberley, where he was very successful, among his patients being President Kruger and Lobengula. He was intimate with Cecil Rhodes, and when the latter, assisted by J.'s influence with Lobengula, estab. the Brit. S. African Co., the doctor accompanied the first emigrant column to Mashonaland in 1890. Next year, being appointed administrator, he succeeded in checking a Boer trek 4000 strong, organised to dispute the Brit. possession of the country. In 1893 a Matabele invasion brought on a war in which J. took a leading part, and ended in the conquest of Matabeleland. Returning home for a rest in 1894 he went out again in 1895, and on 31 Dec. led that disastrous raid into the Transvaal which heralded so many troubles. Captured by the Boers, he was released, and was later sentenced to 15 months' imprisonment, but was loudly applauded in open court. Returning unofficially to Africa he became leader of the Progressive party after the war, and Premier on their success in 1904. His measures were liberal; the rebel prisoners were liberated and shortly afterwards restored to the franchise, while strenuous efforts were made to develop the resources of the country, railroads and education receiving special attention. In 1908 his party was defeated, and J. resigned office. He was made privy councillor in 1907, and baronet in 1911. See Col. H. Marshall Hole, *The Jameson Raid*, 1930.

**Jameson, Margaret Storm** (1897-), novelist, b. Whitby, Yorks. Educ. at Leeds Univ. and London, she was at different times publicity writer, dramatic critic, and editor. She married Prof. Guy Patterson Chapman. Among her finest novels are *The Lovely Ship*, 1927, *The Voyage Home*, 1930, and *A Richer Dust*, 1931, which form a trilogy telling of a shipbuilding family like her own; others are *The Three Kingdoms*, 1926, *Farwell to Youth*, 1928, *Cousin Honore*, 1940, and its sequel, *Cloudless May*, 1943, *The Other Side*, 1945, *The Black Laurel*, 1948, and *The Hidden River*, 1955. Her critical works include *Modern Drama in Europe*, 1920, and *The Decline of Merrie England*, 1930. *Full Circle*, 1928, is a one-act play, and *No Time Like the Present*, 1933, is an autobiography.

**Jamestown:** 1. Cap. of St Helena (q.v.), situated on the NW. coast of the is. It has an open roadstead. Pop. 1500.

2. A city in Chautauqua co., New York, U.S.A., about 60 m. SW. of Buffalo, situated on Lake Chautauqua, and much patronised as a summer resort. It is a furniture manufacturing centre, and also produces toys, textiles, tools, and washing and milking machines. Pop. 43,350.

3. Former settlement in James City co., Virginia, U.S.A.; it was the first Eng.

settlement in the U.S.A., founded 13 May 1607. Only remains, however, of this settlement exist at the present day, and are incorporated in Williamsburg, the first cap. of Virginia.

**Jami, Nur ud-Din Abd ur-Rahman** (1414-92), great Persian poet, scholar, and mystic, b. Jam in Khorasan. He wrote lyrical poems and odes, 7 romantic or didactic *mahnavas* (q.v.), of which *Fusus u Zulaikha* and *Salaman u Absal* have been trans. into English, the former by Rogers (1885) and the latter by Fitzgerald (1856), and many other works, including lives of the saints, and the *Baharistan*, a collection of anecdotes and ethical reflections, which has also been trans.

**Jamieson, John** (1759-1838), scholar and antiquary, b. Glasgow. After studying for the ministry he was ordained to the anti-burgher branch of the Secession Church at Forfar in 1781, and afterwards at Edinburgh in 1797. His chief work is *The Etymological Dictionary of the Scottish Language*, 1808; supplements in 1825; revised ed. in 1879-87. Among his pubs. are eds. of Barbour's *Bruce* and Blind Harry's *Sir William Wallace*.

**Jammes, Francis** (1868-1938), French poet and novelist, b. Tournai in the Pyrenees. In his earlier style there were the delicious *De l'Angelus de l'aube à l'Angelus du soir*, 1898, *Le Deuil des primevères*, 1901, and in his later Catholic style *Les Géorgiques chrétiennes*, 1911. Among his prose stories are *Clara d'Ellebeuse*, 1899, *Almaïde d'Étremont*, 1901, *Pomme d'Anis*, 1904, *Le Poète rustique*, 1920, *Les Robinsons basques*, 1925. His style is characterised by great simplicity. See A. de Bersanecourt, *F. Jammes, poète chrétien*, 1910, and R. Mallet, *F. Jammes*, 1950.

**Jammu, Jamu, or Jummoo**, cap. of the Jammu prov. of the state of Jammu and Kashmir, India, and situated about 80 m. N. of Amritsar. It was once a seat of a Rajput dynasty, now the residence of the former Maharajah of Kashmir.

**Jamnagar, or Nawanagar**, tn and former state of India, on the Gulf of Cutch. The state is now merged in Saurashtra state, of which the Jam Sahib, former ruler, is Rajpramukh, or Governor. The famous cricketer, Ranjitsinhji, was Jam Sahib from 1907 to 1933.

**Jamnla**, see JABNE.

**Jamrud**, fort in W. Pakistan. It lies 10-12 m. to the W. of Peshawar at the entrance of the Khyber Pass. It played an important part in 1878-9 in the war with Afghanistan. A new railway line through the Khyber from J. to the frontier of Afghanistan was opened in 1925.

**Jamshedpur (Tatanagar)**, iron and steel city of India created by Jamshedji Tata and his successors in the Bihar jungle on a site near rich deposits of haematite in Singhbhum and conveniently close to the Jharla coalfield; pop. of the site was 5672 in 1911 and rose to 218,000 in 1951. Besides the iron and steel, allied industries have developed on the site to produce tinplate, cables, rails, wire, nails, farm

implements, and in recent years machinery of various types. When India attained independence, the J. plant was the largest of its kind in the Brit. Commonwealth, producing 1 million tons of steel a year. The city is also notable as being a planned city from the start of operations, with housing schemes for employees that are a pattern for India.

**Jamshid**, subject of many Persian poems and legends, is supposed to have belonged to the mythical 'Pishdadian' dynasty, and to have been dethroned by Zahhak, after a rule of 700 years. J. is said to have divided men into 3 classes, soldiers, artisans, and agriculturists, and to have invented the arts of music and medicine.

**Jämtland**, län or gov. of Sweden; chief tn, Östersund. Area 20,000 sq. m.; pop. 144,880.

**Jan Mayen Island** lies about 300 m. N. of Iceland, in the Arctic Ocean between Greenland and Norway. It is a craggy, volcanic is., whose mossy cliffs are the haunt of millions of seabirds, and whose desolate slopes, when the winter snow recedes, become alive with Arctic plants and an unexpected fauna of insects and spiders, and other small animals. Scattered throughout the is. are the craters of extinct volcanoes, many of recent origin. At one precipitous point, on Egg Bluff, steam still rises from the depths of the is.; near by, dominating the whole is., the mighty white Beerenberg, first climbed by J. M. Wordie (q.v.) in 1921, rises nearly 8000 ft, directly above the surf. From the ice-cap of this volcanic mt, which is about 80 m. round the base and one of the biggest volcanic cones in the world, some 15 glaciers drop towards the sea. The is. is economically useless; but it was conveniently situated for the estab. in 1921 of a meteorological station. It was once a vital factory site in the centre of the Arctic whaling grounds. The whales have gone, but traces of the hunt and the hunters were found in 1947 by the Oxford Univ. expedition on every lonely beach. The earliest hist. of J. M. I. is lost even to the Norsemen's legends, but it is agreed that it was discovered long before the whalers made it their summer home. A little over 2 cents. ago mariners from various nations 'discovered' J. M. I. One of the first of these was the Dutchman Jan Mayen, who landed on the is. in 1614 and whose name it now bears. It was probably discovered first by Henry Hudson in 1607, though others besides Jan Maren since his time have claimed to have discovered it. Fr. whalers called it the Île de Richelieu; in the early days of their whale-hunting the Dutch seem to have named it St Maurice, while their greatest fishing rivals, the English, called it Trinity, or Sir Thomas Smith's, Is. The diaries of early voyagers, however, all comment on the stark barrenness of J. M. I., including that of Robert Fotherby, the Eng. captain who visited the is. in 1615, and reported that in the lowlands 'all the stones are like unto a smith's slinders both in colour and forme, the sand is

generally mixed with a corne like amber.' This 'amber' is formed of pretty yellow-green olivine crystals which shine from the black laval sand of the beaches. The flora of lichens and mosses clings precariously to the crumbling lava. The sea at times is covered with fulmars, petrels, kittiwakes, little auks, gullmots, and puffins. The is. is uninhabited except for the personnel of a meteorological station maintained by the Norwegian Gov. In damp places under the cliffs vegetation is lush and varied, comprising such familiar things as dandelions, bilberries, anemones, and flowering saxifrages. But at altitudes of 7000 ft and 5000 ft above the snow-line may be found mosses and orange lichens projecting through the snow. See *Geographical Journal*, vol. lxi, No. 3, 1922; Scott Russell, *Mountain Prospect*, 1946; 'Oxford Goes Exploring,' by A. J. Marshall, leader of the Oxford Univ. Expedition, in *The Times*, 24-5 Nov. 1947.

**Jan of Mabuse**, see **MABUSE**.

**Janáček, Leoš** (1854-1928), Czech composer, b. Hukvaldy, Moravia, son of a vil. schoolmaster. Was a choir-boy at Brno, and later choir-master in a monastery. Studied in Prague and Leipzig; settled in Brno as conductor and composer. Produced a number of operas of which the most widely known is *Jenufa* (*Her Foster Daughter*), 1903, a drama of Moravian peasant life. *Katya Kabanova*, 1921, is based on Ostrovsky's famous Russian play. *The Storm*. His other prin. operas are *Mr Brouček's Excursions*, 1917, consisting of 2 fantastic dreams within a realistic framework; *The Adventures of the Cunning Vixen*, 1923, many of the characters of which are animals, with a hint of underlying symbolism; *The Makropoulos Affair*, 1925, based on a well-known play by Capek; and *From the House of the Dead*, 1928, which adapts for the operatic stage episodes from Dostoevsky's reminiscences of his prison life in Siberia. He also composed church music, including the remarkable *Glagolitic Mass*, a vast number of choruses and part-songs too intimately wedded to the Slovak or Czech words to be easily performable outside their own country, some fascinatingly original orchestral and chamber music, piano works and songs (e.g. the cycle *Diary of One Who Vanished*), etc. J.'s music, like that of Berlioz or Sibelius or Nielsen, is quite unlike that of any other composer, not only because it is intensely national, but also because it has very striking personal characteristics. See studies by Max Brod (Ger.), 1925, and Daniel Muller (Fr.), 1930 (there is a large literature in Czech).

**Janda, La, Sp.** lake in the prov. of Cádiz. It is believed that on its banks took place the decisive battle of 711 in which Roderic (q.v.), the last Visigothic King of Spain, was defeated by the Moors under Tarik (see **SPAIN, History**).

**Jane, Frederick T.** (1870-1916). Brit. naval officer and founder and first editor of the annuals *Jane's Fighting Ships* (from 1898), an authoritative description of the

world's navies, and *All the World's Aircraft* (from 1910). Educ. at Exeter school. Naval correspondent for the *Engineer*, *Scientific American*, and *Standard*. Other pubs. include *Blake of the 'Rattlesnake'*, 1895, *The Port Guard Ship*, 1899, *The Torpedo in Peace and War*, 1898, *The Jane Naval War Game*, 1898, and other works on the game, which he invented, *Heretics of Sea Power*, 1906, and *The British Battle Fleet*, 1912.

Jane Grey, Lady, see GREY, LADY JANE.

Jane Seymour, Lady, see SEYMOUR.

Janeiro, Rio de, see RIO DE JANEIRO.

Janesville, city, cap. of Rock co., Wisconsin, U.S.A., on the Rock R. about 60 m. SW. of Milwaukee, in tobacco-growing, dairying area. It manufs. automobiles, fountain-pens, and textiles. Wisconsin School for the Blind is here. Pop. 24,900.

Janet, Paul (1823-99), Fr. philosopher, b. Paris. He was prof. of philosophy in Strasbourg Univ. in 1848 and in 1864 became prof. at the Sorbonne, and a member of the Academy of Moral and Political Sciences, receiving prizes from this institution in 1855 and 1858 for *La Famille and Histoire de la Philosophie dans l'antiquité et dans les temps modernes*. He also wrote *Les Causes finales*, which has been trans., *Histoire de la philosophie, Philosophie de la Révolution Française, and Théorie de la morale*. He was a lucid if not original writer, and in philosophy was a follower of Cousin.

Janet, Pierre Marie Félix (1859-1947), Fr. psychologist, b. Paris, where he studied psychology and graduated 1882. After teaching this subject he turned in 1889 to medicine, took his M.D. Paris in 1892, and worked under Charcot at the Salpêtrière and then practised as a neurologist and psychiatrist. In 1903 he was appointed prof. of psychology at the Collège de France. J. made important observations on hysteria and hypnotism, and was first to describe psychasthenia; his descriptions of the clinical manifestations of the psychoneuroses surpass in extent and accuracy anything to be found elsewhere. Among his numerous works are *L'Automatisme Psychologique*, 1889, *État Mental des Hystériques*, 1893, *Les Obsessions et la Psychasthénie*, 1903, and *Les Médications Psychologiques*, 1925-8.

Janeway, James, see CHILDREN'S BOOKS. Janiculum, or Mons Aureus, hill on the W. bank of the Tiber (q.v.) opposite the old city of Rome (q.v.). During the reign of Augustus (q.v.) it came within the city limits. Height 300 ft.

Janin, Jules Gabriel (1804-74), Fr. critic and novelist, b. St Étienne. He made his reputation by his dramatic criticism in the *Journal des Débats*. His *L'Ane mort et la Femme guillotinée*, 1829, was a clever parody of Victor Hugo. This was followed in 1831 by *Barnave* (his best novel), which gives a striking picture of the first Fr. Revolution. A collection of his best articles appeared as *Histoire de la littérature dramatique* (6 vols.), 1853-8. He was elected to the Academy in 1870. See A. Piédaguel, *Jules Janin* (3rd ed.), 1883.

Janina, Yannina, or Yanina, cap. of the dept. of Janina, Greece, is situated on the shore of Lake J., about 50 m. from the sea coast opposite the is. of Corfu. It is the seat of a Gk archbishop, and po. many mosques and churches. Gold and silver embroidery are still produced in the city; it was the stronghold of Ali Pasha, the tyrant of Epirus, from 1788 to 1822; was besieged and captured by the Greeks during the Balkan war, 1913. Pop. (dept.) 154,000; (tn) 32,300.

Janizaries, renowned force of Turkish soldiery estab. in the 14th cent. Down to about 1600 they were composed of forced levies of Christian youths, to whom were added young captives taken in war. Trained under a discipline both military and monastic, they were taught to look upon the corps as their only home and for cents. they were the flower of the Ottoman troops. Receiving no pay except during wartime, they were allowed to work at trades and to act as police. They frequently mutinied, and at length in 1826 a final revolt at Constantinople resulted in their annihilation.

Jannequin, Clément (c. 1475-c. 1560), Fr. composer, probably a pupil of Josquin des Prés (q.v.), but almost nothing is known of his life. He was a great master of the 16th-cent. Fr. polyphonic *chanson* and wrote realistic pieces imitating, by purely vocal means, the sounds of birds, the chase, the battlefield, etc., see also FRENCH MUSIC.

Jannes and Jambres, legendary names of the 2 wizards who 'withstood Moses' (Exod. vii. 11; 2 Tim. iii. 8); in some traditions they were the 'two youths' (R.V. 'servants') who went with Balaam to curse Israel (Targum i.; Num. xxii. 22). They were the subject of many legends, and a book, *Poenitentia Jannis et Mambre*, is referred to among the apocryphal books by Origen. See Schürer, *Gesch.* iii. 292 et seq. (1886-90).

Jannings, Emil (1887-1950), Ger. stage and film actor, b. Rorschach, Switzerland, of Ger.-Amer. parents. He appeared with Max Reinhardt's company in Berlin. His first appearance as a film actor was in an Ernst Lubitsch film (1916), and he also worked for the Amer. screen (1925-9). He returned to the stage in 1932. Outstanding films included *The Last Laugh*, *The Way of all Flesh*, and *The Blue Angel*.

Jansen, Cornelius (1585-1638), Dutch cleric, founder of the school of theology known as Jansenism. He studied at Louvain and Paris, returning to Louvain as a prof. in 1617, where he lectured on Scripture for nearly 20 years, and led the univ. in a bitter controversy with the Jesuits. In 1626 he led a deputation to Spain to plead the cause of the univ. against the Jesuits, and succeeded in getting their authorisation to teach the humanities and philosophy withdrawn by the Court of Madrid (1626). Meanwhile he was working on his great theological treatise, the *Augustinus*, designed to restore the teachings of St Augustine to their true place in Christian doctrine. By recommendation of Philip IV he was

made Bishop of Ypres in 1636, but d. in an epidemic in 1638. He had never had a conflict with Rome, and in his last will and testament declared that he d. 'an obedient son to that church in which I have lived to my dying hour.' Two years after his death the *Augustinus* was pub., and immediately showed that J. had favoured the opinions of Balus, an earlier chancellor of Louvain Univ. who had taught a doctrine of grace which resembled Calvinism. The *Augustinus* had an immense success, and was defended by the friends of J., headed by Arnauld (q.v.). See JANSENISM.

CORNELIUS JANSEN

**Jansenism.** After the death of Jansen in 1638 most of his works and letters were pub., especially the *Augustinus* in 3 vols. in 1640. Jansen had been strongly anti-Protestant, but some of his tenets resembled Calvinism, so that 5 of them were condemned by the Vatican in 1649. Some of Jansen's friends, especially the fathers of Port Royal, headed by Arnauld, defended these propositions, and though in 1653 they were declared heretical, Arnauld would not give way. In 1656 he was degraded and exiled, and in 1661 his adherents were ordered to sign a renunciation of his teaching on pain of imprisonment. A truce was estab. in 1669, and for 30 years the Jansenists, protected by some powerful friends, maintained a precarious footing in France. In 1703 Louis XIV, at Jesuit instigation, began a fierce attack on J., and in 1713 Clement XII in the bull *Unigenitus*, condemned the *Reflexions* of Quesnel, Arnauld's successor. This decree had a mixed reception in France, but the Catholic party proved the stronger. The leading Jansenists withdrew to Holland, where they formed a church. Jansen had intended to restore the teaching of Augustine to what he conceived to be its proper place in the Church, and to prove how it had been perverted by the schoolmen. In vol. i of the *Augustinus* he defines the distinctive tenets of the Pelagians and semi-Pelagians. Vol. ii assigns limits to human reason, and adjusts the claims of authority with particular reference to

Augustine. Reversing the principle of the schoolmen, J. affirmed that philosophy and theology were entirely unconnected. Original sin is not mere imputation of sin; it is a depravation of nature and concupiscence is a taint of sin in body and soul. The third vol. treats of the Grace of Christ, and concludes with an attempt to identify the teachings of the Jesuit Molina with semi-Pelagianism. The fear of God and of eternal punishment cannot remove evil from the heart; 'fear is a self-growth of the feeble soul, there is nothing of God in it,' and, later in the same context, Jansen attacks the scholastic notion of attrition. The fundamental opposition of J.'s teaching to Catholicism lay in his disregarding the distinction between the natural and supernatural order. For him supernatural gifts were not gratuitous but simply man's due. In moral questions the Jansenists called the Jesuits 'laxist,' while the Jesuits called their opponents 'rigorist.' In 1653 Innocent X declared various propositions of Jansen either heretical and irreligious, or injurious to God. Anthony Arnauld (q.v.), against the Pope, argued that though the views as stated by the Pope were censurable, they were not to be found in Jansen's work. This reply provoked a long-drawn dispute over papal infallibility, which incidentally Jansen had defended in a doctoral thesis in 1619. Among the most ardent supporters of J. in France were the nuns of the abbey of Port Royal in the Fields, whose abbess, known later as Maria Angelica de S. Magdalena, was the sister of Arnauld. One of the most famous defenders of J. was Pascal, author of the *Lettres Provinciales*, in which the casuistry of certain Jesuits is brilliantly ridiculed. Louis XIV, at Jesuit instigation, had the convent demolished. Further persecution followed the issue of the bull *Unigenitus*, condemning *Moral Observations on the New Testament* by the Jansenist, Pasquier Quesnel (q.v.). But this merely provoked fanaticism. Marvellous cures and other miracles were attributed to Jansenists, and sects arose called Convulsionaries and Flagellants. At the death of Louis XIV, J. showed a bold and defiant front. The Sorbonne, in his reign Molinist, became Jansenist in the regency, and by the middle of the cent. J. was influential in the Fr. Parliament, and its principles openly professed by men of high position. The Fr. Revolution weakened its hold, but did not extinguish it altogether, and its influence was felt in the Fr. Church throughout the 19th cent. To-day as a separate Church they exist mainly in Holland. See G. Gerberon, *Histoire de Jansenisme*, 1700; *Dictionary of Sects, Heresies, Ecclesiastical Parties*, 1874; E. Pasquier, *Le Jansenisme étude doctrinale d'après les sources*, 1909; N. Abercrombie, *The Origins of Jansenism*, 1936; J. Orsibal, *Les Origines du Jansenisme*, 1947.

Janssen, Cornelius (c. 1590-1665), Dutch painter, b. probably at Amsterdam. He came to England in 1618, and was taken into the service of James I, whose portrait he painted sev. times. His chief pictures

are a portrait of Sir George Villiers, father of the famous Duke of Buckingham; portrait of Charles I (in Chatsworth House); and Wm Harvey (in the Royal College of Physicians).

**Janssen, Peter Johann Theodor** (1844-1908), Ger. historical and portrait painter, b. Düsseldorf. He was awarded the gold medal in Berlin in 1893, and in 1895 became director of the academy at Düsseldorf. His chief work is 'Walther Dodge and the Peasants of Berg before the Battle of Warringen, 1288.'

**Janssen, Pierre Jules César** (1824-1907), Fr. astronomer, b. Paris. He made a study of mathematics, physics, and chem., and in 1857 went to Peru in order to determine the magnetic equator. He attained notoriety by his use of a high dispersive power spectroscope to see the lines of solar prominences in daylight, without waiting for an eclipse. He shared this honour with Lockyer (q.v.). In 1875 he was appointed director of the new astrophysical observatory at Meudon, and interested himself in solar photography, his results being pub. in *Atlas de photographies solaires*, 1904.

**Janssens, Victor Honorius** (1664-1739), Flem. painter, b. Brussels. He studied in Rome, was a painter to the Duke of Holstein for some years, and later, in 1718, became painter to the emperor in Vienna. He was noted for historical pictures such as the 'Dido ordering the building of Carthage.'

**Janssens van Nuyssen, Abraham** (c. 1567-1632), Flem. painter, pupil of Snellinck, who worked in the style of Rubens. He was a master of chiaroscuro, in torchlight and similar effects influenced by Caravaggio. Among his best works are 'Resurrection of Lazarus,' 'Descent from the Cross,' and 'Ecce Homo' (Ghent), and 'Entombment' (Antwerp).

**Jansson, Tove**, contemporary Finnish artist. Her cartoons on the *Moomin* family are popular in England.

**Janthina**, see LANTHINA.

**Januarius, St.**, or **San Gennaro** (d. AD 304), martyr and patron of Naples. Legend relates that he was Bishop of Benevento and suffered under Diocletian. His body is preserved at Naples, and 2 phials which are said to contain his blood are shown when the phenomenon of the 'liquefaction of the blood' occurs. No natural explanation of this has ever been proved. His feast is on 19 Sept.

**January**, first month of the modern year, containing 31 days. The name is derived from the Rom. two-faced god 'Janus,' to whom it was dedicated. The Angles and Saxons called the month 'Wulfmonath,' because cold and hunger induced the wolves to enter the vills. at that season. It was formally adopted by all European nations as the first month of the year in the 18th cent., though 1 Jan. had been regarded as the first day of the year in Scotland since 1600.

**Janus**, one of the oldest Lat. gods. His name may be derived from the same root as *janua*, a gate, or be the masculine form of Diana (Jana). He was 'the spirit of

opening,' and is represented with 2 faces which look both ways. He was invoked at the beginning of any enterprise before the other gods, and as the patron of all 'openings,' whether concrete (e.g. the gates of public or private buildings) or abstract (e.g. the beginning of the day, month, or year); the fifth month of the year was dedicated to him. His only priest was the *Rex sacrorum*, the king as religious head of the state, but every head of a household was regarded as his 'flamen.' His worship was of immemorial antiquity, and there was an archway (erroneously called a temple) supposed to have been built by Numa which was always open in times of war and shut in times of peace. See Warde Fowler, *Roman Festivals*, 1908, and *Religious Experience of the Roman People*, 1911.

**Japan**, or **Nippon**, long chain of is. off the E. coast of Asia, divided from the continent by the Jap. Sea and washed by the Pacific Ocean on its E. shores, lying between long. 156° 31' E. and 124° W., and between lat. 30° 20' and 45° 30' N. The former Jap. Empire had a total area of 263,051 sq. m. and a pop. of 105,226,101 (census of 1 Oct. 1940). J. now consists only of the is. which were formerly known as 'J. Proper' by way of distinguishing between the homeland and the whole empire, including Formosa, Korea, leased and mandated terr., all of which have now been lost. The homeland, or 'J. Proper,' consists of Honshu (or Mainland), 88,976 sq. m.; Hokkaido (which before 1945 included the Kurile Is. as the prov. of Chishima, 30,332 sq. m.; Kyushu, 16,247; Shikoku, 7,248; and Ryukyu or Luchu Is., 920 sq. m., with a total pop. of 89,280,000 (1955). After J.'s defeat in the Second World War she was forced to surrender her other seized lands, including Manchuria (Manchukuo), with an area of 404,428 sq. m. and a pop. of 43,500,000; the Kuriles, or the 'Myriad Isles'; Formosa, or Taiwan, ceded to J. by China in 1895; the peninsula of Korea, or Chosen (84,102 sq. m.), annexed by J. in 1910; the S. half of Sakhalin Is., called Karafuto by the Japanese (area 13,154 sq. m.) and ceded by Russia in 1905; and the Marshall, Caroline, Ladrone (excepting Guam), and Pelew Is., former Ger. possessions in the N. Pacific, which were placed under Jap. mandate under the treaty of Versailles (1919) and were renamed Nanpo, comprising a total area of 830 sq. m. with a pop. (1937) of 121,000. The coastline of J., which exceeds 17,000 m., is long in proportion to the area, with the exception of Honshu, and is deeply indented, especially on the E. shores. There are only 2 large bays on the E. coast, those of Sendai and Matsushima, but there are hundreds of smaller indentations. Further S. lie Tokyo Bay, the Gulf of Sagami, and the Bays of Suruga and Ise. The famous inland sea that separates Shikoku from Kyushu is one of the loveliest sheets of water in the world. It measures about 1325 sq. m., and is studded with beautiful little is. Three narrow waterways connect it with the Pacific Ocean and the Sea

of J.; on the W. Shimonoseki Strait, on the S. Bungo Strait, and on the N. Kii Strait. On the W. shore of Kyushu lie 3 promontories, Nomo, Shimabara, and Nishisonoki, enclosing a bay on whose shores stand Nagasaki and the (pre-1945) naval port of Sasebo. On the S. of Kyushu lie the Bay of Kagoshima, and N. the inlet of Wakasa-wan carrying the harbour of Isuruga, and the (pre-1945) naval port of Maizuru.

The is. are traversed from end to end by ranges of mts, many being volcanic, some few of which are still active. The most

Mt Aso in Kyushu is the largest *caldera* (volcanic crater) in the world, and Mt Asama ranks after Aso as the largest active volcano in J. The mt scenery is not rugged, but soft and beautiful; the vegetation of the hillsides is exceedingly brilliant; the highest peaks do not carry snow all the year round. One famous mt on the boundary of Kagoshimaken, known as Kirishimayama (5538 ft), is especially sacred to the Japanese because the god Ninigi descended on its E. peak and introduced the first Jap. emperor, Jimmu. Many of the volcanoes have after long

E.N.A.

FUJI-SAN OR MOUNT FUJI

famous mt, both for its height (12,385 ft) and for its singular beauty of form and setting, is Fuji-san or Mt Fuji; it lies a short distance from the great port of Yokohama in Honshu; the slopes are cultivated as far up as 1500 ft., then moorland and forest stretch up to the summit, which is crowned with ashes and scoriae. The volcano appears to be extinct, having been dormant since 1707, but the hist. of other volcanoes forbids the people to trust wholly its present peaceful appearance. It possesses a wonderfully perfect shape, and Jap. artists have made its picture familiar by constant reproductions; 5 lakes lie at the N. foot of Fuji-san and add greatly to the beauty of the scenery. Among the highest mts after the Fuji range are those in the provs. of Hida and Etchu, 6 of these rise to 9000 ft; they are known as the Jap. Alps. The Nikko Mts are another range famous for their beautiful vegetation and countless waterfalls.

intervals of silence suddenly become active such as Bandai-san (6037 ft), which burst into terrible activity in 1888 and destroyed utterly 7 prosperous vills. and hundreds of people, or Asamayama, 90 m. SW. of Tokyo, which was in eruption in May 1942, and caused widespread damage. The volcanic character of the country has given J. one great gift in the shape of numberless hot springs, widely reputed for their medicinal value. Though very mountainous the country has sev. extensive plains; that of Kanto, which is very fertile, holds the cap., Tokyo, and the tn of Yokohama. None of the rivs. are of any considerable size, though probably no country is so well watered by a network of streams and lakes. The longest riv. is the Shinano (230 m.), and 2 of the most important are the Tone (200 m.) in Kanto and the Ishikari (228 m.) in Hokkaido. The Shinano waters the plain of Echigo, flows into the sea of J., and is navigable

for about 90 m. Most of the rivs. are short, rapid, and shallow, gaining depth when the snows are melting; they are freely used for electric purposes and whenever possible for transport. The lakes of J. are numerous. They are very beautiful, the largest being Biwa in the centre of Honshu, about 180 m. in circumference; it possesses 8 views of wonderful beauty and is much loved by the Japanese. Lake Suwa in Naganoken is also celebrated for its beauty. The 5 lakes at the foot of the slopes of Fuji-san and 1 in Mt Hakone are popular resorts for both foreigners and Japanese.

The geological basis of the is. consists of granite, syenite, and diorite, granite everywhere predominating; the granite is not always pure, e.g. in the valleys of Nikko a granite-porphry is found with crystals, felspar, and quartz, etc. The soil is usually workable and prolific, and along the banks of the rivs. fertile and well adapted for the cultivation of rice. The climate necessarily varies in different parts of the empire owing to the long extension of the is. Its general characteristics are heat and moisture through the short, bright summer, followed by short, cold, fine winters. The rainy season occurs in the early summer in most parts of J., and is only exceeded by the winter snowfall on the J. Sea coast. In the more mountainous dists. of the is. the snowfall during the winter is very deep. J. is rather a wet country, and although the brilliant sunshine assists in making a healthy climate in spring and autumn, bad fogs are prevalent even during the summer. The typhoon, or great wind, is a terrible visitor, especially during Sept. The equivalent of nearly £3,000,000 sterling has been expended in 1 year for damages caused by the typhoon, including the destruction of ships, vils., roads, embankments, and bridges, etc. The is. also suffer from frequent earthquakes, sometimes accompanied by tidal waves which claim thousands of human victims. In 1923 a terrible earthquake occurred in which nearly 150,000 people were killed in Tokyo and Yokohama, and the damage done was estimated to cost about 5 billion yen. This was followed on 24 May 1925 by an earthquake at Kobe in which many were killed, and shocks were also experienced in 1929 (see under EARTHQUAKE). An earthquake which, accompanied by a 7-ft tidal wave, struck central J. and the is. of Shikoku on 21 Dec. 1946, was almost as severe as the earthquake of 1923, but the casualties were only 680 dead, and 4819 houses were destroyed.

FLORA. J. has a great and beautiful variety of vegetation, the colours of the foliage in spring and autumn being unsurpassed in richness and range of shades. Many Eng. gardens have gained in beauty by the brilliantly coloured shrubs brought from J. Oaks, laurels, conifers, walnuts, birch, chestnut, camphor-trees, and especially the weeping willow and maple, grow freely, while everywhere the bamboo is seen growing in beautiful clumps. Among the queens of the flowering trees

the plum must come first, so graceful in its growth and in its profusion of beautiful blossom and so wonderful in its richly coloured foliage. The cherry-tree is even more beloved by the natives, who stand among the world's greatest and most artistic gardeners. The peach-tree also blooms with amazing profusion. Their fruits are also highly appreciated, especially plums, which are salted and eaten in every family. The Jap. pyrus, or pear-tree, and the malus, or apple-tree, have become familiar to Eng. gardeners, and are much prized for their gay colouring and cloud of blossoms; among the apple varieties the *Floribunda* is especially hardy and beautiful. The magnolia blooms in great perfection, also the azalea, chrysanthemum, peonies, iris, hydrangea, camellia, gum cistus, etc. We owe many of our most graceful and brightly coloured shrubs and flowers to Jap. gardeners. As a race they love the art of gardening, and at no time is the country devoid of blossoms of some kind. Their landscape and water-gardens are creations of beauty, and the miniature, or model gardens, are an astonishing example of patient care and study. In fascinating little places a perfect tree such as a cedar may be 100 years old, yet dwarfed to attain only a few in. in height, though perfectly complete in its proportions. Lilies grow wild in great variety, and the lotus lily during the summer months covers the lakes and rivs. with its delicate blooms. Ferns are found everywhere in great quantities; there are over 150 different species. The chief fruits are the orange, grape, pear, apple, loquat, peach, raspberry, and persimmon; great quantities of these are exported yearly to U.S.A. and Europe. Vegetables are well cultivated and many curious and palatable roots have been introduced from J. to Europe during recent years.

FAUNA. There are sev. kinds of wild animals. The black and brown bear are found in Hokkaido; the ice bear is an occasional visitor, carried down by the Arctic current. Badgers and foxes are numerous, and were once credited with supernatural powers; monkeys abound all over the is.; there are no rabbits, but hares are plentiful. Wild boars and stags, also antelopes, exist in the mountainous dists.; otters and sea otters are numerous and much valued for their fur. The squirrel and the rat are very common, but there are no mice. The bird life carries a large variety; water fowl is very plentiful; wild geese, ducks, teal, and herons, especially the silver heron beloved by Jap. artists, are seen in large numbers, also the kite, falcon, and sparrow-hawk. Among the game birds the commonest are the ptarmigan, snipe, plover, quail, woodcock, and pheasant; there are 2 varieties of the latter, one known as the copper pheasant, being remarkable for its beautiful plumage. Eagles have been found but recently in small quantities. The crane is a sacred bird, being honoured as an emblem of longevity. Among the smaller birds the *Uguisu* comes first, a species of nightingale gifted with a very

beautiful song. The cuckoo, lark, hoopoe, bluebird, starling, wren, kingfisher, and various finches, etc., are all inhab. of the is. Among the 30 species of reptiles are a very few turtles (highly valued when caught), many tortoises, 10 varieties of snakes, only one being venomous; lizards, frogs, toads, and newts are plentiful, and the giant salamander, which has been said to attain a length of 2 ft. Fish forms a very large part of the food of the Japanese; it is wonderfully plentiful both in the sea and the rvs. and lakes. Among the chief are the bream, perch, mullet, mackerel, haddock, and salmon. The gold carp and the goldfish, so prized for their beauty, are very numerous. J. is rich in beautiful insect life, the golden and the jewel beetle, and the many kinds of brilliant butterflies of tropical beauty; there are 7 kinds of silk moths, and from the cocoon of the moth *Culigula japonica* fishing lines are manuf. The singing cricket and the cicada are common everywhere, also beautiful dragon-flies. Spiders abound but are small in size. In the lakes and rvs. live many kinds of fresh-water crabs and myriads of shrimps which are largely used for food.

**POPULATION.** In Oct. 1955 the pop. was 89,280,000, excluding the lost ter. There are 6 tns with a pop. of over 900,000: the cap., Tokyo (formerly Yedo), had in 1955 a pop. of 8,037,000; Osaka (Honshu), 2,547,000 in 1940; Kyoto (Honshu, anct cap.), 1,204,000; Nagoya (Honshu), 1,336,000; Yokohama (Honshu), 1,143,000; Kobe (Honshu), 979,000. Other important cities with 1955 pop. are: Fukuoka (Kyushu), 544,000; Yawata (Kyushu), 286,000; Kure (Honshu), 199,000; Sendai (Honshu), 376,000; Hakodate (Hokkaido), 243,000; Kago-shima (Kyushu), 274,000; Kokura (Kyushu), 242,000; Otaru (Hokkaido), 188,000; Niigata (Honshu), 202,000; Shimonoseki (Honshu), 231,000; Moji (Kyushu), 145,000; there are 71 other tns with a pop. of over 100,000. Yokohama and Kobe are the chief ports and centres of foreign trade. The majority of Japanese are believed to be of Mongoloid origin; the minority are mixtures of Mongoloids with Ainu, or with genetic strains from Sl. Asia and even Europe. The Ainu (q.v.) are probably the native race of the N. Honshu and Hokkaido. The Japanese of the present day do not differ physically very much from the Korean and Chinese. The main part of the race is short of stature and very muscular, but many types are distinguishable, the most important being an element of the Malay; then follow the Manchu-Korean type, the Mongol, and lastly the Ainu. In the S. the people are more refined in appearance and the women (according to W. ideas) are frequently beautiful, while further N. the tendency to prominent cheekbones and flat noses becomes more obvious. They are straight-haired and usually very dark. As a race they are an exceedingly happy, lighthearted people. Children occupy an important place in every family; J. has been called rightly 'the

paradise of children.' The present condition of women is based upon the principle of equality of sexes. As a wife and mother, the Jap. woman enjoys a position of freedom and respect. If single she may, and often does, adopt children and becomes 'house-head' of her legal family. The general character of the Jap. woman is especially worthy of mention; they are unselfish, modest, kind-hearted, and patient, obedient as daughters, faithful as wives, and devoted as mothers. Both men and women are by nature frugal and industrious and share in a passionate love of their country.

**RELIGION.** There is absolute religious freedom in J. The original religion of J. is Shinto (the divine way), a mixture of nature worship and ancestor worship. It regards human people as naturally virtuous, being descended from the gods, and assumes that an individual's conscience is his true guide. The dead are ghosts, inhabiting a world of darkness with the power of bringing sorrow or joy into the lives of the living. There are numerous gods and goddesses, with sev. beautiful and charming legends attached to them. The prin. divinity is Amaterasu, the goddess of the sun. Her shrine at Ise is visited by crowds of pilgrims. There appears to be no definite idea of what kind of life continues after death, but the cult expects natural purity of life without promises of reward. Buddhism reached J. (AD 552) through Korea, and the 2 religions became so intermixed it was difficult to disentangle them. Buddhism, however, gradually absorbed the greater part of Shinto, though divided into various sects. In 1940 there were 3081 Christian preachers in J., and 2104 Christian churches belonging to various denominations. The Rom. Catholic Church was recognised in 1941. Until the outbreak of war in that year there were 7 Brit. and Jap., and 3 Amer. 'Protestant Episcopal' bishops. The Japanese usually adapt whatever creed they follow to their own requirements.

**INDUSTRIES.** The industrial progress of the country made rapid strides up to the outbreak of war (1941). Labour is always cheap and plentiful. Machinery had been largely introduced. The prin. manufs. are foodstuffs, silk, cotton and chemical textiles, chemicals, metal goods and machinery, paper, glass, furniture, toys, and rubber goods. Sugar-refining was a growing industry before 1941, but the more anct industries such as matting, lacquer, and porcelain remain unchanged. The country does not produce enough coal for its own use, but reaching 42,423,000 metric tons in 1935. The production of iron is insufficient and was supplemented from China and Korea before the war. Gold is found and has been worked, but not in great quantities. In 1955 the output was 7,487,000 grammes. Copper occurs in larger quantities and is a fairly valuable asset; the output in 1955 was 72,900,000 kilogrammes. The zinc output in 1955 was 910,000 kilogrammes; iron pyrites, 2,736,000 metric tons:

lead, 37,100,000 kilogrammes; pig-iron, 5,316,000 metric tons; and steel, 9,400,000 metric tons. Steel production is sufficient for Jap. industry, and export reached 1,293,000 tons in 1952, and 1,307,000 tons in 1955, mainly for Britain and India. Seventy per cent of the whole area is covered with forest. The forest area in 1951 was 53,900,000 ac., of which 17,988,000 ac. belonged to the State and some 7,168,000 ac. to local govs. From these forests a quantity of

Japanese Embassy

RING SPINNING FRAME AT HAMAMATSU MILL, TOYO SPINNING CO.

good timber is obtained. Large groves of bamboo furnish material for building, ornamental work, and tools, etc. The forests contain also *Cryptomeria japonica*, *Zelkova leakei*, *Pinus massoniana*, and *Faulownia imperialis*, which is used for fancy boxes, etc. Another smaller industry furnished by the forests is the cultivation of mushrooms; these are dried and exported to China and India. The fishing industry is of very great importance. The value of it to the empire annually naturally varies, but in 1955 reached 4,875,000 tons. The industry of salt-refining is also of importance.

**AGRICULTURE.** Over 40 per cent of the pop. are engaged in agriculture; it is J.'s most important industry but, owing to the mountainous nature of the country, not more than one-sixth of its area is available

for cultivation. Small holdings are the general rule, rarely exceeding 8 ac., but the break-up of the large estates by the Americans in 1945-6 may have the effect of increasing the acreage of small holdings. The soil was not particularly fertile, and hard work and hard living have made the rice fields what they are. Rice is the chief crop; it forms the prin. food of the people, and is also the basis of the national drink, *saké*. It is a summer crop, harvested in Sept.; the fields are flooded while grain is young and then drained. The following are the chief products, the area under cultivation, and the production, for 1955: rice, 3,082,000 hectares (391,989,000 bushels); wheat, 661,000 hectares (531,000,000 bushels); barley, 434,000 hectares (521,000,000 bushels); rye, 580,000 hectares (450,000,000 bushels); tobacco, 75,500 hectares (150,000 metric tons); and tea, 48,400 hectares (73,000 metric tons). Other important crops are millet, small red beans, buckwheat, rape seed, potato, sweet potatoes, indigo, hemp, sugar-cane, and peppermint, etc. The paper mulberry is extensively grown, its fibrous tissue being the chief material used for Jap. paper. Barley is grown with particular care as it provides the material for straw-plaits, which is an important manuf. Stock-breeding is not extensive, pastureland being scarce. The growing liking for beef among the people before 1941 diminished the indigenous cattle, but various foreign breeds were imported. Sheep and pigs were on the increase but the natives prefer beef. Goats are kept for their milk. The rearing of silkworms is a very important asset to the small farmer. Jap. silk has long been famous. The chief silk-producing prefectures are Nagano, Gumma, Yamanashi, Fukushima, Aichi, and Saitama; thousands of families are engaged in its production and manuf. In 1955 the total number of cocoons obtained was 112,000,000 tons. The total raw silk produced in 1955 was 4,387,000 lb. The production of rayon in 1955 was 195,352,000 lb. and exports of silk was 11,210,000 lb. and rayon was 18,046,000 lb.

**RAILWAYS AND COMMUNICATIONS.** Railways made rapid strides before the Second World War. There are now 214,000 m. of railroad, chiefly owned by the State. The first line ran between Yokohama and Tokyo, opened in 1872. After the war with Russia the State nationalised the railways in 1907, and the growth and perfection of the system were still in evolution up to the war. Comprehensive plans were also made for the electrification of the railways and more than one-tenth has been electrified. The postal service is modelled on W. lines, and J. became a member of the international mail service in 1877. In 1955 4,520,000,000 letters, postcards, newspapers, and periodicals were sent and 81,000,000 parcels. There were 15,522 telegraph and post offices in 1955. Telegraphic communication commenced in 1867. In 1884 J. joined the telegraphic union, and in 1955 14,050,000 telegrams were sent. The telephone was

adopted in 1877, a year after it was invented. Before the war there were 981,936 subscribers and 83,641 line m. In 1955 there were 2,192,500 subscribers and 3,123,400 telephones. Roads in J. are divided into 3 classes: state roads, prefectural roads, and vil. roads. They are generally well kept, and the gov. gave an ann. grant for assisting their upkeep and improvement. The first electric tramway was constructed in Kyoto in 1895. Before the war there were sev. electric railways and tramways running in the larger cities. Drainage improved rapidly, the usual W. methods of street scavenging being employed in all tns and cities. Cremation is encouraged with much success, and crematoria have been estab. in Tokyo, Osaka, and many other tns.

**POST-WAR RECONSTRUCTION.** In Sept. 1956 the National Land Bureau of the Ministry of the Interior pub. the first Five-Year Plan of rapid reconstruction of J.'s shattered economy. The plan envisaged the redistribution within J.'s reduced ter. of a pop. estimated to reach 80 million by 1950, the greater production of foodstuffs, the reorganisation and redistribution of industries, the reduction in the number of unemployed, and the restoration of devastated cities. To support the pop. 87 million koku (1 koku equals about 5 bushels) of rice would be required, so that the production of rice was to be increased to 70 million koku by 1950, leaving 17,000,000 to be imported. Actually J. produced 64,338,000 koku of rice in 1950 and 79,030,000 koku in 1955. The pop., however, increased to 83,199,000 in 1950 and 89,275,000 in 1955, and therefore J. still needs to import a large quantity of rice. The index of industrial productivity (average of 1934-6 = 100) was 63.2 in 1945, and 88.0 in 1950, but since then has risen quickly to reach 161.2 in 1953 and 207.1 in 1955. In April 1956 it was 219.4. Before the war J.'s trade was most vigorous during 1935-40, with exports exceeding imports by 658 million yen in 1939. Fixing the amounts in 1935 as 100, and modifying the later amounts according to index number of prices, export and import fell down to 4.4 and 11 respectively in 1945, and slowly recovered to 48 and 57 in 1950, and 83.5 and 104.4 in 1955, that is, export of 723,805 million yen and import of 889,715 million yen, showing an excess of imports of 165,910 million yen (460.83 million dollars).

In December 1955 the gov. issued the new Five-Year Plan to achieve a self-supporting economy and to improve employment. To do this the gov. decided to (a) increase exports to the dollar area; (b) encourage smaller enterprises to provide fuller employment; (c) increase public works and social welfare; (d) expand heavy industries. The aims of this plan were unexpectedly attained within only one year, mainly through record-breaking crops and rapid expansion of exports in 1955-6. During 1945-55 national income increased at the rate of 11 per cent a year, output of mining and manufacturing industry 22 per cent a year, and

exports 46 per cent a year, thus making the ann. income *per capita* 13 per cent higher, industrial output 120.2 per cent higher than in 1935, and recovering the export to 85 per cent of that in 1935. It is clear from these figures that J.s export trade is still too small to absorb her industrial output, and eventually to feed her large population. To balance this rapidly increasing production with the expansion of overseas markets is without doubt J.'s greatest problem, because her pop. is still increasing and is estimated to exceed 100 million by 1965.

**CONSTITUTION AND GOVERNMENT.** From the 1st cent. BC until 1889, the country was ruled by an absolute monarchy, but in 1889 the emperor, after much study of the gov. of other countries, gave J. its pre-1945 (or 'Meiji') constitution. The emperor, called by foreigners the 'Mikado,' and by his subjects 'Tenno,' then possessed the rights of sovereignty and had executive power. He was assisted by Cabinet ministers chosen by himself. He was also advised on important state matters by a privy council, and exercised legislative power with the consent of the imperial Diet, which consisted of 2 Houses: House of Peers and House of Representatives. The House of Peers consisted of (1) male members of the imperial family of full age, (2) princes and marquises over 30 years of age, (3) counts, viscounts, and barons over 30 years of age, (4) persons over 30 years of age nominated by the emperor for meritorious services and erudition, (5) members of the Imperial Academy of Sciences, and (6) representatives of the highest taxpayers nominated by their own class. General manhood suffrage came into force in 1925, under which, in principle, all male subjects over 25 years of age are electors, and those over 30 years are eligible for election. By a subsequent law, the number of the House of Representatives was fixed at 466. The 'Meiji' constitution was superseded in 1946 by a new draft constitution much more in harmony with the concepts of W. democracy (see below under *History—Japan's new epoch*). Women suffrage had not come into being in J. before the war, but women were taking an increasing interest in social work and politics. Voting is by secret ballot. For local gov., J. is divided into prefectures, which are subdivided into municipalities. Modern jurisdiction has been introduced. There were (1941) 51 prisons and 104 detached prisons. The courts of justice are classed as dist. courts, local courts, courts of appeal, and the court of cassation or supreme court.

**COMMERCE.** Immediately before the Second World War J.'s shipping industry was well on the increase. Her exports grew in bulk annually, having increased fourfold in the last few years preceding 1941. After the war it recovered rapidly, but did not reach the total attained in 1939 (see above under *Post-War Reconstruction*). The chief imports in 1955 were: foodstuffs (25.4 per cent of total imports; rice from SE. Asia, Italy, and

Spain; wheat from U.S.A., Canada, and Australia; sugar from Cuba, raw materials for textiles (24.3 per cent; cotton from Pakistan, U.S.A., and Mexico; wool from Australia), petroleum (9.2 per cent; U.S.A. and Saudi-Arabia), machinery (5.5 per cent; U.S.A. and Britain). The chief exports in 1955 were textiles (37.3 per cent of total exports; silk goods to Canada and U.S.A.; cotton goods to China, Indonesia, Australia, and Saudi-Arabia; rayon and staple-fibre fabrics to the same; chemical fibre fabrics to the

which 72 are state-owned. There are over 12,610,000 children in the primary schools, and the percentage of attendance in compulsory education has always been above 99 per cent for the past 50 years. High schools are also state-aided and prepare for a 4-year course at the univs.

Co-education has been successfully practised since 1947, and 43 per cent of higher secondary school students, and 15 per cent of college students, are girls, numbering 1,180,000 in higher educational institutions. In technical colleges

same), iron, steel, and metal goods (31.5 per cent; to India, U.S.A., and Britain), machinery (12.3 per cent; to Pakistan, SE. Asia, and China), foodstuffs (6.8 per cent), and chemicals (4.7 per cent). The number of sailing ships engaged in trade before the war was 15,086 and the number of mercantile steamers was about 3600, but only 813 in 1946 and 1158 in 1955. Yokohama is the prin. commercial port; Kobe comes next in importance, then Osaka and Moji; among other ports are Shimonoseki, Tsuruga, Otaru, and Nagasaki.

**EDUCATION.** Elementary education is free and compulsory for children from 6 to 15 years of age. There are 6141 kindergartens, 26,957 primary schools, 13,723 lower secondary (compulsory) schools, 4574 higher secondary schools, 228 technical colleges and univs., among

and univs. there are 523,270 students including 59,000 scholarship holders.

**ARMY.** From the 12th cent. till the great revolution of the middle of the 19th cent. the fighting power was restricted to a hereditary military caste, the *samurai* (q.v.) or *bushi*, whose hist., rise, and fall is sketched in the section on *History* below. Their weapons were the bow, the single-edged curved sword, and spear. The armour was of a special type which had been considerably changed since the 16th cent., when guns were introduced. A combination of metal plates and scales sewn on leather often highly decorated with elaborate embroidery, damascening, etc., it hung like a loose screen over the body of the wearer, rendering him in appearance bulky and unwieldy. The *samurai* served as feudal retainers of the great families. In the 12th cent. the great Taira and

Minamoto families predominated, and on the fall of the former the Minamotos became the chief military power, followed by the Hojos, the Ashikagas, the Toyotomis, and finally by the Tokugawas, who ruled J. from 1603 to 1867. The abolition of the *samurai* brought about a remodelling of the citizen (*heimin*, 'commoner') army on W. lines. In 1870 the new defence system was estab., modelled upon the Fr. Army and the Brit. Navy, and using Ger. military equipment. By 1876 the army on a war footing reached nearly 50,000, and in 1877 successfully met the Satsuma rebellion and defeated the old *samurai*. The evolution of the army progressed rapidly, and the Sino-Jap. war tested the capacities of the new force; in the Jap. expedition to Peking in 1900 valuable lessons were learned. The Russian war saw 800,000 troops in the field. Improvements followed, and by the imperial ordinance of 1909 the military forces were to consist of the Active Army, liable to serve abroad, and the National Army, both in the reserves. There were militia forces in some of the is. Service was compulsory from 17 to 40, but embodiment was deferred till 20. Two years' service in the Active Army, 'gen'eki, was compulsory for the absolutely fit, 5 years 4 months in the reserve, 'yobi,' 10 years in the second line, 'koki,' and 2 years 8 months in the home defence, 'kokumin.' The normal strength of the Active Army before the Second World War was 15,000 officers and 242,000 other ranks. The air personnel for the army numbered in 1938 10,200, organised in 21 pursuit squadrons, 12 reconnaissance squadrons, 12 bombing squadrons, and a balloon corps. The number of aeroplanes in service was 1500. For the war with China 7 classes of reserves were called up in 1938, giving the army a strength of 850,000 after making up losses. During the 1939 campaign more than 16 divs. (over 300,000 men) were engaged in S. China. The Jap. is. were divided into military dists. corresponding to the divs. of the army, and the dist. was the unit of administration as well as of territorial command. There were normally 17 divs., 4 independent cavalry brigades, 2 independent regiments of mt artillery, and 8 regiments of heavy field artillery. The military budget for 1941-2 amounted to 1,387,000,000 yen, exclusive of sev. appropriations for the war with China. The Imperial Jap. Army was disbanded at the end of the Second World War. In 1950 J. was allowed some rearmament. By the end of Mar. 1957 the strength of the Ground Defence Force had increased to 150,000 uniformed personnel and 11,700 civilians; the Maritime Defence Force to 19,400 and 1000 respectively; and Air Defence Force to 10,346 and 1200 respectively.

**NAVY.** In the early days, as we know from the dread of foreign invasion and the wars with Korea and Kublai Khan, J.'s navy was insignificant. In 1635 the policy of isolation led the Tokugawa gov. to forbid the building of any vessel capable of crossing the ocean, and the foreign

aggression of the middle 19th cent. showed J. defenceless before foreign sea-power. The nucleus of the navy was formed with a gift of 2 war vessels from the Dutch and Queen Victoria, and 2 purchased from the Dutch. Gradually a small force was organised, trained by Brit. officers under Sir Archibald Douglas. The fleet played a part in the Satsuma rebellion, and later J. began herself to build. Her first ironclad was built in England, 1878. At the opening of the war with China, the navy consisted of 28 vessels and 29 torpedo-boats; there were no battleships, while the Chinese possessed 2 powerful armoured ships of the line. The naval victories resulted in immediate building on a large scale, chiefly in Europe, and the Russian war saw her with 6 battleships, 8 armoured cruisers, 44 other cruisers, and 100 destroyers and torpedo-boats. The crushing defeats of the Russian Navy off Port Arthur, Togo's victory in the Straits of Tsushima, and the part the navy played in the First World War have proved the naval power of J. in the Pacific. The statistics for 1940 gave 10 battleships, 7 aircraft carriers, 35 cruisers, 5 coast defence ships, 103 destroyers, 12 torpedo-boats, and 65 submarines. Under the London Treaty, which precluded the replacement of cap. ships from 1931 to 1936, the then existing ships were to be modernised, and by 1941 the existing cap. ships had mostly been modernised. Great secrecy had been preserved concerning programmes of construction, with the result that little was known about the bigger warships being built immediately before the outbreak of the Second World War; but probably some 5 or 6 battleships of about 45,000 tons, armed with 16-in. guns, were in hand in 1941. Four armoured ships of 15,000 tons with 12-in. guns were also under construction. Two large aircraft carriers, sev. cruisers, and a large number of destroyers and submarines were also being completed. The active personnel numbered 107,000. The gross amount of the naval estimates for 1941-2 was 1241 million yen. For fate of Jap. Navy after the war, see under *History* below.

**AIR FORCE.** See under *ARMY* above.

**FINANCE.** The total revenue for the fiscal year 1956 was 1,034,923 million yen, of which tax and stamp revenue accounted for 826,717 million yen, 79.9 per cent of the total. Revenue from surplus during the preceding fiscal year was 38,064 million yen. The total expenditure was the same as the revenue with the reserve of 8000 million yen. Among the expenses, the largest were local finance grant 16 per cent, defence expenses 13.9 per cent, social security 13.4 per cent, education 12.6 per cent, and home administration 10.9 per cent. The most conspicuous change from the pre-war budget is the decrease of military expenditure from 42.5 per cent to 13.9 per cent.

**Dress, food, customs, etc.** The modern Japanese wear W. clothes in both public and private. The traditional kimono, a loose gown-like garment, is worn only on

ceremonial and some formal occasions. The old-fashioned style of hair-dressing, when the hair is carefully packed and piled with combs and ornaments is used only by geisha girls and the *kabuki* world. The staple food is rice, consumed at the rate of 4-96 bushels per head annually. It is boiled with half as much water again, and served with cooked fish, meat, vegetables, soup, and pickles. The Japanese also eat raw fish, especially tuna, and consumption of fish per head is 3 times as much as in Britain and more than 7 times that of the U.S.A. *Miso* (fermented bean paste) and *shoyu* (fermented sauce) are important ingredients in Jap. dishes, as much as 20 lb. and 4 gallons per head respectively being used annually. *Sake* (q.v.), made from rice, is still the favourite alcoholic drink, but W. wines and beers are also popular. Chopsticks are used, but these differ in size and shape from the Chinese form. The Japanese take 3 meals a day, and tea with sweet cakes is served at about 3 p.m. Much importance is attached to the appearance of both table and dishes. Table manners were governed by various ancient schools of etiquette, but such rules are now observed only on ceremonial occasions. There are sev. kinds of tea, among them *sencha*, or natural leaf green tea for everyday use, and *matcha*, or powdered green tea for the ceremony at which it is stirred with a tea-whisk in hot water and served with exquisite ceremonial. The strictly formal cult of the tea ceremony is now limited to a few, though many of the practices are used in daily life.

The Japanese of all classes make frequent use of the bath; the body is washed thoroughly before stepping into the hot tub, which therefore serves rather as a method of relaxation. The general method of heating the house is by the *hibachi*, or charcoal brazier, a wooden or porcelain vessel containing heavy ash on which charcoal is laid. Another and more effective method is the *kotatsu*, a shallow pit in the floor, containing ash and charcoal covered with a wooden frame and mattress. The Japanese do not use bedsteads. The bedclothes are laid each night on matting, and stored during the day in a wall-cupboard (*oshitire*).

As with much else in J., forms of entertainment have been permeated with W. influences. The cinema is popular, and J. produces more than 350 full-length films a year, a figure surpassed only by the U.S.A. during the period 1950-3. The institution of geisha girls (q.v.) is dying out owing to W. forms of amusement. The Japanese are amongst the hardest working people in the world, and, like the people of S. Europe, they need periods of boisterous relaxation, which finds expression frequently in hearty drinking and singing.

**HISTORY.** The racial origin of the Jap. people is still a matter of dispute. The ancient chronicles of the country tell that the god Ninigi descended on an E. peak of the Mt. Kirishimayama, on the is. Kyushu, as the forerunner of their first

emperor named Jimmu, about 660 B.C. Before this date they have no written hist. The Ainus or Ainos, appear to have been the inhab. of J. when the present people migrated from the adjacent continent, though which part they came from is not proved. The Ainu came from Siberia, and they appear to have found a primitive aboriginal tribe who dwelt in pits. The Ainu drove these people N. and estab. themselves on the main part of the is., but there are not many left now. They were formerly a fierce race, but cents. of oppression have reduced them to degeneracy (*see also* AINUS).

Of the coming of the Japanese and the first fierce fights for supremacy very little can be written. The real known hist. begins with the Emperor Jimmu; the date ascribed to his accession is 660 B.C., but it was probably 1st cent. B.C.; from him all the emperors of J. are descended. In A.D. 200 a warrior empress called Jingu invaded Korea, crossing from J. with a large fleet and successfully subduing a part of Korea. About A.D. 500 the inhab. became properly 1 nation, a mixture of Ainu, Mongol, and some S.-Asians, ruled by 1 emperor. Although communication with the continent was frequent even in the 3rd cent., Buddhism was not officially introduced until A.D. 552. With Buddhism as the national religion, the first written constitution was pub. in 604. It was largely improved by the Emperor Kotoku in 646 with a new system of administration based on that of the Tang dynasty in China. Playing an important part in the Reformation of 646, the Fujiwara family became prominent among the nobles. They governed as agents of the emperor, spending his revenues and oppressing the people. It became customary for the empress to be chosen from their daughters; thus the early training of the royal children became one of the privileges of this powerful house which, in fact, though not in name, ruled the empire. They gave J. many scholars and statesmen, but being without soldiers or money, except for the imperial revenues, they were gradually ousted by the warrior families of Taira and Minamoto. These 2 families were at constant war with each other. The Taira were finally exterminated in 1185 by the Minamoto. For some years after this Yoritomo, the chief of the Minamoto, ruled the empire under the title of Sei Tai shogun. The emperor was merely a sacred personage during this time, worshipped, flattered, and always held in esteem but without power. Yoritomo d. in 1198, and the family of Hojo, who acted as stewards to the Shoguns, became the most powerful. The emperor of China, Kublai Khan, demanded that J. should recognise his suzerainty (1280); on its refusal a large fleet was sent which was destroyed off the coast of Kyushu in 1281, leaving J. free. The Hojo family became enfeebled by their luxury and indolence, and an organised revolt succeeded in driving it out and restoring power to the Emperor Go-Daigo, 1334, who, however, was obliged to abdicate

the Jap. governor, Count Terauchi. The offer of Prince Katsura to form a ministry was not accepted by the Lower House, and Katsura thereupon formed a new party, called *Rikken Doshikai* or the Constitutional Crusaders' Association, but in 1913 he died of cancer. In Feb. 1913 the Yamamoto ministry came into power, but soon after fell owing to the Naval Scandal, aroused by the rumour that bribes had been accepted by Jap. officials from the Siemens-Schuckert Co. over the building of a Jap. battleship. After an interval, in which Viscount Kiyoura tried in vain to form a Cabinet, Count Okuma came into power on 14 April 1914, with the assistance of the new *Doshikai* party. Baron Kato was made foreign minister, and after the outbreak of the First World War in Aug. 1914, he enunciated the national policy that 'Japan had no desire nor inclination to become involved in the present conflict, but she believed she owed it to herself to be faithful to the alliance (i.e. with Great Britain) and to strengthen its foundations by ensuring permanent peace in the east and protecting the special interests of the Allied Powers.' On 15 Aug. an ultimatum was issued to Germany demanding that all Ger. battleships should be withdrawn from Jap. and Chinese waters, and that the whole of the leased ter. of Kiao-Chow should be delivered up by 15 Sept. and ultimately restored to China. Having received no reply from Germany, J. declared war on 23 Aug. On 2 Sept. the Jap. Army landed in Kiao-Chow and, having been joined by a small Anglo-Indian force, commenced the siege of the forts, which, by 7 Nov., surrendered. On 16 Nov. the Allies occupied Tsingtao (q.v.). Meanwhile the Jap. fleet was active in the Pacific, destroying the prestige there of the Ger. Navy and capturing the Carolines, the Marshall, and the Marian Is.

On 18 Jan. 1915 J. surprised the world by issuing to China the unwarranted 'Twenty-One Demands' (see also under CHINA). These were divided into 5 groups, of which the last aroused the most bitter controversy. Among other things it demanded that the Chinese should employ Jap. advisers in their affairs, that the Japanese should have the right to build hospitals, schools, etc., in the interior, that a jointly administered Jap. and Chinese arsenal should be set up, and that the control of certain railways, together with the right of construction, should be in the hands of the Japanese. Under protest this group was omitted, but a revised list, together with an ultimatum of acceptance, was presented to China in May. Bitter resentment against J. prevailed in China for some years over the 'Twenty-One Demands': they also brought J. into difficulties with the U.S.A., which were only ended by an agreement between the 2 countries signed on 2 Nov. 1917.

By the treaty of Versailles, 1919, J. received, under mandate, the former Ger. colonies, the Caroline, Marshall, Mariana, and Pelew Is., together with Kiao-Chow. The difficulty with China, resulting from

this latter award, was the subject of the Pacific section of the Washington Conference (q.v.). Kiao-Chow, together with other former Ger. ter. in Shantung, was returned to China, while a treaty of Naval Disarmament between J., Great Britain, France, and the U.S.A. was concluded. The Anglo-Jap. Alliance was merged in and replaced by a 4-power treaty concluded between J., Great Britain, France, and U.S.A., aiming at the maintenance of the *status quo* in the Pacific. In domestic affairs, both during and after the war, J. was undergoing extremely rapid industrial development but had not escaped war 'profiteering,' and this, coupled with the increased cost of living, caused resentment and rioting. Before 1916 trade unions were practically unknown in J., but after that year they became increasingly powerful. Discontent among the workers found expression in strikes, of which there were 417 in 1917 and nearly 500 in 1918. The rice riots of that year brought about the downfall of Terauchi, who had succeeded Okuma as head of the gov. in 1915. A new gov. was formed with Takashi Hara, a journalist, at its head. Factory laws concerning women and children were passed, and welfare work was instituted. After the fall of the Russian Imperial Gov., J. assisted the Allies in enabling the Czechoslovakian army to escape from Siberia; and when the allied troops were withdrawn, the Japanese remained in Siberia for some time after the war. The Jap. civilians in Siberia suffered at the hands of the Bolsheviks, and it was not until 1923 that the Japanese commenced the evacuation of their troops.

At the Versailles Peace Conference J. sought to obtain the recognition of racial equality, but the required unanimous vote was not forthcoming. In 1923 the sympathy and help of the world were extended to J. to repair the damage caused by the terrible earthquake of that year (see above and under EARTHQUAKE). It may be mentioned here that the next serious earthquake in J. was that which struck central J. and the is. of Shikoku on 21 Dec. 1946, causing damage over an area 400 m. by 150 m. or about five-sixths as severe as that of 1923. In Sept. 1923 a gov. was formed by Yamamoto, after an interval of unstable ministries following the assassination of Hara on 4 Nov. 1921. In Dec. of 1923, however, the attempted assassination of the Prince Regent caused Yamamoto to resign, and a new Cabinet was formed by Viscount Kiyoura. This gov. was unpopular, and fell the following year, owing to the resentment aroused in J. by the Amer. Immigration Law, passed in May 1924, forbidding Asiatics to enter the U.S.A. General elections were held in J. at this time, and Viscount Takaaki Kato came into office with a gov. which was a coalition between the *Seiyun-Kai*, or Constitutional Political Association, and the *Kensei-Kai*, which party had arisen out of the *Doshikai*. The prin. achievement of this gov. was in granting universal suffrage to all men over the age of 25. On the death of Kato the premiership fell to

Wakatsuki. On 25 Dec. 1926 the old Emperor Taisho died, and was succeeded by the Crown Prince, who had acted as Prince Regent since 1922, and now became the Emperor Hirohito. In the succeeding years J. was mainly occupied with reconstruction at home and the rebuilding of Tokyo, and in foreign affairs with the problem of naval security.

In 1929 Yuko Hamaguchi was appointed Prime Minister and tried to maintain friendly relations with other powers. His foreign minister, Baron Shidehara, adopted a policy of non-aggression towards China, and consented to the limitation of naval power by the London Conference (q.v.) of 1930. This caused a strong protest by the navy, army, and nationalists. Premier Hamaguchi tried to establish civilian rule over the military caste, but was murdered. The next Premier, Wakatsuki, also a civilian, attempted the same but in vain. Takeshi Inukai, leader of Seiyukai, won an absolute majority in the Lower House in 1932, but was assassinated by nationalist army officers. After Inukai's death succeeding cabinets were controlled by a military bureaucracy. In 1934 J. gave notice of termination of the Washington Treaty of 1922 (see WASHINGTON, TREATIES OF), a step which, coupled with J.'s policy in Manchuria, excited grave apprehension (see also CHINA, History).

*Survival of Japanese feudal institutions.* After the middle of the 19th cent., when the influence of W. science and technology began to infiltrate into the Far E., J. made phenomenal progress in methods of modern industry and warfare. It is only against the background of J.'s social and political structure that her world outlook in the 20th cent. can be understood. Cents. of geographical and mental isolation restricted that outlook, and all J. absorbed were the superficial aspects of Chinese and W. culture. Her feudal institutions survived to the period of the Second World War. Down to 1946 there was no social or political equality and the people were divided into strictly defined classes: the royal family, the aristocrats, the warriors, and the commoners. The foundation of modern or pre-1946 J. was laid during the Meiji restoration which began in 1868. The authority of the royal family was greatly enhanced and the noble and warrior classes became the real governing classes controlling nearly all political, military, and economic power. The much extolled Meiji restoration resulted in the oppression of the masses, whose psychology became a curious compound fashioned of modern industrialism and medieval feudalism, a complex essentially favourable to militarism from above. Military expansion followed naturally. Korea was overrun and there were easy victories over China and Russia in 1895 and 1905. After the unification of Germany under Bismarck, military training in J. was a slavish imitation of the Ger. system. The Meiji period also brought with it the rise of the *satbatsu*, the modern Jap. financial oligarchy. J.'s earliest

modern industries were war industries. It was during the Sino-Jap. wars that the notorious Mitsubishi and Mitsubishi combines developed their power, controlling most Manchurian enterprises and giving their support unconditionally to all the dominant militarists. Political parties were organised in this period, but this too was a movement from above and not from the people. The founders of the parties, Taisuke Itagaki, Hirobumi Ito, and Taro Katsura, came from the old aristocratic class. Such men had no sympathy with nor even understanding of democracy. Jap. parl. institutions were a sham and electoral corruption was rife. No Jap. cabinet could be formed without the consent of the army and the navy. The war minister and the minister of the navy had to be, respectively, a general and an admiral on the active list, and although they were members of the cabinet they were independent of cabinet control and enjoyed direct access to the emperor.

*Japan's Manchurian adventure.* J.'s policy towards China had openly abandoned conciliation in 1931 when the military party, swamping the Liberal Gov., launched an armed adventure in Manchuria, which soon brought the entire prov. under Jap. control. J.'s intervention in Manchuria was little more than the obvious result of a fundamental conflict of economic and strategic interests with those of China. J. realised that Chinese development of railways and ports threatened her hard-won rights in the S. Manchurian Railway. Relying on her privileged position in Manchuria, J. had invested great sums in mining and other primary resources of Manchuria—enterprises of vital importance to J.'s great home pop. Attempts to negotiate a settlement with China naturally proved abortive and the Jap. military leaders, without even consulting the Tokyo Gov., hurled their forces against the whole zone of the railway. After the disarming of the garrison at Mukden and the capture of Kirin, the Jap. authorities held their hand, and the dispute was referred to the League of Nations and the chancelleries of Tokyo and Washington. The League imposed a time limit on J. to withdraw all troops within the treaty zone, which she did while insisting that the dispute could be settled only by direct Sino-Jap. negotiations. An attempt by the powers to find a way out through the Kellogg Pact (q.v.) was equally unsuccessful. The Jap. Gov., adopting delaying tactics, steadily pursued their conquests, and then troops took Chinchow, the H.Q. of the Chinese commander-in-chief. By the end of the year (1931) they had overrun 200,000 sq. m., with no more than 20,000 troops against twentyfold that number of Chinese troops. Later a large Jap. force was landed in Shanghai, where heavy fighting began early in 1932. Meanwhile (Dec. 1931) the League appointed a commission of inquiry in Manchuria under Lord Lytton, whose report (Oct. 1932) made suggestions for setting up a regime in Manchuria, recognising

sovereignty and, at the same time, safeguarding J.'s rights. But J. had already set up a puppet gov. and created a new state, which she called Manchukuo; and her reply to the League was that she was acting in self-defence and that in any event there was no central gov. in China able to carry out a settlement. J. now began to organise larger expeditionary forces and, having withdrawn from the League of Nations, her troops advanced into Jehol and soon flung the Chinese forces out of the whole of that prov. and S. of the Great Wall.

Ju-keng in the W. dists. of N. China. Early in 1936 irregular forces, issuing from Manchukuo, drove the Chinese forces out of the prov. of Chahar, and estab. a pro-Jap. régime in that sparsely populated ter. The Jap. foreign minister (Koki Hirota) now put forward 3 points as essential prerequisites of Sino-Jap. understanding: co-operation in suppressing Communism; recognition of Manchukuo by China; and the cessation by China of all unfriendly actions in relation to J. and to the policy of 'playing off a third power against J.' The first and third were

*Canadian Pacific*

INTERIOR OF A JAPANESE HOUSE

After the occupation of Manchukuo incidents of forward movement alternated with periods of relative calm. Every succeeding year saw a further milestone on J.'s road to empire. Thus, in 1933, it was the final lopping of Jehol, with its old Chinese imperial palaces, its coal and strategic mt passes, from the main body of China and its incorporation in Manchukuo. In 1935 came the elimination of the last vestige of the traditional Russian influence in N. Manchuria through the transfer by purchase of the Soviet share of ownership of the Chinese E. Railway to Manchukuo. The same year was also marked by manœuvres on the part of the Jap. military authorities in China, intended to sap the authority of the Central Gov. at Nanking over 75 million people in N. China. These 'fifth column' (q.v.) tactics culminated in the setting up, with the connivance of the Jap. military authorities, of a puppet regime under Lin

capable of the widest interpretation and could even justify J. asserting the right to supervise China's foreign relations and to send troops to any part of China where 'Communist' forces might be operating.

In line with the policy of expansion on land was the denunciation by the Jap. Gov. of the Washington Naval Treaty and its refusal to conclude any new naval agreement except on the basis of parity with Great Britain and the U.S.A. J. might be regarded, along with Germany and Italy at this time, as one of the 3 major dissatisfied or 'have-not' powers of the world. There is abundant statistical evidence that J.'s economic position was, and is to-day, that of a proletarian nation. J. depended almost entirely on foreign sources for such vitally important raw materials as cotton, wool, rubber, and oil, which were the lifeblood of many of its chief industries; and there is no mineral of any consequence which J. possessed or

possesses in surplus quantities. It would be an over-simplification to suggest that the Jap. Army 'staged' the seizure of Manchuria merely as a means of restoring its shaken prestige at home and driving liberalism and pacifism into the background. Other considerations were involved: the many unsettled economic disputes with the Chinese authorities; the desire to push back the reviving Russian influence in the Far E.; and the disposition of the Manchurian ruler to establish closer relations with the Nationalist regime in China. But that the Jap. Army took full advantage of the strengthened position which it acquired as a result of the outbreak of hostilities in Manchuria is unmistakable. Behind the Jap. sweep towards empire at all costs were a whole complex of impelling forces. Pan-Asianism had its part. Outside J. pan-Asianism was a negligible factor until after the Second World War, when nationalism among colonial races became active. But if the Jap. Empire was to expand further, pan-Asianism, to a certain type of Jap. mind, might become a formidable slogan. J.'s sweep towards imperial expansion was by no means purely military and territorial in character. Goods with the 'made in Japan' mark won their victories and made their enemies, just as the Jap. soldiers on the battlefields of Manchuria and Jehol. J.'s advance to a commanding position on the Asiatic continent might at this time be graphically represented by 3 arrows, pointing in different quarters: the first pointed N. to Manchukuo and the troubled frontiers with Russia; the second pointed W. to China, where the destiny of J. as an imperial power might well be settled either way; and the third pointed S. to the rich tropical lands of the European powers and America, where J.'s activities had thus far been purely commercial in character.

*Japanese 'co-prosperity sphere'—The attack on Pearl Harbour.* The collapse of Holland and France in 1940 at once led to extremist demands for Jap. intervention in the European war and for the occupation of Dutch and Fr. E. Indian possessions. To that end the very phrase 'E. Asia,' coined by the Japanese with the political implications of an E. 'Monroe doctrine,' carried its obvious menace. J. now demanded that all supplies passing through Fr. Indo-China to the Chinese Gov. at Chungking should cease and that all supplies going to Gen. Chiang Kai-shek through Burma and Hong Kong should also cease. At the same time Jap. troops were moved to the 25-m. frontier of Kowloon and a land blockade of the concession there was begun. These moves had their impulse in J.'s intense desire to settle what the Jap. Gov. styled the 'China incident,' which every statement of Jap. policy admitted to be the gov.'s first preoccupation. J.'s foreign minister, Arita, now outlined J.'s conception of a new order 'united under a single sphere' of Jap. hegemony which would cover 'E. Asia' and the S. Seas. Thus the species of Jap. 'Monroe doctrine,' first expressed in 1934, was now

widened so as to include a vast unspecified area which might embrace any land from Java to Tahiti. In fact, expansion southwards had long been the policy of an influential section of Jap. opinion, and J. had therefore steadily increased her share of the shipping in the S. Seas; while the war in China had, as we have seen, given a new significance to such expansion. The tone of the demands put forward in the middle of 1940 suggested that the collapse of France had encouraged the extremists and, through them, the Jap. Gov., to new intransigence. But the Brit. fleet, strongly based on Singapore, was by no means a negligible factor, and behind the British stood, if at this time somewhat equivocally, the Amer. fleet, which had not been materially weakened by the events of the preceding months; but though the Jap. Gov. occupied Fr. Indo-China (q.v.) they found themselves fully occupied in China, where the Nationalist forces were slowly but certainly gaining strength and conducting, not unsuccessfully, an unremitting guerrilla warfare. Yet by the end of 1941 J. had attempted no rash move, though the new gov. of Gen. Tojo entertained, in view of Russia's preoccupation with the Ger. invasion, the most grandiose schemes—schemes which the Brit. Gov. realised might well affect India. J.'s occupation of Fr. Indo-China was in reality an attempt to outflank Brit. and Amer. defences in the Far E. as a first measure to secure dictatorial control of vast ters. The strengthening of the allied line in the Middle E. had removed the immediate threat to India from the W., and the Jap. plan for creating a new order in Asia sought to eliminate the historically established rights of Great Britain, the U.S.A., and other W. powers in that region and aimed at establishing a 'benevolent' political domination over China, the Philippines, Indo-China, Thailand, Malaya, the Netherlands E. Indies, Burma, India, and Ceylon. This project, growing out of J.'s partnership with the Axis powers (see also BERLIN, PACT OF), was framed in such high-sounding assertions as that J. desired to see Asiatic peoples ruled by themselves; but it was also accompanied by a scheme of economic 'co-prosperity,' which really meant that J. hoped to secure vast resources of raw materials in exchange for goods of her own manu. These Jap. ambitions in Asia were, of course, closely modelled on Nazi ambitions in Europe, and were accompanied by the same cry for 'living space,' the same imputation of 'encroachment,' and the same declared intention to create a new economic system for 'liberated' peoples. Outwardly the Jap. aim was to prove that the W. powers had no right to influence Asiatic life and culture; actually the intention was to enable J. to become overlord of the Orient under an economic polity which would have no place for the W. powers, including even her own Axis partners. Meanwhile the Brit. authorities strengthened the defences in Malaya, and the Brit. and Amer. Govs. applied economic sanctions to J.

beginning in July 1941, with the 'freezing' of Jap. assets in reply to the Jap. move against Fr. Indo-China; while the Dutch authorities made it clear that they would protect their interests in the event of further Jap. adventures.

It was evident, when Gen. Tojo, a professional soldier, replaced Prince Konoye as premier (Oct. 1941) that J. was contemplating further military activities on a scale in conformity with the principles outlined above. Tojo's gov. now began secretly to make naval and military dispositions on a most comprehensive plan, with the view of simultaneously attacking Brit. and Amer. Far E. possessions at a moment most convenient for ensuring at least initial success. Delay would mean, in fact, giving up their dreams of forcing J.'s will on the Pacific and E. Asia and, furthermore, J.'s striking power was now at its peak. Besides these considerations, Hitler was forcing her hand in order to divert, if possible, the material aid which America was giving to the Russian armies with disastrous results on his Russian campaign. Tojo therefore sent a special envoy to Washington to join Adm. Nomura, Jap. amb., in order to conduct negotiations for a settlement of outstanding differences with the U.S.A. if possible. In the course of these negotiations President Roosevelt sent a personal message to the Emperor of J. in the vain hope of effecting an understanding; but the Japanese suddenly, on 7 Dec., attacked Pearl Harbour and other Amer. bases in the Pacific, and after this outrage on conventional diplomatic procedure, announced that J. was at war with both Great Britain and the U.S.A., in the W. Pacific. Both those countries promptly declared war on J.

*The first two years of the war in the Pacific.* Soon after the attack on Pearl Harbour Jap. planes bombed and sank the great Brit. warships *Prince of Wales* and *Repulse*, thus gaining command of the seas in the S. Pacific. By the early days of 1942 they had swept through Thailand (Siam) to Burma and captured Penang, Hong Kong, and the greater part of the Brit. Malay peninsula and were landing fresh troops in the Philippines. Thus in the early period of the war in the Far E., Jap. arms carried all before them. Attempts by the Allies to hold fortresses and conduct campaigns without aircraft cover failed disastrously: Hong Kong, Malaya, and Singapore were inevitably lost in this way; and the Japanese conquered the Netherlands E. Indies, Borneo, the Philippines, the Andamans, and most of Burma, and by cutting the Burma Road (q.v.) they isolated China. Only as America and Britain increased their air cover was Jap. expansion stopped eastward by the battle of the Coral Sea (May 1942), followed in the next month by the battle of Midway Is.; and westward by the defeat of air attacks on Ceylon. Throughout 1942, however, the Jap. war took second place in the eyes of Brit. and Amer. statesmen, who were bent on intensifying their effort against Germany as

offering by far the greater danger. But by pursuing an offensive in Papua the Jap. forces were now directly threatening the mainland of Australia, and it was essential for the Allies to check any further advance. Hence in a strenuous campaign over jungle and mt. terrain Australian troops repelled the invaders and captured Gona and Buna, the Jap. bases on the N. coast of New Guinea, exterminating their garrisons. While this war was in progress Amer. marines were landed on the large is. of Guadalcanal (q.v.) in the Solomons and captured an aerodrome which the Japanese had recently constructed there. For long the Japanese fought hard to regain the aerodrome, but by Feb. 1943 the Americans had captured the is. This provided the *point d'appui* for a long-drawn but effective process of 'is. hopping,' which gradually pierced the far-flung outer chain of strongholds covering J. from the Pacific, a process in which the ever-growing air and naval superiority of the Americans eventually asserted itself. For some time after the Japanese had been driven out of Guadalcanal no big land action was fought in the Pacific theatre, but the Americans continued to bomb Jap. bases, and by combined sea and air operations thwarted all Jap. efforts to reinforce their positions, especially in what is known as 'the battle of the Solomon Sea' (Mar. 1943) when J. lost 10 warships, over 100 aircraft, and 15,000 men. In the middle of 1943 the Americans landed forces on New Georgia, while the Australians made progress along the N. coast of New Guinea. Lae and Salamaua, the 2 chief Jap. bases on New Guinea, were taken by the Australians in Sept. 1943. Rabaul, the great Jap. base in New Britain, was overcome by the Americans at the end of the year, who were enabled to gain control through the construction of distant airfields. The first ter. taken from J., which was not a mere recovery but had been in Jap. hands before the war, was the Marshall Is., which gave a base for bombing Truk, in the Carolines, the greatest of J.'s Pacific bases; and continuing their westward and northward advance the Americans, by the middle of 1944, reached the Marianas and captured the strongly fortified is. of Saipan, where at last they had secured an air base within long-distance bombing range of both the Philippines and of J. itself.

*The last two years of the war in the Pacific.* The continual deterioration of the war situation, both for J. herself and for her ally, Germany, throughout the period of the Koiso Cabinet brought that gov. down in April 1945. Political developments within J. reflected events in the military and naval fields in 1944-5. Most serious of all, the Jap. Navy was now definitely deprived of command of the sea, even in those inner waters in which it was expected to have a great strategic advantage, so that J.'s shipping routes through the E. and S. China Seas, and even the coasts of J. herself, were laid open to attack. This meant the breakdown of J.'s

original strategy, which relied on the bases in the Carolines, Marianas, Philippines, and Ryukyu Is. as 'unsinkable aircraft carriers' for covering J.'s maritime communications to the mainland of Asia and the Malay Archipelago and for preventing a close approach of the enemy by sea to the Jap. homeland. It meant also that J. was subjected to air attacks heavier than was expected; strong carrier-based air forces, as well as Super-Fortresses from Saipan, now took part in raids, and after the Amer. capture of Iwojima in the Bonins, land-based fighter aircraft were able to support the bombers, and the relative invulnerability hitherto given to J. by her geographical remoteness from allied bases was being rapidly discounted.

J.'s hope of using Burma as a spring-board for invading India had been finally destroyed by the failure of the Jap. thrust into Manipur in the spring of 1944; but Burma was still useful for defending the land approaches to Siam and Malaya and blocking the Burma Road supply route to China. Hence J. was prepared to fight stubbornly to hold it, and with the greater hope of success from the fact that the task of the allied leader, Adm. Mountbatten, was made more difficult through the low priority for shipping and landing craft allotted to his SE. Asia Command. During the winter of 1944-5 Adm. Mountbatten was restricted to an offensive campaign by land across densely forested mt ranges between India and Burma, hampered by the most formidable difficulties of transport. But these difficulties were overcome, largely by the aid of airborne supplies, and with the capture of Mandalay the Jap. hold on Upper Burma was broken. Again, the allied success at Myitkyina had led to the prolongation of the road from Ledo to meet the old Burma Road, and it was possible once more to send lorries through to China.

In striking contrast to the ship-starved offensive of the SE. Asia Command of Adm. Mountbatten, the Amer. invasion of the Philippines under Gen. MacArthur was carried out with an immense concentration of maritime transport and newly built landing craft. Against this massive attack the Japanese had some 200,000 men in the Philippines, but they were scattered over many different Is., and the native pop. was either apathetic or hostile. Even in the inner waters of the archipelago movement by sea between the Is. was threatened by Amer. air attack. For J., therefore, everything depended on victory over the Amer. fleet; without command of the sea the dispersed Jap. land forces would be isolated in their various captured Is. It was the moment for J. to risk a naval battle, and in Oct. 1944 the main strength of the Jap. Navy was deployed in a determined attempt to crush the Amer. naval force which was covering the invasion of Leyte. The battle which ensued was a decisive defeat for the Japanese and it decided the fate of the Philippines. Strategically the Amer. reconquest of Manila with the naval harbour of Cavite meant that all Jap. shipping

routes S. of Formosa and Hong Kong were now exposed to close naval and air attack. The vast ters. to W. and S. of the S. China Sea overrun by the Japanese since 1940, comprising Indo-China, Siam, Burma, Malaya, and the Dutch E. Indies, were now virtually cut off from J. by sea. Some slight compensation was provided for J. by the success of an offensive in S. China which opened a land corridor from the middle Yangtze to Indo-China, but this could be only of limited use for military movements. To all intents and purposes J. had now lost the resources of the S. lands and her garrisons remaining there were almost as effectively isolated as the by-passed forces still holding out in New Guinea, New Britain, Bougainville, and Truk. But the opening of through communications from Hankow S.-westward to Indo-China and southward to Canton yielded overland routes valuable for Jap. continental strategy, besides defeating and dispersing large Chinese armies in Kwangsi and Kwangtung and resulting in the capture of a number of airfields constructed at great expense by the Americans for the use of their air forces in China. The Jap. commander-in-chief in China responsible for this successful campaign, Gen. Hata, was made a field-marshal and brought back to J. to be inspector-general of military training, and in 1945 he was appointed by the Suzuki gov. one of the 2 commanders for the military defence of the Jap. homeland. The Jap. hold on China, however, despite this success of Gen. Hata, was now threatened from a new direction—from the sea which the Jap. Navy had formerly controlled, but controlled no longer. The Japanese, now that Germany was beaten, had to prepare to defend Hong Kong, Canton, Amoy, and Shanghai against allied seaborne invasion. They had also to prepare to defend Indo-China against attack from the sea now that the Americans were estab. in the Philippines.

For the ordinary Japanese, however, and indeed for his rulers, no theatre of war could compare with the homeland in importance. For the *shinkoku* or 'divine land' was now threatened with invasion from the sea. The loss of Saipan had brought down the Tojo Cabinet and the fears aroused by this event were soon realised in 'Super-Fortress' raids on the industrial cities of central J., including Tokyo itself. Soon the premier, Koiso, had to admit the loss of Iwojima (21 Mar. 1945) and the Jap. Navy, after its mauling in the Philippine waters, did not dare to go to the rescue of the garrison. Then Adm. Nimitz invaded Okinawa, an Is. of the Ryukyu group commanding the sea approaches to Shanghai as well as to SW. J. The air-raids by the great Amer. bombers reached a climax in Mar.-June and with the promise of still worse to come. The gov. was petitioned to take more drastic action in the matter of shelters in Tokyo, but was powerless to do more than advise everybody not needed in Tokyo to depart at once, huge areas of the cap. being now devastated.

The prospect in the spring of 1945 that Germany would be defeated confronted J. with a major problem which was at once political and strategic. For obviously with Germany out of the war, far greater forces would be available to concentrate on J. But whether to give up the outer zone of conquests from Burma to the Carolines and concentrate on the defence of the inner zone comprising J. itself, Korea, Manchuria, and China, was a problem which brought extremists and moderates in sharp conflict with each other. Koiso told the Diet on 23 Mar. that J. intended

negotiations. Therefore in April (1945) the influential groups secured the appointment as Prime Minister of Adm. Suzuki, former Grand Chamberlain, in place of Koiso. Yet even before this statesmen behind the throne had been preparing the way for such an appointment and restraining the agitation of Col. Kingoro Hashimoto's fanatical followers for a 'regeneration' of the political structure. Koiso, though an extremist in foreign policy, was a conservative in domestic affairs, and therefore willing to co-operate with the elder statesmen against Hashimoto, whose

New York Times Photos

THE EMPEROR HIROHITO IN PUBLIC, 1946

to take the offensive to retake Iwojima, Saipan, and Guadalcanal. Okinawa had not then fallen, and it was a more serious loss even than that of the other is. Yet he was unable to explain how J. could effect such a miracle if her navy dared not venture out of its home waters. But the extremists, often composed of the more youthful officers, could not prevail against the general staffs and the *sabaisu* or great business houses whose minds had not, of course, been deluded by the fraudulent war-time Jap. propaganda. These knew, even before the end of 1944, that the tide of war had definitely turned against J. and that it would soon be a question of trying to get out of the war on terms falling far short of J.'s original ambitions. Thus, while as yet there was no question of unconditional surrender, it was essential to get rid of the ultra-extremists who would bar the way to any hope of peace

group wanted to get rid of the Yokusankai and substitute a large, unified, and disciplined party state on the familiar Fascist model. The Yokusankai had, since 1942, been the only recognised political organisation, but it had never had any real political stamina, and behind this façade the old-time politicians retained their party groupings and more or less supported the gov. of the day. But apart from these party difficulties, Koiso also found the same difficulty as his predecessor, Tojo, had in securing effective co-ordination between the gov. and the High Command. Tojo had been his own war minister and had ultimately made himself chief of the army general staff as well; Koiso deemed it imprudent to excite criticism by arrogating these posts to himself and therefore tried to co-ordinate their functions through the Cabinet secretary. But there were repeated changes in

this office, one appointee after another being regarded as unsuitable—an indication more of the gravity of the administrative crisis facing the gov. than of the inherent importance of the office.

*Closing days of the war and surrender of Japan.* The Jap. garrison of 100,000 men on Okinawa defended the is. with the utmost tenacity, as indeed had the garrison of 20,000 on Iwojima, but organised resistance on Okinawa ceased on 21 June. The campaign in the Philippines ceased at the end of the month. On 14 July J. was bombarded by Amer. warships. Then, on 6 Aug., the first atomic bomb was dropped on J. at Hiroshima (q.v.); the second (and last) of the missiles on Nagasaki on the 9th. Thus did disasters accumulate and without hope of mitigation in any quarter. On the verge of surrender, J. now found herself confronted by a new and powerful enemy in Russia, which nation had not renewed the Neutrality Pact due to expire in April 1946 unless expressly renewed, and now declared war on J. to wipe out the humiliation of past defeats and to restore the *status quo* of nearly half a cent. ago. On 9 Aug. the Red Army invaded Manchuria. Meanwhile allied aircraft, operating from speedily organised runways on Okinawa, destroyed in one day 60 more Jap. ships. This was the end. Though J. still had a great fighter air force it was to a great extent a grounded force. The measure of Jap. losses was catastrophic. Thus in New Guinea, of an army of originally 120,000 men only 12,000 survived. Between the date of the attack on Pearl Harbour and Aug. 1945 some 320 Jap. warships had been sunk or put out of action, including 11 battleships, 17 heavy and 22 light cruisers, 7 aircraft carriers, 139 destroyers, and about the same number of submarines, 4 escort carriers, and other craft. J.'s mercantile marine had practically disappeared. On land, sea, and in the air J. was shattered and was now in fact faced with the prospect of speedy annihilation from further atomic bombs. Hence on 14 Aug. J. accepted the allied demand for unconditional surrender addressed from Potsdam (see POTSDAM CONFERENCE) in the names of Mr Churchill, President Truman, and Gen. Chiang Kai-shek. Amer. forces began landing in J. on 29 Aug. and the instrument of unconditional surrender of J. was signed on board the Amer. battleship *Missouri* in Tokyo Bay on 2 Sept. Within the ensuing days of the month the Jap. forces in Luzon (Philippines) and throughout the SW. Pacific also surrendered, while the surrender in SE. Asia was received by Adm. Mountbatten on 2 Sept. That of the Jap. forces in China was signed at Nanking by Gen. Okamura on 9 Sept. For details of the war in the Far E. see BURMA, SECOND WORLD WAR CAMPAIGNS IN; MALAYA, BRITISH, JAPANESE INVASION OF (1941-2); NAVAL OPERATIONS IN SECOND WORLD WAR; PACIFIC CAMPAIGNS OF FAR EASTERN FRONT IN SECOND WORLD WAR.

*Japan's new epoch.* The surrender of

J. marked the opening of a new epoch in the hist. of the Far E. For the preceding half-cent. J., as has been shown, had pursued an uninterrupted policy of expansion. Her imperialistic aims had dominated the mind of the ruling class which moulded the outlook of the Jap. people in a manner to which hist. affords no parallel. On the basis of unquestioning loyalty to the imperial throne, the whole nation was taught to face any hardships which might be entailed in following the national destiny; the throne itself was exalted from a temporal to a quasi-divine institution and, like the Herrenvolk of Germany, the servants of the throne down to the humblest private soldier were encouraged to regard themselves as a race apart from the rest of mankind, participating in the God-like characteristics of emperor and nation. Naturally the governing class was apprehensive lest the surrender should have a disastrous effect on public morale and they exhorted the people to look upon the calamity as a mere temporary set-back due to the atomic bomb; but when they realised that popular loyalty was unimpaired they made no further attempt to minimise the implications of surrender. But, immune now from the risk of arrest, Prince Konoze, thrice Prime Minister of J., and after the surrender again one of the emperor's advisors, was the first important Japanese since the surrender to declare to the world that both the 'China incident' and the war with the Allies could have been averted and that the Jap. militarists were principally guilty for both. Some of the old-time leaders sought suicide. F.-M. Sugiyama, chief of the Jap. General Staff up to Feb. 1944 and later minister of war in the Koiso Cabinet, committed suicide on 12 Sept., and Gen. Tojo tried to kill himself when Amer. officers went to arrest him. Gen. MacArthur, supreme commander of the allied forces of occupation, at once ordered the dissolution of the notorious K. Amur Society (sometimes called Black Dragon Society, originally founded to encourage the exclusion of the Jap. frontier to the Amur in Manchuria, the militarist secret organisation which for 45 years, by assassination and other methods of coercion, ruled Jap. political life) and the arrest of its leaders. Among others arrested at this time was Adm. Shigetaro Shimada, who, as navy minister, planned the attack on Pearl Harbour. Gen. MacArthur found comparatively little difficulty in carrying out his instructions for the disarmament of J. and for the destruction of her war potential both in the moral and material sphere. The land forces were disarmed and disbanded and all aircraft were confiscated. The U.N. (q.v.) agreed to scuttle all surviving Jap. war vessels, except about 40 destroyers and some coast defence vessels. After the dissolution of the Imperial General H.Q. and the arrest of many prominent individuals preparatory to their indictment as war criminals (see JAPANESE (WAR CRIMINALS) TRIAL) came the entire control by allied authorities of the

commercial and industrial life of J.; the break up of large estates among peasant proprietors; and the diversion of productive capacity into a programme to provide the people with the necessities of life. All barriers to the gathering and dissemination of news were removed, censorship by the Jap. authorities was forbidden, and the whole foundation of the elaborate system of 'thought control,' so effectively conducted for many years by the governing oligarchy, was destroyed. The speed of social reform, and especially the abolition of the *kempai* or military security police, led to the reconstruction of the Jap. Cabinet, and Prince Higashi-kuni, who had succeeded Suzuki as premier, gave place to Baron Shidehara, whose administration gave an assurance that the political power of the military clique and of the bureaucrats of the old type had been broken, and that the aim of the administration was to inaugurate a regime in which policy would be determined by the will of the electorate.

A year after the surrender the House of Representatives in Tokyo adopted by an overwhelming majority a new draft constitution for J. superseding the Meiji constitution of 1889. This new constitution indicated a wish to depart entirely from traditional beliefs wherever they were in conflict with the concepts of W. democracy. Based largely upon Amer. ideas, the new constitution based the foundations of the State not upon divine mandate, but upon the will of the electorate; it restricted the functions of the emperor, who became a symbol of the State; it renounced warfare as an instrument of public policy, and banned the maintenance of any armed forces by which war could be waged. The adoption of this constitution was perhaps not surprising in view of the fact that defeat had destroyed the foundations of national life and left nothing in their place. All the old beliefs and traditions had gone. In place of an outburst of dangerous subversive activity by militarist leaders, such as had been confidently expected by experts in Far E. affairs, the Jap. people now seemed engrossed in novel political developments on democratic lines; while the trials of war criminals, so far from investing leaders of the old type with the halo of martyrdom, merely completed their discredit in popular estimation, and the Diet itself pressed for a more thoroughgoing 'purge' of officials than any upon which the Allied Command insisted. The Jap. people in fact desired neither revolution nor reaction: they were concerned principally with orderly development, and the elections of April 1946, so far from representing a landslide in any direction, gave a small majority in the House to a coalition of Liberals and Progressives, the heirs of the former Yokusankai and Minseitō groups, whose popularity, however, was then steadily declining, while that of the Socialist party was sharply rising. Women voted for the first time in Jap. hist. and there were 38 women among the candidates elected. The voting age for

men had been reduced from 25 to 20. Experience throughout 1946 showed that Gen. MacArthur could rely upon Jap. co-operation in the task of restoring normal social and economic conditions. His directives were issued to a 'Liaison' dept., which was in effect the Ministry of Foreign Affairs. Allied Military Gov. also existed, but its prin. functions were supervisory rather than actually administrative. Perhaps the greatest contrast with the allied occupation of Germany was that, instead of being split up into administrative zones, J. was administered as a whole by the single controlling authority, the Supreme Commander's H.Q., working through the Jap. Gov., and in the provs. through the Allied Military Gov., which, despite its name, was in fact entirely staffed by Americans.

The new constitution came into effect on 3 May 1947. The first election for the House of Councillors, the new upper House of the Diet replacing the old House of Peers, was held on 20 April, and that for the Lower House on 25 April. The Socialists gained more seats than any other single party, but the Communists polled only 1 per cent of the total popular vote. The House of Representatives of the Diet elected (21 Feb. 1948) as premier Hitoshi Ashida, Democratic party leader, to replace Tetsu Katayama, a Socialist and a Christian, who had come into power in May 1947 and whose Cabinet now resigned (10 Feb. 1948).

Through all the vicissitudes of total defeat, total demilitarisation, and total occupation the Japanese succeeded in adhering to the 3 things essential to the future plans with which they are credited—the emperor system, the national structure of gov., and the close-knit official bureaucratic machine. Under Gen. MacArthur a 'model' new democratic constitution became law. A democratically elected Diet, fashioned partly on the Brit. Houses of Parliament and partly on the Amer. Congress, was actively functioning. A sweeping land reform was instituted; and trade unions were legalised after years of militaristic repression. Ultra-nationalists and militarists were purged from public offices. But it was objected by some observers that J.'s democratisation existed only on paper and that while, militarily, the occupation was smoothly successful, politically it achieved very little that would endure. Economically J. was slowly recovering but still dependent upon America's bounty. Socially, as an instrument for inspiring feudalistic J. to become attracted to Westerners and their ideas, the occupation might well transpire to have failed. In the material sense J. was completely disarmed, a task in which the Brit. Commonwealth troops took an important part. Without allied permission and assistance, J. could not re-create her military machine for many years. But there was no corresponding mental disarmament or change of heart.

Despite the democratisation of Jap. political and social institutions, both allied H.Q. and the Jap. Gov. felt

increasing concern over the activities of the Jap. Communist party, the leaders of which held their sixth ann. congress at the end of 1947. In his New Year message to the people, the former premier, Tetsu Katayama, pledged the Social Democratic party to a 'fight against Communism' to the last ditch. His Cabinet made known its intention to combat Communist influence in labour unions so far as the constitution permits. But the strength of the Communist party seemed unimpaired. The hist. of the Jap. Communist party, *Nippon Kyosanto*, as an independent party began in 1921, when 2 men, Tokuda and Nosaka, attended the Far E. Communist Conference in Irkutsk, under the presidency of Stalin. But their influence remained negligible until the party was formally reorganised in Dec. 1945. After that date, although claiming officially only 17,000 members (the unofficial figure was 100,000), the party became a powerful and aggressive minority group, supported by a large body of sympathisers and wielding through tireless activity an influence out of all proportion to its numbers. Their immediate aim was to win over the labour unions. Until Gen. MacArthur prohibited the general strike planned for 1 Feb. 1947 the National Congress of Industrial Organisations, with the aid of the Jap. Federation of Labour, steadily endeavoured to stage mass demonstrations, strikes, and 'production control.' This evidently indicated that the infiltration tactics of Communists had met with some success. Success in the big industrial centres during the so-called 'October offensives' of 1946 and 1947 and the control acquired in certain rural areas, coupled also with the work of the Young Communist League (*Seinen kyosan renmei*), were all indicative of the party's existing and potential strength. The Communist expansion reached its peak in 1948-9, under the second and third Cabinets of Shigeru Yoshida, leader of the Jap. Liberal Democratic party and a determined anti-Communist. The start of the Korean war in 1950 inspired the Jap. Communist party to adopt measures which caused outbreaks of disorder all over the country. There was particularly grave rioting at Tokyo on 1 May 1952, resulting in more than 500 casualties. The Communists lost many supporters, and Yoshida re-established order by the creation of new army and navy defence forces, an Internal Security Bureau, and regulations against destructionism. Until 1955, however, the state of Jap. political parties was one of utter confusion; but in that year the Democrats and Liberals united to form a new conservative group named the Liberal Democratic party (15 Nov.). A month earlier the left- and right-wing Socialist groups combined as the Jap. Socialist party. This was a completely new phenomenon in J.'s parl. hist. The doctrine of the Liberal Democratic party is that of parl. democracy, while that of the Socialists aims at the abandonment of the capitalistic structure through parl.

methods. The party strength in the House of Representatives in July 1956 was: Liberal-Democrats 299; Socialists 153; others 10; vacant 5; total 467. In the House of Councillors it was: Liberal-Democrats 122; Socialists 80; others 48; total 250. The Liberal-Democrats' leaders are Nobusuke Kishi (premier since Mar. 1957), and Tanzan Ishibashi. Mosaburo Suzuki, Jotaro Kawakami, and Inajiro Asanuma lead the Socialists, and the Communist party leaders are Sanzo Nosaka and Yoshio Shiga.

LANGUAGE AND LITERATURE. With the exception of that of the Luchu Is., no other language claims relationship to the Japanese. Some authorities include it in the 'Aitale group'; it is an agglutinative tongue. Many Chinese words are employed, especially for new words, such as 'bicycle.' It is exceedingly difficult to learn, and a great deal of Chinese must be understood as well. There are practically 3 languages to learn, the colloquial, the polite, and the written, which all differ to an extraordinary degree. The written language of the earliest times probably closely represented the colloquial, but by the 9th-10th cents. the 2 forms of speech began to separate, the spoken form being changed much more rapidly than the written. The literature of the country is frequently written in Chinese. Notwithstanding the difficulty of learning the Jap. scripts, illiteracy is only 10 per cent of the nation in J. proper. Moreover English is the language of commerce and is compulsory in the high schools. See S. Miyazaki, *The Japanese Dictionary explained in English*, 1950.

The earliest book we know of is the *Kojiki* (Record of Ancient Matters), AD 711-712. It contains a story of the creation and the heavenly birth of the Jap. race, with a hist. of some of the early emperors, with sev. songs included; much of it is dull and primitive. The next book, written AD 720, is the *Nihonshoki* or *Nihongi* (Chronicles of J.). It was written entirely in Chinese, and from that time most of the literature was pub. in Chinese. Another book, about AD 760, is called the *Manyōshū* or *Collection of the Myriad Leaves*, an anthology of the ancient poems. There are sev. hist., notably the *Nihon Gwaishi*, a few law books, and a great deal of poetry. The classical romances are exceedingly charming, such as the fairy story entitled *Taketori Monogatari* (Tale of the Bamboo Cutter), 9th cent. etc. Among the diaries is one called *Murasaki Shikibu Nikki*, written by a Jap. authoress, and very difficult to read. Women have always largely influenced the literature of the country, and have added many works of merit and charm. During the time of peace under the rule of the Tokugawa Shoguns philosophy was much studied, while popular romances and drama became common. Chinese influence on Jap. culture gradually receded. After the Restoration an enormous number of Eng. and Fr. works were trans. and pub., naturally influencing the literature of the time.

More modern authors include Rohan Kōda, Futabai Shimei, Ōgai Mori, a surgeon-general, Ryunosuke Akutagawa, and Ichio Higuchi, who borders on genius in her life-like tales. Among 20th-cent. writers are Mushakoji, Arishima, Shiga, Nanyō, Nogami, Nakajo, Oguri Tayo, Kosura Tagai, Yanagawa Shunyo, Ōzaki Koyo, Kunikida Doppo, Tosan, Masamune, Shimamura, Shima-zaki, Iwana, Tokuda, Kikuchi Kan, Hayashi Fusao, Yokomitsu Riichi. See D. Keene, *Anthology of Japanese Literature*, 1956, *Modern Japanese Literature*, 1957.

There were, before the Second World War, many newspapers and journals, and some Jap. newspapers printed in English. Yokohama produced the first daily paper, 1871, also the first Eng. jour., *The Japan Mail*, 1865. The Jap. press was unfortunately hampered by vigorous censorship.

The No plays (q.v.) are the classical drama of J. Historical dramas and comedies of contemporary life are the most popular, and many European works have been trans. and adapted. Tsunouchi is a 20th-cent. dramatist of repute. For greater detail see DRAMA. See also E. Ernst, *The Kabuki Theatre*.

*Japanese music* is simpler in melodic structure than W. music.

**Japan, Sea of, or Japan Sea (Nipponkai)**, divides the is. of Japan from Korea and E. Siberia. It is almost tideless and extends about 600 m. from E. to W. and 500 m. from N. to S. with an average depth of 1200 fathoms.

'**Japan News**,' see ARMY NEWS SERVICES.

**Japanese Architecture** was based primarily upon older Chinese architecture, but developed distinctive characteristics of its own. Up to quite recent times, most Jap. buildings were constructed entirely of timber, and some of them erected more than 1200 years ago still survive. The reason for adopting timber construction is partly that it resists earthquakes more effectively than brick or stone do. Roofs were steep, with immense projecting eaves carried on carved brackets, and were either hipped or

gabled. They were generally covered with tiles. Curving lines predominated throughout. The chief surviving historical examples are Buddhist temples, viz. the group in the anct cap. city of Heijo, near Nara, with a pagoda, 8th cent. AD; temples of the Heian period (784-1185) on Mt Koya and Mt Hiei; temples of the Kamakura period (1186-1392) at Kamakura, showing Chinese influence; the temple gateway of the Muromachi period (1393-1572) at Kyoto; and the temple of the Momoyama period (1573-1614), near

unknown. It clearly shows the colouring and construction of Ajanta and Tartary schools. The frescoes were burnt by fire in 1949. The first famous native artist of whom we know was a noble named Kōsē-no-Kanaoka, at the court of the Emperor Seiwa, about AD 880; very few of his works have survived, and those that have are chiefly conventional in design, but most perfect in their blending of colours. His descendants, who continued to the close of the 15th cent., were famous artists, and founded the native school of

HIMEJI CASTLE, JAPAN

*Japanese Embassy*

The keep was built 1581-1610.

Sendai. In modern times reinforced concrete has largely replaced timber construction for all buildings except dwelling-houses, and W. fashions of design have mainly superseded native tradition. The Imperial Hotel at Tokyo (1916), by the Amer. architect F. L. Wright (q.v.), is a typical example. Many or most Jap. houses, however, continue to follow the native tradition in their very light construction, and have notably stark interiors free from all superfluous ornament and furniture. See also JAPANESE ART, and bibliography.

**Japanese Art** is essentially realistic, almost impressionist. Studies from nature are perfect and alive. The art of painting has existed in Japan for 12 cents. Since 1897, when national treasures became protected, and reproductions were pub., the real art of the nation has become better known. The oldest painting of whose existence we know is the 12 frescoes in the main hall of the temple of Horyuji, near Nara, of AD 607, but the artist is

Yamatōe; the followers of this particular branch of painting delighted in quaint animals, insects, and imagined creatures, grasshoppers, frogs, butterflies, and hobgoblins, etc., which they represented with extraordinary charm and vitality. During the 15th cent. 2 Buddhist priests became very famous: Chōdōsu (Mincho) and Nyōsetsu. Both were the pioneers of *suiboku* (black-ink painting) school, and the latter instructed Shūbun and Sesshū. A little later came Kano Masanobu, a pupil of Shūbun and founder of the Kano school. These 3 and Tosa Mitsunobu (Tosa school) became the leaders of 3 famous schools of painting. The Kano school has outlived the other 2, with its generous breadth of idea, its extreme simplicity, and its brilliant colour schemes. A new development of art began with Hishikawa Moronobu (d. 1694); his pictures are filled with delicate work; he gave Japan her first beautiful wood-engravings and illustrated books. About 1775 Ōkyō became famous for his representations of

animal life. Following the Kano school came Ogata Korin (1663-1743), a man who left his eccentric and vivid influence on the works of his many pupils; he also excelled in lacquer work. Distinguished traditional painters after the Meiji restoration are Kano Hogai, Haahimoto Gabo, and Yokoyama Taikan. The W. style of painting has estab. itself as the major school of Jap. modern painting, and Sotaro Yasui and Ryuzaburo Ume-hara are the 2 most prominent masters.

Sculpture and carving in metal and wood have been a highly developed art in Japan for 12 cents.; many of the temples are store-houses of fine examples, going back as far as the 6th cent. Sacred images were not the only subjects for the glyptic art: bells, vases, candlesticks, lanterns, arms, and armour all being objects for the artist's skill. Stone was never used to any extent, but bronze, ivory, and wood have always been employed from the earliest times. The golden ages of Jap. sculpture are the Nara period (645-781) and the Kamakura period (1184-1335). The finest examples of these periods can be seen in nearly all the anc. temples in Nara and Kyoto. Among those whose names were recorded, the most distinguished are Tori (7th cent.), Jocho (d. 1057), Unkei and his pupil, Kaikei (12th-13th cents.). The elaborate metalwork of the sword hilts, when every noble and samurai carried a sword, was for over 500 years a wonderful work of art. Many of these sword sculptors were held in great esteem, while the swords themselves were handed down as family heirlooms. The art of inlaying with gold and silver became highly developed at a very early time. A great deal of their bronze work is very fine; one particular kind which colours to a golden yellow is remarkable to a degree, and the Japanese have excelled in this particular branch of metalwork. The common domestic flower vases, alcove ornaments, and incense burners are often of exceeding beauty of design and workmanship. The great bronze Buddha at Nara, and the huge Amida at Kamakura, are a proof of their early skill in casting large objects. Another branch of art grew quickly with the use of tobacco, and this was the carving of *netsuke*, or buttons employed to suspend the tobacco pouch from the girdle, also the bowl of the pipe and the pouch clasps. Following the *netsuke* came the *okimono*, little ornaments, wonderful copies of crayfish, dragons, eagles, birds, and the like; some were of large size, but many of the most perfect are tiny little productions to delight either an artist or a child. Wood-carving has, from very anc. days, been one of Japan's greatest arts. The temples bear the records of cents. of exquisite work, but seldom the names of the artists. Decorative wood-carving flourished in the Momoyama period (1573-1614) to its greatest extent, as applied to castles, mansions, and temples. The art of the woodcut was introduced into Japan from China, and was used for the printing of texts and pictures. The name of

Katsushika Hokusai (q.v.) (1760-1849) is well known in this field; his 36 views of Mt Fuji are of remarkable beauty. He illustrated numberless books, and represented both scenery and human life with accuracy and vividness. By his prints and drawings he transcended nationality and may be considered one of the world's great masters. Other famous names are Utamaro (q.v.) (1754-1806) and Hiroshige (q.v.) (1798-1858), who depicted every aspect of his country in numerous sets of prints. The Jap. colour print has been one of the important influences on W. art since about 1860.

The art of lacquering was a gift from China at the beginning of the 6th cent. Plain black lacquer was the first achievement, later mother-of-pearl and gold dust decorated the work, followed by conventional patterns, and still later by floral designs of great beauty. Features of the temples and castles were adorned with the most elaborate lacquer work. In all the finer examples of this art gold predominates, and the effect is rich and soft. Enamelling is another development of the modern Jap. artist. To-day vases, bowls, censers, etc., can be obtained in the finest cloisonné enamel work. The translucent enamels are wonderfully decorative, both in delicate design and exquisite colouring. Mention should also be made of the 'tea ceremony' (*cha-no-yu*) as a form of aesthetic ritual, establishing a standard of harmonious design in all its accessories since the 15th cent.

According to a survey carried out by allied H.Q. only 38 of Japan's 5703 greatest national art objects were damaged or destroyed by air-raids during the Second World War. Jap. A. must always appear different from the art of other countries; in one sense it is impressionist by reason of its choice of subjects and want of detailed background; yet in another sense the perfect painting of every petal, feather, or feature makes their productions anything but impressionist. Their whole art, in which is reflected the true national character, aims at perfection in one main object, with a consequent simplicity and disregard for what is non-essential. See also JAPANESE ARCHITECTURE. See L. Binyon, *Japanese Colour Prints*, 1923, and *Painting in the Far East*, 1934; H. Minamoto, *Illustrated History of Japanese Art* (trans. H. G. Henderson), 1935; K. Toda, *Japanese Scroll Painting*, 1935; N. Tsuda, *Handbook of Japanese Art*, 1935; Jean Buihot, *Histoire des arts du Japon*, 1949; R. T. Paine and A. Soper, *The Art and Architecture of Japan*, 1955.

Japanese (War Criminals) Trial (1946-1948). The International Military Tribunal for the Far E., under the presidency of Sir Wm Webb, met early in 1947 to try the Jap. war leaders Hideki Tojo (q.v.) and his 24 co-defendants for conspiring to wage aggressive war for the purpose of securing military, naval, political, and economic domination of E. Asia and the Pacific and Indian Oceans; for responsibility in 'conventional war crimes' (i.e.

atrocities) practised by the Jap. Army and Navy; for breaches of the laws and customs of war, and on many other counts. The trial lasted 417 days and adjourned on 16 April 1948, after hearing the prosecution's final reply to the summing up of the defence, judgment being delivered on 12 Nov. The tribunal found all the defendants guilty and 7 of them were sentenced to death by hanging. Of the 7, all but Koki Hirota, foreign minister (1933-8), were military men. These were Gens. Hideki Tojo, Kenji Doihara, Seishiro Itagaki, Heitaro Kimura, Iwane Matsui, and Akira Muto. All the other accused were condemned to imprisonment for life, except Mamoru Shigemitsu, foreign minister (April 1943-April 1945), who was sentenced to 7 years' imprisonment, and Shigenori Togo, foreign minister under Tojo, sentenced to 20 years' imprisonment. The president, expressing an opinion differing in certain ways from the majority judgment, said that the crimes of the Japanese accused were far less heinous, varied, and extensive than those of the Germans accused at Nuremberg. He expatiated on the implications of the Jap. Emperor's responsibility. The authority of the Emperor (he stated) was proved beyond question when he ended the war on 14 Aug. 1945. The 7 Jap. leaders who were condemned to death at the trial were hanged on 23 Dec.

Japanning was originally the art of lacquering (q.v.) as practised by Japanese and Chinese. The original Jap. lacquers were derived from the sap of *Rhus vernicifera* and were hard, tough, durable, and very brilliant. The name became used to describe the application of coloured varnishes, but more particularly the black japans which consisted of asphaltum and linseed oil thinned with turpentine (q.v.). Whilst air drying types are available, J. is mainly carried out by a stoving process. At one time, Japan of this type was used extensively on fabricated metal articles such as bicycle frames, but it is now usually used only on cheap metal objects such as deod-boxes, trays, screws, etc. Its place is being taken by stoving paints (see PAINTS).

Japheth, youngest son of Noah (Gen. v. 32) or second (Gen. ix. 24), the father of one of the 3 great divs. of the human race (see ETHNOLOGY). The name Japhetic has been applied loosely to the European stock now called Aryan or Indo-Germanic.

Japonica, see CHAENOMELES.

Japurá, riv. of Brazil. It rises in the Colombian Andes as the Caquetá and flows 400 m. E. into Brazil, joining the Amazon near Tofé. Combined length, 1500 m.

Jagues-Daleroze, Émile (1865-1950), Swiss musical educationist, b. Vienna. Studied under Fuchs and Bruckner in Vienna, and under Delibes in Paris. Prof. of music, Geneva Conservatoire, 1892, where he evolved his educational method, the *Gymnastique rythmique*, a system of musical and gymnastic training which has won world-wide fame. Institutions for teaching his system were opened at

Helleran, near Dresden, in Geneva (his H.Q.), Paris, and London. He was also a composer, but his works have not maintained themselves. He wrote a number of books on his system, and also *Souvenirs*, 1942, and *La Musique et nous*, 1945.

Jargoon (or 'Matura Diamond'), name of certain varieties of zircon, which can be cut as gems, but are not of the reddish colour of the iacinth. Js are usually smoky or colourless.

Jarmo, prehistoric vil. site near Suleimaniyah, Iraq. Excavation by an Amer. group (Chicago Univ.) in 1952-5 revealed important pre-pottery neolithic culture, dated by radio-carbon to c. 4750 BC, and thus the earliest then found in the Near E.

Jarnac, Fr. tn in the dept of Charente, on the R. Charente. Louis I, Prince de Condé (q.v.), was killed here (13 Mar. 1569) in the victory of the Duke of Anjou, later Henry III (q.v.), over the Huguenots. Brandy is made here. Pop. 3900.

Jarnach, Philip (1892- ), composer, of Sp. and Ger. parentage, b. Noisy, France. Educ. in music under Rislér, for piano, and under Lavignac for musicology; but largely self-taught. Taught at the Zurich Conservatory, 1918-21, and later in Berlin. Disciple of Busoni, and cosmopolitan rather than national. Apart from composing various works of his own, he completed Busoni's unfinished opera *Doktor Faust*.

Järnefelt, Armas (1869- ), Finnish composer, b. Viipuri (Viiborg). Studied under Wegelius, Busoni, and Massenet in Helsingfors, Berlin, and Paris respectively. Became director of the opera and head of the conservatoire at Viipuri, and then at Helsingfors, later becoming court conductor in Stockholm. Has written orchestral and choral music.

Jaro, tn of the prov. of Iloilo, Philippine Is., 4 m. NW. of the cap., Iloilo. It has a large trade in sugar and agric. produce. J. is actually a part of Iloilo city. Pop. 16,947.

Jaroměř, Czechoslovak tn in the region of Hradec Králové (q.v.), on the Labe (see ELBE). Pop. 7300.

Jaroslav, or Jaroslavl, see YAROSLAVL.

Jarosław, tn of Poland, in Rzeszów prov., on the San, 30 m. E. of Rzeszów (q.v.). It went to Austria in 1772, but was returned to Poland in 1919. There are flour and timber industries, and manufs. of metal goods. Pop. 20,000.

Jarrah, or *Eucalyptus marginata*, also known as the mahogany gum-tree. It is indigenous to SW. Australia, and is much valued on account of its wood, which is used in building and furniture-making.

Jarrow, industrial tn and municipal bor. in the co. of Durham, England, situated on the R. Tyne, about 6 m. E. of Newcastle upon Tyne, 4 m. SE. of S. Shields. Although J. was probably occupied under the Romans, the name is derived from a Saxon word meaning 'marsh' or 'fen'—the marsh being J. Slake (corrupted from J.'s Lake), an estuary of the Tyne to the E. of the tn. The Venerable Bede spent

the last 50 years of his life in the monastery founded by St Benedict Biscop at J., and there wrote his *Historia Ecclesiastica Gentis Anglorum*. At this monastery was probably written the *Codex Amiatinus*, a MS. of the Vulgate copied early in the 8th cent. The monastic ruins may be seen near St Paul's Church, once part of the original foundation. From the time of Bede until the 19th cent. little is known of J., but during the earlier part of that cent. coal-mining was begun, salt was panned, and the shipbuilding industry was estab. at J. by the brothers Palmer. From their yard was launched the first practicable iron screw collier (1852), and warships of all classes were constructed. Iron works were estab. alongside the shipyards, but these industries, in spite of their initial success—900 ships of a total displacement of 2 million tons were launched from J. until 1933—later declined. Finally J. was included in the special area of Durham and Tyneside, and the site of the Palmer works was purchased by the Special Areas Commissioner. New industries began to be set up, particularly through the efforts of Sir John Jarvis, M.P. In 1946 the Tyne Tunnel Act was passed to authorise the construction of 3 tunnels under the Tyne between J. and Wallsend, a 1230-ft long pedestrian tunnel, with a twin tunnel alongside for cyclists, and a vehicular tunnel, quite separate from the other two. Excavation began in 1947 and the N. (Howden) and S. (J.) workings were joined in 1949. A redevelopment plan for the older part of the tn was adopted by the council in 1944. The new J. is essentially part of industrial Tyneside, and the whole area is well served by land, sea, and air communications. With the N. sea on one side and the moors on the other the area has an exceptionally clear atmosphere. Present industries include sectional steel rolling, steel casting, special refined iron manuf., ship repairing, oil installation, slag crushing and preparation for road-work, patent wagon axle-box manuf., light electrical accessory manuf., bakers' oven and ancillary equipment production, metal box manuf., general engineering products, and paper- and chemical-making. J. gives its name to a parl. div. returning 1 member to the House of Commons. Pop. 28,930.

**Jasher** (R.V. Jasher), Book of, or Book of the Upright, one of the most important of the lost works of the Jews. It is twice quoted in the canonical books of the O.T., and it is noteworthy that each quotation is poetical, Joshua x. 13 tolling how Joshua commanded the sun to stand still over Gibeon and the moon over Ajalon and David's lament over Saul and Jonathan, 2 Sam. i. 18. From these it is deduced that it was a collection of songs, more secular than religious, dealing with the exploits of Israelitish heroes. Various Talmudic authorities have attempted unsuccessfully to identify it with one or other of the early canonical books. It was a separate production of the post-Solomonic period, containing, however, many poems

of earlier date such as occur in Exodus, Judges, Samuel, etc. During the later Middle Ages 3 Jewish works appeared claiming to be the lost B. of J., and in 1751 there appeared an astounding forgery purporting to be a trans. of it into English by Alcuin.

**Jasione**, genus of herbs, family Campanulaceae; about 12 species are found in Europe and in Mediterranean dists., one of them *J. montana*—Sheep's bit—being native to Britain, growing in grassy places with blue flowers of fine shades.

**Jasło**, ln of Poland, in Rzeszów prov., on the Wisłoka, 31 m. SW. of Rzeszów (q.v.). It is the centre of an important petroleum and natural-gas producing dist. Pop. 5000.

**Jasmin**, **Jacques** (1798–1864), Provençal poet, b. Agen, whose real name was Jacques Boé. His first vol. of poems, called *Papillotes* (Curl Papers), was pub. in 1825, containing some verse in French, but mostly in the Provençal 'patois'. These 'patois' poems are generally in the form of short epic narratives, both grave and gay, dealing with familiar scenes of peasant life which he himself often recited. J. is now generally considered the direct forerunner of Mistral and the *Félibrige*. Four successive vols. of the *Papillotes* were pub. during his life-time and contained the famous poems 'Charivari', 'My Recollections', 'Martha the Simple', 'The Twin Brothers', 'The Blind Girl of Castel-Cuillé' (trans. into English by Longfellow, and set to music by Coleridge-Taylor, 1901); and 'Francoetto' (trans. into English by J. D. Craig in his *Poets and Poetry of the South of France*, 1866). In 1852 J.'s verse was crowned by the Fr. Academy. See C. A. Sainte-Beuve, *Portraits contemporains*, 1870; F. De Montron, *Jasmin Poète* (2nd ed.), 1876; J. Andrieu, *Jasmin et son Œuvre*, 1881; J. Smiles, *Jasmin. Barber. Poet. Philanthropist*, 1891; P. Mariéton, *Jacques Jasmin*, 1898.

**Jasmine**, or **Jessamine**, name applied to *Jasminum*, a genus of Oleaceae, of some 200 shrubs, most of which bear sweet-scented flowers followed by a fruit which is vertically divided in two. *J. officinale*, the common J., grows in Europe and Asia. *J. nudiflorum* is the Chinese winter-flowering J. There are also *Gardenia florida*, a species of Rubiaceae, known as Cape J.; *Gelsemium sempervirens*, a species of Loganiaceae, the Carolina J.; *Plumeria rubra*, a species of Apocynaceae, the J.-tree; *Calotropis procera*, an asclepiadaceous plant, the Fr. J.; and *Androsace chamaejasme*, the Rock J.

**Jason**, leader of the Argonauts (q.v.), son of Aeson, King of Iolcus. His half-brother, Pelias, drove him from the kingdom, and he was educ. by the Centaur Chiron. Pelias was warned by oracle against the man *with one sandal*. When J. came to claim his kingdom he entered the market-place with one sandal, and Pelias, recognising the omen, sent him to seek the golden fleece. J., by the help of Medea, secured the fleece and returned with her in the *Argo*. Medea, pretending

to restore youth to Pallas, persuaded his daughters to dismember him and place the members in a cauldron. J. and Medea were expelled. Finally J. forsook Medea for Glauce. Medea in revenge slew the new bride and her own children by J.

**Jason**, Gk name commonly adopted by Jews in the Hellenistic age, as an equivalent of Heb. Joshua. There are sev. J.s mentioned in Maccabees, and one in Acts and Romans. (1) J. of Cyrene, a Hellenistic Jew who probably lived in the second half of the 2nd cent. bc, and was the author of a hist. of the times of the Maccabees down

which it is derived by decomposition. Through the admixture of oxides and silicates of iron its colours vary from red, brown, yellow, to green. The J. of antiquity was apparently a brilliant green translucent form, and the name was evidently applied to forms of chalcodony (q.v.). The ribbon J. of Siberia has well-marked red and green stripes. Egyptian J. usually occurs in brown nodules in the Nile valley and Libyan desert. A rare form of the mineral is termed porcelain J., distinguished by minute holes and a multiplicity of cracks; it has evidently been so altered by being baked *in situ*.

Canadian Government

#### MALIGNE LAKE, JASPER NATIONAL PARK

to the victory over Nicanor (175-161). (2) The second son of Simon II. By bribing Antiochus Epiphanes he managed to usurp the high priesthood of his brother, Onias III (Antioch II). Another bribe enabled him to set up a gymnasium in Jerusalem and to enrol its inhab. as 'citizens of Antioch.' He d. in exile (2 Macc. iv, v). (3) The son of Eleazer, sent by Judas to Rome (1 Macc. viii. 17). He is probably the J. mentioned as the father of Antipater (1 Macc. xii. 16). (4) J. of Thessalonica, the host of St Paul in that city, his surety with the magistrates (Acts xvii. 1), and, according to tradition, Bishop of Tarsus. He may be the J. of Rom. xvi. 21, Paul's 'kinsman.'

**Jasper**, crypto-crystalline form of silica, usually opaque, through contained argillaceous matter. It is related to flint, chert, and chalcodony, and is found in veins and cavities in igneous rocks from

**Jasper Park**, largest national park in the world, situated in N. Alberta, Canada, estab. in 1907, area 4200 sq. m. The park lies on the main line of the Canadian National Railways Transcontinental Line and is easily accessible from Banff or Edmonton by bus. J. P. is named after Jasper Hawes, trader and interpreter with the NW. Co., who built a trading post within the present park in about 1813. It is the home of the famous Columbia Ice Fields. J. P. offers unlimited scope for mt climbing. The Alpine Club of Canada frequently holds its ann. camp in Jasper National Park, which has become a popular skiing centre during the winter months. The all-year resort of Jasper has a permanent pop. of approximately 2000.

**Jaspers, Karl** (1883- ), Ger. philosopher and psychiatrist, b. Oldenburg, son of Karl J., a bank director. He was educ..

at the Humanistisches Gymnasium, Oldenburg. He became a *Privatdozent* at Heidelberg in 1918 and prof. there in 1916. He has been prof. of philosophy at Basel Univ. since 1948. During the Second World War J. never made the slightest concession to the Nazis and courageously upheld the great traditions of W. civilisation, symbolised for him by such names as Goethe, Jacob Burckhardt, Kierkegaard, and Nietzsche. The address which J. delivered on the occasion of his being awarded the Goethe Prize of the city of Frankfurt (Aug. 1947) indicates his unequivocal search for truth and his profound understanding of the spiritual and moral needs of our age. This is exemplified in his book *Von der Wahrheit*, 1948. His other works are *Psychopathologie*, 1913, 1946, *Psychologie der Weltanschauung*, 1919, 1926, and *Philosophie*, 1932. See E. L. Allen, *The Self and its Hazards: an Introduction to the Thought of Karl Jaspers*, 1949.

**Jassy** (Iasi, Yassy), cap. of prov. of Iasi, Rumania, 5 m. W. of the R. Pruth and the Russian frontier. It was nearly destroyed by fire in 1822, but was rebuilt on a modern plan. It is the seat of the Gk Orthodox metropolitan of Moldavia and of a Rom. Catholic archbishop, and has a univ. founded 1864. J. has a trade in petroleum, salt, metals, timber, cereals, fruit, wine, and cattle. Here was concluded the peace between Turkey and Russia in 1792. From 1565 to 1862 J. was the cap. of Moldavia. In the First World War, when much of Rumania fell to the Central Powers, the Rumanian Court remained at J. throughout the period of these reverses. In the Second World War, in the course of the Russian offensive against Ger. and Rumanian forces launched on 20 Aug. 1944, the second Ukrainian Group under Gen. Malinovsky attacked the strong positions covering J., which fell to them on 22 Aug. after a 3-day battle which broke the Axis line to a width of 75 m. and a depth of nearly 40 m. between the Siret and Pruth. Pop. (1948) 94,000.

**Jastrowie** (Ger. Jastrow), tn of Poland, in Koszalin prov., 60 m. SSE. of Koszalin (q.v.). Until 1945 it belonged to Prussia. It has woollen mills and a trade in agric. produce. Pop. 4000.

**Jászapáti**, tn of Hungary, in Szolnok co., 22 m. N. of Szolnok (q.v.). It has a trade in cereals, wine, horses, and swine. Pop. 12,200.

**Jászberény**, tn of Hungary, in Szolnok co., on the R. Zagyva, 25 m. NW. of Szolnok (q.v.). It is said to have been once the seat of Attila (q.v.). There is a textile industry, and a trade in cereals, wine, and live-stock. Pop. 35,000.

**Jātaka**, name used to designate the legends which recount the 550 incarnations of Buddha. These fables are widely disseminated throughout India, and occur in various disguises in the folklores of nearly all European countries. See V. Fausto-Solís (ed.) and T. Rhys Davids (trans.), *The Jātaka, with its Commentary*, 1877-91, and *Buddhist Birth Stories*,

1880; E. B. Cowell, *The Jātaka*, 1895; J. J. Meyer, *Twice Told Tales*, 1903.

**Játiva** (anct *Saetabis*), Sp. tn in the prov. of Valencia. It has an anct castle and a vast Gothic church. The Borgia family (q.v.) originated here, and José Ribera (q.v.) was b. here. Famous in Rom. times for its linen, it is to-day a mkt tn with a trade in wine. Pop. 18,100.

**Jatropha**, genus of Euphorbiaceae, occurs in tropical and subtropical America. There are 160 species in all. *J. podagrica*, Guatemala Rhubarb, with a thick swollen stem, is often cultivated in greenhouses. *J. curcas*, Physic Nut, is cultivated for its seeds which contain a purgative oil, also used in soap-making.

**Jats**, people of NW. India and Pakistan. They form a considerable portion of the pop. of E. Punjab, Rajputana, and the adjacent area of Uttar Pradesh. Two former states of Rajputana—Bharatpur and Dholpur—were under Jat rulers. Hindu legends seem to point to a prehistoric occupation of the Indus valley by the people. The J. are exceptionally able agriculturists and cattle breeders. They are dark in colour, and have regular features. They are not necessarily Hindu, Sikh, or Muslim.

**Jauer**, see JAWOR.

**Jauja**, or Atanjauja, tn and resort on the riv. of the same name, in the dept of Junin, central Peru, 115 m. NE. of Lima. Silver mines occur in the prov. Flour, potatoes, and lumber are the other main products. Pop. 8300.

**Jaumave**, NE. tn and com. in the prov. of Tamaulipas, Mexico, about 30 m. SW. of Ciudad Victoria. Large quantities of itxle fibre are grown in the J. valley. Cereals and live-stock are raised. Pop. 2000.

**Jaundice**, or Icterus, yellow colouration of the skin and mucous membranes due to the presence of abnormal quantities of bilirubin in the blood (see BILE). Bilirubin is a product of the breakdown of blood haemoglobin. This breakdown normally occurs in the liver, the iron of the haemoglobin being retained and the bilirubin being excreted in the bile (see LIVER). J. therefore is a symptom either of failure of excretion of bile, in which case the retained bile is reabsorbed into the blood stream, or of abnormal intravascular breakdown of the red corpuscles, or of acute destructive conditions of the liver liberating into the blood stream the bilirubin present in the liver cells. *Obstructive J.* is due to failure of excretion of bile owing to obstruction of the hepatic ducts or of the common bile duct by gallstones (see CALCULUS), tumour, stenosis, or inflammation. In obstructive J. the urine becomes dark orange or wine coloured and the stools clay-coloured. *Catarrhal J.* is an inflammatory condition of the hepatic ducts, caused as a rule by a virus infection, and is sometimes epidemic. The inflammatory exudate blocks the hepatic ducts, preventing the excretion of bile from the liver. *Catarrhal J.* is therefore of obstructive origin. *Haemolytic J.* is the name given

to J. resulting from any excessive intravascular destruction of the red corpuscles. In these cases, not being obstructive, the urine and stools do not alter in colour. *Acholic J.*, a condition often familial in which the red corpuscles are excessively fragile. In this form of haemolytic anaemia, J. is intermittent and usually mild. *Icterus neonatorum* is a normal physiological haemolytic J. occurring in infants from 3 to 14 days after birth. It is due to the destruction of foetal red corpuscles. *Icterus gravis neonatorum* is a severe condition of haemolytic J. in the new-born resulting from a serological incompatibility between maternal and foetal blood and the consequent destruction of foetal red corpuscles (see RHESUS FACTOR). *Toxic J.* is a condition of acute atrophy or necrosis of the liver caused by the action of toxic substances, such as chloroform or phosphorus, or micro-organisms (see YELLOW FEVER). *Toxic haemolytic J.* may also occur in septicaemia due to certain micro-organisms or their toxins, e.g. *streptococcus haemolyticus*, which destroy red corpuscles within the blood stream.

Jaunpur, city of Uttar Pradesh state, India, situated on the R. Gunti. It was originally the cap. of a Muslim kingdom, and contains many very fine mosques of outstanding architectural interest, built to a considerable extent with the stonework of former Hindu and Jain temples. The stone bridge across the riv., built between 1564 and 1568, is also remarkable.

Jáuregui y Aguilar, Juan de, Chevalier de Calatrava (c. 1570-c. 1641), Sp. poet and painter, b. Seville. He visited Rome (1607), and produced a verse trans. of Tasso's *Aminia*. His *Rimas* appeared in 1618 and *Discurso poético* in 1623, assailing the Gongoristic movement; yet Gongora's style influenced his *Orfeo*, 1624, and especially his trans. of Lucan's epic, *Farsalia*, 1648. He painted a well-known portrait of Cervantes, preserved at the Museum of Madrid. See J. Jordán de Urries, *Biografía y estudio crítico de Jáuregui*, 1899.

Jauréguiberry, Jean Bernard (1815-87), Fr. admiral who served with distinction in the Franco-Prussian war. He was b. at Bayonne, entered the navy (1831), and subsequently served in the Crimea and in China. He was minister of marine from 1879 to 1880, and from 1882 to 1883.

Jaurès, Jean Léon (1859-1914), Fr. Socialist and man of letters, b. Castres. In 1883 he was appointed to the chair of philosophy at the univ. of Toulouse; but he resigned his professorship on his election in 1885 to the Chamber of Deputies. He embraced the cause of the miners in the Carmaux strike. He became the recognised Socialist leader in the Chamber in 1893, and was one of the chief champions of Dreyfus. In 1902 J. became vice-president of the Chamber. His chief work is the *Histoire Socialiste, 1789-1900*, pub in 1901. He was a fervent advocate of world peace, and in July 1914 he proposed the resolution, carried at a Socialist conference in Paris, in favour of a general

strike to prevent war. This caused a good deal of antagonism to J., and resulted in his assassination 2 weeks later. See C. Rappoport, *Jean Jaurès: l'Homme, le Penseur, le Socialiste*, 1915; L. Lévy-Bruhl, *Quelques Pages sur Jean Jaurès*, 1921, and lives by G. Téry, 1915; L. Soulié, 1921; L. Lévy-Bruhl, 1924; J. Jackson, 1943.

Java, fourth largest is. in the Greater Sundas, Indonesia; situated S. of Borneo, across the J. Sea. It is the most important is. in Indonesia culturally, politically, and economically. J. is 650 m. long and 125 m. at its greatest width; area

E.N.A.

PADDY FIELD

48,842 sq. m. It is of volcanic origin, with mt ranges (including some active volcanoes) running E.-W. and rising to 12,060 ft in Mt Mahameru. There are numerous torrential rivs., mostly unnavigable, most important of which are the Solo and Brantas, used for artificial irrigation. There is a highland region in the W., with vegetation generally luxuriant. The forests produce teak, casuarina, and sago palm. Agric. products include cinchona (most of the world's supply), rubber, tea, rice, coffee, and tobacco. Mineral resources include oil, sulphur, gold, and phosphate. Industries include textile mills, tanning, metalwork, and batik. There are some well-developed road and railway services. The climate is tropical, but healthy in the highlands. Cap. Jakarta (formerly Batavia). Other trade centres are Jogjakarta, Semarang, Solo, and Surabaya. 'Java man' (*Pithecanthropus erectus*) was found near Trinil in 1891. Very dense pop. of c. 40,000,000, comprising Malay, Sudanese, Madurese,

Chinese, and Arabs. Religion is mainly Muslim, which succeeded Hindu and Buddhist influence in the early 16th cent. The Dutch arrived in 1596, and estab. Batavia in 1619. J. was occupied by the British, 1811-16, and by the Japanese in the Second World War. It was divided between the Rep. of Indonesia and the Dutch-sponsored autonomous states in 1945; united as 3 provs. of Indonesia in 1950.

**Java Sea**, situated between Java and Borneo, and stretches from the W. of Celebes to the E. of Sumatra.

**Java Sparrow**, see RICE BIRD.

**Javari**, trib. of the Amazon, joining it near the Tabatinga after a N.E. course of 600 m. It forms part of the boundary between Brazil and Peru, and is navigable.

**Javea**, or **Jabea** (anc. *Xávea*), Sp. tn in the prov. of Alicante. It produces wines, lemons, oranges, and muscatel raisins. Pop. 6400.

**Jaw**, bones forming the framework of the mouth. In man the upper J. is termed the superior maxilla; the lower J. the inferior maxilla or mandible. The latter, the largest bone of the face, consists of a horizontal portion and 2 upright portions, called the rami. Both J.s bear teeth (q.v.). The closing and opening of the J. is effected by 4 pairs of muscles, 2 attached to the outer, and 2 to the inner side of the ramus of the lower J.

**Jawor** (Ger. *Jauer*), tn of Poland, in Wrocław prov., 39 m. WSW. of Wrocław (q.v.). Until 1945 it was in Lower Silesia (q.v.). In the 14th cent. it was the cap. of a principality. There are textile, metal, and leather industries. Pop. 10,000.

**Jaworow**, see YAVOROV.

**Jaworzno**, tn in the prov. of Cracow (q.v.), Poland. There are petroleum wells, coal-mines, and zinc-smelting works. Pop. 17,500.

**Jay, Harriett** (1863-1932), authoress and actress, b. London. She was brought up by Robert Buchanan, the Scottish poet and writer, who married her elder sister. She collaborated with Buchanan in sev. of his works, and pub. independently *The Queen of Connanght*, 1875, *Madge Dunraven*, 1879, *Two Men and a Maid*, 1881, *A Marriage of Convenience*, 1885, and *The Life of Robert Buchanan*, 1903. As an actress she also won great distinction.

**Jay, John** (1745-1829), Amer. politician and lawyer, b. New York. He drew up the constitution of New York state in 1777, and was appointed judge. He became president of the Continental Congress in 1778. In 1789 he was made first chief justice of the Supreme Court. In 1794 he drew up a treaty, called the J. Treaty, whereby the inland trade between the U.S.A. and Brit. N. America was properly organised in the interests of both countries. J. became Governor of New York in 1795. He was a very able politician, especially in the field of international politics. His pub. writings include *Correspondence and Public Papers of John Jay*, and *Diary, During the Peace Negotiations of 1782*. Lives have been

pub. by W. Jay, 1833, W. Whitelocke, 1887, G. Pellew, 1890, and F. Monaghan, 1935.

**Jay, William** (1769-1853), Eng. Non-conformist minister, b. Tisbury, Wilts, England. Early in life he worked as a mason. Cornelius Winter had him educ. for the ministry. His devotional writings had a vast circulation in England and America. See G. Redford and J. A. James (ed.), *Autobiography of William Jay*, 1854.

**Jay, William** (1789-1858), Amer. abolitionist, b. New York. He became a judge in 1818. He founded the Amer. Bible Society (1816), but the greater part of his energies was devoted to anti-slavery interests. The Anti-Slavery Society had in J. one of its most fervent and eloquent members. In 1833 he pub. *The Life and Writings of John Jay*. See B. Tuckerman, *Jay and the Constitutional Movement for Abolition*, 1893.

**Jay**, or *Garrulus glandarius*, species of the subfamily (Garrulinae) and of the crow family (Corvidae), and a native of Europe, while other species of the same genus are found in India and other parts of Asia and in Japan. In the New World the blue J.s (*Cyanocitta*) are found in N. America and *Cyanocorax* in Central and S. America, these latter birds being more blue than the common J. In England the common J. has become rare owing to persecution, and this is the case in Scotland and in some parts of Ireland. It is characterised by a crest of black and white feathers, a black tail, and white and black bars on the wing coverts, its body being a brownish colour on the upper surface and lighter underneath. It has wing-patches of blue. The J.s are sly and retiring in their habits, and have a screeching cry with the power to vary it by mimicking other birds. They feed chiefly on snails, insects, worms, and nuts. They hide their nests in trees with thick foliage and lay about 6 or 7 eggs at a time.

**Jayadeva**, Hindu poet, best known as the author of the mystic poem, *Gita-govinda*, the tale of the god Krishna and his love for the shepherdess Radha, which is the theme of many Indian artists, musicians, and dancers. His date is disputed: Lassen (q.v.) believed he fl. in the 12th cent. He is considered the finest lyric poet of India. See Sir W. Jones, *Poems, consisting chiefly of Translations from the Asiatic Languages*, 1777; Sir E. Arnold, *The Indian Song of Songs' from the Gita Govinda of Jayadeva*, 1875, and *Indian Poetry*, 1881.

**Jayhun**, see AMU-DARYA.

**Jazz** originated shortly before 1900, as a result of the fusion of a number of Negro folk-music idioms with European influences and instrumentation. The content of original African material, stemming from the direct influence of the emancipated slave, is far smaller than might be expected, whereas the vocal aspect as expressed in work-songs, spirituals, and ballads retains a strong line in subsequent developments. Since the A.-S. language prevails (with only a smattering of French,

Spanish, and Creole intruding) in all vocal J., it is not surprising to find an appreciable amount of Eng., Scottish, and Irish ballad influence in the pre-J. development period. The strongest lines were those of 'blues' and 'ragtime': the former persists to-day, mostly in instrumental form, whereas ragtime, a piano offshoot of the earliest forms, has almost disappeared into antiquity. Both types depend on a strict chord structure; the blues generally consist of a 12-bar verse (or chorus) divided into 3 sections of 4 bars each, in which the first and second sections repeat themselves. Ragtime is based on 16-bar themes. Most J. compositions of later date revolve round these 2 bases.

Geographically J. had its origins in the S. states of America, S. of the Mason-Dixon line; hence the term 'Dixieland' applied to white J. style. The focal point of these musical activities became New Orleans, where J. evolved as the standard form of entertainment in the sporting and gambling dens. Thence it spread northwards up the Mississippi to Chicago towards the end of the First World War. By 1925 there was a strong faction in New York, and Europe had already had its first taste of the new music. Curiously it took J. more than another decade to find its footing on the W. coast. Instrumentally J. bands varied considerably over the years, from the early brass bands of 1880-90 to the classic instrumentation of 2 cornets, clarinet, trombone, guitar or banjo, bass or tuba, and drums, as used in New Orleans from 1910 to 1920. This voicing is significant, not only in the direct transition from choral music (the clarinet taking the place of the descant or contrapuntal extemporisation), but also in its close affinity to the written music played by brass bands. The piano was added later, when J. band work extended from street function and funerals to dance halls. All voices of the saxophone family were used intermittently, especially amongst the less pure bands of the early period. Chicago style J. of the 1920-30 period admitted solo alto and tenor saxophones (more commonly the latter), and these instruments have retained their places in J. to-day.

Extemporisation is a frequently misunderstood term as applied to J. Initially all J. must be improvised, both collectively and by soloists. By frequent playing and rehearsal the more competent bands arrive at an unwritten or 'head' arrangement, which may continue unaltered in a band's repertoire for sev. years. This type of arrangement imposes a harmonic restriction on the collective improvisation, but leaves the soloist free to extemporise both melodically and rhythmically against the harmonic pattern estab. by the band. Syncopation presents a vexed question. Technically this is a device resorted to by white musicians in trying to emulate the rhythmic drive of the coloured originators of J. Negro groups tend to play on the beat; that is to say the rhythm section establishes a beat, to which they adhere. The melody instruments, collectively or

individually, can place their rhythmic accents where they please relatively to this foundation. Intonation plays another important part in J. From the inception of the J. idiom much emphasis has been correctly laid on what is known as 'hot' tone. Originally this was a Negroid distortion of the correct instrumental tone, as applied to all reed and brass instruments. 'Hot' tone includes not only the admission of excessive vibrato but also the distortion of the pure sound—generally a thickening of the tone—which has been widely practised in J. by both coloured and white musicians. Its origin lies possibly in the poor quality of the instruments played by the pioneers more than in their inability to blow their instruments correctly. The reluctance of classical experts to accept J. is closely attributable to this factor.

The commercialisation of J. by environment in New York and other large cities of the U.S.A. brought about the peculiar trend known as 'swing,' a word first used by musicians to denote rhythmic urge. Swing existed as early as 1924 in a few large coloured orchestras, but popularity was only achieved when sev. large white bands were formed, playing arranged music with extemporised solos. These usually consisted of 4 trumpets, 3 trombones, 4 reeds, 4 rhythm, but later enlarged to as many as 10 brass and 6 reeds. The music they played relied for its effect on a syncopated attempt at dynamics, with exhibitionism underlying most of the solo work. The world-wide interest in this distorted aftermath of J. was responsible for attracting public attention to the pure form. Swing became fashionable in 1935, and absorbed most of the best J. instrumentalists, demanding a high standard of performance and attracting a generation of younger musicians, who had conventional training of the highest order. Many of them were to form the nucleus of a faction which broke away from the highly disciplined work to be found in swing bands. They reverted to J. in a modern form, from 1940 onwards, before the demise of swing. The resultant music was a highly technical, classicalised version of improvised J., sometimes known as 'bebop.' It relied on strong contrapuntal developments, and has, over a period of 15 years, almost eliminated the functions of the basic rhythm section which was an essential part of the classic J. form. As in swing, technique commands higher emphasis than feeling, although a considerable degree of improvisation remains. Instrumentally the change has brought about the complete replacement of the clarinet by the alto and tenor saxophones. Whilst the idiom is kept very much alive by constant changes, there are many who regret the excessive sophistication which is rapidly changing J. from a rumbustious and rebellious folk and dance music to something akin to the classical form known as chamber music. See S. Traill and G. Lascelles (editors), *Just Jazz*, 1957; L. Feather (editor), *The Encyclopedia Yearbook of Jazz* (ann.).

Je Bail (anot Byblos), see SYRIA, *Archaeology and Art*.

Jeanes, Anna T., see MASS EDUCATION.

Jeanne d'Albret (1528-79), Queen of Navarre, the daughter of Henri, King of Navarre, Duke of Albret and peer of France, and Marguerite, sister of the Fr. king, Francis I. She married Antoine de Bourbon, Duke of Vendôme, and their son Henri became Henri (Henry) IV, King of France.

Jeanne d'Arc, see JOAN OF ARC.

Jeanneret, Charles Edward, see LE CORBUSIER.

Jeannette, bor. of Westmoreland co., Pennsylvania, U.S.A., 21 m. ESE. of Pittsburgh. It manufs. glass, rubber, metal products, beverages, and cement, and there are coal and shale deposits. Pop. 18,170.

Jeans, Sir James Hopwood (1877-1946), mathematician, b. Southport, son of W. T. Jeans, a parl. journalist. Educ. Merchant Taylors' School; Trinity College, Cambridge; 2nd wrangler, 1898; Smith's prizeman, 1900. Fellow of Trinity, 1901; univ. lecturer in mathematics, 1904. Prof., applied mathematics, Princeton Univ., 1905-9. Stokes lecturer in applied mathematics, Cambridge, 1910-12. Awarded Adams prize in 1917 for essay *Problems of Cosmogony and Stellar Dynamics*. Secretary to Royal Society, 1919-29. Research associate, Mt Wilson Observatory, 1923. President, Royal Astronomical Society, 1926-7. Knighted, 1928. O.M., 1939. President, Brit. Association, 1934. One of his first scientific investigations was that resulting in the proof of Maxwell's law governing the distribution of velocities among molecules, his studies in this field being pub. in 1904 as *The Dynamical Theory of Gases*. At Princeton in 1906 he pub. his *Elementary Treatise on Theoretical Mathematics*, and, 2 years later, his *Mathematical Theory of Electricity and Magnetism*, the various eds. of which afford an indication of the development of the Quantum Theory, on which latter, in 1914, he made a report to the Physical Society entitled *Radiation and the Quantum Theory*. But his most impressive work was that which he accomplished in the sphere of cosmogony, on which he pub., besides the essay above, *Astronomy and Cosmogony*, 1928. In this field his most striking achievement was his explanation, following Chamberlin and Moulton, of planets and their satellites as being due to tidal forces raised in a star by the close passage of another star. The completeness of these mathematical investigations destroyed the nebular hypothesis of Kant and Laplace. He also threw some light on the conjectural source of stellar radiations and energy. His popular expositions of science enjoyed phenomenal sales—less surprising in view of the attractive style of his treatises, the non-mathematical sections of which may be enjoyed even by the layman. These popular books also include J.'s contentious philosophical deductions from modern science. He stressed the part played by mathematics in science to a degree

scarcely equalled since Pythagoras. Other works: *Atomicity and Quanta*, 1926; *Eos, or the Wider Aspects of Cosmogony*, 1928; *The Mysterious Universe*, 1930; *The Universe Around Us*, 1930, *The New Background of Science*, 1933; *Science and Music*, 1937; *The Growth of Physical Science*, 1947.

Jebavý, Václav, Czech poet, writing as 'Otakar Březina' (1868-1929), b. Počátky, S. Bohemia. Vols. of poems: *Secret Distances*, 1895; *Dawning in the West*, 1896; *Polar Winds*, 1897; *Temple Builders*, 1899; *The Hands*, 1901. Essays: *The Music of the Springs*, 1903. Eng. trans. of his poetry have been made by Percy Paul Selver in *A Century of Czech and Slovak Poetry*, 1946, and *Otakar Březina*, 1921.

Jebb, Sir (Hubert Miles) Gladwyn (b. 1900), Brit. diplomat, educ. at Eton and Magdalen College, Oxford. He entered the diplomatic service in 1924; served in Teheran and Rome; was appointed counsellor in 1943, and as such attended the conferences of Quebec, Cairo, Teheran, Dumbarton Oaks, Yalta, San Francisco, and Potsdam. He played a prominent part in the estab. of U.N.O., and became popularly known during his term as U.K. permanent representative to the U.N. 1950-4. He was knighted in 1954 and became Brit. ambas. to France.

Jebb, Sir Richard Claverhouse (1841-1905), Scottish classical scholar and writer, b. Dundee. Educ. at Charterhouse and Trinity College, Cambridge. He was prof. of Greek at Glasgow Univ. from 1875 until 1889, when he was appointed regius prof. of Greek at Cambridge. J. was one of the founders of the Brit. School of Archaeology at Athens. In 1891 he became Unionist M.P. for Cambridge Univ. J.'s most outstanding works are his ed. of the commentary on *The Attic Orators from Antiphon to Isaeus*, 1876, and his ed. of the works of Sophocles with trans. and commentary in 7 vols. See Lady Caroline Jebb, *Life and Letters of Sir Richard Claverhouse Jebb*, 1907.

Jebel-al-Rahma, see ARAFAT.

Jebel al-Tur, see OLIVES, MOUNT OF.

Jebel Barkal, see BARKAL.

Jebel Druse, see DRUSES and SYRIA.

Jebel Musa, see SINAI: 1.

Jebel-Nur (mt of light), name given to Mt Hira, a hill a few m. from Mecca, because Mohammed received his first revelation there.

Jebel Shammar, Shummer, or Shomer, dist. of central Arabia in the N. of Nejd. It contains 2 granite ridges traversing it from E. to W., one of which is about 6000 ft high. The cap. is Hall. During the Arabian war much fighting took place in this dist., and in 1921 Hall was captured and the dist. annexed by Ibn Sa'ud. Pop. 150,000.

Jebel Tariq, see GIBRALTAR.

Jebusites, Canaanitish inhab. of Jebus, an earlier name for Jerusalem, until its citadel was captured by David (2 Sam. v. 7 f.).

Jecoonah, see JEHOLACHIN.

Jedburgh, royal burgh and co. tn of

Roxburghshire, Scotland, situated on Jed Water, 48 m. S.E. of Edinburgh. The name was originally Jedworth, and it is now known as Jethart. The tn is an old one and played a part in the Border wars. The abbey, dating from the 12th cent., was once the church attached to an Augustinian priory founded by David I and reduced by the English during the 16th cent. The old castle was destroyed in 1409, and on its site now stand the remains of a prison. The tn has associations with Mary Queen of Scots, Prince Charles Edward, Burns, and others. It is a woollen manufacturing centre, and has iron foundries. Pop. 4100.

Jedda, Jeddah, or Jiddah, prin. seaport of Hejaz, Arabia, situated on the Red Sea, between 50 and 60 m. W. by N. of Mecca, of which tn it is the port. Consequently the pilgrims bound for that city disembark here, a great number visiting it annually. It exports hides, mother-of-pearl, coffee, and carpets. A municipal council has been set up in the tn. The members are chief officials and persons who are nominated or approved by the King of Saudi Arabia. Subject to the royal approval, resolutions passed by the council become law. On 27 May 1927 Great Britain recognised the complete independence of the dominion of Ibn Saud, King of Hejaz, in a treaty signed at J. The Fr. Gov. raised its consulate at J. to the rank of a legation in 1929. Its example was followed by Great Britain, and Turkey and Holland are also represented, as well as the Soviet Gov. J. has an airport. Pop. about 80,000 or more.

Jedo, or Jeddo, see TOKYO.

Jeejeebhoy, Sir Jamssetjee, Bart (1783-1859), Indian merchant and philanthropist, b. Bombay. He gave hospitals, schools, colleges, and public works. In 1842 Queen Victoria bestowed a knighthood on him, and in 1858 a baronetcy, the first honours of their kind to be bestowed on an Indian. J. became the official leader of the Parsees in India.

Jefferies, Richard (1848-87), naturalist and novelist, b. Coote Farn, near Swindon, Wilts, son of a small farmer. He went to school at Sydenham, then at Swindon until he was about 15, but his most inspiring teachers were his father and a keeper on a neighbouring estate, who made him acquainted with the wonders of nature and taught him to use his powers of observation. Indeed it is said that he really owed his first work of any value, *The Gamekeeper at Home*, 1878, to what he had learned from his close friendship with the Burderop keeper, whom he used to help as a youth. He began life as a journalist on the staff of the *North Wilts Herald* of which he was editor during 1866-7. His letter to *The Times* (1872) on 'The Wiltshire Labourer' brought him into public notice and thereafter he wrote for the *Pall Mall Gazette*, in which appeared his *Gamekeeper at Home* and *Wild Life in a Southern County*, 1879, both afterwards repub. Both these works are full of minute observation and vivid description of country life. They were

followed by *The Amateur Poacher*, 1880, by some considered his best work, *Wood Magic*, 1881, *Round about a Great Estate*, 1881, *The Open Air*, 1885 (with a Brighton and Beachy Head background), and others on similar subjects. Among his novels are *Bevis*, 1882, in which he draws on his own childish memories and which has been described as the best boys' book in the language, and *After London, or Wild England*, 1885, a romance of the future when London has ceased to exist. *The Story of my Heart*, 1883, is an idealised

N.P.G.

RICHARD JEFFERIES  
Plaster cast from a bust by  
Margaret Thomas.

picture of his inner life. *Life of the Fields*, 1884, includes one of his best essays—'Clematis Lane.' Other works are *Hodge and his Masters*, 1880, *Nature near London*, 1883, and *Amarillis at the Fair*, 1887. J. d. after a painful illness, which lasted for 6 years. In his own line, that of depicting with an intimate knowledge of nature all the elements of country life and wild life, plant and animal, surviving in the face of modern civilisation, he has had few equals. *Fields and Hedgerow* was pub. after his death (1889). See lives by E. Thomas, 1909, C. J. Massee, 1913, A. F. Thom, 1920, and R. Arkell, 1933. See also S. J. Looker (ed.), *Jefferies' England*, 1937; M. Elwin, *The Essential Richard Jefferies*, 1948; S. J. Looker (ed.), *The Nature Diaries and Note-books of Richard Jefferies*, 1948.

**Jeffers, John Robinson** (1887- ), Amer. poet, b. Pittsburgh, Pennsylvania. After studying medicine at the univ. of S. California and forestry at the univ. of Washington, he settled near Carmel on the coast of California, where he lived in seclusion. The tragic and horrible are presented in his work with a kind of moral despair which has caused him to be reckoned one of the most powerful of modern Amer. poets. Of some 20 books of verse which he has pub. among the best known are *Tamar*, 1924, *Road Stallion*, 1925, *Candor*, 1928, *Thurso's Landing*, 1932, *Give Your Heart to the Hawks*, 1933, *Be Angry to the Sun*, 1941, *The Double Axe*, 1948, and *Hungerfield*, 1954. His *Selected Poetry* was pub. in 1938. See R. Gilbert, *Shine, Perishing Republic*, 1936, and study by L. C. Powell, 1940.

**Jefferson, Thomas** (1743-1826), third and one of the greatest presidents of the U.S.A., b. Shadwell, Albemarle co., Virginia, the son of a planter. He was of Welsh origin. A member of the second Continental Congress of the 13 Amer. colonies, he sprang into fame in America's pantheon by writing the Declaration of Independence, which was adopted with only a few slight changes. He was made governor of Virginia in 1779, and narrowly escaped capture by Tarleton. He succeeded Benjamin Franklin as the Amer. envoy to France, and later when Washington became President of the U.S.A. he made J. secretary of state. It was largely owing to J. that the cap. of the U.S.A. was estab. on the banks of the Potomac R., in what is now the city of Washington, and he himself was afterwards the first president inaugurated there. In 1796 Hamilton was the natural leader of the Federalist party, but John Adams was nominated for the presidency. J., as the leader of the Republican, which afterwards became the historic Democratic party, ran against him. Adams was elected president, and J. vice-president. In 1800 J. once more ran for the presidency with Aaron Burr as his party's candidate for vice-president. J.'s party won, but both J. and Burr had received an equal vote. J. however, was chosen by the House of Representatives on the advice of his old antagonist Hamilton. In 1804 J. was re-elected by an overwhelming majority. The greatest and most far-reaching act of his presidency was the Louisiana purchase, whereby the U.S.A. secured a vast ter. W. of the Mississippi R. some 1,171,931 sq. m. in extent. This purchase completely changed the future hist. of the U.S.A. It paved the way for continental expansion. It made the Mississippi entirely an Amer. owned riv. During J.'s term also the U.S.A. sent an expedition against the Tripoli pirates and stopped their raids, considerably reduced the national debt, and issued the famous embargo act prohibiting the sailing of Amer. vessels for foreign ports while the Brit. and Fr. navies were chasing each other on the high seas.

**J. was a statesman of compromises;**

for J. the philosopher, in the 18th-cent. sense, was rather a different man from J. as manager of his own large properties and as office-holder. Thus, while he hated slavery and tried to suppress the traffic he remained the owner of 200 Negroes; he was always suspicious of bankers, yet he turned to London for the funds needed for the Louisiana purchase; and he hated political chicanery, yet he must have been aware that a bargain was being struck between his supporters and those of Alexander Hamilton to obtain his election as president. Such compromises, however, are the price of political pre-eminence. Nevertheless the positive and outstanding achievements of J. were very great: in his own state of Virginia, the termination of feudal land tenure, separation of Church and State, the foundation of a programme of free education: in the U.S.A., the public land system, the Bill of Rights, and the Louisiana purchase—besides considerable contributions to the theory of checks and balances among the executive, legislative, and judicial branches of the federal constitution.

J. retired to his home, Monticello, in Virginia, and in his old age founded the univ. of Virginia near Charlottesville. A curious thing about J. is the epitaph he wrote for his own tomb. He, who had held so many high offices at the hands of his countrymen, wrote this: 'Here was buried Thomas Jefferson, author of the Declaration of American Independence, of the Statute of Virginia for Religious Freedom, and Father of the university of Virginia.' He d. on 4 July. A memorial tablet was unveiled to J. in 1933 at Glynceirog, N. Wales, of which vil. his father was a native. He made an important contribution to the revolutionary cause in *A Summary View of the Rights of British America*, 1774. See M. Beloff, *Thomas Jefferson and American Democracy*, 1948; J. Dewey, *Jefferson*, 1948; D. Malone, *Jefferson the Virginian*, 1948 (vol. I of a projected 4-vol. biography).

**Jefferson City**, cap. of Missouri, U.S.A., 110 m. W. of St. Louis. It is a railway centre and port on the Missouri R. in a grain and livestock area with zinc, lead, and clay deposits. It manufs. grain, wood, and dairy products, shoes, clothing, and bricks; there are also printing works. The Capitol, Missouri State Library, and Lincoln Univ. are here. Pop. 25,100.

**Jefferson River**, riv. of the U.S.A. It rises in SW. Montana and finally joins the Madison and Gallatin R.s. the 3 streams forming the Missouri. It is about 200 m. long.

**Jeffrey, Francis Jeffrey, Lord** (1773-1850), judge and critic, educ. at Edinburgh, Glasgow, and Oxford. Meeting for years with little success, either as lawyer or journalist, his opportunity came in 1802, with the founding of the *Edinburgh Review*. Sydney Smith (q.v.) was first editor, but when he removed to London in 1803 J. was placed in charge. Retaining control for 26 years, he raised the *Edinburgh* to the highest rank. In

1806 J. went to London, where he had his famous duel with Moore, so satirised by Byron. In 1830 he was made Lord Advocate, and entered Parliament. In 1834 he accepted a judgeship and a peerage. Among his critical works are *Samuel Richardson*, 1853, and *Jonathan Swift*, 1853. See life by R. Bald, 1925.

**Jeffrey, William** (1896-1946), poet, b. Kirk o' Shotts, Lanarkshire. After studying at Glasgow Univ. he served in France with the artillery in the First World War. In 1920 he took up journalism and became a leader writer and dramatic critic on the *Glasgow Herald*. His poetry has a mystical vein reminiscent of Blake, and marked him as one of the leaders of the modern Scottish Renaissance. The best known of his works are *Prometheus Returns*, 1921, *The Wise Men Come to Town*, 1923, *The Lamb of Lomond*, 1926, *Mountain Songs*, 1928, *The Golden Stag*, 1932, *Eagle of Coruisk*, 1933, and *Sea Glimmer*, 1947. *Selected Poems* with a memoir appeared in 1951.

**Jeffreys of Wem, George Jeffreys, Lord** (1648-89), Lord High Chancellor of England, b. Acton, Denbighshire. In 1668 he was called to the Bar, and in 1683 became Lord Chief Justice. As the records of J.'s life are derived from hostile sources his reputation for injustice and cruelty must be accepted with some reserve. His conduct of the trial of Algernon Sidney is considered to have been fair in general. The action for which J. is most notorious is his presidency of the Bloody Assize (1685), whereby over 300 victims were drawn and quartered, and 1000 sent as slaves to the W. Indian plantations. In opposition to the Long Parliament the Court of High Commission was revived and J. placed at its head (1686). In 1688 J. was the king's chief instrument in securing the commitment to the Tower of the 7 bishops. But the fall of James II drew in its train the fall of J.; he fled, was arrested, and d. miserably in the Tower. See Sir E. A. Parry, *The Bloody Assize*, 1929; S. Schofield, *Jeffreys of the Bloody Assizes*, 1937; H. Montgomery Hyde, *Judge Jeffreys*, 1948.

**Jeffries, Ellis** (1872-1943), Eng. actress, b. Colombo, Ceylon. Associated with Cyril Maude at the Haymarket, where one of her greatest successes was in W. H. Davies's comedy *Cousin Kate*. She began her career at 17 in the chorus of the Savoy Opera and played in pantomime and light opera. She then took part in comedy with Charles Wyndham, with John Hare at the Garrick, in America in *The Notorious Mrs Ebbels*, and at the Duke of York's in *The Marriage of Kitty*. Tall, graceful, with a clear, incisive utterance, she was a true comedienne. Began a film career in 1930, appearing in *Eliza Comes to Stay*, *The Return of a Stranger*, and other films. Her son is well known on the stage as George Curzon.

**Jeffries, George** (d. c. 1685), Eng. musical composer, a member of the Chapel Royal, and organist to Charles I at Oxford, 1643, during the Civil war. He wrote anthems, services, over 120 motets,

and other church music, also music for masques and plays, secular songs, etc., and 'fancies' for strings and for the virginals.

**Jeffries, Matthew**, fl. 16th and 17th cents., Eng. composer of church music and vicar-choral at Wells Cathedral.

**Jegni Pangola**, see TOMI.

**Jehangir, or Salim Nureddin Mohammed**, see JAHANGIR.

**Jehoshaphat**, see JOASH.

**Jehoiachin, or Jeconiah**, King of Judah, succeeded his father, Jehoiakim, in 598 BC. He reigned 3 months, being dethroned by Nebuchadnezzar and carried captive to Babylon. But 37 years later Evil-Merodach released him, and maintained him for the rest of his life (2 Kings xxiv. 6-16; xxv. 27).

**Jehoiada**, high priest under Ahaziah, Athaliah, and Joash (between 841 and 797 BC). When Athaliah, mother of Ahaziah, sought to destroy all the seed royal, J. hid Joash, the young son of Ahaziah, in the temple, and subsequently anointed him king while the guard slew Athaliah, the usurping queen, on his instructions. J. then destroyed the house of Baal, set up a public fund for repairing the temple, and restored it (2 Kings xi, xii; 2 Chron. xxiii. xxiv).

**Jehoiakim, or Eliakim**, King of Judah (608-598 BC), was put on the throne by Pharaoh-nechoh. But Nebuchadnezzar, King of Babylon, sacked Jerusalem, and J. became his vassal for 3 years (c. 605-602 BC) when he revolted. Jerusalem was sacked and the king slain (2 Kings xxiii. 34 ff., xxiv. 1-5; 2 Chron. xxxvi. 4-8).

**Jehol**, formerly a prov. of China, now part of the Inner Mongolian Autonomous Region. J. was formerly inhabited by the Mongolian leagues of Josoto in the S. and Jooda in the N. See MONGOLIA.

**Jehoshaphat** (c. 873-849 BC), King of Judah, succeeded his father Asa, and began as an able and wise ruler, rooting out idolatry and building strongholds throughout the land. But his prosperity ended when he married Athaliah, daughter of Ahab, King of Israel. Ahab, seduced by false prophets, and against the warning of Micaiah, attacked Ramoth Gilead and persuaded J. to join him. Ahab was mortally wounded, and J. just escaped with his life. J. campaigned successfully against Moab and Ammon, but was killed (after Joram) by the rebel Jehu (1 Kings xv. 24; 2 Kings iii. 9; 2 Chron. xvii-xx).

**Jehoshaphat**, Valley of, mentioned only in Joel iii. 2 as a place where God will judge the enemies of His people, and sometimes identified with the valley of Berachah where Jehoshaphat conquered Ammon and Moab (2 Chron. xx. 26), but more probably with part of the Kidron valley between the Mt of Olives and the Mt of the Temple. Among Muslims and Jews, as well as Christians, it has been thought to be the site of the Last Judgment.

**Jehovah**. It is now felt that there is no authority for such a pronunciation of the name of God, which is founded on a misapprehension. The original word, known

as the Tetragrammaton, consists of the letters JHVH, or better, YHWH. This name came to be considered too ineffable to pronounce, and hence the vowels of the word *Adonai* (lord) were inserted, as a direction to the reader to replace it by this word. Thus we have the form YeHo-WaH, of JeHoVaH—short *e* taking the place of short *a*. If the Tetragrammaton is preceded by the word *Adonai*, the vowels of *Elohim* (God) are inserted, giving the form YeHoWiH. There has been much controversy both as to the original form of the word and also as to its origin and meaning. The early theory is now almost abandoned, there being general agreement in the acceptance of Ewald's suggestion that the true form is Yahweh. The forms Yahu and Yah also occur, both separately and as a component part in proper names. The question as to the origin of the title is more difficult. Exodus iii. 13 and vi. 3 imply that it was first revealed to Moses, but it had already been used earlier (e.g. Gen. iv. 26). The use of the name, indeed, formed the chief means by which the composite authorship of Genesis was discovered (see HEXATEUCH). The meaning is given in Exodus iii. 14, by God himself, as 'I am that I am,' and later simply 'I am,' and according to this interpretation, which is generally accepted, the word is the third person singular imperfect of the archaic stem HWH (to be). Many scholars, however, have regarded the idea as too abstract for so early a period, and have sought for a more concrete explanation.

**Jehovah's Witnesses**, unorthodox religious society of strong Adventist views. It was founded by Charles Taze ('Pastor') Russell in 1884 (incorporated in the state of Pennsylvania) as the Watch Tower Bible and Tract Society, and has been known as J. W. since 1939. The central organisation of the society is the Watch Tower Bible and Tract Society, and the International Bible Students' Association is their organisation for foreign work. See studies by J. W. Royston Pike, 1945, H. W. Stroup, 1954, and H. Thurston, 1955.

**Jehu**, son of Jehoshaphat, son of Nimshi, was general under Jehoram. During the latter's illness at Jezreel he seized the throne, and secured it by wholesale slaughter of the house of Ahab (2 Kings ix. f.), as foretold by Elijah. Elisha supported him. J. is mentioned in a tablet of Shalmaneser III (842 BC) as paying tribute to Assyria. He was noted for his reckless driving (2 Kings ix. 20).

**Jejunum**, meaning empty, one of the 3 arbitrary divs. of the small intestine (q.v.). It is about 1½ in. wide, and about 8 to 9 ft in length, and is the connecting portion lying between the duodenum and the ileum. In general, its structure resembles that of the duodenum.

**Jelalabad**, see JALALABAD.

**Jelenia Gora** (Gor. Hirschberg), tn of Poland, in Wroclaw prov., on the Bobrawa at the foot of the Riesenbirge (q.v.), 60 m. WSW. of Wroclaw (q.v.). In the 14th cent. it belonged to Bohemia, and it

passed to Prussia in 1741. It is a textile centre, and has manufs. of chemicals and optical lenses. Pop. 42,000.

**Jelgava** (formerly Ger. Mitau; Russian Mitava), tn in Latvia, 25 m. SW. of Riga. There are textile and sugar industries. Pop. (1935) 34,000. Founded 1226 by Livonian knights; from 1561 cap. of Kurland (q.v.); 1795-1920 Russian.

**Jellachich**, Joseph, Baron von (1801-59), Austrian general and administrator, b. Peterwardein. He gained the confidence of the Croats, and was appointed Ban of Croatia (1848). He took the chief part in suppressing the Hungarian rising (1848-9), and commanded his troops against Montenegro (1853).

**Jellicoe**, John Rushworth Jellicoe, 1st Earl (1859-1935), admiral, b. Southampton; younger son of Capt. John H. J., commodore of the Royal Mail Steam Packet Co.; and great-grandson of Adm.

E.N.A.

LORD JELICOE

Patton, Second Sea Lord at the time of the battle of Trafalgar. After some schooling at Rottingdean, J. passed the preliminary examination for the navy at the age of 12 and entered the training-ship *Britannia*. Became sub-lieutenant, 1878; lieutenant, 1880, with 3 first-class certificates. In 1881 he was appointed to H.M.S. *Agincourt*; he was present at the bombardment of Alexandria, July 1882; and he accompanied the naval brigade that marched with Wolseley to Cairo and fought at Tel-el-Kebir. His next ship was H.M.S. *Monarch*: from her, in May 1886, J. performed a life-saving feat for which he received the Board of Trade

medal. He was for a while gunnery-lieutenant in H.M.S. *Colossus*; then junior staff-officer in H.M.S. *Excellent*; then first lieutenant in H.M.S. *Sans Pareil*. He was for 3 years assistant to Capt. (afterwards Lord) Fisher, director of naval ordnance. J. became commander in 1891, and was on board H.M.S. *Victoria* when she went down in the Mediterranean, 22 June 1893. He next served in H.M.S. *Ramillies*; then, becoming captain in Jan. 1897, he became flag-captain in H.M.S. *Centurion*, and was chief of staff to Vice-Adm. Sir E. Seymour during the attempted relief of the Peking legations, 1900: severely wounded at Peltang. He was naval assistant to the controller of the navy, 1902-3, and was then appointed to command of H.M.S. *Drake*. Director of Naval Ordnance, 1905-7, he greatly improved the shooting abilities of the navy. He was made rear-admiral, Feb., and K.C.V.O., Aug., 1907; was rear-admiral in Atlantic Fleet, 1907-8; lord commissioner of the Admiralty, Third Sea Lord, and controller of the navy, 1908-10; vice-admiral, 1910; in command of the Atlantic Fleet, 1910-1911. He commanded the 2nd Div. Home Fleet, 1911-12; and was Second Sea Lord, 1912-14. In 1913, for a while, he left his shore duties to command the 'Red' fleet in manœuvres. On the outbreak of the First World War, J. was given command of the Grand Fleet. He became full admiral, Mar. 1915; and thenceforward till near the end of 1916 the fleet's hist. is his—especially the battle of Jutland, 31 May 1916, wherein his flag flew in H.M.S. *Iron Duke*. At the end of Nov. 1916 J. was made First Sea Lord, and relinquished command of the fleet to Sir David Beatty. He became chief of the naval staff, 1917. J. suddenly ceased to be First Sea Lord at the end of that year, being succeeded by Sir Rosslyn Wemyss. No official explanation was given of the abrupt dismissal. He was elevated to the peerage as Viscount J. of Scapa and, later, received the thanks of Parliament together with a grant of £50,000. After the armistice he toured the dominions in H.M.S. *New Zealand*, to prepare for reorganisation of empire navies. Governor of New Zealand, 1920-3. He retired from the service in 1924, and in 1925 was created Earl J. and Viscount Brocas of Southampton. He pub. *The Grand Fleet, 1914-16, its Creation, Development, and Work*, 1919, *The Crisis of the Naval War, 1920* (which narrates the chief features of his work in the critical year of 1917), *The Submarine Peril, 1934* (on the peril of 1917 and its lessons for the future). See life by R. H. S. Bacon, 1936.

**Jellinge**, see VIKING ART.

**Jelly**, solid state of matter produced by the addition to a liquid of some colloid substance, e.g. gelatine. A distinguishing feature of J. is its elasticity. J.s are much used as an article of food, and are eaten as sweets or savouries. The best J. is made from calves' feet. Ox-foot J. is also an excellent dish for invalids. Gelatine is much used in the manuf. of sweetmeats, e.g. in gums and pastilles. Of vegetable

J.s agar-agar is well known, and is useful as a medium in bacteriology. Of the inorganic J.s that produced from a solution of silicic acid is best known. See JAM and PRESERVING.

**Jelly-fish**, bell-shaped or disk-shaped marine hydrozoa, embracing Scyphomedusae, Trachylina, Ctenophora, and

JELLY-FISH

Siphonophora, in all of which the body is shaped like a bell or a parachute. The body is bordered by a fringe of writhing tentacles. The J. normally swims with its subumbrellar surface downwards. The distinguishing feature of the J. is the mesogloea, a diaphanous and gelatinous secretion layer, situated between the ectoderm and the endoderm, and developed in great quantity. On the subumbrellar surface is the mouth, generally bordered by lips which bear stinging threads. The muscular system is arranged in a circular formation on the under surface of the umbrella. The muscles contract and the water is thereby pumped from the subumbrella, and the animal is jerked upward. This is the only means of locomotion. The J. seize their prey by their tentacles; the victim becomes paralysed and is drawn into the mouth. The Ctenophora are a species of J. which have both radial and bilateral symmetry. They are bell-shaped, the mouth being situated at the broader end. They have 8 meridians of iridescent paddles. Locomotion is effected by strokes of the paddle.

**Jemappes**, industrial tn in the prov. of Hainaut, Belgium, 3 m. W. of Mons. Here the Fr. Revolutionary army under Dumouriez defeated the Austrians and became masters of Belgium (1792). There are rich coal mines, glass, porcelain, crystal, iron, and chemical works. Pop. 13,100.

**Jemeppe**, tn in Belgium, 5 m. SW. of the city of Liège, on the R. Meuse. It has coal-mines, freestone and marble quarries. Its chief industries are iron, glass, and cokes. Pop. 13,300.

**Jena**, Ger. city in the dist. of Gera, on the Saale, 23 m. W. by N. of Gera (q.v.). On 14 Oct. 1806 Napoleon I (q.v.) won 2 great victories over the Prussians on the N. outskirts of the city. In the Second World War the city was taken by the Amer. Third Army in April 1945. The univ. of J., founded in 1558, attained fame in the 18th cent. when Hegel, Schiller, Fichte, Schelling, and Schlegel (qq.v.) were connected with it. The city has also associations with Goethe (q.v.). There is a Gothic Rathaus, and a fine 15th-16th-cent. church. The well-known optical works of J. were founded by Carl Zeiss in 1846; there are also engineering, publishing, and chemical industries. Pop. 80,000.

**Jenghiz Khan**, see GENGHIS and MONGOLS.

**Jenkin, Henry Charles Fleeming** (1833-1885), engineer. In 1859 he with Lord Kelvin made experiments in the manuf. and use of cables. His researches on gutta-percha were of the utmost value. He was elected F.R.S., and was appointed prof. of engineering at Univ. College, London, in 1865, and at Edinburgh Univ. in 1868. He pub. a valuable text-book on *Magnetism and Electricity*, 1873, and invented 'telpherage,' an electric automatic system for transporting goods. See R. L. Stevenson's essays, *Talk and Talkers* (Jenkin is 'Cockshot').

**Jenkins, Robert** (fl. 1731), Eng. sea-captain. He appeared before the House of Commons with one of his ears in cotton, alleging that the Spaniards had boarded his vessel off Havana in 1731, accused him of smuggling, and cut off his ear. This provoked war between England and Spain (1739) and led to Walpole's downfall (1742).

**Jenkinson, Anthony** (d. 1611), Eng. merchant and sea-captain. He visited Asia Minor and N. Africa (1546), and in 1557 was appointed agent of the Muscovy Co. He travelled to Bokhara (1558-9), and was commissioned to trade with Persia. By his efforts his company obtained the monopoly of the White Sea trade. See *Early Voyages and Travels in Russia and Persia* (Hakluyt Society, 1886), and biographical introduction by E. D. Morgan.

**Jenkinson, Robert Banks**, see LIVERPOOL, 2ND EARL OF.

**Jenné**, tn, an important centre of commerce in Upper Senegal (Fr.), on the R. Niger, 250 m. SSW. of Timbuktu. Once the cap. of the Songhai empire.

**Jenner, Edward** (1749-1823), physician and originator of vaccination, b. Berkeley, Glos. He was educ. for the medical profession; in 1770 he became a pupil of John Hunter, with whom he remained 2 years. He returned to practice in Berkeley. J. never passed a medical examination, such examinations not being compulsory in his time. He bought the degree of Doctor of Medicine from a Scottish univ. and later applied to Oxford Univ. for an honorary degree of M.D. and received it. He took great interest in the natural hist. of his dist. and he founded a local medical

association. As a child J. had himself suffered the risk associated with the inoculation of smallpox matter, and from his apprenticeship days with Hunter he was curious about the popular belief in Glos. that persons who contracted cowpox were thenceforth immune from smallpox. J. reasoned that if it were possible to transmit the cowpox virus from one individual to another (by inoculating persons successively by the arm-to-arm method) the result would be an available source of cowpox lymph which would be independent of the existence or otherwise of the natural disease in cows at any given

EDWARD JENNER

After a print engraved and coloured by I. R. Smith.

time. If this could be done, he saw that another difficulty might arise: after transmission through many individuals the virus might lose its immunising power. In 1778 J. began collecting material to confirm his conviction concerning cowpox as a protective virus and set out to investigate the above 2 propositions. After a number of experiments he pub. his results in his celebrated *Inquiry into the Causes and Effects of the Variolae Vaccinae*, 1778. J. believed that efficiently performed vaccination carried out with lymph taken at the right stage of the pox would give complete and permanent protection against smallpox, a view he maintained all his life. This was unfortunate because it was not true, though those who did contract smallpox suffered only from mild attacks. After him no one else attempted to extend the province of artificial immunity until Pasteur in 1880 introduced the inoculation of fowls for fowl cholera. All modern methods of preventing certain infectious diseases by immunological

methods trace their ancestry back ultimately to the substitution by J. in 1798 of vaccination—which became an estab. fact by 1800. Attempting in 1798 to introduce a system of vaccination in London, he met with great opposition, but nevertheless secured a hearing from many influential persons, including the royal family. Vaccination spread through England and other countries with such good results that in 1802 Parliament voted J. a grant of £10,000 (and in 1807 another of £20,000), and on the Continent he was elected a member of most of the great scientific societies. See lives by J. Baron (2nd ed.), 1850, and F. D. G. Drewitt, 1933.

**Jenner, Sir William, Bart** (1815–98), physician, b. Chatham, educ. at Univ. College, London. In 1844 he became M.D., and in 1847 began a course of investigation by which he eventually proved the distinction between typhus and typhoid. He became prof. of medicine at Univ. College, physician to sev. great hospitals, and medical adviser to the royal family, attending the Prince of Wales in his attack of typhoid. Receiving a baronetcy in 1868, he was in 1881 elected president of the College of Physicians. Rather autocratic in manner, but kind and considerate, he was in such request as a consultant that he left a fortune of £375,000. His writings include important works on fever and diphtheria.

**Jennings, Sarah**, see MARLBOROUGH.

**Jenolan Caves**, beautiful stalactite caves situated on the W. side of the Blue Mts, 113 m. W. of Sydney, New S. Wales.

**Jensen, Johannes Vilhelm** (1873–1950), Dan. novelist, poet, and essayist, b. Farsø. He studied philosophy and medicine at Viborg. He travelled extensively, and many of his books and stories are based on his journeys. He excelled in his descriptions of nature and scenery, both of his own native land and abroad. His most important works are *Himmerlands Historier*, 1898–1910, *Kongens Fald* (hist. novel of 16th cent.), 1899–1902, *Madame d'Ors*, 1904, *Skovene*, 1904, *Eksotiske Noveller*, 1907–25, and a series of 6 novels together called *Den lange Rejse*, and descriptive of the progress of the Nordic race throughout the ages. Other pubs.: *Det Blivende*, 1934; *Dr. Renaults Fisteiser*, 1935; *Gudrun*, 1936; *Darduse* (play), 1937; and numerous short stories. Awarded Nobel prize, 1944. See O. Gelsted, *J. V. Jensen*, 1938; A. Henriques, *J. V. Jensen*, 1938; L. Nedergaard, *J. V. Jensen*, 1943.

**Jenson, Nicolas**, or Nicol (c. 1420–80), b. Sommevoire, near Bar-sur-Aube, Master of the Mint at Tours or perhaps Paris during the reign of Charles VII, thought by some to be a Walloon by descent. The king, hearing of Gutenberg's printing experiments, sent J. to Mainz in 1458 to obtain Gutenberg's secret. Leaving Mainz J. went to Italy, eventually settling in Venice. It is believed, however, that in the years 1462–70 he was associated with Sweeneyheim and Pannartz, 2 Ger. printers who had estab. themselves in the Benedictine monastery at Subiaco near Rome.

At all events, he began printing at Venice about the year 1470, and there designed a roman type of much beauty and merit that has been classic to the present time. He is mentioned in the *Cologne Chronicle* of 1499 as a printer to whom some had erroneously given credit of being the first inventor of the art. Extant portraits of him appear to be imaginary. See M. W. Haynes, *The Student's History of Printing*, 1930.

**Jephthah**, an illegitimate child of Gilead (Judges xi. 1 ff.), was driven out by his brethren and became leader of a band of freebooters, until recalled by the elders of Gilead to lead them against the Ammonites. He refused to come unless he was afterwards made their judge, and this was promised. He collected a large army and vowed that if successful he would offer as a burnt-offering to God the first thing that came forth from his doors on his return. This rash and ignorant vow led him to sacrifice his daughter, allowing her first 2 months to bewail her virginity. J. later turned on the Ephraimites who affronted him, trapping them as they fled at a ford of the Jordan, and detecting them by their inability to pronounce 'Shibboleth' properly (q.v.). See Fernandez, 'Jephthé' (*Verbum Domini* i.), 1921; A. Van Hoonacker, *Le Voeu de Jephthé*, 1903; C. F. Burney, *Judges*, 1922.

**Jeppesen, Knud** (1892– ), Dan. musicologist and composer, a pupil of Carl Nielsen. He occupies an eminent position in Dan. musical life as composer, educator, and musicologist. After taking his musical degree, he continued his studies in Vienna with Guido Adler and Robert Lach, obtaining his doctorate of philosophy with a detailed study of Palestrina's harmonic system, pub. in Danish, German, and English. As administrator and lecturer J. has held high posts at Copenhagen Conservatoire and Copenhagen and Aarhus Univs. He has written many works on music and ed. *Acta musicologica*, a quarterly concerned with musical science. He is not prolific as a composer. His 'Te Deum Danicum' is probably his finest work.

**Jepson, Edgar Alfred** (1863–1938), novelist, b. Kenilworth, Warwickshire. Educ. at Leamington College and Oxford, he worked as a schoolmaster first at Newport, Monmouthshire, and then at Harrison College, Barbados. Returning to London in 1894 he became editor of *Vanity Fair*, and wrote a great number of romances of adventure, including *Sibyl Falcon*, 1895, *The Keepers of the People*, 1898, *The Girl's Head*, 1910, *The Gillingham Rubies*, 1915, *The Loudwater Mystery*, 1919, *The Whiskered Footman*, 1922, *The Tragedies of Mr Pip*, 1926, and *The Moon Gods*, 1930. He also pub. some delightful stories about children, including *The Admirable Tinker*, 1904, *The Lady Noggs*, *Peerness*, 1906, and *Pollyooly*, 1911. *Memoires of a Victorian*, 1933, and *Memoires of an Edwardian*, 1937, are autobiographical.

**Jerabius**, see CARCHEMISH.

**Jerahsh**, see GERASA.

**Jerba**, or **Girba** (anot **Meninx**), is. of

Tunisia in the Gulf of Gabes, off Africa, has an area of 425 sq. m. It is separated from the mainland by a fordable channel formerly crossed by a Rom. viaduct. There are many Rom. remains, including a triumphal arch and 2 castles. It is very fertile; olives, dates, and oranges grow there. The inhab. are occupied in sponge fishing. The chief tn is Haumt-es-Suk. Pop. of tn about 3000; of is. 35,000.

JERBOA

Jerboa, name popularly given to members of the Dipodidae, a family of rodents remarkable for their powers of leaping. They are terrestrial animals, inhabiting the sandy or grassy plains in Asia, E. Europe, and N. Africa. *Dipus*, the typical genus, is from 6 to 8 in. in length, with a long tail and naked ears; the fore-limbs are very short and have 5 fingers, while the curiously elongated hind-limbs have only 3 toes. It is by means of these enormous legs that they are able to leap when in danger, but when undisturbed they walk on them in an ordinary way. The J.s are also burrowing animals, using their strong incisors for that purpose; their habits are nocturnal, and they feed on roots, seeds, insects, birds' eggs, etc., and occasionally do great damage to grain-crops. They are sometimes eaten by the Arabs. *D. hirtipes* is a well-known species; *Alactaga* is common on the Siberian steppes, *A. jaculus* being known as the jumping rabbit. *Platycomys* is distinguished by a flattened, lancet-shaped tail; *Zapus* is the so-called jumping-mouse of the U.S.A., and the genus *Sminthus*, whose legs are short and nearly equal, may be regarded as approaching most nearly to ancestral form.

Jeremiah, the great prophet, son of Hilkiah, whom some have identified with the Hilkiah mentioned in 2 Kings xxii, belonged to a priestly family of Anathoth, which he later quitted for Jerusalem. His call (ch. i) took place in the thirteenth year of Josiah (c. 627 bc). Five years later occurred the famous discovery of the Book of the Law, which led to

Josiah's great reform. In this J. does not figure at all, though he was no doubt in full sympathy with it. Some, however, have interpreted Jer. viii. 8 as showing that he was not. He was perhaps connected with a high-place at Anathoth, and might well have been disturbed at the displacement of his family by the reformer (cf. Buchanan Gray, *Sacrifice and Priesthood*). In any case it was not long before the prophet began to feel that no great or deep reformation could be carried out by the secular arm, and he took up the individualistic attitude which marks him off from the other prophets. His prophecies spread over the reigns of Jehoahaz, Jehoiakim, Jeconiah, Zedekiah, and part of the period of exile. The book of J. is interspersed with accounts of historical incidents, and the life of J. himself, added by a later hand, is tender and sad throughout. The prophet insists that the spiritual well-being of the chosen people is not bound up with their prosperity as a nation, and that only through defeat and oppression can the remnant be saved. He insists on the necessity of a spiritual religion and that the possession of the temple will not secure them from defeat. The Lachish Ostraca found in 1935 at Tell ed-Duweir belong to Zedekiah's last years and refer to a prophet who may be J. For the defeatism and, as was thought, lack of patriotism shown in his prophecies, J. was extremely unpopular and had to submit to much persecution. His book, which he had prepared with the aid of his friend Baruch, was torn and burnt, and he suffered frequent imprisonment in the most cruel conditions. After the capture of the city he was allowed to stay where he wished, and attached himself to Gedaliah, a Jewish prince who became the Babylonian governor. On the assassination of Gedaliah, he was forced to retire to Egypt, where tradition says that he met his death by stoning at the city of Tahpanes. See L. Elliott-Binns, 1919; G. A. Smith, 1929; H. H. Rowley, 1948; D. Winton Thomas, *The Prophet in the Lachish Ostraca*, 1946.

Jérémie, seaport on NW. of Tiburón peninsula, Haiti, 119 m. W. of Port-au-Prince. It has an important trade in cocoa, coffee, and log-wood. The father of the elder Dumas (q.v.) was b. here. Its airport was most useful as a centre for bringing aid when the city was razed to the ground by the hurricane of Oct. 1954. Pop. 11,000.

Jerez de la Frontera (formerly Xeres, anct Ceret), Sp. tn in the prov. of Cádiz, lying in a vine-covered plain 12 m. NE. of Cádiz city. It is chiefly famous for the wine, sherry (q.v.), to which it has given its name. The numerous white wine-lobes (*bodegas*) are a feature of the tn. There are Moorish remains, fine churches, and many interesting mansions. Pop. 102,000.

Jerez de los Caballeros, Sp. tn in the prov. of Badajoz, with anct walls and a Templars' castle. It is the centre of an agric. dist., and herds of swine and mules are kept. Pop. 16,000.

**Jerfalcon, Gerfalcon, Gyrfalcon,** or *Falco rusticolus*, name of a species of falcon (q.v.) belonging to the Falconidae: it is found in W. Russia, Scandinavia, Iceland, Greenland, and Arctic America, and its colour varies from grey to white.

**Jerishau, Jens Adolf** (1816-83), Dan. sculptor, was a pupil of Thorwaldsen. He was commissioned to carve a frieze for the royal palace of Christiansborg, near Copenhagen, and this piece of work, which was finely executed, estab. him in high repute. Among his best classical studies are 'Heracles and Hebe,' 'Penelope,' and the 'Wedding of Alexander.' His

parts of the old city of J., and their evidence, including the traces of destruction and of fire, seemed to corroborate the biblical story. Further investigation in 1920 showed that the stone rampart was of the Middle Bronze Age (c. 1800 bc), but the date of the inner wall was left to be estab. by Sir Charles Marston's expedition under Dr John Garstang, prof. of archaeology at Liverpool Univ., which proved that the inner wall belonged mainly to the Late Bronze Age, the period of Joshua. Cuttings made by Dr Garstang, in June 1930, in the mound of old J.—the ruins of the walls are situated near

IN THE WINE CELLARS OF JEREZ DE LA FRONTERA

religious subjects include 'The Resurrection,' 'Adam and Eve,' and a figure of Christ. J. also made a portrait statue of Oersted.

**Jericho**, once an important city of Palestine, in the Jordan Valley, 15 m. NE. of Jerusalem. The site of the old city was in the midst of a fertile dist. where palms, rose trees, raisins, and balsams grew in profusion. According to the Bible narrative and other accepted authorities, the tn was captured by the Israelites on their entry into Canaan, re-fortified by Hiel the Bethelite, destroyed under Vespasian, and rebuilt under Hadrian. Antony is said to have given its groves to Cleopatra, and Herod the Great dwelt there. In anct times J. held a fairly important position strategically, dominating the chief trade routes of antiquity from Jerusalem towards the E. But it was too isolated to be able to rely in an emergency on the help of friendly cities, and consequently it was, from a very remote age, surrounded by defensive walls: and both hist. and archaeology agree that the city was frequently destroyed. Early in this cent., Ger. excavators discovered the defensive ram-

the modern vil. El Riha (Arabic form of J.), on a low mound at the foot of the W. plateau—revealed that the fortifications of J. represent an almost continuous occupation, twice broken by invasion between 2000 and 1600 bc; at which latter date the walls were reconstructed upon the brink of the mound, and these in their turn perished in some conflagration. The W. side of the defences showed continuous signs of destruction and conflagration, the outer rampart (which is 6 ft thick) suffering most, its remains falling down the slope. The most arresting fact disclosed by Dr Garstang is the traces of intense fire 'including reddened masses of brick, cracked stones, charred timbers, and ashes. Houses alongside the wall are found burned to the ground, their roofs fallen upon the domestic pottery within.' All these facts give strong support to the Bible narrative, making it probable that the fallen walls of the Late Bronze Age are actually those of the city which is said to have been taken and burnt by the Israelites under Joshua. More recent excavations, directed by Miss K. Kenyon of the Brit. School of Archaeology in Jerusalem, and not yet completed,

promise to contribute greatly to knowledge of the origins of civilisation. Evidence collected seems to prove the existence of civilisation in J. 3000 years before the beginnings of Egypt and Sumer. Neolithic fortifications indicate the existence of enemies with similar standards. See Sir Charles Marston, *New Knowledge about the Old Testament*, 1933, and *Palestine Exploration Quarterly*, 1956.

**Jericho**, *Rose* of, or *Anastatica hierochuntina*, ann. species of Cruciferae, which also alone forms a genus. It is native to Syria and the Middle E. See RESURRECTION PLANTS.

**Jeritza, Maria** (1887- ), Czech soprano, b. Brno. She studied piano, violin, cello, and harp, cultivated her voice when she was 14 under Auspitzer of Brno, and made her debut as Elsa in *Lohengrin* at Olomouc in 1910. She was a member of the Imperial Opera in Vienna in 1913 and of the Metropolitan Opera, New York, in 1925, and in 1935 she received the Order for Meritorious Service. An Eng. trans. of her reminiscences, entitled *Sunlight and Song*, appeared in 1924.

**Jeroboam I**, son of Nebat, was the first King of Israel (931-910 BC) after its separation from Judah on the death of Solomon. As Solomon's tax-gatherer in his own dist. of Ephraim he was suspected of treason and made a hasty flight into Egypt. On Solomon's death he returned and led the deputation to Rehoboam, asking for a lightening of taxation. On the young king's refusal, he led the revolt of the 10 tribes, and became their king (see ISRAEL). His erection of golden calves for worship at Bethel and Dan led to his name becoming a byword in later days as having 'made Israel to sin.'

**Jeroboam II**, reigned c. 787-747 BC, son of Joash, fourth king of the dynasty of Jehu, and perhaps the greatest of N. Israelite kings. His reign was long and prosperous, an Indian summer during the temporary decline of Syria and the preoccupation of Assyria elsewhere. This led to moral and religious decay, as worldly goods so often do, and Amos and Hosea prophesied warnings of judgment upon the faithless nation.

**Jerome**, St (Sophronius Eusebius Hieronymus), b. of Christian parents in Stridon on the borders of Dalmatia and Pannonia, between 331 and 340. At about the age of 20 he was sent to Rome, where he studied the classical authors under Aelius Donatus and was baptised by Pope Liberius. He continued his studies at Trier and later at Aquileia, where he first studied theology. He then began a tour of the E., arriving at Antioch in the year 373, where, after a severe illness, he retired for 4 years to the desert, spending his time in penance and study, especially of Hebrew. In 379 he was ordained priest at Antioch, and went to Constantinople. In 382 he visited Rome on ecclcs. business, began his work on the Bible, and he met Marcella, Paula, and other noble ladies, who returned with him in 386 to Bethlehem. His writings against the Pelagians placed his life in jeopardy, and in 416 he

had to flee from his retreat, to die 4 years later. J.'s best-known work is his Lat. version of the Bible, the Vulgate, ever since in use throughout the Rom. Church. His classic, however, is the *De Viris Illustribus* (continued by Isidore of Seville, Ildelfonso, Sigebert of Gembloux, etc.), the most important work of its kind in the early Middle Ages, from which, with the *History of the Church* and the *Chronicon* of Eusebius, local chroniclers drew most of their facts and ideas. See his complete works ed. by the Benedictines (5 vols. folio), Paris, 1693-1706, D. Vallarsi (11 vols.), Verona, 1734-42, and Herding, 1879; also lives by F. Collombet, 1844; E. L. Cutts, 1878; F. W. Farrar in *Lives of the Fathers*, 1889; F. Bulic, 1919-22; F. Cavallera, 1922; A. Largent, 1922.

**Jerome, Jerome Klapka** (1859-1927), novelist and playwright, b. Walsall, Staffs., son of a lay preacher. The family moved to Poplar, and young J. was educ. at Marylebone Grammar School, afterwards becoming a railway clerk at Euston station. He was at different times reporter and schoolmaster, and also tried the stage, of which he wrote in *On the Stage—and Off*, 1885. In 1889 he became celebrated through *Idle Thoughts of an Idle Fellow* and his most famous book, *Three Men in a Boat*, which sold a million (pirated) copies in America. It was followed by *Three Men on the Bummel*, 1900, an account of a tour in Germany, and a novel, *Paul Kelter*, 1902. In 1892 J. was joint editor of *The Idler*, and in 1893 started his own twopenny weekly *To-day*, with Stevenson's *Ebb Tide* as the serial, but a costly lawsuit brought it to an end. Of his plays the most famous is *The Passing of the Third Floor Back*, 1908, a kind of modern morality, with characters named Cheat, Slut, Rogue, and Cad. In the First World War he was an ambulance driver. His autobiography, *My Life and Times*, appeared in 1926. See life by A. Moss, 1929.

**Jerome Bonaparte**, see BONAPARTE, *Jerome Bonaparte*.

**Jerome of Prague** (d. 1416), early Bohemian Church reformer and friend of Huss (q.v.), with whom he co-operated in obtaining a decree for the expulsion of the Nominalists, who had to transfer to Leipzig. Little is known of his early years; he is said to have belonged to a noble Bohemian family and to have been a little younger than Huss. He began his studies at Prague, but proceeded to Oxford in 1398. He was impressed by Wycliffe's writings, and always lived a roving life. After leaving Oxford he went to the univ. of Paris, then to Cologne and Heidelberg, and finally returned to Prague in 1407. Here he attracted attention by his advanced and outspoken views, and offence was given because he exhibited Wycliffe's picture in his rooms. When the reorganisation of the Prague Univ. was discussed, Huss and Jerome, as leaders of the Bohemians, incurred the anger of the king, who threatened them with death by fire if they opposed his will. J. was arrested, but in prison he

renounced the doctrines of Huss and Wycliffe. Later, however, he again maintained the theories he had formerly advocated and was burned as a heretic. In his writings he constantly refers to the *formalists* of Duns Scotus, but it is evident that he is, at the same time, inspired by Wycliffe's logic, which he had studied closely in Paris. This explains his love of subtlety and his tendency to oppose faith to philosophic doctrine. Details of his life and teaching will be found in most hist. of Bohemia.

**Jerram, Sir Thomas Henry Martyn** (1858-1933), Brit. admiral. He led the second battle squadron at the battle of Jutland. K.C.M.G., 1916. Admiral, 1917. G.C.M.G., 1919.

**Jerrold, Douglas** (1893- ), author and editor, b. Scarborough, great-grandson of Douglas Wm J. (q.v.). Educ. at Westminster and Oxford, he served with the Royal Naval Div. during the First World War and then entered the Civil Service. From 1930 to 1936 he was editor of the *English Review* and from 1945 of the *New English Review*. His books include 2 novels, *The Truth About Quetz*, 1927, and *Storm Over Europe*, 1930, and a number of historical works, including *The War on Land*, 1914-18, 1928, *An Introduction to the History of England*, 1949, and *England: Past, Present, and Future*, 1950. *The Lie About the West*, 1954, was a reply to Prof. Toynbee's theory of the existing world situation.

**Jerrold, Douglas William** (1803-57), author and dramatist, b. London. After contributing to many papers and doing much literary hack-work, he scored a great success with his nautical play, *Black-eyed Susan*, or, *All in the Downs*, which was produced in 1829 at the Surrey Theatre, with T. P. Cooke as the hero. J. wrote other plays, the most popular of which was *Time Works Wonders*, 1845, but only *Black-eyed Susan* still holds the stage. When *Punch* was founded he joined the staff, and in its columns appeared the famous *Mrs Caudle's Curtain Lectures*, 1846. His other works include *The Story of a Feather*, 1844, *The Chronicles of Cloverbrook*, 1846, and *A Man Made of Money*, 1849. From 1852 until his death he ed. *Lloyd's Weekly Newspaper*. A voluminous writer, he had a keen sense of humour and a caustic wit which made him many enemies, but in his writings he was blatant rather than refined. His books now seem very old-fashioned, and even his masterpiece is little read, save by students of the humour of the forties. There is a biography by his son Wm Blanchard J. (q.v.).

**Jerrold, Walter Copeland** (1865-1929), journalist and author, b. Liverpool, grandson of Douglas Wm J. (q.v.). His works include biographies of M. Faraday, 1891, Gladstone, 1893, Meredith, 1902, Lamb, 1905, T. Hood, 1907, and Douglas Jerrold, 1918; also *Triumphs of the Printing Press*, 1896, *Highways and Byways in Kent*, 1907, *D. Jerrold and Punch*, 1910, *Henry VIII and his Wives*, 1925, and *Five Queer Women*, 1929. He ed. Thackeray, De

Quincey, Dickens, and others in the Temple Classics, as well as *Nursery Rhymes*, 1902-12, *D. Jerrold's Essays*, 1903, and *The Book of Living Poets*, 1907. He wrote for children as 'W. Copeland.'

**Jerrold, William Blanchard** (1826-84), author, b. London, eldest son of Douglas Wm J. (q.v.), at whose death, in 1857, he succeeded to the editorship of *Lloyd's Weekly Newspaper*. He wrote the farce *Cool as a Cucumber*, in which Charles Matthews the younger made his reputation. Among his best books are some gastronomic manuals, his biography of his father, and *The Best of all Good Company*, accounts of imaginary days spent with the leading Victorian novelists.

**Jersey**, largest and most southerly of the Channel Is. (q.v.), has an area of about 45 sq. m., and a pop. of about 57,000 (1951), divided almost equally between the main tn and port of St Helier on the S. coast and the remainder of the is. The coastline is rugged and steep in the N.; in the E., W., and S. there are a number of wide sandy bays. Reefs, rocks, tides, and currents render navigation difficult. The climate is mild, with warm summers. The is. slopes gently southwards and the land is very fertile, thanks also to wise husbandry, aided by the regular use of animal manure, seaweed (vraie), and artificial fertilisers. The local folk are of Norman stock but there has been considerable admixture of Fr. and Breton immigrants, often the residue of imported seasonal labour, and of Eng. *rentiers* who for over 100 years have found the is. a congenial place for retirement. The J. language, based on the Norman language, is still current in the country dists. but during the past 40 years has been rapidly replaced by English. French remains the official language of the is. but the legislature, the courts, and all business affairs are now conducted almost exclusively in English.

The is.'s political institutions are of great antiquity, and are not set out in a formal constitution. The is. is divided into 12 pars., originally based on Church organisation, each with its elected officials and budget. The States (*Les Etats*) serves both as the central legislature and, through committees, as a central administrative body. The members of the par. councils and of the States are unpaid and much of the administration of the is., including police work other than part of that in St Helier, is carried out by elected unpaid officials. Various social services are now being introduced. The rate of income-tax, levied on similar lines to that in the U.K., is (1958) 4s. in the £.

The Royal Court is one of the oldest in the kingdom. It is composed of the bailiff and crown officers and of 12 elected *jurés-justiciers* or *jurats* who hold office for life, and who hitherto have also held life office in the States thus combining judicial, legislative, and administrative functions. Reforms adopted in 1948 have excluded the jurats from the States and have also excluded from the States ex-officio membership of the 12 Anglican

par. priests, thus making the States—apart from the Bailiff who presides—a wholly elective body comprising 12 senators elected for 9 years, 12 constables of the 12 par., who serve by virtue of their 3-year office, and 28 deputies elected for a period of 3 years.

There is also a police court and a petty debts court, for minor offences, also trial by jury for criminal cases only. An ancient court 'assise d'héritage' is held twice yearly at which local *seigneurs* renew their homage to the queen and advocates (barristers) of the Royal Court renew their oath of office. Local law and customs are based on Norman law, but substantial modifications in respect of inheritance, women's rights, and other matters have been introduced. Laws of modern origin, e.g. income-tax, are based on Eng. practice.

J., like the other Channel Is., was occupied by Ger. troops from the end of June 1940 till 9 May 1945. Very strong defences were built by the occupying troops. The absence of any fighting on the is. during the period, or in the course of, occupation and liberation, spared the is. any serious physical damage.

In the 19th cent. shipbuilding, seafaring, and overseas trading—and in earlier days, privateering—were the is.'s mainstay. These activities have disappeared and the is. is now dependent upon agriculture, mainly for export, and upon seasonal tourist traffic. Import trade is substantial and is done almost entirely with the U.K.

Early potatoes and tomatoes, both grown outdoors and often in succession in one season, are the main export crops. Pre-war ann. exports, entirely to the U.K., averaged about 60,000 tons of potatoes and 25,000 tons of tomatoes, and 53,000 tons of granite, of an aggregate value of about £2 millions. Tomato exports to the U.K. in 1947 reached a record of 44,590 tons valued at £2½ millions. Some 1000 head of cattle are exported each year, mainly to the U.K. and the U.S.A., also to Australia and New Zealand. The normal cattle pop. of the is. numbers about 10,000. The J. breed of cattle is remarkably free from disease and the high yield of milk and its high butter fat content is unsurpassed. Breeding standards are maintained by the breeders' organisations. The animals lose some of their peculiar characteristics after 4 or 5 generations have been bred overseas, and this ensures a recurring demand for cattle from the is.

J. has some peculiarities of fauna, and there are some notable megalithic tombs, the finest being La Hougue Bie. See T. D. Kendrick and Jacquetta Hawkes, *The Archaeology of the Channel Islands*: vol. II, *The Bailiwick of Jersey*, 1937; G. R. Balleine, *A History of the Island of Jersey*, 1950, and *The Bailiwick of Jersey*, 1951.

**Jersey Breed, see CATTLE.**

**Jersey City**, co. seat of Hudson co., New Jersey, U.S.A. At the N. the Hudson and Hackensack R.s make it almost an

is., whilst southward it is flanked by New York and Newark bays. It is separated from New York by 1 m. of riv., and connected with it by sev. lines of ferries, the Hudson R. tunnels, and also by a great vehicular tunnel which was opened in 1928. It is the E. terminus of many railways, and has spacious docks along its 12 m. of water frontage. The second largest city in the state, it manufs. ink, chemicals, cans, machine-shop and foundry products, petroleum products, steel and metal products, soap, pencils and other graphite goods, cosmetics, cigarettes, footwear, elevators, paint, coke, clocks, and clothing. It is the site of St Peter's College, John Marshall College, a state teachers' college, and a junior college. It has a fine public library and a modern medical centre. Early Dutch trading posts were estab. in this area; Eng. rule began in 1664. The coming of the railroads and the old Morris Canal in the 1830's stimulated growth. In Aug. 1916 German sabotage caused a devastating explosion of munitions on Black Tom Is. on the waterfront. Paulus Hook occupied the site till 1820, when the city of Jersey was incorporated. Pop. 299,000.

**Jerusalem**, city of Judea, situated 31° 46' N. lat. and 35° 13' E. long. It stands on a plateau formed of 2 hills, and bounded both E. and W. by valleys, that on the E. being the brook Kidron referred to in the N.T. To the N. there are also 2 valleys. The generally exact idea of the geography and geology of J. is due to a succession of investigations which commenced in 1833. After that time the work continued under various investigators, of whom the most prominent were De Vogüé (1860-3), Capt. Wilson, R.E. (1866), Capt. Warren, R.E. (1867-70), and Lieut. Conder, R.E. (1872-5). Still more results have been obtained by the Palestine Exploration Fund, which commenced operations in 1894, and a great impetus was given to the work after the First World War, especially through the activities of the Brit. School of Archaeology in J. In the period 1910-1930 the chief excavations in the vicinity of J. were those of Parker in 1911, Weill in 1913 and 1923, Macalister and Duncan in 1923-5, and by Crowfoot in 1927-8, all of Ophel, the hill to the SE. of the city; and the topographical data from these excavations are of value as establishing the position of the City of David, and also as indicating, though not finally proving, that some of the rock-cut caves may formerly have been used for royal tombs. Excavations at the Citadel at the Jaffa Gate, so conspicuous a feature of the walled city, have proved that the massive tower commonly called the Tower of David is really the Tower of Phasaël, one of three erected by Herod c. 25 BC as defences for his citadel and palace, and that it was inserted in a pre-Herodian wall on the NW. corner of the ancient city, a large section of which has been uncovered running across the courtyard of the present Mameluks Citadel. Excavations in 1946 tended to confirm doubts which had

arisen as to previously accepted beliefs about the extent of the first J., estab. in the time of the Heb. monarchy about 1000 BC to 587 BC. The hill on which the Citadel stands is traditionally known as Mt Zion, but the excavations do not support the theory that a part of the 'Stronghold of Zion,' the City of David and his successors, was located on that hill. Researches at the Walling Wall go to show that the boundaries of this celebrated relic coincide with those of the platform of the temple of Solomon, of

(q.v.), with remains of the basilica of Constantine; the Walling or W. Wall; the Mt of Olives; the tomb of David (Caenaculum); the Crusaders' Church of St Anne; the Jewish tombs in the valley of Jehoshaphat; the Armenian Cathedral; the Ecce Homo arch; the Church of the Tomb of the Virgin; and the Garden of Gethsemane. 'The old city within the walls, that city "compact together" with its vaulted *sugs* [bazaars] and narrow streets, that have undergone no change for cents., with its steep alleys flanked in

Paul Popper

## JERUSALEM AND THE MOSQUE OF OMAR

which courses of stone are supposed to be in existence below the surface. Each of the 2 hills which form the site of the city is a natural fortress, for the 2 are divided by a deep valley (the Tyropeon), and it is probable that from the earliest times they were so used. The lack of water must, however, have proved a serious disadvantage. The 'Virgin's Spring' in the Kidron valley, and just outside the old city wall, is the only spring near the city, and there is but 1 important well within. The water in the Pool of Siloam is brought from the Virgin's Spring by a rock-cut aqueduct, running through the old Ophel wall. The temple (comprising the dist. now known as the Haram) was built on the E. hill. On the W. hill was built the upper city.

The chief monuments of interest to visitors are the Church of the Holy Sepulchre

many cases by masterpieces of Saracenic architecture, may well, however, be regarded as the greatest monument of all, unique in its compactness, in its appearance of hoary antiquity, and in that homogeneity which it is the aim of its present administrators [then the Brit. mandatory gov.] jealously to preserve' (H.M.S.O., *Jerusalem City Plan*, 1948). Of new buildings some of the most striking are the Anglican Cathedral and Close of St George, built by George Jeffrey; the Franciscan basilica in Gethsemane; the Ger. Catholic church outside the Zion Gate; the It. Hospital, designed like a Florentine palace; the Lutheran Church of the Murlitan; and the fine Heb. Univ. (modern) with superb sculptures by Eric Gill. The walled city of J. is entered by 7 gates: the Jaffa ('Gate of the Friend'); New, near Allenby Square; Damascus ('Gate of the

Column'), N. wall; Herod's ('Gate of Flowers'), N. wall; St Stephen's ('Gate of Our Lady Mary' or 'Gate of the Tribes'), E. wall; Dung ('Gate of the Moors'), S. wall; and Zion ('Gate of the Prophet David'), S. wall, on Mt Zion. The Golden Gate, built in the 6th cent. on the Haram enclosure, was walled up by the Turks soon after they occupied Jerusalem in the 16th cent.

J. has greatly altered in appearance since the First World War, and continued to develop throughout the Brit. mandatory regime. Some of the suburbs have the aspect of bustling towns in the W. states of America; while new streets are being made and new districts opened up. There are also motor-bus services. There are big banks and commercial houses, and new premises on a far more modern plan than those of even a few years before have been erected. The great majority of the pop. of J. dwells outside the walls of the city, though later than the middle of last cent. there was not a building outside the gates of the city walls. But to-day hotels, large stores, and commercial buildings generally have been opened up outside the city proper, and with this development have come the garden cities. This greater J. has now spread half way to Bethlehem to the S., to Mt Scopus to the N. (the site of the Brit. cemetery), and to the W. as far as Ain Karim, the bp. of John the Baptist. Extension eastward is impossible, because there the land falls steeply into the Kidron valley. The beauty of the buildings of J., considered apart from their sanctity, lies largely in the colour and texture of their stone, which, after cents., has mellowed to a golden grey. It blends in a remarkable manner the walls and gateways of the Old City, the towers of its many churches and monasteries, the modern commercial buildings along Princess Mary Avenue, and the villas of Rehavia and Qatamon. One of the aims of the Palestine Gov.'s town-planning commission under the mandatory regime was to maintain this unity of character throughout the fast developing city by insisting on the use of stone for all buildings. The ubiquity of stone was threatened by the use of concrete, providing an instance of a W. technique, introduced by Jewish immigration, which conflicted with the traditional way of life. The account which Britain can give of her stewardship in respect of town planning in J. is one of which any administration might be proud. The successive measures of the Brit. planners during the 30 years of mandatory rule were directed to one or other of 2 objectives: the preservation of the Old City and the encouragement of high standards, hygienic, social, and aesthetic, in the modern city, which during those 30 years had fast been growing up around it.

The buildings of Greater J. extend nearly as far as the Well of the Magi. Here the residences (and also those at Bethlehem itself) are especially handsome, many of them having been built by native craftsmen who had learned their trade in

the U.S.A. and returned to Palestine as wealthy men. It is estimated that some £3,000,000 was spent between 1925 and 1930 on the erection of private dwellings in Greater J., while over £250,000 was spent upon the handsome King David Hotel. On 22 July 1946 an entire corner of the hotel was destroyed by bombs of Jewish terrorists. Military H.Q. in Palestine and the prin. secretariat offices, with the exception of that of the High Commissioner, were located in the building and over 50 persons were killed, including sev. senior gov. officials. The most attractive of the garden cities are Janin and Beth-Hakerem, while the new Arab colony of Talbiyah, SW. of the city, has replaced what a few years ago was a waste, bearing a few olive-trees. The largest and best known of the garden cities is the Talpith, lying S. of the city on the Bethlehem road, which has been developed by the Palestine Land Development Co., and contains besides hundreds of stone dwellings—all detached and conspicuous for their balconies, arched windows, large verandas, striking roofs, and fine gardens—a town hall, baths, synagogue, theatre, and indeed all the amenities of an independent community. Some of the most important public or commercial buildings completed in recent years in J. or outside the Old City are the Heb. Univ., opened by Lord Balfour in 1925, the new library on Mt Scopus, containing the largest collection of Heb. books and papers in the world, the Pontifical Biblical Institute, the College of Jerra Santa, the Rothschild (Hadassah) Univ. Hospital on Mt Scopus (designed by Eric Mendelsohn), the General Post Office (designed by Austin Harrison, who designed Nuffield College), a good blend of W. functional ideas with E. motives, and the Anglo-Palestine Bank. J., being a Holy City for 3 Faiths, is the seat of a number of prelates and religious bodies. There are 3 Christian patriarchates, Orthodox, Latin, and Armenian, having the style of 'Beatitude,' and, in addition to the Anglican bishop in J., a Jacobite and a Coptic bishop.

For long it was thought that the name of J. was given to the city after its conquest by David, but this judgment has been reversed by the discovery of the Amarna tablets (c. 1400 BC) in 1890. Here the name occurs in the form *Urusalem*, some 500 years before the time of David. The derivation has been variously derived from Heb. forms meaning 'the city of peace,' 'possession of peace,' 'foundation of peace,' 'city of the god Salim,' etc. In the Book of Joshua it is spoken of as *Jebus*, with the explanatory note 'which is Jerusalem,' and an account is given of Joshua's assault on it. It fell back, however, into the hands of 'the stranger,' and it was not until the time of David that it was permanently captured and made the seat of the regal gov. (see *DAVID*). This occurred at the beginning of the 10th cent. BC. For its hist. down to its destruction in the time of Zedekiah see *ISRAEL*, where is also given an account of the attempts to rebuild it under Ezra and

Nehemiah, of the various foreign powers under whose dominion it successively came, and of the factions with which the city was torn, until the time of its utter destruction by Titus, the Rom. general. It was not long, however, before the city was rebuilt, though on a smaller scale, by the Emperor Hadrian, and the new name of Aelia Capitolina was given to it. During the first few cents. it passed through a period of tranquillity, but it again came into prominence as the habit of pilgrimage to sacred places grew up, and as spot after spot associated with events in the life of Christ was identified by revelations made miraculously to

comparatively peaceful and uneventful. It passed into Turkish hands in 1517, and remained under Turkish rule until the First World War of 1914-18, when it was taken by Gen. Allenby in Dec. 1917. The full story of the brilliant capture of J. will be found in the *Record of the Advance of the Egyptian Expeditionary Force*, compiled by Lt.-Col. H. Pirie-Gordon, 1919. On his official entry Allenby made it known by proclamation that 'every sacred building, monument, holy spot, shrine, traditional site, endowment, pious bequest, or customary place of prayer of whatsoever form of the 3 religions will be maintained and protected according

individuals. Many great churches were erected, of which the first was Constantine's Church of the Anastasis (336) near the Holy Sepulchre. The Church of St Stephen and many other eccles. buildings were erected by the Empress Eudocia from about 450 onwards, and Justinian built the Church of St Mary, which later formed part of the Mohammedan mosque el-Aksa. In 614 the city was taken by Chosroës, the Persian, and most of the churches were destroyed. It was recaptured by Heraclius in 627, but lost again 9 years later, to remain in the hands of the Muslims until 1099. At the beginning of this period the mosque el-Aksa was erected on the site of the Jewish temple. In 1099 the city was taken by Godfrey of Bouillon and his knights, thus returning once more into Christian hands. But the Lat. kingdom of J. was not long-lived, nor was it by any means stable during its continuance. It fell in 1244, after having been for a short time in the hands of the ex-communicate Frederick II, to whom it had been ceded by treaty in 1229 after having been captured by the Muslims. From 1244 to 1917 J. remained in Muslim hands, and during this period its hist. was

to the existing customs and beliefs of those to whose faiths they are sacred.' From 1920 onwards there were sporadic outbursts against the Jews on the part of the Arabs, especially in 1929—the Wailing Wall riots—and from 1936 to 1938, when underground Arab revolt against the Jewish immigration and the National Home threatened the whole country (see further under PALESTINE and WAILING WALL). The pop., which has greatly increased from immigration under the mandatory regime, was 62,700 in 1922, 127,000 in 1939, 155,000 at the end of 1944, and 164,440 (99,320 Jews) in Dec. 1946.

Towards the end of 1945 the Brit. Gov. announced the setting up of a joint Anglo-Amer. inquiry into the conditions of European and Palestinian Jewry. The institution of this inquiry displeased the Zionists and was followed by terrorist outrages organised by Irgun Zvi Leumi, the 'Stern Gang,' and Haganah, although disowned by the Jewish Agency. Many outrages were perpetrated in J. in 1946-7. With the ending of the Brit. mandatory regime in May 1948 war broke out in Palestine between the Arabs and Jews. It was hoped that a truce would protect

J. and the holy places, but in fact the war actually began in J. itself, when the Arab Legion from Transjordan shelled the Jewish quarters of the city and the Jews occupied various institutions from which they fired on the city and attacked J. generally. (For the war in J. see ISRAEL.)

According to the decision of the U.N. the city of J., with its surrounding towns and vills, and all the Holy Places, is to be part neither of the Arab nor the Jewish State, but is to be administered by an International Trusteeship system. This decision was ignored by both Israel and Jordan, with tacit Brit. support. J. is now divided into 2 cities: the Jordanians hold the NE. and E. parts, including the walled city (except for Mt Zion) and most of the Holy Places (pop. estimated at 35,000); the rest is held by Israel, as well as an enclave on Mt Scopus containing the disused buildings of the univ. and the Hadassah hospital. Arrangements are made for pilgrims to cross the border at Easter and Christmas at the so-called 'Mandelbaum Gate.' Shooting frequently occurs across the narrow no-man's-land, and some loss of life has been occasioned thereby.

The Israeli part of J. has been much extended and has a pop. of about 160,000. On 23 Jan. 1950 the *Knesset* (Parliament) declared J. to be the cap. of Israel and the gov. offices were removed there from Tel-Aviv, the Foreign Office being the last to arrive (in July 1953). New univ. and official buildings have been erected between the suburbs of Rehavia and Beit Hakerem, and the remains of Herzl and other Zionist leaders have been reinterred at Bayit Vegan. The U.N. Truce Commission has its H.Q. in J.

See also ISRAEL; PALESTINE. See Sir C. Warren, *Underground Jerusalem*, 1876; G. Le Strange, *Syria and the Holy Land*, 1890; various pubs. of the Palestine Exploration Fund; Sir C. M. Watson, *Jerusalem*, 1912; George Jeffery, *A Brief Description of the Holy Sepulchre, Jerusalem, and other Christian Churches in the Holy City*, 1919; H. Duckworth, *The Church of the Holy Sepulchre*, 1922; *Jerusalem Nouvelle* (Paris), ed. by Vincent and Abel, 1922-6; C. R. Ashbee, *Jerusalem*, 1924; E. Reynolds-Ball, *A Practical Guide to Jerusalem and its Environs*, 1925; E. L. Sukenik and L. Mayer, *Third Wall of Jerusalem*, 1930; H. C. Luke and E. Keith-Roach, *The Handbook of Palestine*, 1934; H. M. S. O., *Jerusalem City Plan: Preservation and Development during British Mandate, 1914-18, 1948*; R. M. Graves, *Experiment in Anarchy*, 1949.

*Jerusalem Artichoke*, or *Helianthus tuberosus*, well-known species of Compositae, closely allied to the sunflower, which is cultivated on account of its edible tubers. It is indigenous to America.

*Jerusalem Chamber*, part of the deanery of Westminster Abbey, was originally the abbot's parlour, and dates from the late 14th cent. It derives its name probably from the tapestries of the hist. of Jerusalem which formerly adorned it. Henry

IV died here in 1413. The chamber was restored in 1624; it was the meeting-place of the scholars who prepared the R.V. of the Bible, 1871-81. The Crown is lodged here on the night before the coronation.

*Jervaux Abbey* (Yorks, England), ruined Cistercian monastery, founded in 1156. Remains of the cruciform church, the cloistral courts, chapter house, and refectory, etc., belong to the Transitional Norman or Early Eng. period. The last abbot was hanged in 1537, because he was implicated in the Pilgrimage of Grace.

*Jervis, John*, 1st Earl St Vincent, see ST VINCENT.

'*Jervis Bay*,' 18-year-old pleasure liner which was transformed during the Second World War into an armed merchant cruiser. She was unarmoured; her 7 and 6-in. guns were kept there to guard convoys. She will live in naval annals for her gallant action on 12 Nov. 1940, against the powerful Ger. pocket battleship *Admiral Scheer*, in which she saved 34 of a convoy of 38 ships when they were attacked without warning by the Ger. ship. The *J. B.* sailed out against the battleship alone. Her object was not the hopeless one of sinking the *Admiral Scheer*; there was no hope even of inflicting material damage. The object was to gain time to give the convoy a reasonable chance of escape. This the *J. B.* and its crew achieved after a 2 hours' fight. Her death roll was 190. Some 65 survivors were rescued, the ship being sunk. Her captain, E. S. Fogarty Fegen, R.N., was awarded a posthumous V.C.

Jeshurun occurs 4 times in the O.T. as a designation for Israel (q.v.). It has been described as a sort of 'pet name,' meaning literally 'the righteous little people.'

*Jesmond*, see NEWCASTLE UPON TYNE.

*Jessamine*, see JASMINE.

*Jesse, Edward* (1780-1868), writer on natural hist., b. Hutton-Cranswick, near Halifax. He lived for a time in Richmond Park, and in 1830 was appointed deputy surveyor of the royal parks. His works include *Gleanings in Natural History* (in 3 series), 1832, 1833, 1835, *An Angler's Rambles*, 1836, and *Lectures on Natural History*, 1861.

*Jesse, Friniwyd Tennysson*, novelist, a great-niece of Lord Tennysson, the poet. During the First World War she was a freelance newspaper correspondent, and after the armistice she worked for the National Relief Commission. In 1918 she married H. M. Harwood, doctor and playwright, and they collaborated in a number of plays, including *Billeted*, 1920, *The Pelican*, 1926, and *How to be Healthy Though Married*, 1930, as well as in a series of war-time letters of the Second World War, collected as *London Front*, 1940, and *White London Burns*, 1942. Her novels include *The Milky Way*, 1913, *Beggars on Horseback*, 1915, *Secret Bread*, 1917, *The White Riband*, 1921, *Tom Fool*, 1926, *Moonraker*, 1927, *A Pin to See the Peepshow*, 1934, *Act of God*, 1936, and *The Alabaster Cup*, 1950.

She also pub. sev. collections of short stories.

**Jesse Window**, stained-glass window displaying the 'Tree of Jesse,' i.e. a genealogical tree showing the descent of Christ from the royal house of David, who was the son of Jesse. There are medieval examples at the cathedrals at Wells and Chartres, and in the abbey-church at Dorchester, Oxon.

**Jessel**, Sir George (1824-83), judge, b. and d. in London, was of Jewish extraction. He was called to the Bar in 1847, made a Q.C. in 1855, and entered Parliament in 1868, as a Liberal. He became solicitor-general, was knighted, and made privy councillor and master of the rolls in 1873.

**Jest-books**. There are 2 kinds of J.—compilations of witty sayings and practical jokes ascribed to some particular wit to ensure their sale and popularity, and collections of *facetiae* admittedly brought together from various sources. Numbers of typical jests and practical jokes probably existed independently throughout all countries.

The following famous J. may be mentioned: *Tarlton's Jests: a Hundred Merry Tales* (c. 1525, first extant ed., 1611); *The Witty and Entertaining Exploits of George Buchanan*, commonly called the *King's Fool* (Buchanan long being famous as a humorist as well as a humanist); *Joe Miller's Jest-Book, or the Wit's Vade Mecum* (1739, really compiled by John Mottley, 1692-1750). Other similar collections are the *Jests of Scogin*, by 'A. B. of Phisicke Dootour,' 1613; *Tales and Quick Answers, very Merry and Pleasant to Rede* (about 1535); John Taylor, *Wit and Mirth*, 1629, more original than most; *Wit and Drollery*, 1661, by 'the most refined wits of the Age'; *Merry Drollery*, 1661; and *Westminster Drollery, or a choice collection of the newest Songs and Poems both at Courts and Theaters*, by 'a Person of Quality,' 1671. The modern counterpart of these compilations is found in such collections of humorous anecdotes as Bennett Cerf's *Life of the Party*, 1956, and others by him. See also **CEAP-BOOKS**; **GOUGHAM**, **TALES OF THE MAD MEN OF**; **HUMOUR**. See W. Hazlitt, *Shakespeare Jest-Books*, 1876; *Studies in Jocular Literature*, 1890; 'The Literature of Roquetry' (in *Types of English Literature*), 1907; W. Jerrold, *Book of Famous Wits*, 1912; F. Kirkman, *The Wits*, 1932.

**Jester**, or **Gestour**, literally, a minstrel or professional reciter of romances, 'gestes' (Lat. *gesta*), or legendary tales. Later 'geste' became a synonym for a witty tale or clever sally, and gestour meant a clownish wit, merry-andrew, or buffoon kept by great people for their amusement, in imitation of the king's 'court fool.' This custom dates from very early times. Court J.s probably existed in England in Saxon times, Hitard, fool of Edmund Ironside (d. c. 1016), being one of the earliest known. Goles, fool of William I, Will Somers, fool of Henry VIII, and Archie Armstrong, fool of James I, are all famous characters. As a court institution fools did not apparently

outlive the Commonwealth in England. Dicky Pierce, the last private fool, attached to Lord Suffolk's household, died in 1728. Court fools are mentioned in the Sanskrit *Ramayana*; Philip of Macedon, Attila, Haroun-al-Raschid, and Montezuma all owned fools, and they flourished especially in the Middle Ages. The majority of professional J.s were by no means half-witted, at least not in later times, but merely assumed the cloak of folly which allowed of considerable licence of speech and behaviour. The traditional dress consists of parti-coloured garments, a fool's cap or hood with cockscomb, ass's ears, and bells, the sceptre (bauble or 'marotte'), and a large collar. See F. Douce, *Illustrations of Shakespeare*, 1839; J. Doran, *History of Court Fools*, 1858; A. F. Nick, *Die Hofund Volksnarren*, 1861; E. K. Chambers, *Medieval Stage*, 1903; J. L. Hotson, *Shakespeare's Molley*, 1952.

**Jesuits**, The, popular name for the Society or Company of Jesus, a religious order of the Rom. Catholic Church, founded in 1534 by Ignatius Loyola (q.v.). The first object of the founder was work in the Holy Land, but the journey thither was made impossible by the Turkish war, and so the Spaniard renounced his first and cherished dream, and offered the services of his band to the Pope in any capacity, but especially as missionaries. At this time the prestige and authority of the papacy were gravely imperilled by the rapid secession of Protestant or Reformed churches, and in this way Loyola came to be intimately associated with what is called the Counter-Reformation. In 1540 he obtained the sanction of Pope Paul III for the new rule of the Society of Jesus, and at Rome in the following year was elected as the first of its generals.

Loyola was a man of indomitable will and forceful personality, and in drawing up the constitutions of the society with his companions he used the greatest care and deliberation, with the result that they have undergone little change since they were finally adopted in 1558. In the training of a Jesuit, soon after his novitiate begins, 30 days are spent in meditation on the *Spiritual Exercises*, a manual which the founder himself composed; they are a systematic presentation of the truths of religion, arranged so as to appeal both to the head and the heart, and so to strengthen the will of the student and purify his motives in submission to God and love of Christ. The novitiate lasts 2 years, and then simple vows of poverty, chastity, and obedience are taken. Those who are to be priests then do 2 or 3 years of philosophy, 5 years teaching in one of the society's schools, 4 years of theology, and, after an interval of sev. years, they have another year of probation (tertian-ship). After the third year of theology the scholastic is ordained priest. The normal period of training is thus about 13 years. Not all J. proceed to solemn profession, which involves a fourth vow, of special obedience to the Pope to go on missions. The secular and menial offices

of the society are done by lay brothers, called temporal coadjutors, who also are bound by the 3 vows. There are no 'secret Jesuits.' The general is elected by the general congregation, in which each prov. is represented by the provincial and 2 elected fathers. He holds office for life, and is advised by a council of 6 assistants of various nationalities, whose recommendations, however, he is at liberty to disregard. The general commits the administration of the sev. provs. to chosen representatives, called provincials, and he also appoints the chief superiors of all novitiates, colleges, and professed houses or residences. A great deal of power is thus concentrated in the hands of the one man; but he cannot change the constitutions.

The main novelty of the new order lay in its abandonment of the daily choir office obligatory on all the older orders and also in complete centralisation. Thus it attained a flexibility hitherto unknown, which soon made itself felt in the Counter-Reformation, of which the J. were the protagonists. The order spread rapidly over Italy, Spain, Portugal, France, Germany, the Netherlands, and sent subjects to England and Russia. In England its foothold was always insecure, owing to the penal laws against all Catholic priests. Its hist. may be divided into 3 periods, namely, the rise, the suppression, and the restoration. In his work of building up the society and disseminating the new ideas and methods, Loyola was assisted by a band of eager disciples, including James Lainez, Francis Xavier, Nicholas Bobadilla, and Francis Borgia, among his own countrymen; Simon Rodriguez, a Portuguese, and Peter le Fèvre, a native of Savoy. So successful was their work that on the celebration of its first centenary the order counted 13,112 members, dispersed over 32 provs. Moreover Jesuit missionaries were sent to all corners of the earth, and wherever they went they carried with them learning and culture, besides the spiritual message of their Church. Thus they sent missions to China and Japan, Brazil and the Portuguese settlements in India, the Philippine Is., California, and Ethiopia, and not seldom suffered martyrdom. Their missions in Paraguay were particularly successful and have earned the praise of historians of all shades of opinion.

By the middle of the 18th cent. the J. were unpopular with all the sovereigns of Europe, and Portugal expelled them by a royal decree in 1759; France and Spain soon followed her example. Finally, Pope Clement XIV, under pressure from the Bourbons and other sovereigns, and hoping thereby to gain their goodwill, issued his brief *Dominus ac Redemptor Noster*, by which the society was suppressed throughout the world (1773); but it was not enforced by Catherine the Great in Russia, where the society continued its activities. At this time there were 61 novitiates, 176 seminaries, 669 colleges, 359 residences and professed houses, and 275 missions in heathen countries; the

membership was estimated at 22,500. The suppression, however, was only temporary; in 1814 Pope Pius VII restored the J. everywhere, after having approved them locally in Russia (1801) and Naples (1804). The society has never regained its former political influence, but its sphere of religious influence is greater than ever. To-day only in Switzerland are the J. formally and by name forbidden to have estab. In England they worked in the 16th and 17th cents. under the shadow of the penal laws which imposed death on all Catholic priests. Since these were relaxed and all religious communities were tolerated they have estab. sev. houses—including Beaumont College (Old Windsor) and Stonyhurst College (Lancs). The whole order numbers about 20,000, with 900 in England.

The causes which led to their universal expulsion in the 18th cent. were the activities of the Jansenists (q.v.) and other eccles. opponents, and of the civil powers, for the J.'s power and influence in new and distant lands (e.g. S. America) embroiled them in politics. And, moreover, the doctrine that the Pope is Christ's vicar on earth, and therefore that the first duty of the true Catholic is complete obedience to his word in spiritual matters, was improperly stretched by some J. (and others) into the temporal domain. The lawfulness of tyrannicide was formally taught by only one Jesuit of eminence, Mariana, and so to teach was forbidden to members of the society under severe penalties from about 1600. But from it arose their actual or suspected complicity in a number of conspiracies and plots. They were believed to have had a hand in the Gunpowder Plot, in the formation of the Ligue de Guise, in the revocation of the Edict of Nantes, and in the outbreak of the Thirty Years War. It is clear that the govs. of Europe looked on the J. as a menace to the state; in particular, sovereigns were frightened by Jesuit opposition to the new-fangled doctrine of the 'divine right of kings.' Obedience was always a cardinal virtue of the J.; throughout every grade of the society the word of a superior is law in all matters that are not sinful. The resulting solidarity of the body made it a further object of fear and suspicion to kings and to many lesser people, while its skill in casuistry was the chief ground of attack in Pascal's *Lettres Provinciales* (1656-7). And a certain tendency among some J. to use worldly and intellectual rather than purely spiritual means of compassing a worthy end earned much dislike for them. It became a common impression that the J. taught that 'the end justifies the means,' though it is entirely unproved that any Jesuit ever did so. The society had no official connection with the Sp. (or other) Inquisition, and in some places (e.g. Paraguay) definitely opposed it. The self-devotion, enthusiasm, and, above all, the zeal for thorough and scientific education which members of the society have continued for cents. to show cannot fail to impress the student, not only of hist., but of the more intimate

field of human psychology, and to secure some measure of sincere admiration. Both the scientific works of its members and their conduct of boys' schools have been a very definite contribution to the world's intellectual progress. See *Rules of the Society of Jesus*, 1863; F. Parkman, *The Jesuits in North America*, 1868; E. Taunton, *History of the Jesuits in England*, 1901; T. J. Campbell, *The Jesuits, 1534-1921*, 1923; La Farge, *The Jesuits in Modern Times*, 1928; Goodier, *The Jesuits*, 1928; Broderick, *The Origin of the Jesuits*, 1940; and *The Progress of the Jesuits*, 1946; M. P. Harney, *The Jesuits in History*, 1941. Also, bibliography of IGNATIUS LOYOLA (q.v.).

Jesuits' Bark, see CINCHONA.

Jesus, Son of Sirach, see ECCLESIASTICUS.

Jesus Christ, in Christian theology the Second Person of the Holy Trinity (q.v.) incarnate. The name Jesus is the Gk form of Heb. *Jehoshua* and means 'the Lord is help' or 'salvation'; Christ, derived from the Gk *Christos*, means 'anointed.' See also HOLY NAME.

Our knowledge of the life of Christ depends almost entirely upon the documentary records of the N.T., though there are a few references to Him in early non-Christian writings, e.g. the Talmud, Josephus, Tacitus, Philo, and Pliny (q.v.). These latter dispose of any doubts as to the historicity of Jesus. The first N.T. evidence for the life, death, and resurrection of Christ and their immediate consequences is to be gathered from the early Pauline epistles, Thessalonians I and II, and Galatians. The references are implicit and incidental, but in I Cor. xi and xv (c. AD 55) St Paul quotes 2 passages from the oral catechesis which clearly date back to the time of his conversion in about AD 35. For the dating of the Gospels see MATTHEW, THE GOSPEL ACCORDING TO ST; MARK, THE GOSPEL ACCORDING TO ST; LUKE, THE GOSPEL ACCORDING TO ST; JOHN, THE GOSPEL ACCORDING TO ST; and the articles on BIBLE, CHRISTIANITY, and GOSPELS. It must, however, be remembered that the Gospels are doctrinal rather than biographical.

Behind the written records, whose historical accuracy is supported by the strongest internal evidence, there exists the oral tradition, going back to the earliest days. The first chapters of the Acts also embody primitive records and reminiscences which testify to the life, death, and resurrection of Jesus. The following paragraphs summarise the Gospel account of the earthly life of Jesus. At Nazareth in Galilee there lived a virgin named Mary, espoused to Joseph, a carpenter, of the family of David. To her came the archangel Gabriel with the message that she should conceive by the power of the Holy Ghost and not in the ordinary course of nature (see ANNUNCIATION), and bring forth a son Jesus, who should be the Son of God. So it came to pass. But the requirements of an official census obliged Joseph and Mary to travel

to Bethlehem in Judaea. Here, in a stable, Jesus was b., and to Him came shepherds and Magi offering their worship. The visit of the Magi brought danger, and almost immediately the Holy Family had to flee into Egypt until the death of Herod, when they returned and dwelt again at Nazareth. There is now general agreement that the estab. chronology dates the Nativity too late, and that Christ was b. at least 4 years earlier than is implied by our system of chronology. Only one other incident of Christ's early life is told us: the finding of the boy Jesus in the Temple, listening to and questioning the doctors.

Except for this, the canonical gospels are silent concerning the hidden years at Nazareth. But from the gibe made when He visited Nazareth later in His ministry, 'Is not this the carpenter?' we gather that He quietly pursued the trade of Joseph, until (apparently after His foster father's death), at the age of about 30, He set out on His brief public ministry. From the synoptics we should gather that this was virtually confined to Galilee and lasted only 1 year. But the fourth Gospel speaks of 3 passovers spent at Jerusalem. This seems more probable. The beginning of the ministry of Jesus is closely connected with the preaching of His cousin, John the Baptist. Jesus came to him for baptism, and John bore witness to Jesus, of whom he declared himself to be merely the forerunner. Jesus wandered for 40 days, fasting and praying in the deserts of the Lower Jordan. During this period occurred the Temptation. There followed a brief ministry in Judaea, during which some of the future 12 apostles from among John's disciples met Jesus. Then, after John had been thrown into prison by Herod, Jesus returned to Galilee. We hear of only one visit, and that an unsuccessful one, to His native city of Nazareth. Capernaum, called in Matt. ix. 1 'His own city,' seems to have been the centre of His mission.

His ministry was of two kinds: a public preaching to the people, and the private instruction of His disciples. He set out on a tour through Galilee, proclaiming His mission in the words of Isaiah: 'The Spirit of the Lord is upon me, because he appointed me to preach good tidings to the poor.' Closely connected with Christ's teaching was His ministry of healing. 'He hath sent me to proclaim release to the captives and recovering of sight to the blind, to set at liberty them that are bruised' (see MIRACLES). Two things He required, repentance and faith; and, as He foresaw, His message (like John's) appealed to the poor and humble, rather than to the rich and the religious authorities. Christ's attitude to the religious leaders of His time was almost entirely one of condemnation. He did not teach that they should be disregarded; what they commanded was to be observed and done, but they were blamed for allowing their preoccupation with minute details to usurp the claims of weightier matters. Against one particular point in the

Pharasaic formalism, the strict observance of the Sabbath day, His teaching is summed up by His words: 'The Sabbath was made for man, not man for the Sabbath.' And in reply to a question from a doctor of the law, He said: 'Thou shalt love the Lord thy God with thy whole heart, and with thy whole soul, and with thy whole mind. This is the greatest and first commandment. And the second is like unto this: thou shalt love thy neighbour as thyself. On these 2 commandments dependeth the whole law and the Prophets' (Matt. xxii. 37-40).

W. F. Mansell

HEAD OF CHRIST, BY LEONARDO DA VINCI

Though the Gospel is full of the tender love and sympathy of Christ for all that is good in man, we must not overlook the sterner side. 'If any man will come after me, let him deny himself, and take up his cross, and follow me.' In His teaching Jesus used the common E. device of parables. Large numbers of the parables of Jesus are collected in the synoptic gospels, all of a homely kind, likely to appeal to people of all classes. Even more important, however, was the work of training His chosen Apostles, as is shown by the antithesis continually presented between the disciples and the multitudes. We see also the succession of attempts made by Jesus to secure the requisite time and quiet for the purpose. As the opposition of the religious authorities became more and more overt, Jesus withdrew more and more to devote Himself to this work. The excursion into Tyre and Sidon and to Caesarea Philippi, on the occasion of St Peter's confession of Him as Messiah and Son of God, were prompted also by a desire to avoid His powerful enemies. The slow journey down to Jerusalem for

the last passover was occupied chiefly in instruction, mainly on the subject of His approaching death, which the disciples remained tragically unable to grasp.

So the Jewish religious and national leaders took counsel with the Herodians (a political party in support of the Idumean Herod) against Jesus, to put Him to death. Jesus entered Jerusalem in triumph, as all 3 synoptics tell us, specifically fulfilling a Messianic prophecy. The enthusiasm of the people infuriated the religious leaders, and His immediate death was resolved upon. His nights He spent at Bethany, and each day the little party went into Jerusalem. On the evening of the Thursday He held the Last Supper, the mystic feast, the actions of which have been repeated by all Christian communities from that time till now in remembrance of Him. Then followed the Agony in the Garden, and the story of the Passion begins. This is narrated at considerable length by each of the 4 evangelists, and though there are certain notable differences, especially in the account given by St John, there is agreement in the main outline. All are agreed that it was by Judas Iscariot, one of the 12, that Jesus was betrayed, and that He was tried in great haste. Before the Rom. governor it was the political aspect of the Messianic claim that was used against Him, and by unscrupulous pressure on the reluctant Pilate His condemnation was secured. All the 12 had forsaken Him and fled, while Peter had actually denied his Master. Christ was hurried to the hill of Golgotha. But He was too weak from exhaustion to bear His own cross, and He was aided by Simon of Cyrene. At Golgotha He was crucified, with the title above His head 'King of the Jews.' In 3 hours He was dead, and by permit obtained from Pilate that same day He was buried on the spot, in a tomb guarded by Pilate's soldiers. Then on the third day He rose again and appeared to them singly and collectively, not as a ghost but as a complete human being, with a body that was solid and tangible, that could eat and talk and walk and speak, yet a body that possessed pre-natural powers. Even more difficult to evade than the visions is the evidence of the empty tomb. After 40 days of this extraordinary intercourse with His disciples Jesus appeared, and disappeared for the last time, on the Mt of Olives, ascending symbolically up to heaven, promising to send them the Holy Spirit—which He did 9 days after, on the Feast of Pentecost (q.v.).

The early Church discounted the authenticity of any likeness of Christ attributed to persons who had seen Him. Thus the early pictures are symbolic and the traditional likeness begins to appear only after some cents. One tradition attributed portraits of our Lord to St Luke; another tradition embraces the 'images not made with hands,' notably the famous 'Veronica' likeness and the Holy Shroud of Turin (q.v.).

The earthly life of Jesus was only a beginning. St Luke, for example, at the

beginning of the Acts of the Apostles, speaks of his former treatise in being concerned with all that Jesus *began* both to do and to teach until the time of His Ascension. In this sense the story of the life of Christ is still continuing, as He still works in the Church of which He is the Head. The teaching of the Church on the Person of Christ is dealt with in the main articles to be found listed under the heading CHRISTIANITY. Individual shorter articles will also be found, under their separate headings, on every aspect of Christian life and civilisation. For other views of the life of Jesus see the article RELIGION and the other religions referred to therein, BRAHMA; BUDDHA; ISLAM; JEWS; JUDAISM; MOHAMMEDANISM; see also the articles AGNOSTICISM; ATHEISM.

Innumerable lives of Christ have been written through the ages by both believers and unbelievers, and it would be impossible even to select a bibliography. The fundamental teaching of the Church on the subject is to be found in the Catechism. The Gospels themselves are to be found in every trans. of the N.T., among which, in English, are the Douai and R. A. Knox versions (Rom. Catholic), and the Authorised, Revised, and Moffat versions (Anglican). Each Christian denomination (on which separate articles will be found) lists and publishes its own factual and instructional literature. See also the missals, prayer books, and other devotional works.

**Jesus College**, Cambridge, founded in 1496 by John Alcock, Bishop of Ely. Its site was previously occupied by a Benedictine nunnery dedicated to St Radegund. Its full name is 'The College of the most blessed Virgin Mary, St John the Evangelist, and the glorious Virgin St Radegund,' but it has always been called 'Jesus College' after the dedication of the Chapel. Architecturally Jesus is one of the most interesting of Cambridge colleges, for Alcock retained and adapted a considerable part of the nunnery buildings. The Chapel is for the most part Early Eng., but there are traces of Norman work. Most of the windows are by Burne-Jones. Archbishop Cramer was an early fellow, and Laurence Sterne and S. T. Coleridge were at the college.

**Jesus College**, Oxford, was founded in 1571 by Queen Elizabeth I. Its first benefactor was Hugh ap Ilico (Price), a native of Brecon, and it has always had a close connection with Wales. Its earliest buildings, facing Turl St., were completed in 1574, but were entirely reconstructed in 1856. The hall dates from 1620, the chapel from 1621, and the library from 1679. Among famous old members are Sir Leoline Jenkins, J. R. Green, and Col. T. E. Lawrence.

**Jet**, kind of lignite or anthracite, which can be easily cut and carved, and takes a fine polish. It probably takes its name from Gasgas, in Lycia, where, according to Pliny, a similar substance was found. J. was used in Britain for ornaments from prehistoric times. Necklaces, beads, buttons, etc., of the Beaker period of the Bronze Age, of the Neolithic period, and

of the Early Iron Age are known, and Gaius Julius Solinus (3rd cent.) alludes to the abundance of J. in Britain. Caedmon, too, refers to the J. It was probably obtained from the coast of Yorks and especially Whitby, where the finest quality is still found. It is also imported from Spain, but Sp. J. is generally less hard and lustrous than that found at Whitby. It is found, too, in the dept of Aude in France, and in the Lies of Württemberg, and is known in many localities of the U.S.A. It is chiefly used for mourning ornaments, but imitations occur in vulcanite and in glass.

**Jet Propulsion**, form of motive power particularly applied to aircraft, by means of reaction to the mass of air ejected at the rear of an engine. This form of propulsion is a direct application of Newton's third law of motion (to every action there is an equal and opposite reaction, q.v.) and the basic principles were first stated by a Fr. engineer, René Lorin, who pub. patents in 1913. Although not developed to practical use, the first design contained the essentials as practised to-day and the latest high-speed engine, the ram-jet (or athodyd), is exactly like the original simple design without working parts shown in the diagram. Efficient propulsion by jet reaction can only take place at high speeds, and it was not until aircraft capable of more than 400 m.p.h. were developed that the system was of more than academic interest.

In 1930 Whittle (then a R.A.F. cadet, now Air Commodore Sir Frank Whittle) had the idea of using a gas turbine to produce the large air-flow necessary for J. P., and, with little support until 1937, he worked on a series of engines, of which the W 1 eventually flew in the Gloster E 28/39 on 14 May 1941. The other pioneer work was done independently by the Ernst Heinkel firm in Germany, where experiments started in 1939, and the first engine, the Heinkel S3B, was flown in the experimental He. 178 monoplane on 27 Aug. 1939. After the first successes other firms in Britain and Germany were given instructions to develop J. P. engines, and by the end of the war many existed in both countries; the Germans were the first to put jet aircraft into service but the engines were much less reliable than Brit. types. Development in France was started by Rateau before the war, but was delayed by the occupation; while in the U.S.A. work was not started until 1941, when a Whittle engine and complete drawings were flown across the Atlantic.

Ignoring the mechanics of the different systems (see AERO-ENGINES) J. P. works on the principle of taking air into the engine, compressing it and reducing its velocity to a speed suitable for combustion, mixing with fuel, burning, and thereby expanding the mixture and increasing its kinetic energy, before finally ejecting it at high speed. Although the reaction is measured as pounds of thrust, propulsion is *not* the result of the jet pushing on the surrounding air; it is purely a reaction to the escaping jet.

Effectiveness of the jet depends upon the initial air compression (present average is about 4:1), and if a turbine engine is used many thousand horse-power from the gases must be absorbed in the turbine driving the compressor, while with a ram-jet, where compression is the result of forward speed only, it must be high enough to give the initial compression of 4:1 before reasonable return of power for fuel expended can be obtained. In both cases high air speeds (over 400 m.p.h. in the first and over 600 m.p.h. in the second) are necessary, so that the high air resistance to the aircraft means large fuel consumption to provide the necessary power.

Rockets (q.v.) are J. P. engines which carry their own oxygen—either in the fuel, or separately in liquid form—and are therefore independent of atmosphere for the air supply for combustion. Rockets have been used successfully for missiles

Jever, Ger. tn in the *Land of Lower Saxony* (q.v.), 112 m. NW. of Hanover (q.v.). It is one of the oldest tns of E. Friesland, has an anct castle (now a museum), and is known for its beer. There is also woollen milling and meat processing. Pop. 11,000.

Jevons, William Stanley (1835-82), economist and logician; b. Liverpool. At 15 he was sent to London to Univ. College. He already believed that important achievements as a thinker were possible for him. Whilst at Univ. College, his favourite subjects were chem. and botany. He unexpectedly received the assayership to the new mint in Australia and accepted the post because in financial need. He remained in Sydney for 5 years. In 1859 he again entered Univ. College as a student, taking the courses of the B.A. and M.A. degrees of the Univ. of London. Not long after taking his

PURE JET PROPULSION

The original propulsive duct suggested by René Lorin in 1913, which still expresses the basic principles, although details vary.

1. Air stream due to motion.
2. Air intake.
3. Diffuser to reduce air speed and increase pressure.
4. Fuel injectors.
5. Combustion chamber where the heat and expand.
6. Outlet venturi where kinetic energy of gas is converted from pressure to velocity.
7. High speed propulsive jet of hot gases.

(Ger. V.2 long range, anti-aircraft and ground short range), for the propulsion of fighter and research aircraft, and are frequently used to assist the take-off of heavily loaded aeroplanes. Characteristics are very high thrust for short periods.

All forms of J. P. engine are simpler and lighter for their power than other heat engines, but fuel consumption of the pure jet is high, and when a long range is needed the power of the engine is usually put into the turbine, which is then geared to drive a propeller. This form of engine is known as a propeller-turbine or turbo-prop. See also AERO-ENGINES and SUPERSONIC SPEEDS.

Jethou, one of the Channel Is., subject to Guernsey (q.v.). It is an infertile, granite ls. 1 m. in circumference, separated from Herm by a narrow channel, and sometimes inhabited by a single family.

Jeton, or Jetton, round piece of metal or ivory, which was formerly used in card games for counting, as well as a pass to the gaming tables.

Jetsam, see FLOTSAM.

Jette, or Jette-Saint-Pierre, NW. suburb of Brussels, Belgium. It is engaged in agriculture and manuf. of chemicals, enamelled goods, chicory, train oil, and cigarettes. Pop. 30,800.

M.A. degree, he was appointed tutor at Owens Collego, Manchester. In 1866 he was elected prof. of logic and mental and moral philosophy, and Cobden prof. of political economy there; in 1876 he exchanged the Owens professorship for the political economy chair in Univ. College, London; in 1880, owing to ill health, he resigned. He wrote a number of books on logic and political economy between 1864 and 1880. His letters and four. were ed. by his wife and pub. 1886. See L. Liard in *Les Logiciens anglais* (vi), 1878.

Jew, The Wandering, legendary Jew who, for an insult offered to Christ at the time of His Passion, is doomed to wander eternally throughout the world. The story is of no antiquity and does not appear at all in the E., no reference being made to it even in the great work of Jean d'Outremeuse. The tradition varies considerably, and no 2 versions agree as to the name of the Jew. The chronicle of St Albans Abbey for 1228 tells of the visit of an Armenian bishop who gave an account of the W. J. under the name of Kartaphilos. According to this version, he was a door-keeper of the Judgment Hall, and as Jesus passed out he struck Him saying: 'Go, Jesus, go on faster,'

to which the Christ replied: 'I go, but thou shalt tarry till I come again.' Matthew Paris in 1228, continuing the same chronicle, tells us that Kartaphilos was baptised by Ananias under the name of Joseph, and henceforth, at the end of every 100 years, falls into a trance from which he wakes to find himself at the age of 30, the age at which he was when he struck Jesus. The 'rhymed chronicle' of the W. J. was written in 1242 by Philip Mouskes, afterwards Bishop of Tournai. The version given by Paul von Fitzen, Bishop of Schleswig, in 1547 has it that Jesus, overborne by the weight of His cross, stopped to rest at the door of a cobbler, by name Ahasuerus, who pushed Him away saying: 'Away with you! Away!'; to which Jesus replied as in the version previously given. In Ger. legend the W. J. is associated with Johann Butadaeus (or Bultadaeus), who is alleged to have been seen in Antwerp in the 13th, 15th, and 16th cents. (Menzel, *History of German Poetry*). In Fr. legend he is called Lakedion or Laquedem (Mitternacht, *Dissertatio in Johan.*). The Fr. novelist Alexandre Arnoux in July 1931 issued a book, *Carnet de Route du Juif Errant*, in which the eternal wanderer tells some of his supposed adventures in various ages and lands. In Eugène Sue's Fr. novel *Le Juif Errant*, 1845, the Jew is named Salathiel, as also in G. Croly's novel *Salathiel*, 1827.

**Jewel**, John (1522-71), Bishop of Salisbury, b. Berryarbor, near Ilfracombe. He was educ. at Barnstaple and Oxford, where he became a lecturer. He defended the Eng. Church against Rome in his *Apologia Ecclesiae Anglicanae*, 1562. He spent some time abroad during Mary's reign, but returned to England on the accession of Elizabeth and was made Bishop of Salisbury.

**Jewellery**, derived from O.F. *jouel*, has in France 2 distinct branches concerned in the making of personal ornaments. These are *Bijouterie*, the working of ornaments in gold, silver, or any other metal, mineral, or material, often set with diamonds; and *Joaillerie*, which is concerned in the making of mounts, with open backs, and setting therein fashioned precious stones, mainly diamonds. The making of J. is the oldest of the crafts, an ornament for the head probably being the first type, or a necklace made of almost any material, threaded berries, stones with natural holes, shells, bone, teeth, amber, jet, etc., colour, as to-day, playing an important part in the crude conceptions of early man. More than 4000 years have elapsed since the goldsmiths of Ur of the Chaldees produced very delicate examples of the jeweller's art, using practically the same methods as are employed to-day. Like later Gk and Etruscan goldsmiths they relied almost entirely on gold for effect. The consummate craftsmanship of these people, as shown in the museums, included wire and grain work which has never been equalled and delicately plaited broad bands comparable to the admired Milanese bracelets of to-day, but infinitely

finer. Gold and semi-precious stones were used by Egyptian jewellers 4000 years ago to give notes of colour, and glass beads were also being made. Finger rings, necklets, earrings, brooches, and bracelets are all found. Finger rings, like the 'signet,' served a useful purpose; men's neck chains were signs of authority, and remain so to this day; bracelets were used for decorative and offensive as well as defensive purposes. Gold and silver, enamelled and set with bright-coloured gem-stones, distinguish Byzantine, A.-S., Medieval, and Renaissance J., as also that produced during the weak Gothic

ETRUSCAN ORNAMENTS IN GOLD  
FOUND IN RHINELAND

revival about 1830 and, to some extent, in the rococo period of the Victorian era. To the opening up of the diamond mines in Golconda and Hyderabad in the 17th cent. may be traced the greatest revolution which has taken place in the design and making of J. Prior to this, diamonds were polished on their natural faces, and the highest form of cutting was the 'table cut.' Then came the 'rose,' flat at the back, with small facets on the curved top, followed in 1643 by the *taille-en-seize* 'rose,' which was methodically cut with 16 facets. The invention of what is termed the 'brilliant' by Vincenzo Peruzzi at the closing of the 17th cent. made a notable change, though slow, in the design and construction of J. *Joaillerie* began to supersede *Bijouterie*, and the diamond definitely commenced its domination in the seventies of the 19th cent. The discoveries of the great mines in S. Africa greatly strengthened a growing fashion, the diamond mounter became the more important factor, and the revolution became complete so far as the larger and finer pieces of J. are concerned. Diamonds were first set into very slightly conventionalised floral forms, the base of which was

silver-fronted gold. Then another change took place, and platinum superseded the lumpy and not very rigid mount which was so easily affected by handling and atmosphere. Gradually design changed and from the naturalistic floral type grew J. with a flavour of the Renaissance, and ultimately the saner vogue we see to-day. In this diamonds and fine coloured gemstones are used as definite units in a design, and not merely to fill an area. Meanwhile the art of the original type of jeweller had been kept alive from the end of the 19th

PENDANT WORN BY QUEEN MARY  
OF ENGLAND (1553-8)

The painting of the queen, by Antonio Moro, in the Prado, Madrid, shows her wearing this historic jewel. The pearl was found in 1513, and the pendant was variously in the possession of Ferdinand V of Spain, Queen Mary, Napoleon III, and (1931) the Duchess of Abercorn. It is known as 'La Pelegrina.'

cent. up to 1925 by such men as René Lalique, René Foy, and Georges Fouquet in France, Hugo Schafer in Germany, and Henry Wilson in England, who considered artistic handling of material more than its intrinsic value. To-day the works of Carl Fabergé (1846-1920), jeweller and goldsmith to the Imperial Court of Russia, enjoy a vogue as an exquisite product of a recent but extinct civilisation.

After the Paris exhibition of 1925, jewellers discarded nature as the source for design and drew their inspiration from geometrical motifs. This phase has passed, and present trends have returned to floral, bow, and ribbon motifs. Increasing use of gold in form of coloured alloys, red, white, green, grey, with platinum, is evident. Palladium, because of its lightness, is being used. The prin. types of cut in vogue are, besides the brilliant and rose, the emerald or trap-cut, marquise, and in

particular a lavish use of narrow, rectangular diamonds, called baguettes when small, and bâtons when somewhat larger. An innovation dating from the Paris exhibition of 1937 is 'invisible' setting, the massing of cut gems without sign of the metal mount showing at all. The prin. centres in which J. is manuf. are London—at one time Clerkenwell was the centre, but during the last quarter of a cent. the industry has gradually migrated to the W. End—Birmingham, Paris, Brussels, Vienna, Berlin, Pforzheim, and Hanau. The lost wax method of centrifugal casting, a modern adaptation of an ancient method, is now widely used in the mass production of J. Intricate and delicate patterns can be reproduced in minute detail from a master pattern. Much of the highly skilled craftwork is thus eliminated, little remaining to be done but setting and polishing. See C. J. Davenport, *Cantor Lectures on the History of Personal Jewellery from Prehistoric Times*, 1902; H. Clifford Smith, *Jewellery*, 1909; G. F. Herbert Smith, *Gemstones*, 1912, 1949; Joan Evans, *English Jewellery from 5th Century A.D. to 1800*, 1921; W. T. Baxter, *Jewellery, Gem Cutting and Metalcraft*, 1938; A. Selwyn, *Retail Jewellers' Handbook*, 1845, 1955; L. Wiener, *Hand-made Jewellery*, 1948; Ronald Jessup, *Anglo-Saxon Jewellery*, 1950; Ernie Bradford, *Four Centuries of European Jewellery*, 1953. Jewett, Sarah Orne (1849-1909), Amer. novelist, b. S. Berwick, Maine, daughter of a doctor. She had little formal education, but read widely. Her first story was pub. in 1869, and in 1877 she estab. her reputation as a writer with *Deephaven*, a series of sketches dealing with her own countryside. She followed this with over a dozen novels and collections of short stories, of which *The Country of the Pointed Firs*, 1895, is reckoned the best, depicting the prov. life of New England; among others were *A Country Doctor*, 1884, *A Marsh Island*, 1885, *The King of Folly Island*, 1888, *Tales of New England*, 1890, and *The Tory Lover*, 1901. She was made a D.Litt. of Bowdoin and her letters were pub. in 1911. See biography by F. O. Matthiessen, 1929.

Jewish Autonomous Oblast, in the Khabarovsk Kray of the Russian Far E., situated in the Amur bend W. of Khabarovsk, partly forested, with rich mineral resources. Area 13,800 sq. m.; pop. (1939) 168,000, mostly Russians and Ukrainians. There is gold-mining and a timber industry, also grain and dairy farming. The cap. is Birobidzhan. Russian colonisation in the area started in 1852; Jewish, 1928; the J. A. O. was formed in 1934. See W. Kolarz, *The Peoples of the Soviet Far East*, 1954.

Jews. The early hist. of the Hebrews has been given in the article ISRAEL, and here a sketch will be given of the hist. of the Jewish people from the fall of Jerusalem in AD 70 until the present day. The fall of Jerusalem did not mean that the J. were doomed. The J. rebelled again in AD 115-17, this time in Babylonia, Egypt,

Cyrenaloea, and Cyprus (particularly in the last 2 ters.) and in 132-5. The discontent and desperation of the J. of Judaea increased by the fact that Hadrian contemplated the estab. of a pagan city on the site of Jerusalem, led to the general revolt in the year 132 under Bar Cochba (q.v.), supported by Rabbi Akiba. He kept up the revolt for 3 years. The rising was so successful that Rome determined to make a repetition impossible and in AD 135, Jerusalem was destroyed and its site ploughed up. The ter. of Jerusalem was turned into a Rom. colony under the name of Aelia Capitolina, and no Jew was allowed even in its vicinity. The name of Jerusalem was henceforth to be obliterated from the mind of man. Many of the pop. were put to death and many more carried off to slavery. From that time Palestine gradually sank into obscurity. The most violent methods were used by the Romans to reduce the J., and all J. throughout the Empire shared in the oppression. One of the most far-reaching effects of the Judeo-Rom. wars, and of the subsequent destruction of the Jewish national centre, was the wide dispersion of that people, which has remained to this day one of its distinguishing features. Even before the disaster of 135, however, large communities had already grown up in Babylonia, Egypt, Syria, the Yemen, and many other countries.

The Babylonian J. had formed a separate community since the time of the Exile, and had spread far and wide over the domains of the Persian Empire. These J. were at first of little importance from the religious point of view, but their intellectual status was raised by the arrival of leading personalities of Judaea deported by Nebuchadnezzar to Babylon in the 6th cent. BC. Babylonian J. were headed by the 'Prince of the Captivity,' who claimed descent from the house of David, and lived in semi-regal state. In the same period and in the cents. which followed, large numbers of J. had also settled in Egypt, where they also formed military colonies for the defence of that country, such as Elephantine. In the later cents. they congregated at Alexandria. Here had arisen the philosophic schools of Hellenic Judaism such as that of Philo Judaeus. It is, indeed, significant that the Egyptian J., unlike the founders of the Hasmonaean (see MACCABEES) State, did not resist 'assimilation.' On the contrary they became completely 'Hellenised,' abandoning their anct tongue for Greek and adopting Gk names. The Septuagint, the earliest Gk trans. of the Hebrew, was their work. The J. had also travelled far and wide throughout the W., and everywhere they had met with a considerable measure of toleration. After the fall of Jerusalem, the J. were left stunned under the catastrophe. The rally of Judaism is due largely to Rabban Johanan ben Zaccai, considered as a disciple of Hillel, who, having escaped from the besieged city, obtained permission from Emperor Vespasian to make Jamnia (Jabneh) his new centre. This place then became the

seat of a great rabbinical academy, and of the reconstructed Sanhedrin. Here the study and development of the Torah received a fresh impetus, and the canon of Jewish sacred scriptures was finally settled by Rabbi Akiba. The great product during the first 200 years of Jewish scholarship is the Mishnah, a collection of the results of the study of the Torah in Palestine, which may be considered a *corpus* of Jewish law. This was incorporated 300 years later in the Talmud (q.v.).

It is sad to record that a period of years of oppression began for Judaism with the accession of Constantine (after having extended to Christianity all the privileges and rights that hitherto paganism alone had enjoyed), though at first the statutes directed against the J. aimed more at restriction than at persecution. After the div. of the empire, the J. in W. Europe were deprived of the privileges granted them by previous emperors, and the canons of the Church councils of the period throw much light on the way in which they were regarded. They had a favourable period, however, under the Carolingians.

Meanwhile the spiritual leadership of Jewry passed into the hands of Babylonian J. who showed much intellectual activity. In 614, when Jerusalem fell into the hands of the Persians, the J. entered the city with the conquerors; but their triumph was short-lived. Everywhere, however, both in E. and W., we find them most active in commerce, engaged everywhere in ministering to the needs and luxuries of civilisation. The period from about 700 to 1100, though one of the darkest ages in Europe and of growing persecution of the J., has been described as the 'golden age of Middle Eastern Judaism,' and, during this period (apart from the great E. Jewish luminaries, such as the Gaon Saadia (*Arabic* Sa'id) ben Joseph, of Fayûm (Upper Egypt), 892-942), one particular band of J. stands out in great prominence. The J. of Spain were, during that period, the representatives of the world's greatest culture. Here they flourished under the favourable rule of Islam. The rise of the Hispano-Jewish colleges dates from the arrival at Córdoba of Moses ben Enoch, who had been ransomed from slavery by his co-religionists. Aided by the munificence of Chasdal ibn Shaprut, the schools of Córdoba rapidly became flourishing centres of letters and of Talmudic study.

In all depths of learning J. now became prominent. Menachem ben Saruk and Dunash ben Labrat were poets and early students of Heb. grammar, who were soon superseded by Johan ibn Janach, the great master of Heb. philology, who died in 1050. Some of the most beautiful of Heb. poetry was also produced at this time. The foremost of the Payetanim or liturgical poets was Eleazar ben Kalir, whose poems have now a place in the service of certain Jewish holy days. One of the greatest of Jewish poets was Solomon ibn Gebirol (1021-70), whose best-known

poem, *Kether Malchuth* (The Crown of Kingdom), has been incorporated into the liturgy for the eve of the Day of Atonement. Judah Halevi (c. 1086-c. 1142) has been described as the greatest Heb. poet since the time of David, and his poems are remarkable for depth of emotion and beauty of expression. Abraham ben Meir (Ibn Ezra of Toledo, c. 1088-1167) was one of the finest Bible commentators. He also visited London, where he wrote an important work. Solomon ibn Gebirol was less famous as a poet than as a philosopher, for he first introduced, indirectly, the Gk philosophy (as interpreted by the Arabians) to the Christians of the Middle Ages. His *Fons Vitae* is a systematisation of the Gk and Arabic philosophy, which formed later an important source of scholasticism. Medieval Judaism culminates in the figure of the intellectual giant Moses Maimonides (q.v.). Though the Sp. schools stand supreme during this period, similar institutions not destitute of learned men are to be found in France and Germany. The greatest of the Franco-Ger. Jewish luminaries was Rabbi Solomon Yis'haki, known (from his initials) as Rashi (q.v.). On the whole, however, Franco-Ger. scholars did not attain to the polish and versatility, as well as the philosophical breadth of view, which distinguished their Sp. brethren, but they possessed in an abundant measure moral earnestness and deep piety.

But during all this period, while Judaism had been producing its ripest fruits of learning in Europe, the clouds had been gathering. Though treated as obnoxious strangers and unbelievers, at least the J. in the Carolingian empire, and even in England and Christian Spain, found some justice and occasional favour as a useful mercantile class in a state of society in which religion and arms were the only tolerable occupations. Regarded by the rulers as a very valuable source of revenue, even as an indispensable adjunct of the pop. and competing with none of them, the J. not only enjoyed the protection of the authorities, but also largely the passive good-will of their neighbours. The Crusades were more instrumental than anything else in changing the condition of the J. for the worse, accompanied as they were by wholesale massacres. The fury which had possessed the crusaders and caused them to attack the 'Saracens of Europe' rather than the Saracens of Asia was felt in the different countries themselves. The J. had always been a separate community dwelling in the land, but not forming part of it, and this isolation led to the levelling of the most extravagant charges against them, which were

by the credulous vulgar. of these charges, such as that of the slaughtering of children for ritual purposes, were, strangely enough, identical with those levelled against the Christians themselves during the first cents. of Christianity. Moreover, the wealth of the J. made them fit objects for pillage and spoliation. The J. were excluded from possession of the soil, and from every

honourable profession or handicraft. They were thus driven to money-lending, and in this pursuit acquired a reputation for avarice and extortion only less than that of the sovereigns and nobles who made use of them.

To England the J. came in large numbers with William the Conqueror, and settled in the large tns. In 1144 there was a great disturbance over the accusation made against the J. of Norwich of having slain a Christian boy, known afterwards as St Wm of Norwich, for their Pass-over. Such accusations continually recur in the years that follow, and the case of little St Hugh of Lincoln, narrated by Chaucer in the *Prioresses Tale*, is well known. The most serious event in the hist. of Jewry in medieval England occurred when a deputation of leading J. appeared at Westminster for the coronation of Richard I in 1189. They were attacked by the mob, and a report spread that the king had ordered a general massacre. A very good attempt to carry out this supposed order was made in London and many other tns. The massacre was particularly great in York. In 1290 the J. were expelled from England, not to return until 1656.

In Central Europe, the lot of the J. was even more unfavourable. Only in Rome, under the influence of the popes, and particularly in Turkey and Poland, was any toleration allowed them. In other countries they were perpetually subject to extortion and persecution, and any peace that was given them seems usually to have been merely a breathing time that they might accumulate more material for plunder. They were now kept rigidly apart from Christians, confined to particular quarters of the tns they lived in, later known as ghettos, and often obliged to wear a yellow badge to distinguish them from other people. Many of them, especially in Germany, left their homes and sought refuge in Poland and Lithuania (then in 'union' with Poland), where the J. achieved religious autonomy; regular synodal assemblies (called Va'ad Arba' Arazoth) were convened, which greatly helped to maintain unity. In the early 17th cent. a good deal more than half the J. in the world were congregated in that belt of country. The Polish kings protected them, but the respite was short-lived. In the 10 years (1648-58) of the massacres by the savage Cossacks (q.v.) and in the Polish-Russian and Polish-Swedish wars a great number of J. (250,000 to 500,000) lost their lives. With the 3 partitions of Poland (q.v.) in the late 18th cent. over a million J. came under Russian rule. A sort of territorial ghetto, the Jewish Pale of Settlement, was estab. from the Baltic to the Black Sea near Odessa, and throughout this area the urb. ghetto system was imposed.

It is hardly necessary to speak of Spain during the latter half of the Middle Ages. The atrocity of the Inquisition in that country is a byword. These persecutions in Spain caused many of the Sp. J. to make an outward profession of Christianity,

and, if we may judge from the words of Torquemada, Grand Inquisitor during the latter half of the 15th cent., many of these 'Marranos' (Sp. J. who, outwardly, but not from secret conviction, accepted the Christian faith) held high positions in the Catholic priesthood. Finally it was resolved to expel all J. from the Sp. domains, and in 1492 some 200,000 Sp. J. left their homes and the graves of their forefathers. Some went to Portugal, some to Holland, S. France, or Italy. Others sought a refuge in Ottoman ters., where they were warmly welcomed by the Sultan Bajazet II.

During this period of oppression the learning of the previous age turned to mysticism and the intricacies of the Talmud. To mysticism belongs the Cabbala (q.v.), strange medley of Jewish religious philosophy and spiritual quackery. To the same trend of thought may be ascribed the rise of many pseudo-Messiahs such as Sabbatai Zevi (q.v.). The Reformation did not at first produce any change in the attitude of the Christian states towards their Jewish subjects. But the spread of the New Learning led to an intelligent interest being taken in the productions of Jewish scholars, and a landmark in the rise of tolerance is marked by the pub. in 1706-11 of Jacob Christian Basnage's *History and Religion of the Jews since Christ to the Present Day*. The 17th cent. also saw the rise of the famous Benedict Spinoza (1632-77), one of the greatest men that Jewry has produced. But cents. of oppression had done its work, and by the middle of the 18th cent., when external affairs were about to take a turn for the better, the general conditions of the J. had sunk to a low ebb. As a whole, the J. remained a class of social pariahs, petty traders, or artisans despised by all.

But, during the years that have passed since then, a marvellous evolution has been seen. As the J. have become enfranchised, they have produced a host of men of distinction in all walks of life. Numerous are the outstanding men of Jewish origin in science, art, politics, and other fields: Mendelssohn, Disraeli, Hertz, Rufus Isaacs (Marquess of Reading), Ehrlich, Einstein, Gompertz, Mond, Schwarz, Graetz, A. von Wassermann, Henle, Freud, Bialik, Heine, J. Wassermann, E. Ludwig, S. Zweig, Wertel, Kafka, G. D. Ascoli, Schnitzler, Zamenhof, and many others. Especially has progress been seen in the spheres of political activities. In this connection we can only deal with England. In 1723 the words 'On the true faith of a Christian' were removed from the Jewish oaths. In 1753 a Jewish Naturalisation Bill was passed, but such was its unpopularity that it was repealed in the following year. In 1833 began a series of unsuccessful attempts to remove Jewish disabilities, the Bills being invariably thrown out by the House of Lords. A compromise by which Baron de Rothschild, who had been elected for the City of London, was allowed to sit in Parliament, was arrived at in 1858, and in 1860

the parl. oath for both Houses was permanently amended. But Jewry has been fated never to obtain freedom and security for all its people at one time. As a set-off to their recovery in W. Europe, a new foe appeared in 'Anti-Semitism'—new because now, in the 19th cent., the attack was grounded not on creed but on 'race.' The movement began in Germany about 1880, and spread throughout Central Europe, and the Dreyfus case was evidence enough of the hold it obtained in France. It revived, too, the old intolerance in Russia. From 1881 onwards the plight of the J. in Russia was almost as bad as it had been in W. Europe at the time of the Crusades. A series of pogroms was initiated and repeated from time to time till as late as 1910. Between 1880 and 1910 at least 3,000,000 J. fled from E. Europe. Many found refuge on Brit. soil, in England or in the dominions; but the great majority went to the U.S.A. In 1870 the number of Amer. J. was roughly about 250,000; in 1940 it was about 4½ millions.

*Jews in the First World War period and after.* The First World War and the turmoil and confusion that followed caused widespread suffering and loss of life to Jewish people. The sufferings of the J. in Russia were particularly severe, becoming, if possible, more tragic at every new change that swept over that country. The stern official discipline under the Czarist regime bore particularly heavily upon them, restricting their freedom of movement and emphasising the severity of their disabilities. The first revolution, with its consequent disorganisation, deprived many people of legal protection, and particularly those who were unpopular. In some areas individual J. were creditors to whom their neighbours owed money, and the chance of cancelling debts by means of violence was often a direct incentive to crime. As the largest body of individualists in a Communist state, the J. suffered most of all by the change to the Soviet Gov. After the First World War the 2 most important developments in Jewish hist. were the outstanding development of Palestine as a Jewish national home (see ISRAEL and ZIONISM) and the revival of Anti-Semitism in Germany under Hitler. Anti-Semitism, indeed, formed almost the central feature of the 'philosophy' of Hitler's *Mein Kampf* (q.v.) and, under the so-called Aryan Paragraph, J. were first expelled from the civil service; afterwards, Jewish lawyers, doctors of medicine, dentists, teachers, and editors of journals, were deprived of their livelihood; finally, Jewish business men were boycotted, the peasantry purged of 'non-Aryans,' and Jewish trade union officials removed. By the close of 1935 all J. were, in effect, 'denationalised' and deprived of all civic rights. At the beginning of 1932 there were some 600,000 J. in Germany. Thousands fled to other countries and it is one of the tragic ironies of hist. that some 5 or 6 years later, when Nazis had overrun most of Europe, the refugees found

themselves persecuted anew and quite often by those amongst whom they had sought a new home.

It seems probable that the total number of J. slaughtered by the Germans during the Second World War was not far short of 6 million. According to the Inter-allied Information Committee the number of Jewish victims deported or perished in Axis-controlled Europe between 1939 and 1942 was 2,000,000, while another 5 million were in danger of extermination. In Belgium the actual extermination of the J. was decided upon in May 1942 and, according to Ger. statistics, 25,000 of the 52,000 J. living in that country in 1941 had been deported by the Gestapo. On the day of the Ger. occupation of Czechoslovakia there were 90,000 J. in Bohemia and Moravia and 95,000 in Slovakia; by May-June 1942 more than 72,000 had left Bohemia and Moravia and 65,000 had left Slovakia—all for Polish ghettos where they were cruelly exterminated. The J. in France, Holland, and Norway suffered in the same way. In Yugoslavia Ger. sadism had resulted in the murder of 58,000 of the 86,000 J. in that country since the Ger. invasion (6 April 1941). From the very first moment of the occupation of Poland by the Germans the J. were the object of especial persecution. Murder and robbery were the order of the day. On 1 Nov. 1940, a ghetto was organised in Warsaw and J. were forbidden to leave its walls. In this ghetto and indeed in all the other ghettos, conditions were appalling. In some houses up to 1000 persons lived; individual rooms accommodated an average of 13 persons. Typhus and other diseases took heavy toll of the starved and half-starved. This terrible plan of systematic murder was considered too slow by the Germans, however, for in Mar. 1942 more direct methods of annihilation were instituted. Himmler (q.v.), after a brief stay in Warsaw, issued an order that half the number of Polish J. were to be killed in 1 year. Deportations were, accordingly, begun on 17 Aug. and 10,000 persons were removed daily, while in the meantime a special Extermination Commando had been organised and trained in murder beforehand in Germany. Places of execution were organised at Chelm and Belzec, where those who survived the shootings were murdered *en masse* by means of electrocution and lethal gas. In fact the Germans had transformed Poland into one vast centre for murdering J., not only those of Polish nationality, but those of other European nationalities also. See also AUSCHWITZ (OSWIECIM); BELSEN; BUCHENWALD; CONCENTRATION CAMP; BACHAU. The Anglo-U.S. Palestine Report shows that during the war of 1939-45 the Jewish pop. of Nazi-occupied Europe was reduced by slaughter and starvation by 5,721,600, or more than half the 1939 total. Statistics, however, vary. It is estimated that, before the sack of Jerusalem in AD 70, the J. numbered 4½ million. At the close of the 15th cent. there were only 1½ million. Before the Second

4½ million were in the U.S.A. Of the 10 million in Europe, 9 million were in central and E. Europe—3 million being in Poland. The *Jewish Year Book* gives the 1936 total as 11½ million, of which there were 5 million in the U.S.A., 2 million in the U.S.S.R., 1,600,000 in Israel, and 450,000 in the U.K.

See E. R. Bevan and C. Singer, *The Legacy of Israel*, 1927; L. Magnus, *The Jews in the Christian Era*, etc., 1929; M. M. Kaplan, *Judaism as a Civilisation*, 1934; A. Ruppin, *The Jews in the Modern World*, 1934; J. L. Landau, *Judaism Ancient and Modern*, 1936; S. W. Baron, *A Social and Religious History of the Jews* (3 vols.), 1937; C. Roth, *The Jewish Contribution to Civilisation*, 1943, and *A Short History of the Jewish People*, 1948; P. Goodman, *History of the Jews*, 1951. See also HEBREW LANGUAGE AND LITERATURE and ZIONIST MOVEMENT.

**Jew's Ear**, or *Auricularia auricula-judae*, fungus shaped somewhat like an ear. It is found chiefly on elders, and was given its name from a legend that Judas hanged himself on an elder-tree.

**Jew's Harp**, small musical instrument, consisting of an elastic vibrating steel tongue riveted at one end to a frame of brass or iron. The narrow free end is at right angles to the vibrating piece. The instrument is held between the teeth, while the metal tongue is twirled by the forefinger. Sound is increased in intensity by the breath, and altered in pitch by the shape of the mouth's cavity.

JEW'S HARP

**Jew's Mallow**, or *Corchorus olitorius*, family Tiliaceae, found in tropical Asia; also *C. capsularis*; both are annuals, growing to 12 ft. and chief sources of jute fibre.

**Jex-Blake, Sophia Louisa** (1840-1912), physician, b. Hastings, Sussex. She was mathematical tutor of Queen's College,

London, from 1858 to 1861, and in 1866 began to study medicine in Boston, U.S.A. She returned to England in 1868, and matriculated in the medical faculty of the univ. of Edinburgh in 1869. In 1874 she founded the London School of Medicine for Women, and in 1877 qualified in medicine at Dublin. In 1878 she opened a dispensary for women and children in Edinburgh, and a cottage hospital in 1885. In 1886 she founded the Edinburgh School of Medicine for Women. She pub. *American Schools and Colleges*, 1867, *Medical Women*, 1872, *Care of Infants*, 1884, and *Puerperal Fever*, 1877. See life by M. Todd, 1918; M. Masefield, *Seven Against Edinburgh*, 1951, E. M. Bell, *Storming the Citadel; the Rise of the Woman Doctor*, 1953.

Jezireh Road, see ARVAD.

Jezreel, city on a spur of the Mt Gilboa range, 11 m. from Nazareth. It was the cap. of Ahab; here Ahab coveted Naboth's vineyard, and Jezebel had Naboth murdered. The modern vil. Zer'in, built of stone, stands on a bare and rocky knoll, where the remains of ancient cisterns and old sarcophagi are still seen.

Jezreel, Plain of, see ESDRAELON.

Jhansi, city of Uttar Pradesh State, India. It is situated in the former prov. of Bundelkhand (q.v.), is 60 m. distant from Gwalior, and is an important railway centre. In 1857 the Rani of J. took the lead in revolt against the Brit. troops. The seizure of the fort was followed by a massacre of officers who had capitulated. The fort and city were recaptured the following year.

Jhelum, tn on the J. R., in W. Pakistan. Timber floated down from Kashmir forests is collected here, and boat-building is carried on.

Jhelum, The, anct Hydaspes, one of the 5 rivs. of the W. Punjab in Pakistan. It rises in the hills of Kashmir, and is navigable for about 70 m. in that state. It flows through Walur Lake, thence through the snow-clad Himalaya. Upon its emergence from these mts, via the Baramula Pass, it again becomes navigable. About 250 m. from its source it enters the plain of the Punjab, and after another 200 m. joins the Chenab, also one of the 5 rivs., at Timmu. In the J. valley is situated the lovely and world-famous 'Happy Valley' of Kashmir.

Jhering, or Ihering, Rudolf von (1818-1892), Ger. jurist, b. Aurich in E. Friesland. He was educ. at the univ. of Heidelberg, and at Göttingen and Berlin. Later he was a prof. at Basel, then at Rostock, in 1849 at Kiel, and in 1851 at Gießen. He set forth a fresh view of the Rom. law, adapting the old as the basis for a new system of jurisprudence. He gained a great reputation, and in 1868 was offered the chair of Rom. Law at Vienna, which he held until 1872, when he went to Göttingen as prof. His chief works are *Geist des römischen Rechts auf den verschiedenen Stufen seiner Entwicklung*, 1852-65, *Der Kampf ums Recht*, 1872, 1925 (Eng. trans. 1884), *Zweck im Recht*, 1877-83, and *Jurisprudenz des täglichen*

*Lebens*, 1870 (Eng. trans. 1904). See study by M. Rümelin, 1922; also K. Wieland, *Andreas Heusler und Rudolf von Jhering*, 1935.

Jib (etymology uncertain, only found in English, probably connected with *gibbet*), foremost sail of a ship. It is triangular in shape, and stretches from the outer end of the J.-boom (which is the spar run out from the termination of the bowsprit) to the fore topmasthead. This is in the case of larger vessels; in smaller craft which have no J.-boom the J. extends from the bowsprit to the masthead. A 'flying jib' is a sail set in addition to the J., and lashed to the 'flying jib-boom.' A 'middle jib' is a sail sometimes rigged in addition to the J. and flying J., extending from the end of the J.-boom when the J. is half-way down it. As many as 6 J.s may be carried by large vessels, the outmost being called the 'jib of jibs.'

Jibraltar, see GIBRALTAR.

Jibuti, Jibouti, or Djibouti, see DJIBOUTI. Jicarillas, tribe of N. Amer. Indians of Athapascan stock, originally inhabiting parts of New Mexico and Arizona, now on a reservation in New Mexico. They were once very formidable, but are now subdued and rapidly decreasing in number. They make excellent basket work.

Jidda, Jiddah, see JEDDA.

Jig (Fr. *gigue*; It. *giga*) was originally a sprightly It. dance in 6/8, 12/8, or 3/8 time. It was often used artistically by old masters and introduced into their suites. Bach and Handel used it to finish a suite, and then simple time is sometimes found, but with the characteristic rhythm represented by triplets.

Jigger, see CHIGOE.

Jigoro Kano, see JU-JITSU.

Jihad, Muslim name for a general religious war against Christians, infidels, or other unbelievers.

Jihlava: 1. Region (*kras*) in Central Czechoslovakia, bordering on Austria, mainly part of the former prov. of Moravia (q.v.) but including also part of Bohemia (q.v.). Area 2,455 sq. m.; pop. 423,000.

2. (Ger. *Iglau*) Czechoslovak tn. cap. of the region of J. In the Middle Ages it was a mining centre, silver having been worked since the 8th cent. There are textile and engineering industries, and a trade in market produce. Pop. 23,500.

Jijona, Sp. tn in the prov. of Alicante. It manufs. shoes, and has a trade in fruit and honey. Pop. 8000.

Jilolo, see HALMAHERA.

Jimenez de Cisneros, see XIMENES.

Jiménez, Juan Ramón (1881-1956), Sp. poet, b. Moguer. Of delicate health, J. was essentially an aesthete. A marked evolution can be seen in his poetic style. His early poems (1903-5) such as *Arias tristes* and *Jardines lejanos* are simple, short-lined lyrics, influenced by Verlaine. Then his verse becomes firmer, more ornate, as in *La Soledad sonora*, 1911, where he uses alexandrines. Finally, in 1916, he abandoned fixed metres and adopted the *verso libre* ('poesia desnuda'): *Diario de un poeta recién casado*, 1916,

*Eternidades*, 1918, and *La Estación*, 1923-1936. His influence on contemporary poetry was immense. Fifty of his poems have been trans. into English by J. B. Trend, 1950. He received the Nobel prize for literature in 1956. See *E. Diez Canedo, J. R. Jiménez y su obra*, 1944.

Jimines de Cisneros, Francisco, see XIMENES.

Jinas (literally the 'victorious' one as contrasted with the merely 'awakened' one, Buddha), in the Indian religion of Jainism (q.v.), the deified saints who give the sect its name. A Jina is an omniscient sage who re-establishes the law in its integrity when it has become corrupt. Jainists hold that 24 J. have appeared at long intervals of time. Mahavira, founder of the Jainist sect, was the twenty-fourth Jina.

Jingo and Jingoism. The derivation of J. is uncertain, but the modern application was borrowed from the lines of a music hall song by W. Hunt, very popular in 1878, the chorus of which ran:

'We don't want to fight, but by Jingo! if we do,  
We've got the ships, we've got the men,  
and got the money too.'

The term J. was at that time used as a nickname for those who supported Beaconsfield's anti-Russian policy of sending ships to the E. to assist the Turks against the Russians. From this the term has come to mean any person who advocates a bellicose or chauvinist policy, and Jingoism, therefore, denotes the policy of the Jingoists.

Jinn, see GENIUS.

Jinn, or Djinn, name of a class of spirits in Arabian mythology. The greatest of them was Eblis, who was formed out of smokeless fire. In the Arabian Nights they are spoken of as long anterior to Solomon. There are both good and bad J., and among the latter the 5 sons of Eblis may be mentioned besides the Ghoul, which appears in human form, the Sealáh, found in forests, the Delhán, living on ls., and the Shikk, shaped like a human being halved lengthwise. Eblis is often made the equivalent of Satan. The J. are reputed to assume various shapes, and live chiefly in the mts of Káf, but their evil influence can be averted by talismans, etc.

Jinnah, Mahomed Ali (1876-1948), first Governor-General of Pakistan on partition of India, 1947. Known as Qaid-i-Azam (Great Leader). B. of a wealthy merchant family in Karachi, J. was educ. in Karachi and Bombay, then studied law at Lincoln's Inn in London and was called to the Bar in 1896. Returning to India he found his family fortunes dissipated and started to practise in Bombay. After a few difficult years he became very successful at the Bombay Bar.

Always attracted to politics, he joined the Indian Congress, becoming private secretary to Dadabhai Naoroji, one of the founders of Congress. Elected to the Central Legislature, of which he remained a member for nearly 40 years, he stood at

first for Hindu-Muslim unity in an independent India, helped to organise the boycott of the Simon Commission, 1928, and attended the Round Table Conferences in London, 1931-3. Although he spoke at this time of a dominion of all India, doubts had already entered his mind on the outlook for Muslims. He returned to India in 1934 and was elected president of the Muslim League, a position he occupied until his death. The sweeping Congress election victories in 1936-7 confirmed him in his view that Hindus would dominate Muslims to the

*The High Commissioner for Pakistan*  
MAHOMED ALI JINNAH

point of exclusion and subordination. In 1940 at Lahore J. declared publicly that Hindus and Muslims represented distinct civilisations and that the only course open to both was to allow the major nations (of India) to separate to their homelands. From this position he never withdrew. On partition in 1947 J. became Governor-General of the new dominion, Pakistan, and president of the Constituent Assembly.

J. was a striking figure, tall, lean, and handsome. Of exceptional legal ability, he was a most persuasive advocate. As a politician he was shrewd and astute but also incorruptible and inflexible. He had no administrative experience and would not have claimed to be an administrator. But as the leader of the 70,000,000 Muslims previously in India he had no rival, and can truly be described as the founder of Pakistan.

**Jinotega**, tn in W. Nicaragua, 13 m. NW. of Matagalpa, is the cap. of J. dept. Large quantities of coffee are grown in the dist.; hat-making and flour-milling are other occupations. Pop. 4550.

**Jinotepe**, tn in S. Nicaragua, cap. of the dept. of Carazo, is 22 m. SSE. of Managua. It is the centre of a sugar and coffee producing dist. Pop. 7000.

**Jipijapa**, city of Manabí prov., Ecuador, in the W. lowlands of that country, connected by road with Portoviejo and Guayaquil (80 m. to the SE.). J. is famous for the export of straw ('Panama') hats. Pop. 7600.

**Jirjeh**, see GIRGEH.

**Jitomir**, see ZHITOMIR.

**Jiu-Jitsu**, see JU-JITSU.

**Jivaro**, Amer.-Indian tribe of Ecuador and Peru. They are warlike and numerous, and are famed for their practice of shrinking the heads of captured enemies, the heads being kept as trophies. They were reduced by the Spaniards after the conquest of Peru, but won back their liberty in 1599 by a general insurrection. See B. Flornoy, *Jivaro, Among the Head-shrinkers of the Amazon*, 1953.

**Jmudes**, see SAMOGITIA.

**Joab** ('Yahweh is a father'), son of Zeruah; David's nephew and general, first mentioned in 2 Sam. ii. 12 ff. in the campaign against Abner and Ishbaal. He was promoted general after the capture of Zion, and later captain 'over all the host of Israel' (2 Sam. xx. 23). He was a headstrong character whom David failed to control (2 Sam. iii. 39; xviii. 14 f.). He was prominent in the rebellion of Absalom and that of Sheba. He later took part in Adonijah's attempt to gain the crown, and was executed by Solomon.

**Joachim, George**, see RHETICUS.

**Joachim, Harold Henry** (1868-1938), philosopher; educ. at Harrow and Balliol College, Oxford. His father was a brother of the violinist Joseph J., and his mother a daughter of the organist and composer Henry Smart. After teaching moral philosophy at St Andrews, J. went to Oxford, where he became Wykeham prof. of logic with a fellowship of New College from 1919 to 1935, and was a leading representative of the Hegelian tradition. He pub. few works, but all are of outstanding quality: *Study of the Ethics of Spinoza*, 1901, and *Nature of Truth*, 1906 (expounds the doctrine of truth as 'coherence'); trans. of Aristotle's *De Lineis Insecabilibus*, 1908, and *de Generatione et Corruptione*, 1922, both showing a profound knowledge of anc. philosophy. His unpub. lectures on Aristotle have the same authoritative character.

**Joachim, Joseph** (1831-1907), Austro-Hungarian violinist, conductor, and composer, b. Kittsee near Pressburg. As a boy prodigy he visited Vienna (1841) and Leipzig (1843), where his talent won Mendelssohn's recognition, and London (1844). At the age of 18 he became leader in the Grand Duke's band at Weimar; 4 years later he was appointed to the court of Hanover, and for the next 13 years continued as director of the royal con-

certs. From 1862 until his death he appeared regularly every year in London, chiefly at the St James's Hall and the Crystal Palace, where he became known pre-eminently as the untiring apostle of Brahms. In 1868 he began his official career as a teacher at the Berlin Royal Academy of Arts, and in the following year founded the J. quartet, which for many years represented chamber music at its finest. See life by A. Moser, 1898, 1908-10 (Eng. trans. by L. Durham, 1901).

**Joachimsthal**, see JACHYMOV.

**Joad**, Cyril Edwin Mitchinson (1891-1953), author, specialising in works of popularised philosophy. Educ. at Blundell's School and Balliol College, Oxford; John Locke, scholar in moral philosophy, 1914. Entered civil service in Board of Trade, 1914, later going to Ministry of Labour; retired 1930. Chairman of the National Peace Council, 1938. Appointed head of Dept of Philosophy and Psychology, Birkbeck College, univ. of London, 1930. Acquired a popular reputation by his answers as a member of the 'Brains Trust,' a feature of B.B.C. programmes. His numerous publs. include *Essays in Common Sense Philosophy*, 1919, *Philosophical Aspects of Modern Science*, 1932, *The Book of Joad*, 1935, *Great Philosophies*, 1937, *The Testament of Joad 1937, A Year More or Less*, 1948, and *Decadence: A Philosophical Enquiry*, 1948.

**Joan**, wife of the Black Prince, see FAIR MAID OF KENT.

**Joan I.** of Naples (1327-82), daughter of Charles, Duke of Calabria, became queen in succession to her grandfather, King Robert, in 1343. She had no sons and so made Louis I, Duke of Anjou, her heir, with the result that Charles, Duke of Durazzo, who regarded himself as the rightful future King of Naples, seized the city. J. was captured and executed at Aversa.

**Joan II.** of Naples (1370-1435), daughter of Charles of Durazzo, King of Naples. She succeeded her brother Ladislas in 1414, and was at that time the widow of Wm. of Austria. She next married Jacques de Bourbon, Count of La Marche, but at the same time chose Count Pandolfello as her lover. He was arrested and executed by her husband, she herself being condemned to religious seclusion. On regaining her liberty she in her turn had Jacques imprisoned. Her whole reign was disturbed by civil wars, and on her death the throne passed to Alfonso of Aragon.

**Joan**, Pope, mythical personage, long believed to have filled the papal chair as John VIII, about 855. She was said to have been the daughter of an Eng. missionary, and educ. at Cologne. She fell in love with a monk with whom she went to Athens in male attire, but returned to Rome on his death. Here she opened a school, and entered the priesthood, eventually being elected pope, but d. during a papal procession. This tale was first overthrown by Blondel in 1647, who pub.

an *Éclaircissement de la question*, but was finally and completely refuted by Döllinger in his *Papstthum des Mittelalters*, 1863 (Eng. trans., 1872).

**Joan of Arc, St. (Fr. Jeanne d'Arc)**, (1412-31), the Maid of Orleans or 'La Pucelle,' Fr. saint and national leader, was b. in the vil. of Domrémy near Vaucouleurs, on the borders of Champagne. Her parents were peasants. Her extraordinary character and conduct make her one of the most striking and controversial figures in hist. From the age of 13, according to her own account, she began to hear the voices of Sts Micheli, Margaret, and Catherine commanding her to deliver her country from the Eng. invader and to conduct Charles VII., King of France, to Rheims, to be crowned. She persuaded the local governor to let her go to the king, at Chinon, to tell him her message: there her fervour and sincerity conquered the scepticism and defeatism of the court. She was given permission to go to the deliverance of Orleans, at that time under Eng. siege. She donned male dress and a suit of white armour, and, mounted on a black charger, put herself at the head of an army of 6000 men, and advanced to aid Dunois in the siege of Orleans. She entered the city in April 1429, and forced the English to raise the siege and retreat after 14 days' fighting, and Charles entered Rheims and was crowned in July of the same year. After this she drove the English from thence. They and the Burgundians swore that she must be a witch: her own followers clearly regarded her as a saint. But at court many were jealous of her influence over the king and waited for the chance to get rid of her. When she failed to take Paris her prestige suffered a considerable blow; soon after (May 1430) she was captured by the Burgundians and sold to the English. She was imprisoned at Rouen, condemned as a heretic, and finally burned at the stake. There is no doubt that the English wanted her death for political reasons; but those who tried her were largely Frenchmen, and it is now considered quite probable that her life might have been spared had she presented her case more carefully. It was when she insisted on putting on male dress again—possibly as a protection against her jailers—that her fate seems to have been finally sealed. In 1455 a special commission appointed by the Pope rehabilitated her. She was canonised in 1920. There are interesting dramatic interpretations of J. by G. Bernard Shaw and J. Anouilh (trans. into English by Christopher Fry). See also A. Lang, *The Maid of France*, 1908; H. Belloc, *Joan of Arc*, 1929; W. Barrett, *Trial of Jeanne d'Arc*, 1931; V. Sackville-West, *Joan of Arc*, 1936; F. Winwar, *The Saint and the Devil*, 1948; A. Buchan, *Joan of Arc and the Recovery of France*, 1948; Regine Pernoud (trans.), *The Retrial of Joan of Arc*, 1955.

**Joanes, or Juanes, Vicente** (1523-79), Sp. painter, who was sometimes referred to as 'the Spanish Raphael,' b. Fuente de la Higuera in the prov. of Valencia. He

studied chiefly at Rome, but his best works are at Valencia. All his subjects are religious, and are marked by a beauty of colour and minuteness of finish.

**Joannes Damascenus, St. or Chrysorrohoas** (c. 676-749?), theologian, hymn-writer, and one of the later Gk fathers, b. at Damascus. He defended the veneration of images in a controversy with Leo the Isaurian. He spent his later years in the monastery of St Sabas, near Jerusalem. His works include an *Encyclopaedia of Christian Theology*; treatises against Jacobite and Monophysite heretics; disputations against superstitions; homilies; *Barlaam and Josaphat*, a disguised version of the life of Buddha; *Fons Scientiae*; and *De Imaginibus*. But he is best remembered by his hymns, many of which have been trans. into English. He was declared a Doctor of the Church in 1890. His feast is on 27 March. The first good ed. of his works was that of Le Quien, 1712; this was reprinted in 1748. See H. Menger, *Die Bilderlehre des Johannes von Damaskus*, 1938.

**Joash, or Jehoash**: 1. Son of Ahaziah and King of Judah (836-797 BC), came to the throne at the age of 7. J. at first ruled well, and restored the Temple, but later relapsed into the Baal worship of his grandmother Athaliah (2 Chron. xxiv. 15 ff.). He was ultimately assassinated. See also **ATHALIAH**; **JEHOIADA**.

2. (**Jehoshaphat**) Son of Jehoahaz, King of Israel (c. 798-783 BC), third in the dynasty of Jehu. By 3 great victories over Benhadad, foretold by Elisha, he regained the lands conquered by Hazael, and then reduced Judah to dependence on Israel.

**Job, Book of** (Heb. *ʾIyyōb*), one of the most remarkable books of the O.T., belonging to the Hagiographa. The book in its present form divides naturally into 5 parts: (1) The introduction (chs. i. and ii.) first shows us Job as a prosperous Edomite Emir, whose prosperity is equalled by his godliness and uprightness. At a council in Heaven we hear God express his approval of Job and the Adversary is allowed to torment him so that his perfect righteousness may be proved. In spite of his wife, Job maintains his integrity, but on the arrival of 3 friends to console with him, he breaks into a passionate lamentation. (2) The discussion between Job and his 3 friends, Eliphaz, Bildad, and Zophar (chs. iii.-xxiii.). This contains 3 cycles of dialogue, each cycle consisting of 3 speeches by Job in answer to speeches by each of the 3 friends in turn. In the last cycle Zophar's silence seems to show that Job has ended the discussion, but some hold that the third cycle is really complete, verses 11-23 of ch. xxvii being in truth Zophar, and not Job. (See Froude's essay on Job and the authorities there quoted.) The view of Job's friends is that suffering is inevitably and invariably the result of sin, and that Job's case cannot be an exception. Job, in the consciousness of his innocence, is almost driven to deny the justice of God. He is, however, saved, and ends by concluding that sin and suffering in the individual

are not necessarily connected, and by adjuring God to reveal the reason why he is thus afflicted. (3) Introduces the speeches (chs. xxxiv.-xxxvii.) of a young man named Elihu. He expresses his utter abhorrence of Job's utterance against God, and lays stress on the disciplinary value of suffering, a point already slightly noticed by the 3 friends. (4) God's reply out of the tempest (chs. xxxviii.-xli.), a series of poetic pictures of the mysteries of the universe, so presented as to humble Job, and draw from him a confession of his utter ignorance and worthlessness before his Creator. (5) The conclusion (ch. xlii.) tells how, thus humbled, Job is restored to double the prosperity he had enjoyed before. The problem with which the B. of J. deals is the mystery of suffering, which must have engrossed the attention of the Jews in the early post-exilic period to which this work is usually referred. The text is, unfortunately, in a very corrupt condition, but there is a fairly regular sequence of thought. The Elihu passages appear to be a later interpolation. There is no reason to believe that the story is historical; it is probably founded upon a legend. It doubtless owes much, however, to the poetic genius of its compiler. A vast amount of literature and art (e.g. Blake's *Vision of the Book of Job*) has grown up around it. See A. B. Davidson, *Job*, 1884, and works by T. Cheyne, 1897, H. Duhn, 1897, C. Budde, 1903, and A. Nairne, 1935. See also J. Wicksteed's ed. of Blake's *Vision of the Book of Job*, 1910; H. W. Robinson, *The Cross of Job*, 1938; E. J. Kissane, *The Book of Job*, 1939; W. B. Stevenson, *The Book of Job*, 1947.

**Jobber**, professional dealer on the Stock Exchange whose business it is to 'make a market' for a special line of securities. He is precluded by the rules of the Stock Exchange from acting as a broker, but can make bargains direct with members of the public provided he does not do so in the House. He can buy securities with the intention of taking delivery, and can sell with the intention of delivering whether he has the shares or intends to obtain them subsequently. Generally speaking a J.'s business is to sell or buy immediately what he has bought or sold respectively. J.s quote securities at 2 prices, the higher at which they will sell, the lower at which they will buy. The difference is called the 'turn of the market.' When there is a free market, i.e. where the securities are being freely bought and sold, the J. must content himself with a smaller 'turn,' but he will have ample opportunities of getting his profits by converse bargains. Members may not act as brokers and J.s at the same time, and on their ann. application for re-election must state in which capacity they intend to act.

**Job's Tears**, popular name of the ann. graminaceous plant known botanically as *Cotylacryma-jobi*. The fruit resembles tears, and the grass occurs in India.

**Jocasta**, wife of Laius of Thebes, and mother of Oedipus (q.v.). She married the latter, not knowing he was her son, and on realising her crime, killed herself.

**Jocelin**, or **Jocellin** (fl. 1200), Cistercian monk, was the author of *The Life and Miracles of Saint Waltheof of Melrose*, *A Life of David, King of Scotland*, *A Life of Saint Kentigern*, and *A Latin Narrative of the Life and Miracles of St Patrick*. The last work was first printed in 1624, and an Eng. version by E. L. Swift was pub. at Dublin in 1809.

**Jocelin de Brakelonde** (d. c. 1213), Eng. chronicler, probably b. Bury St Edmunds. He became a monk at the Benedictine abbey there in 1173. He wrote a chronicle of the abbey from 1173 to 1202, in which he gives a minute account of the abbot Samson and of his reforms, as well as of the monastic life of the time. J.'s style is clear and pleasing, and it was his picture of Samson which inspired Carlyle to write his essay on the abbot in *Past and Present*.

**Jochumsson, Matthias** (1835-1920), Icelandic divine, poet, and dramatist, one of the greatest names in the literary hist. of Iceland. Among his masterly trans. are *Hamlet*, *Macbeth*, *Othello*, *Romeo and Juliet*, and Byron's *Manfred*. J.'s autobiography was pub. posthumously.

**Jockey Club**, see HORSE-RACING.

**Jockey Club Stakes**, see HORSE-RACING.

**Joculatores**, see JONGLEURS.

**Jode, Pieter de** (1570-1634), the Elder, Flem. engraver, b. Antwerp. He studied under Hendrik Goltzius and afterwards went to Italy. In 1601 he returned to Antwerp and engraved many plates after the prin. Flem. painters. Van Dyck painted a portrait of J. and his son (q.v.) together.

**Jode, Pieter de** (1606-74), the Younger, son of the above, was taught by his father, and was one of the many engravers employed in reproducing the paintings of Rubens and Van Dyck (q.v.).

**Jodel**, or **Jodelin**, see YODEL.

**Jodelle, Etienne** (1532-73), Fr. poet and playwright, b. in Paris. He was one of the members of the Pléiade. He aimed at substituting classical drama for the morality and mystery plays that then occupied the Fr. stage. He produced his first play, *Cléopâtre captive*, in 1552. This was represented before the court, J. himself playing the title-role, and is famous for being the starting-point of Fr. classical tragedy. He also wrote 2 other plays: *Eugène*, a comedy, and *Dido*, a tragedy which follows Virgil's narrative. His collected poems, *Œuvres et mélanges poétiques*, were pub. in 1574. See H. Chamard, *Histoire de la Pléiade* (4 vols.), 1939-40.

**Jodhpur**, former Indian state, now part of Rajasthan state, India. J. is the chief city of the Marwar area. The fort stands on a rock some 400 ft above the surrounding plain and contains the Old Palaces, buildings of great beauty and interest. There is an important civil aerodrome. See INDIAN PRINCELY STATES.

**Jodrell Bank**, experimental station, Lower Withington, Cheshire, England, at which is located the world's largest radio telescope, under the direction of Prof. C. B. Lovell. See RADIO ASTRONOMY.

**Joe Bassett**, Eng. country name for the grubs of the Cockchafer beetle.

**Joel**, second in biblical order of the 12 minor prophets, son of Pethuel (i. 1) or, as many important MSS. read, of Bethuel. His prophecies contain no clear references to contemporaneous events, nor to sins sufficiently specific to give any clue to his date. He is generally held to have prophesied in the reign of Joash, King of Judah, though some think him post-exilic. The book contains 3 prophecies, all closely connected. Chs. i and ii tell of a great plague of locusts, a figurative allusion to the armies of Assyria. Then comes the prophecy of the outpouring of the Holy Ghost (ii. 28), followed by the great judgment on the enemies of Judaea in the valley of Jehoshaphat. See commentaries by S. C. Driver, 1915; J. Schmalohr, 1922; also E. O. Merx, *Die Prophetie des Joels*, 1879; L. Dennefeld, *Les Problèmes du Livre de Joel*, 1926.

**Jœuf**, Fr. tn in the dept of Meurthe-et-Moselle. It has a steel industry. Pop. 9700.

**Joffre, Joseph Jacques Césaire** (1852-1931), Fr. soldier, to whom is generally given the credit for making the decision to stand against the Germans at the battle

MARSHAL JOFFRE

of the Marne in Sept. 1914. He was b. Rivesaltes, 4 Jan., third son of a family of 11 children, the father being a master cooper. Educ. at the Collège de Perpignan and the École Polytechnique, he joined the army as a second-lieutenant during the Franco-Prussian War of 1871. He saw service in various colonial expeditions, among which were the Chinese expedition of 1884; while in 1894 he was sent to the rescue of the Bonnier column, which was subsequently massacred by the Tuaregs, and succeeded, after a struggle, in occupying Timbuktu (see his *March to Timbuktu* 1915). His comparatively slight experience of actual warfare was not supplemented by any very adequate training in the theory of war, and when he reached the Higher Command he had to apply himself to the study of an art which Foch, Pétain, and others had been teaching for many years. Indeed

the name of J. was scarcely known to the Fr. people before the First World War, and his rise in the military profession had been a matter of purely administrative success. Yet in character and common sense J. was a great soldier. His conception of the plan to turn the Ger. right flank, and to so do at the moment chosen, saved Paris; and with the salvation of Paris the morale of the Fr. people remained unimpaired at the one moment in the war when its impairment might have been irreparable. J.'s was a steady influence in the early days of the war. He was one of the few soldiers to foresee the course of the war; others, like the Ger. leaders, looked forward to a short decisive encounter. Writers dispute the precise part played by the different Fr. commanders in the strategy adopted on the eve of the Marne battle. Some give the entire credit to J., asserting that Gallieni (q.v.) strongly advised an attack on von Kluck's exposed flank by Maunoury's army alone; others—the majority—give the major share in conception to Gallieni, and attribute the rest to the legendary reputation of J. But there seems to be no doubt that the planning of the battle was the work of J. After the Marne battle, however, when the Ger. resistance stiffened, rival generals conducted a campaign against J., and the champions of Gallieni and of Sarrail (q.v.) charged J. with rejecting all superior authority and organising a military junta at Chantilly. Indeed J. never seems to have inspired the supreme confidence of Gallieni, for when Gallieni in 1915 became minister of war, he cast some implied aspersion on J.'s conduct of the war by demanding information on the Verdun defences. J. tendered his resignation (Oct. 1915), but the Fr. Gov. retained its confidence in him. The vendetta against him, however, continued. Finally, on 13 Dec. 1916, a decree conferred on J. the title of technical adviser to the gov. in matters appertaining to the direction of the war, with retention of the title 'Commander-in-Chief'; but the command of the Fr. front was to be given to Gen. Nivelle. The Fr. Senate were opposed to this arrangement, and after Briand had appointed Gen. Lyautey war minister, J.'s 2 offices were suppressed, and on 26 Dec. he was created Marshal of France, the first to receive the revived honour, which had been abolished after the fall of the Second Empire. In 1918 he was made a member of the Académie Française. A statue of J. stands outside an hotel in Chantilly, where he had made his staff H.Q. early in the war. See F. W. Halsey, *Balfour, Viviani, and Joffre*, 1917; Le Goffic, *Les Trois Maréchaux: Joffre, Foch, Pétain*, 1920; R. Recouly, *Joffre*, 1931. See also his memoirs (Eng. trans. 1932).

**Joggs, see JOWES.**

**Jogjakarta**, or Jokjakarta, tn of S. Java, Indonesia, at the foot of Mt Merapi, 35 m. S. of Surakarta on the railway from Jakarta to Surabaya. It is the cultural and trade centre for an agric. area (rice,

rubber, copra, sugar). J. is famous for metalwork, jewellery, and batik. There are celebrated temple ruins and monuments near by. Cap. of the original Rep. of Indonesia, 1948.

Johanna, or Anjouan, one of the Comoro Is. (q.v.), at the N. end of the Mozambique Channel, Indian Ocean. It is the central is. of the group, and is 20 m. long and 18 m. wide. Mutsamudu is the port and prin. tn. Coffee is grown and agriculture is one of the chief occupations. J. was made a Fr. protectorate in 1886 along

temp. often occurs when there is a summer thunderstorm. J. was founded in 1886 on the farm Randjeslaagte on the ridge known as the Witwatersrand (q.v.) when the main reef of gold-bearing conglomerates was discovered by George Harrison. The small mining camp was probably named after Johannes Meyer, the Mining Commissioner of that time. Its early hist. was one of rapid development and of political and civil strife. The political disabilities of the new pop., known as Uitlanders (foreigners), which had

*South African Railways*

JOHANNESBURG: AN AIR VIEW OF THE CENTRAL AREA

with the other is. of the group. Pop. 65,000.

Johannes Sootus, see ERIGENA.

Johannesburg, city in the Transvaal Prov. of the Union of S. Africa, situated on the high veld, 5740 ft above sea level, is 429 m. by road from Durban and 941 m. from Cape Town. J. is the centre of the great gold-mining industry of the Witwatersrand and the most important business, commercial, and financial centre in S. Africa. It has one of the finest climates in the world, with summer rains on an average of 96 days a year and cold dry days with brilliant sunshine throughout the winter months. The average ann. rainfall is 29.47 in., the average mean maximum temp. is 77.7° in Jan. and 60.1° in July, and the average mean minimum 40.2° in July and 56.5° in Jan. Extremes of heat and cold are rarely experienced, although a sudden drop in

flocked to the rich gold-fields led in 1895 to the Jameson Raid and to the Anglo-Boer War of 1899-1902. On the outbreak of war in Oct. 1899 most of the Uitlanders left the tn and business and mining came to a standstill. In May 1900 Brit. troops under Lord Roberts entered J., and by the end of the war the tn and mines were functioning normally. From bare veld in 1885 a tn of 10,331 European inhab. had sprung up by 1890 and the European pop. increased to 83,363 in 1904, to 150,286 in 1921, to 252,579 in 1936, and 336,292 in 1948. The total pop. in 1954 was 818,700, made up of 354,300 Whites, 409,200 Bantu, 33,000 Coloured, and 22,200 Asiatics. The area of J. is 57,007 ac. or 89.07 sq. m.

Local gov. in 1886 was exercised by a mining commissioner assisted by a Diggers' Committee elected by the gold-seekers. In 1887 a Sanitary Board was

estab.. and in 1896 Johannesburg became a tn governed by a Stadsraad (Tn Council). In 1900 the duties of the Stadsraad passed to the military governor, and in 1901 a nominated council became responsible for local affairs; this was replaced by an elected council of 30 in Dec. 1903, and since that time local gov. has been modelled on the Eng. system. A Transvaal Prov. Ordinance of 1928 transformed the tn of J. into a city. To-day (1958) local gov. is in the hands of a City Council of 42 members. The City Council owns and operates 2 power stations, a gas works, an abattoir and livestock market, a produce market, fine sewage disposal works, and a transport system of trams, motor buses, and trolley buses. There is a plentiful water supply obtained from the Rand Water Board and distributed by the City Engineer's Dept. The City Council has 245 parks and open spaces, with a total area of 6314 ac. There are 12 municipal open-air swimming-baths, a fine zoological garden, and a municipal golf course. The council owns the Ellis Park rugby and cricket grounds where international games are played. Public health and social welfare work is highly developed. In 1948 the council owned 2112 sub-economic houses for Europeans and Eurafriicans and in its sub-economic townships and hostels housed a pop. of 111,860 native Africans. Slum areas are being rapidly cleared. The rateable value of the city in 1954 was £2410,306,360.

The J. Public Library is a municipal institution, with a fine central library, including special collections on science and technology, fine arts and Africana, a municipal reference library, an Africana Museum, and a municipal theatre. The city also maintains branch libraries for Europeans and non-Europeans, mobile libraries, school libraries, hospital and prison libraries. The Municipal Art Gallery, designed by Sir Edwin Lutyens, contains a fine collection of 19th cent. and modern art, the original stock having been selected by Sir Hugh Lane. The city orchestra is subsidised by the council annually from city funds. There were 221 churches and church halls in J. in 1946. St Mary's Cathedral, designed by Sir Herbert Baker and Mr F. L. H. Fleming, is a fine building not yet completed. The Dutch Reformed church is a modern building and the Catholic pro-cathedral is to be rebuilt. J. is an important educational centre. The univ. of the Witwatersrand has faculties of arts, science, medicine, engineering, commerce, law, dentistry, and architecture. It includes the Bernard Price Institute of Geophysical Research, a speech and hearing clinic, and a good library. The Witwatersrand Technical College provides vocational and other classes for young people and adults, and controls an art school, a trades school, and a business college. The J. Teachers' Training College is a prov. institution. The majority of primary and high schools are run by the Transvaal Prov., although there are sev. important

private schools, notably St John's College and Marist Brothers' College for boys, and Roedebeek, Kingsmead, and sev. convent schools for girls.

Gray *A History of the Discovery of the Witwatersrand Gold-fields*, 1940; H. A. Ohlwey, *Out of the Crucible* (2nd ed.), 1948.

Johanngeorgenstadt, Ger. tn in the dist. of Karl-Marx-Stadt, in the Erzgebirge (q.v.), on the Czechoslovak frontier, 28 m. SSW. of Karl-Marx-Stadt (q.v.). It is a sports resort and is in a uranium-mining dist. Pop. 7000.

Johannisberg, Ger. vil. in the Land of Hessen (q.v.), 14 m. WSW. of Wiesbaden (q.v.). Its wines, particularly those from the vineyards of the castle, are among the finest of the Rheingau (q.v.).

John, St, the apostle, son of Zebedee and brother of James the Great. The call of James and J., who with St Peter form the inner circle of the apostolic band, is described in all 3 synoptic gospels. J. is also generally identified (1) with the companion of St Andrew mentioned in the Fourth Gospel who, from being a disciple of J. the Baptist, became a follower of Jesus; (2) with the 'other disciple,' spoken of also as 'the disciple whom Jesus loved,' mentioned in the Fourth Gospel. Three incidents in the Gospels throw special light on his character as Boanerges (q.v.): the request of the brothers (Mark x. 35-41), the rebuke given to the man casting out devils in the name of Jesus (Mark ix. 38), and the request that fire should be called down from heaven to destroy the Samaritan vil. (Luke ix. 54). St J. appears in the early chapters of Acts, as the companion of St Peter, while he is spoken of in Gal. ii. 9 as one of the pillars of the Church at Jerusalem. To him Christ entrusted his mother on Calvary. He had connections with the family of the High Priest, and access to the latter's house. J. ended his days as Bishop of Ephesus where Polycarp, teacher of Irenaeus, knew him; and it was there he wrote his gospel and epistles. He was a young man when called by Christ, and d. at a great age about the last decade of the 1st cent. A tradition from the time of Irenaeus (c. AD 175) asserts that he had survived imprisonment on the island of Patmos (where he wrote Apocalypses) and torture under Domitian.

John, Epistles of, 3 canonical epistles ascribed to the apostle J. The authenticity of the first Epistle is generally admitted, in the sense that it is certainly by the author of the fourth Gospel (q.v.). It is further probable that the Epistle was written after the Gospel. The aim of the Epistle is primarily to build up the writer's 'children' in the true Christian life, but to do this he has to be polemical to some extent. There has been much discussion as to what enemies his words are directed against, but they may be classed generally as Gnostics, whose errors

of life and conduct were as serious dangers to the flock as were their heretical doctrines. It is an ancient tradition that the Epistle was directed partially against Cerinthus. The language of all the Epistles shows clearly that they are not really 'general,' but are addressed to a particular church or group of churches whose members were well known to the writer. This is particularly so in the case of the first Epistle. The question of the authorship of the two later Epistles is more difficult. Their authenticity was much disputed before the formation of the canon. Jerome suggested that J. the Presbyter, as the author calls himself, was a different person from St J. the Apostle. Style and language, however, as well as particular phraseology and ideas, link them closely with the first Epistle. It is now generally agreed that the 'lady' to whom the second Epistle is addressed stands for the particular church addressed herself. See commentaries by B. Westcott, 1883; J. Carpenter, 1927; G. H. MacGregor, 1928; E. C. Hoskyns (in Gore's *New Commentary*), 1928.

**John's Gospel** according to St. The fourth Gospel stands in striking contrast to the 3 synoptic gospels which precede it. It has often been remarked how St J.'s Gospel begins with the same words as the Book of Genesis: 'In the beginning,' and opens with an elaborate philosophic and metaphysical statement as to the eternal life of the incarnate Word. Everywhere the abstract takes precedence of the concrete. The tone of the fourth Gospel is often rather that of a dogmatic than of a biographical work. It is taken for granted that the hearers are acquainted with the characters introduced, e.g. J. the Baptist. Many vital points in the actual hist. of Jesus are omitted, e.g. His baptism and the institution of the Eucharist, though J. gives our Lord's promise of the Eucharist at great length in ch. vi. The earthly life of Christ is considered by J. in its connection with His life as God and with the whole of human experience. The incidents narrated are chosen partly to supplement a correct synoptic narrative, but mainly for their doctrinal value; and Christ's words are not given simply as spoken, but as matured and interpreted in the mind of the writer. The authorship of St J.'s Gospel has also been a most important critical problem during the last cent. There is now a tendency to return to the traditional view and ascribe it to St J. the Apostle, or possibly to J. the Presbyter spoken of by Papias. The extreme anti-traditional view of the Tübingen school made the author a Gentile Christian, and placed the work in the middle of the 2nd cent.: Baur suggested AD 160-170, Pfleiderer AD 140, Keim AD 130. Harnack, however, in his *Chronology of Early Christian Literature* placed it between AD 80 and AD 110. This chronology presents no obstacle to the authorship by St J. the Apostle, and much internal evidence is adduced in support of the traditional view that it was written by him in his old age.

The traditional view well explains the peculiar characteristics of the Gospel, and the conditions under which he would have written are excellently expressed by Dr Armitage Robinson: 'The old disciple needs no documents to compile as others might compile a laboured hist. The whole is present in his memory, shaped by years of reflection, illuminated by the experience of a lifetime.' On the other hand new archaeological discovery has led many to place J.'s Gospel much earlier. We possess papyrus fragments of the Gospels, including J., dating back to the early years of the 2nd cent., and part of a life of Christ based on all 4, of similar date. Torrey holds that it is a trans. of an Aramaic original written well before AD 70. Some radical scholars (e.g. Goodenough) now think it the earliest of all the Gospels. Olmstead, the ancient historian, in 1942 insisted that the narratives of J. were written down in Aramaic before AD 40 and were later put into Greek, so that they are the oldest and most authentic sources for the life of Christ. Certainly archaeology has most remarkably confirmed the topographical allusions in J., and these must be earlier in origin than AD 70 when Jerusalem was destroyed. J. had been forced like Peter to leave Palestine, and he lived to an old age in Ephesus. The accuracy of his local colouring is so remarkable that Albright (*Archaeology of Palestine*, 1949) maintains that the story he tells was put into substantially its extant form before 66-70 AD. The Dead Sea scrolls have proved that much of the imagery of Light and Darkness that distinguishes the fourth Gospel was current in Judaism among the Essenes in the time of Christ. It is not derived from later philosophic or pagan sources. See F. C. Burkitt, *Gospel History and its Transmission*, 1906; B. Westcott, *Gospel of St John*, 1908; J. Donovan, *The Authorship of St John's Gospel*, 1936; F. R. Hoase, *The Original Order and Chapters of St John's Gospel*, 1944; A. C. Headlam, *The Fourth Gospel as History*, 1948; also works by A. Plummer, 1913; J. Lagrange, 1925; G. H. MacGregor, 1928; J. O. Murray, 1936; P. Gardner-Smith, 1938; E. C. Hoskyns, 1938; N. Davey, 1938.

**John, Knights of St.** see HOSPITALIERS, KNIGHTS.

**John**, the name of 22 popes, of whom the most celebrated are:

**John I**, St (523-6), native of Tuscany, succeeded Hormisdas and was a friend of Boethius. Sent to Constantinople by Theodoric to obtain toleration for Arians, but on his return was imprisoned by the king who was dissatisfied with the mission. He d. in captivity.

**John IV** (640-2), native of Dalmatia, succeeded Severinus. He condemned the Monothelite heresy.

**John VI** (701-5), of Gk birth, succeeded Sergius I. Appealed to in the conflict between St Wilfrid of York and the see of Canterbury, decided in favour of the former.

**John VIII** (872-82), native of Rome, succeeded Adrian II. Saracens ravaged

Rome during his pontificate. He supported Charles the Bold's claim to the empire, and crowned him in 875. See A. F. De Montor, *Histoire des souverains pontifes*, 1849; F. Dvornik, *Les Slaves, Byzance et Rome du IX<sup>e</sup> siècle*, 1926.

**John X** (914-23), native of Romagna, succeeded Lando. Placed himself at the head of an army and drove Saracens from Italy. Said to have been murdered.

**John XXII** (1316-34), native of Cahors, France, b. at Cahors in 1249. His name was Jacques Duesc or Deuze. He endeavoured to propagate Christianity in distant lands and is important in Ger. hist. for taking active part in disputes of Emperors Louis of Bavaria and Frederick of Austria. See also **POPEs**, LIST of THE.

**John** (c. 1167-1216), King of England, probably b. Oxford, the youngest son of Henry II and Eleanor of Aquitaine, nicknamed John Lackland, though in fact he acquired large estates by gift and by his first marriage. In 1185 he was sent as governor to Ireland, but his administration was not a success, and he was soon recalled. J.'s coalition with his brother Richard and Philip of France in 1189, in circumstances of peculiar treachery, was traditionally regarded as Henry II's death-blow. During Richard's absence in the Holy Land he plotted against him continually and is said to have joined Philip of France in opposing Richard's release. From 1194 relations between the brothers were better. In 1199 J. became king, and the death of Arthur, son of his elder brother, Geoffrey, in 1203—probably murdered on J.'s orders—removed his closest rival to the crown. His foreign wars were disastrous, although J. himself was an able soldier. Philip of France annexed Normandy, Anjou, Maine, and Touraine without great difficulty. In 1205 began the great struggle between J. and the Pope, Innocent III, over the election to the Archbishopric of Canterbury, which led to the interdict of 1208, the deposition of 1211, and the excommunication of 1212. Eventually J. submitted, agreed to hold his kingdom as a fief of the papacy, and to accept the Pope's nominee, Stephen Langton (q.v.), as archbishop. But his arbitrary rule at home, coupled with the defeat of his forces at Bouvines (1214) by Philip, and the loss of Poitou stirred the barons to revolt, and, led by Stephen Langton, they forced the king to sign Magna Carta (q.v.) at Runnymede (15 June 1215). J. had probably no intention of keeping his promises from the start and induced the Pope to annul the charter. The barons appealed to Philip of France, and the Dauphin Louis had landed in England when J. suddenly d. at Newark. He married (1) Isabella of Gloucester; (2) Isabella of Angoulême. J. had great ability and his reign was not, as has sometimes been supposed, an unqualified disaster. In his dealings with the papacy, for example, he frequently managed to emerge surprisingly well. During the interdict he was able to appropriate for himself large eccles. revenues which com-

pensated for the moneys he had been unable to obtain from his lay subjects, and by the end of his reign he had papal backing against his enemies. He appears to have been unusually unscrupulous in an unscrupulous age, and his opportunism succeeded less well than it might have done, because he pursued it in virtual isolation and left the way open for his enemies to combine against him. See Kate Newgate, *John Lackland*, 1892, and E. B. D'Auvergne, *John, King of England*, 1934.

**John II** (1319-64), King of France, surnamed 'the Good,' succeeded his father, Philip VI, 1350. He alienated a powerful section of the nobility by his choice of favourites and his attempts at arbitrary rule. J. was taken prisoner by the English at the battle of Poitiers in 1356. He returned to France after the Peace of Brétigny, but when his ransom could not be raised, owing to the poverty of the country, J. returned to England in 1364 and d. there later the same year.

**John II**, or **Hans** (1481-1513), King of Denmark (from 1481) and of Norway and Sweden (from 1497), was occupied with wars and rebellions throughout his reign. His expedition against the Dithmarschers in S. Schleswig (1500) failed completely. This disaster led to revolts in both Norway and Sweden, and though the former kingdom was pacified in 1508, the latter continued the struggle till within a year of John's death. Under Sten Sture, and later under Svante Sture, who had gained the support of the Hansa tns, the Swedes succeeded in throwing off the Danish yoke (1501).

**John**, kings of Poland, who reigned during the following periods:

**John I** (1492-1501), gallant soldier but a poor statesman. A rebellion in Moldavia frustrated his projected crusade against the Turks.

**John II** (*Castmir*). See under **CASIMIR**.

**John III** (*Sobieski*) (1674-96), b. 1624 in Galicia, the son of the castellan of Crakow. He served with distinction in the army, and became commander-in-chief in 1668, having gained important victories over the Cossacks and Tartars (or Tatars) in the Ukraine. A splendid victory over the Turks in 1673 secured him the Polish throne after Michael Korybut's death. By the treaty of Zaryvno (1676) he recovered most of Ukraine from the Turks. In 1683 he drove them from Vienna, and after a brilliant victory forced them to retire from Hungary, becoming the hero of all Europe; but the last years of his reign were taken up with intrigues at home.

**John**, kings of Portugal:

**John I** (1357-1433), called 'the Great' and 'father of his country,' was the father of Henry the Navigator. He proved a wise ruler, though his reign was darkened by continuous strife with John I of Castile.

**John II** (1455-95), called 'the Perfect,' curbed the powers of his haughty noblemen, and drew up the celebrated treaty of Tordesillas with Castile (1494).

**John III** (1502-57), bid fair to wreck the prosperity of Lisbon and his realm at large by being too partial to the whims of the clerical party.

**John IV** (1603-56), *b.* Villa Viçosa, became king by popular consent after the rebellion of 1640 against Philip IV of Spain. His reign was occupied with a long struggle with Spain, and at his death his country had not yet reasserted its independence.

**John V** (1689-1750), allied himself with Austria in the war which closed with the treaty of Utrecht (1713), and afterwards became a tool in the hands of the Church party.

**John VI** (1769-1826), was regent from 1799 until 1816, when he became king. He lived in Brazil, and when he returned home in 1822 he agreed to govern on constitutional lines.

**John, Augustus Edwin** (1879- ), painter, *b.* Tenby, Wales. Attended the Slade School, London, and afterwards lived in Paris and Provence. His pictures were first exhibited at the New English Art Club. He taught art at Univ. College, Liverpool, 1901-2. At the Arts and Crafts Exhibition, Burlington House, 1916, J. exhibited his 'Peasant Industries'—now in the Tate Gallery. He was official artist to the Canadian Corps in the First World War, and designed for it a memorial cartoon, 'Canadians opposite Lens.' By 1921 he was A.R.A.; by 1928, R.A., but resigned in 1938 on account of the Academy's rejection of a sculpture by Epstein. Re-elected R.A., 1940.

He painted portraits of the chief members of the Peace Conference; also of Bernard Shaw (q.v.) (1916), Lord Fisher (1918), Lord Sumner (1918), the Marchesa Casati (1918-19), and the Princess Bibesco (1924). 'The Smiling Woman' (1910) and 'Madame Suggia' (1923), both in the Tate Gallery, have rival claims to be his masterpiece. It is as a portrait painter that he has achieved most fame, his skill in directly representing character and temperament with the brush leaving him without a rival among his contemporaries in this branch of the art. An admirable example is his portrait of Lord Fisher; while the 'Portrait of a Girl' and 'Vivian' (also a portrait of a young girl, but in the symmetrical rather than the angular style) emphasise his scorn of aesthetic theory as a substitute for the expression of temperament. Early interest in nomadic life and travels in Ireland and Wales produced a series of admirable subject paintings and landscapes. His sense of colour values is well exemplified in his landscapes of S. France and in paintings of flowers. His fine 'Les Martignes' has been compared with the work of Cézanne (q.v.). J. is also superb as a draughtsman, and has made a number of fine etchings. Elected president of the Royal Academy of Wales, 1934. Trustee of the Tate Gallery, 1933-41; Royal Society of Portrait Painters, 1938; O.M., 1942. Collected exhibition at the Royal Academy, 1954. See autobiography, *Charnecuro*, 1952.

**John, Sir William Goscombe** (1860-

1952), sculptor; *b.* Cardiff; son of Thomas J. He was educ. at Llandaff, and studied in Cardiff School of Art; City and Guilds of London School of Art; and R.A. Schools, receiving the gold medal and travelling fellowship, 1889. He was awarded the gold medal, Paris Salon, 1901, and the gold medal at the Royal Society of Brit. Sculptors, 1942. He is represented in many Eng. galleries; and the works include statues of Edward VII (equestrian), Capetown and Liverpool; Prince Christian Victor, Windsor; D. Lloyd George, Carnarvon; Viscount Wolseley (equestrian), Horse Guards Parade, and Arthur Sullivan memorial, Embankment Gardens, near the Savoy.

**John Bull**, see BULL, JOHN.

**John Dory**, see DORY.

**John Lewis Partnership, The**, was founded by a Settlement in Trust, 1929, and completed by a second Settlement in 1950. It comprises (1957) some 20 dept stores in various parts of the U.K., including the business of John Lewis & Co. and Peter Jones of London, about 20 specialist food and other shops, 3 'supermarkets,' farms, and production units. After the usual provision for reserves and payment of a fixed rate of interest on borrowed capital (averaging less than 4½ per cent on the £14½ million of issued share capital) the whole of the remaining profits are divided among all the workers in all the Partnership companies. See J. Spedan Lewis, *Partnership for All*, 1949.

**John Nepomucen**, St (c. 1345-93), patron of Bohemia, *b.* Nepomuk, or Pomuk, near Pilsen. Educ. at the univ. of Prague, he entered the church, and became confessor to Sophia, wife of Wenceslaus IV. Refusing to reveal to Wenceslaus what he had heard from the queen in sacramental confession, he was flung into the Moldau. The feast of his martyrdom is celebrated on 16 May.

**John of Arderne** (1307-80), surgeon. Nothing is known of his early life. He practised first in Wilts and served as an army surgeon in the service of Henry Plantagenet, Earl of Derby. He next went to Newark, where he practised for many years, and in 1370 moved to London. J. was a well-educ., sound, practical surgeon, with a practice among the wealthier classes. His writings were collected after his death and preserved in a MS. now in the Royal Library, Stockholm. This MS. is a vellum roll 17 ft 8 in. in length by 15 in. A replica in London was trans. and pub. by Sir D'Arcy Power, *De Arte Physicale et de Chirurgia*, 1922. J.'s most important contribution to surgery was his operation for fistula-in-ano; his fee for the operation was £40, a suit of clothes, and 100 shillings per annum as long as the patient lived; his treatise on the subject, written about 1376, was ed. and pub. by Power in 1910.

**John of Austria** (1545-78), soldier, the natural son of Emperor Charles V. He grew up a man of far-reaching ambitions, and the tragedy of his disappointed life may be traced to the petty jealousy of his

half-brother Philip II of Spain, who was always at pains to defeat these ambitions. Philip had designed that he should become a monk, but Don John chose a soldier's career, and gained signal honours, first against Algerian pirates, then against the Moors of Granada (1570), and finally at the decisive naval battle of Lepanto (1571), when he was admiral of the combined fleets of Venice and Spain. Felled in his project of a kingship over Tunis, Don John was finally appointed Viceroy of the Netherlands (1576). Here he was powerless from lack of funds, men, or any support from Philip. His opponent was the redoubtable William the Silent. In 1577 he was forced to surrender and to recognise the 'Pacification of Ghent.' See lives by Sir W. Stirling-Maxwell, 1883, and G. Slocombe, 1935.

John of Bohemia (1296-1346), 'the Blind,' son of Emperor Henry VII, also known as J. of Luxembourg. In 1310 he was crowned King of Bohemia (q.v.). Some years later, when the royal houses of Bavaria and Austria were contending for the imperial crown, J. secured the prize for the former by his victory at Mühldorf (1322). For 2 years (1333-5) he fought in Italy against the Ghibellines, and eventually met his death at Crécy (q.v.), where he was supporting the Fr. king. Blindness overtook him towards the end of his life.

John of Gaeta, see GELASIUS II.

John of Gaunt (1340-99), Duke of Lancaster, fourth son of Edward III, b. Ghent, Flanders. In 1359 he married Blanche, heiress to the Duchy of Lancaster, and was himself created Duke of Lancaster in 1362. Their son later became Henry IV of England. Blanche d. in 1369, and 3 years later J. of G. married Constance, daughter of Pedro the Cruel of Castile and assumed the title of King of Castile in 1372. His efforts to estab. his claim against his rival, Henry of Trastamare, proved unsuccessful, and in 1387 he renounced all claims in favour of his daughter Catherine. He was an ambitious man and was popularly blamed for many of the evils of the day, and certainly added to the troubles of his nephew, Richard II, by his intrigues. He used Wycliffe and the Lollards as pawns in his intrigues against the crown and the court party; but it is doubtful if he had any real interest in Wycliffe's theology. In 1394 his wife, Constance, d. and he married his mistress, Catherine Swynford, his children by whom were legitimised in 1397. They were the Beauforts, and included the cardinal of that name. See S. Armitage-Smith, *John of Gaunt*, 1905.

John of Kronstadt, Father (1829-1908), Russian Orthodox priest. Joann Sergeev took his divinity degree in 1885 at the theological academy of St Petersburg, and became priest of the Collegiate church of Kronstadt, where he soon gained extraordinary influence. his sermons arousing such enthusiasm that miracles of healing were attributed to him. People of every class flocked to him with their bodily and spiritual troubles, and with their alms he

founded numerous charitable institutions. He violently opposed the teaching of Tolstoy. His pubs. include *Ma chère vie dans le Christ*, *Sermons sur le Dieu Créateur*, *Sermons et instructions*, *Quelques mois de réponse aux fausses doctrines du comte Tolstoy*, etc.

John of Leyden, properly Johann Beuckels, or Borkhold (1509-36), a Dutch tailor who settled in Leyden as an inn-keeper. A disciple of the Anabaptist Matthias, he was sent on a mission to Münster (1533). His fiery oratory soon gathered a company of zealous converts, known as the 'saints.' This success led to a strange episode. For a twelvemonth J. became King of Münster, assumed the royal purple, married sev. wives, dispensed justice in the market-place, and put his enemies to death. In 1535 the bishop recovered the city, and J. was tortured and executed.

John of Salisbury (c. 1115-80), philosopher and ecclesiastic. Studied at Paris (1136-46), where his teachers included Abélard, Wm of Conches, and Richard l'Érèque. Returning to England c. 1150, he became secretary to Archbishop Theobald and, later, to St Thomas à Becket. J. of S. was sent by Henry II on sev. diplomatic missions, and delivered to that monarch the papal bull authorising the conquest of Ireland. From 1164 to 1170 he shared Becket's exile in France, during which time he wrote the *Historia Pontificalis*. He was present at the archbishop's murder in Canterbury Cathedral. Six years later (1176) he was appointed Bishop of Chartres, in which capacity he attended the Lateran Council of 1179. His prin. works are *Politicus*, the picture of an ideal state on the lines of Plato's *Republic*, and *Metalogicus*, a fusion of Augustinian and Aristotelian philosophy. Both have been ed. by C. C. J. Webb; the former in 1909, the latter in 1929. J. of S. also wrote 2 lives of St Anselm and that of St Thomas à Becket.

John of the Cross, St (Juan de Yepes) (1542-91), b. Fontiveros, Old Castile. He joined the Carmelites at Medina in 1562, and studied theology at Salamanca (1564-7). He assisted St Teresa (q.v.) in the Carmelite reform, and was her confessor from 1572 to 1577. During the next year he was imprisoned at Toledo and subjected to the vilest maltreatment by the unreformed branch of his order. He escaped under the most dramatic circumstances, was made prior of sev. reformed houses, and appointed visitor of the Andalusian prov. in 1585. The remaining years of his life witnessed renewed suffering and humiliation. He d. in obscurity at Ubeda. St J.'s writings (*The Ascent of Mount Carmel*, *The Dark Night of the Soul*, and *The Spiritual Canticle*) are masterpieces of mystical theology and among the glories of Sp. literature. They have been trans. into Eng. by E. A. Peers (1932). St J. was canonised in 1726, declared a Doctor of the Church in 1926; his feast is on 24 Nov. See his life by Father Bruno, O.D.C., 1938.

**John o' Groat's House**, 1½ m. W. of Duncansby Head in Caithness, Scotland. The expression is proverbially used for the most northerly point of Great Britain.

**John Rylands Library**, founded by the widow of John Rylands (1801-88), cotton merchant of Wigan, who d. intestate leaving his widow to succeed to a fortune of over £2,000,000. In 1888 she bought the splendid library of Earl Spencer of Althorp. To house it she built in Deansgate, Manchester, the present Gothic building. An endowment was also provided and the collection has since been extended by the addition of many other books and MSS., making it one of the finest libraries in England. It is open to registered readers for reference only.

**John the Baptist**, son of Zachariah, a priest of the Temple, and Elizabeth, a kinswoman of the Blessed Virgin, b. to them in their old age according to the promise of an angel (Luke 1. 5). His bp. is generally identified as Ain Karim, 5 m. W. of Jerusalem. The immediate forerunner of Christ, he was the last of the great prophets to preach repentance and the coming of the Messiah. J. lived in the wilderness of Judea until, probably at the age of 30, he appeared as a preacher near the Jordan. Such as came to him confessing and penitent he baptised, his baptism being the sign of inward repentance and amendment (Josephus, *Antiquities of the Jews*, xviii, v. 2). Jesus also came to him for baptism, and on this occasion J. makes a clear confession and acknowledgment of his own inferiority. His preaching caused a great stir, and people from all parts of the country crowded to hear him. He did no miracle; but his form, his manner of life, his intrepid rebuke of wickedness in high places, recalled the most striking prophetic figures of O.T. times. His denunciation of Herod Antipas furnished the pretext for his imprisonment, while it incurred the deadly hatred of Herod's partner; and in due course he was murdered in prison (Matt. xiv.). Josephus lays the scene of his murder in Machaerus, the fortress of the Dead Sea. Tradition says that his body was buried at Samaria, where the Crusaders built the church of St. J., now a Muslim mosque. The head is said to have been finally buried in Damascus.

**John's, Eve of St.**, see ST JOHN'S, EVE OF.

**John's College, St. Cambridge**, founded in 1511 by the Lady Margaret Beaufort. Her executors supervised its building, among them Bishop Fisher of Rochester. There are 6 courts: the most easterly with its fine Great Gateway dates from the Tudor period; Second Court contains a panelled master's gallery with fine mouldings (1598-1602) and leads into Third Court (1721) whence the so-called Bridge of Sighs (1831) crosses the riv. to New Court (19th cent.). Chapel Court and North Court were designed by Sir E. Maufe after World War I. Lord Burghley, Roger Ascham, Wordsworth, Castlereagh, Palmerston, Sir J. Herschel, and Sir John Cockcroft were students here.

**John's College, St. Oxford**, see ST JOHN'S.

**Johns Hopkins University and Johns Hopkins Hospital**, at Baltimore, Maryland, U.S.A., owe their existence primarily to the contribution of \$7,000,000 by Johns Hopkins (q.v.), a rich merchant of Baltimore. The univ., with Daniel Coit Gilman as president, opened its doors in 1876; the hospital in 1889. Since 1902 the univ. has developed a new campus of 125 ac. on the N. edge of Baltimore, with buildings of Georgian colonial style. It has undergraduate courses in arts and sciences, business and industrial management, and engineering, a faculty of philosophy, and schools of medicine, engineering, hygiene and public health, and advanced international studies. The univ. library contained 1,000,000 vols. in 1955. Teaching staff, 1384; students, 7247. The Johns Hopkins Press is affiliated.

**Johnson, Amy** (1905-41), Eng. airwoman who became famous in 1930 for her flight from England to Australia in 19 days, being the first woman to accomplish the flight alone. In 1931 she flew to Tokyo across Siberia and thence back to Britain, and in the following year beat by 10½ hrs. the record set up by J. A. Mollison (whom she had married in that year) in flying to the Cape. In 1933, with her husband, she made a successful crossing of the Atlantic via Newfoundland but was obliged to make a forced landing when within 60 m. of New York. Perhaps her greatest achievement was in 1936, when she flew to the Cape and back and beat both the outward and homeward records. In the Second World War she worked as a ferry pilot for the Air Transport Auxiliary and was killed in the Thames estuary.

**Johnson, Andrew** (1808-75), seventeenth president of the U.S.A., b. Raleigh, N. Carolina, his father being a porter at an inn, his mother a maid there. He was apprenticed to a tailor. In 1826 he moved with his family to Tennessee, where he set up his own shop. At 19 years of age he married and his wife taught him to write. From 1830 to 1834 he was mayor of Greenville, Tennessee; for 4 years between 1835 and 1841 he sat in the state House of Representatives, and later in the state Senate. Next year he was elected to Congress, where he remained for 10 years (1843-53), and finally to the national Senate (1857-62). From 1853 to 1857 he was governor of Tennessee. On the declaration of civil war, President Lincoln made him military governor of Tennessee. In 1864 he was nominated for the vice-presidency on the same ticket as Lincoln, and after Lincoln's assassination he became president (1865-9). But the adoption of his predecessor's lenient policy with regard to the rebellious S. states was misconstrued as deliberate disloyalty, and he was accordingly impeached. The trial ended in his acquittal. Later biographies have done much to re-instate his reputation. He retired into private life in 1869, was elected to the U.S. Senate again in 1875, but d. 3

months later. See lives by D. De Witt, 1903, and R. W. W. Winston, 1928.

**Johnson, Eastman** (1824-1906), Amer. artist, b. Lovell, Maine; he studied at Düsseldorf and in Italy, France, and Holland. Among his works are 'The Old Kentucky Home,' 1867, 'The Old Stage Coach,' 1871, 'Cranberry Harvest,' 1880, and many portraits.

**Johnson, Francis** (1796-1876), orientalist. Held the chair of Sanskrit and Telugu at Hallebury College (1824-55), as well as of Bengali (1845-55). Ed. sev. Sanskrit and Persian texts, including the first book of *Hilopadésa*, 1840 (4th ed., 1884), selections from the *Mahabharata*, 1842, the *Gulistan* of Sa'di, 1863, and pub. a *Persian-Arabic-English Dictionary*, 1852.

**Johnson, Hewlett** (1874- ), Eng. ecclesiastic, educ. at Macclesfield, Victoria Univ., and Wadham College, Oxford. Vicar of St Margaret's, Altrincham, 1908. Dean of Manchester from 1924 to 1931; and of Canterbury from 1931. Wrote *The Socialist Sixth of the World*, 1940 (now in its 22nd ed. and trans. into 24 languages, entitled in America, *The Soviet Power*). He wrote a sequel on the same theme, *Soviet Success*, 1947.

**Johnson, Jakobina** (1883- ), Icelandic poetess who for the greater part of her life has resided in Canada and the U.S.A. Her original verse is rich in beauty, and she has won renown by her sensitive trans. of Icelandic poetry into English.

**Johnson, John Arthur** ('Jack') (1878-1946), Amer. Negro heavy-weight prize fighter, b. Galveston, Texas. At 22 he was a milk-roundsman in Galveston; at 23 he was winning money in the ring and in his first 8 years of prize fighting he was beaten only twice. He first became known in 1907 by beating Robert Fitzsimmons in 2 rounds at Philadelphia. The following year he became the first coloured heavy-weight champion of the world by beating French-Canadian Tommy Burns at Sydney. His most famous fight, however, was in 1910, when, at Reno, he defeated Jim Jeffries; for feeling had run high in America over the match and the defeat of the 'white man's hope,' as Jeffries had been called, caused much dissatisfaction. After J. had performed in the music-halls in the States and in Great Britain, an attempt was made to arrange a match with Bombardier Wells in England in 1911, but the home secretary would not allow it to take place. Soon afterwards the suicide of J.'s white wife (Etta Duryea, whom he had married in 1909) revealed the acuteness of the race question in America. On 5 April 1915 J. lost to Jess Willard at Havana, but was only knocked out after twenty-six battering rounds. In all, his major fights numbered 109 in 29 years in the ring. But the \$100,000 he is said to have made was soon dissipated in the purchase of a luxurious restaurant in Chicago and of an expensive house in an exclusive suburb of New York. He wrestled in Paris, appeared in the bull-ring in Spain, his head bald and his great figure paunched, and once he played the part of a general in the

opera *Aida* in New York. He pub. *Mes Combats* in 1914. He d. in hospital at Raleigh, N. Carolina, 2 hours after his car crashed into a telegraph pole.

**Johnson, Lionel Pigot** (1867-1902), poet, b. Broadstairs, Kent. After studying at Westminster and New College, Oxford, he settled in London and lived a secluded and bookish life, contributing critical articles and reviews to various periodicals. In 1891 he was converted to Roman Catholicism and became deeply interested in the Irish Renaissance. His two vols. of poetry, *Poems*, 1895, and *Ireland, with Other Poems*, 1897, drew much of their inspiration from ancient Celtic legend; though his best-known piece is 'On the Statue of King Charles at Charing Cross.' His health became undermined by drink and insomnia and he d. as the result of a fall in Fleet Street. His *Reviews and Critical Papers* were pub. in 1921. See memoir by C. K. Shorter, 1908.

**Johnson, Richard** (1573-c. 1659), miscellaneous writer, b. London. While still an apprentice he pub. *The Nine Worthies of London*, 1592. His best-known work is *The Famous Historie of the Seven Champions of Christendom*, 1596, which is mentioned in Meres's *Palladis Tamia*. Others of J.'s works are *The Pleasant Walks of Moorfields*, *The Pleasant Conceits of Old Hobson*, and *The Most Pleasant History of Tom a Lincolne*, all pub. in 1607. *Look on Me*, London, 1613, is a pamphlet on London abuses. Vols. of verse include *A Crowne Garlande of Golden Roses*, 1612, and *The Golden Garland of Princely Pleasures* (3rd ed.), 1620.

**Johnson, Richard Mentor** (1781-1850), ninth vice-president of the U.S.A., was admitted to the Bar in 1802, and sat in Congress from 1807 to 1812 and from 1811 to 1819, and was for many years a member of the Senate. In 1836 the Democratic party nominated him and the Senate elected him to the vice-presidency, which he retained till 1841. His chief claim to fame rests on his part in the war of 1812 with England. In command of cavalry from Kentucky he helped to clear Michigan of the invading Eng. troops. In the victory of Thames, J. killed the famous chief Tecumseh, who led the Indians who favoured the Eng. cause.

**Johnson, Robert Underwood** (1853-1937), Amer. poet and editor, b. Washington, D.C. From 1873 he was connected with the *Century Magazine*, of which he became editor in 1909. From 1920 to 1921 he was Amer. ambas. at Rome. Among his vols. of verse are *The Winter Hour*, 1891, *Songs of Liberty*, 1897, *The Poet of Honour*, 1930, *Poems of Fifty Years*, 1931, and *Aftermath*, 1933. *Remembered Yesterdays*, 1923, is a book of memoirs.

**Johnson, Samuel** (1709-84), lexicographer, critic, poet, and essayist, b. Lichfield, the son of a bookseller. A precocious boy, he was from early days a great reader; and a customer of his father, struck by the lad's talents, sent J. in 1727 to Pembroke College, Oxford, where he distinguished himself by his classical

erudition. After acting as an usher at Market Bosworth Grammar School, he married, in 1735, the widow (d. 1752) of Henry Porter, a Birmingham mercer, and settling at Edial, took private pupils, amongst whom was David Garrick (q.v.). In 1737 he went to London with Garrick, determined to earn a livelihood by his pen. He soon became a regular contributor to the *Gentleman's Magazine*, and for some time prepared the parl. reports which appeared in that periodical. He did much hack-work for Cave, the publisher of the magazine; but it was Dodsley

SAMUEL JOHNSON

who pub. J.'s poem *London* (1738), for the copyright of which the author received £10. Six years later he wrote a biography of his friend Richard Savage, with whom he had sometimes roamed the streets at night for want of the price of a lodging. In 1747 he issued the plan of his *Dictionary*, upon which, with the help of six amanuenses, he laboured for eight years. He pub. the best of his poems, *The Vanity of Human Wishes*, in 1749; and in the same year Garrick produced *Irene* at Drury Lane Theatre, where it ran for nine nights. J. in 1750 conceived the idea of a paper on the lines of the *Spectator*, which he called the *Rambler*, issued twice a week from 20 March. It brought him a wider fame than any of his earlier writings. In 1754 Lord Chesterfield, to whom the plan of the *Dictionary* had been inscribed long ago, now repented himself of his continued neglect of its compiler, and in the *World* wrote two papers commending the work; whereupon J., whose pride had been outraged, replied in the famous oft-quoted letter (7 Feb. 1755), in which he said that the notice, 'had it been early, had been kind,' and added, 'but it has been delayed

till I am indifferent and cannot enjoy it; till I am solitary, and cannot impart it; till I am known and do not want it.' The quiet severe dignity of this inimitable letter alone would have made its author famous. J.'s mother d. in 1759, and to pay the expenses of her illness and funeral he wrote *Rasselas*, the most popular of all his works. Three years later his financial troubles came to an end with the grant by Lord Bute of a Civil List pension of £300 a year. In 1765 he brought out his long-promised ed. of *Shakespeare*, and between 1779 and 1781 pub. *The Lives of the English Poets*. In 1773 he made a journey with Boswell to the Scottish highlands, related to his *Journey to the Western Islands of Scotland*, 1775, and in Boswell's *Journal of a Tour to the Hebrides*, 1785. J. had acquired a position in literary and artistic circles that has rewarded the efforts of no other man. He was the acknowledged dictator of 'The Club,' founded in 1763 by himself and Sir Joshua Reynolds, and numbering among its limited membership Burke, Beauchamp, Langton, Hawkins, Boswell, Garrick, Gibbon, Fox, Sheridan, and Adam Smith. There he laid down the law to all and sundry in that witty, truculent style of conversation which Boswell has made familiar. Among his private friends were the Thrales and the Burneys, and with these he made excursions to different parts of England, a fascinating companion, if not always a pleasant guest. After Thrale's death he quarrelled with the widow, who became the wife of Piozzi. As a writer he had a ponderous style, which was often burlesqued, and was best described by Goldsmith, who said that the Doctor would make little fishes talk like whales. He was didactic to an extraordinary degree, and he inculcated moral sentiments with gusto in season and out of season in *Rasselas* as in the *Rambler*. A man markedly disposed to belief in superstitions, he had notwithstanding very deep religious faith, as can be clearly seen in the posthumous *Prayers and Meditations* (1785). He had great courage, and a tender regard for humanity that was evinced in the kindness for and the generosity he displayed towards the unhappy, the poor, and the weak. J. is the most familiar figure of the 18th cent., and if in the first place he owes this to his remarkable personality, in the second he is indebted for it to Boswell, who, in his biography, the masterpiece of biographies, has painted him to the life. The best ed. of Boswell's work is that brought out by Dr Birkbeck Hill (6 vols.), 1887. See James Boswell, *The Life of Samuel Johnson, LL.D.*, 1791; Leslie Stephen, *Dr Johnson*, 1878; W. Raleigh, *Six Essays on Johnson*, 1910; S. C. Roberts, *The Story of Dr Johnson: being an Introduction to Boswell's Life*, 1922; J. Bailey, *Dr Johnson and his Circle*, 1927; R. Lynd, *Dr Johnson and Company*, 1927; M. C. Struble, *A Johnson Handbook*, 1933; W. B. Watkins, *Johnson and English Poetry before 1660*, 1936; Sir A. McNair, *Dr Johnson and the Law*, 1948; J. W. Krutch, *Samuel Johnson*,

1948; J. H. Hagstrum, *Samuel Johnson's Literary Criticism*, 1952.

Johnson, William Eugene (1862-1945), Amer. temperance advocate, known as 'Pussyfoot' J., b. Coventry, New York state. He wrote articles on temperance which had a wide circulation in smaller newspapers in the U.S.A., and in 1895 became associate editor of *The Voice*, New York, the organ of the temperance cause. In 1905 he went to Washington to work among Congressmen for temperance legislation. The Federal Gov. was powerless over the liquor traffic in the various states, but Theodore Roosevelt appointed J. Federal agent to enforce the law, especially in Oklahoma. By his swift and noiseless methods—whence his sobriquet of 'Pussyfoot'—he secured thousands of convictions against bootleggers. In 1911 he retired in order to devote himself to the cause of prohibition which was then rapidly becoming a political issue throughout the U.S.A. Later he set out to convert other countries, including Sweden, China, India, Russia, and Italy. He came to London in 1919, but while preparing to address a meeting was 'ragged' by students, and a missile was thrown which caused the loss of his right eye.

Johnson City, tn in Washington co., Tennessee, U.S.A. It is a rail junction and a trade and shipping point for the surrounding mountainous area of timber, farms, and limestone quarries. It is a burley tobacco market, and manufs. wood products, bricks, textiles, and pig iron; there are also foundry, limestone, and dairy products, and flour- and saw-milling. It is the seat of E. Tennessee State College and near by is Milligan College. Pop. 27,865.

Johnson, Albert Sidney (1803-62), Amer. general, b. Kentucky, graduated at W. Point. In the army he rapidly rose to the command of the forces of Texas and successfully banished the Indian marauders from the N. of that state. After serving in the Mexican war he was appointed paymaster to the U.S. Army (1849), and in 1858 quelled the Mormon revolt without bloodshed. On the outbreak of civil war he joined the Confederates, but was mortally wounded at Shiloh (1862). President Davis pronounced his loss irreparable. This battle came near to being the graveyard of all Gen. U. S. Grant's hopes for fame. J. completely surprised him and the first day's fighting favoured the Confederates. But J. was hit in the thigh by a cannon ball. Had he submitted to surgical treatment his life might have been saved; but he dismounted in the midst of his men and d. fighting. The next day the reinforced Union troops won the contest.

Johnston, Alexander Keith (1804-71), Scottish geographer, was an exceptionally accomplished linguist and a skilful designer. His *magnum opus* was his *Physical Atlas*, 1848, which illustrates the zoology, geology, botany, meteorology, and ethnology of the world, and was described by the Fr. Geographical Society in

1851 as 'un des plus magnifiques monuments' of science in the cent. J. pub. also a *Dictionary of Geography*, 1850, a *National Atlas*, 1843, and a splendid *Royal Atlas*, 1861.

Johnston, Alexander Keith (1844-79), geographer, b. Edinburgh, was the son of Alexander Keith J. (q.v.). The *Globe Atlas of Europe*, and the maps of Murray's *Scotland*, were drawn under his direction. In 1878 he was appointed to the command of an expedition to Lake Nyasa, under the auspices of the Royal Geographical Society, but he d. of dysentery and was buried in Africa. 'Africa,' in Stanford's *Compendium of Geography*, and a series of treatises on physical geography are his chief works.

Johnston, Archibald, Lord Warriston (c. 1610-63), advocate and statesman, b. Edinburgh and educ. at Glasgow Univ., who was employed by the Covenanters in framing their protests against the attacks of Laud and the High Church party, and in answering the aggressive proclamations of Charles I. The General Assembly of 1638 chose him as clerk, and later he was deputed with 7 others to negotiate with the Eng. commissioners. Throughout the Civil war he proved so staunch a parliamentarian that Cromwell raised him to the peerage and appointed him as a commissioner-judge of Scotland. After the Restoration he was executed at Edinburgh (1663).

Johnston, Arthur (1587-1641), Scottish writer of Lat. verse, graduated at Padua as M.D. in 1610. During protracted foreign travels he visited Rome, Germany, the Netherlands, and Denmark, spent 20 years in France, and was for some time associated with the univ. of Sedan. About 1625 he was appointed physician to Charles I. His Lat. version of the Psalms (1637) is inferior in popularity and probably in merit to Buchanan's, but his contributions to the *Deliciae Poetarum Scotorum*, 1637, his satire entitled *Consilium Collegii Medici Parisiensis*, 1619, and his elegy on James VI, 1625, prove him a good Lat. scholar and no mean poet.

Johnston, Sir Harry Hamilton (1858-1927), explorer and author; b. Kennington, S. London. After exploring Tunisia and Angola he penetrated into the Congo dist. above Stanley Pool, 1883, and in the following year led a scientific expedition to Mt Kilimanjaro. For 3 years, 1885-1888, he governed Cameroon and the Niger delta as vice-consul or consul in the Brit. interests; and later, as consul for Portuguese E. Africa, he subdued the slave-trading Arabs in the region of Lake Nyasa, and estab. a large Brit. protectorate N. of Lake Tanganyika. For 5 years, 1891-96, he was consul-general in Brit. Central Africa; and for 2 years, 1899-1901, he was employed in the administration of Uganda. Among his books of travel and description are *The Colonisation of Africa*, 1899, and *A History of the British Empire in Africa*, 1910.

Johnston, James Finlay Weir (1796-1855), chemist, studied under Berzelius in Sweden, and later became prof. of chem.

at Durham Univ. He chiefly interested himself in the relation of his chosen science to agriculture, and for that purpose analysed soils from all parts of the realm. His *Elements of Agricultural Chemistry and Geology* (3rd ed.), 1844, and similarly his *Lectures*, 1883, did much to stimulate cultivation on scientific lines.

**Johnston, Joseph Eggleston** (1807-91), Amer. general, graduated at W. Point, and fought in the Black Hawk and Seminole wars. In 1861 he seceded from the U.S. Army to join the Confederate forces, and was given the command of the army of the Shenandoah. At the first battle of Bull Run he promptly relieved Beauregard and in 1862 was seriously wounded at the battle of Fair Oaks, where he commanded. In 1864 began his famous duel with Sherman, the opposing Federal leader, who lost during the daily actions and skirmishes some 26,000 men to J.'s 10,000. In 1865, after a desperate resistance at Bentonville, he surrendered to Sherman on terms similar to those of Lee. He wrote *Narrative of Military Operations directed during the late war between the States*, by J. E. Johnston, 1874. See life by G. E. Govan and J. Livingood, 1956.

**Johnstone, Family of**, Border family, notorious for its turbulence and feuds with its neighbours, especially the Douglasses and Maxwells. The family took its name from the lordship of Johnstone in Annandale, Dumfriesshire, and 3 branches of the family still exist: Johnstone of Annandale, Johnstone of Westerhall, and Johnstone of Hilton and Caskieben in Aberdeenshire. All 3 branches claimed the title of Earl of Annandale which had become extinct in 1658; Charles II decided the claim in favour of a member of the first, the Earl of Hartfell, who was created Marquess of Annandale in 1701.

**Johnstone, burgh in Renfrewshire**, Scotland, about 3 m. SW. of Paisley. The town has cotton mills, manufs. of bootlaces, brass and iron foundries, and machine shops. Pop. 16,321.

**Johnstown**: 1. City and co. seat of Fulton co., New York, U.S.A., in the foothills of the Adirondacks, on Cayadutta Creek, and 40 m. NW. of Albany. It manufs. woollen and leather gloves, leather garments, boots and shoes, and has some light industries. A number of 18th cent. houses are to be seen, including Johnson Hall, 1762, home of Sir Wm Johnson who founded J. in 1760.

2. Industrial city of Cambria co., Pennsylvania, U.S.A., 55 m. ESE. of Pittsburgh at the confluence of Conemaugh R. and Stony Creek, in mt. region. Iron and steel, bituminous coal, machinery, machine tools, clothing, packed meat, chemicals, and furniture are produced. It was flooded in 1889 with the loss of 2000 lives. Pop. 63,232.

**Johore**, state of the Federation of Malaya, at the S. extremity of the Malay Peninsula, under the rule of a Malay sultan. Before the creation of the Malayan Union in 1946 J. was one of what were known as the Unfederated Malay

States and its relations with Great Britain were defined by a treaty dated 1885, by an amendment of which, in 1914, the sultan agreed to accept, and to act upon the advice of, a Brit. officer called the General Adviser. The Sultan (Ibrahim, proclaimed 1895) is assisted by an Executive and a Legislative Council. The coast is swampy, and the general character of the country low-lying and covered with forest. The highest peak is Mt. Ophir (3840 ft) and the prin. riv. the Muar. J. is connected by rail with Penang and Singapore. The chief products are rubber, gambier, black pepper, coffee, and timber. Prin. imports are food, drink, tobacco, raw materials; the prin. export rubber. Trade is conducted mainly through Singapore. There are 121 m. of railway in J. state and 875 m. of metallised road; thus, with the help of navigable rivs., good communication is available. Rubber estates are situated on either side along nearly the whole length of the railway. Area 7500 sq. m.; pop. (1955) 932,500, of whom 422,000 were Malays, 427,600 Chinese, and 75,300 Indians.

Brit. relations with J., most southerly state on the peninsula and therefore very near Singapore, were close throughout last cent., but the formal treaty with the Sultan was only signed in 1914. The Brit. Adviser was withdrawn in 1956, by mutual agreement, as a result of new constitutional arrangements by which J. became a member state of the Federation, which proclaimed its independence on 31 Aug. 1957.

**Johore Bahru**, cap. of the state of Johore, Malay Peninsula, on the S. coast, about 15 m. N. of Singapore. It has a fine palace built by the Sultan Abubakar. A causeway for freight and passenger traffic was opened in 1923 across the Straits between J. B. and Singapore. It carries a 26-ft roadway besides the double rail track. The rail and road causeway is 34 m. long. Pop. 46,000.

**Joiny, Fr. tn** in the dept of Yonne, on the Yonne. It has the remains of a castle, and produces wine and woollen goods. Pop. 6100.

**Joinery**, complementary craft to carpentry (q.v.); the latter is concerned with the structural parts, the former with the ornamentation of buildings, etc. It includes the work done at the bench in the preparation of the finished woodwork of buildings, such as doors, window frames, cupboards, etc. The joiner works almost entirely in planed or wrought wood, whilst the material used by the carpenter is not so treated. The timber for joiner's work should be seasoned until it has lost one-third of its weight. The operations of J. require greater accuracy than those of carpentry; the joints must be accurately fitted and all exposed surfaces made smooth. The wood used by joiners is called *stuff*, and consists of planks or boards, deals, and battens, so named according to their widths. Battens vary from 2 to 7 in. in width, deals are 9 in., and planks 11 in. Matchboarding has a

court may direct a sale unless the others buy out the interest of the party or parties requesting sale.

**Joints.** Study of anatomical J. is technically termed arthrology and includes an examination of the connections between any 2 or more parts of the skeleton. It is usual to divide J. into 2 classes, viz. *immovable* and *movable*, and the latter again into *perfect* and *imperfect*. Examples of the immovable (synarthroses) are those formed where an ossification takes place, as in a membrane, e.g. a suture of the skull. A special form of immovable junction is shown in the gomphoses or peg and socket J. of the fangs

STRUCTURE OF A PERFECT JOINT  
(DIARTHROSIS)

B, bone; AC, articular cartilages; SM, synovial membrane; JC, joint capsule; SF, synovial fluid.

of teeth into tooth sockets of the jaw. Certain bones, which are distinct in early life, tend to join by ossification after middle age. This *synostosis* is shown in the case of the fusion of the distinct *pubis*, *ischium*, and *ilium* into the single *os innominatum*. Imperfect J. (*amphiarthroses*) are those in which the conjoined bones are connected by cartilages or ligaments, the flexibility of which alone allows of any mobility at the junction. Examples of such J. occur in the vertebral column, where thick plates of fibrocartilage separate the flat surfaces of the vertebrae. The arrangement gives considerable springiness to the column, and tends to eradicate shocks caused by the jar in walking, jumping, etc.; at the same time the body may be bent in any direction even though the actual movement between any pair of vertebrae be slight. The *pubic symphysis* and the *sacro-iliac* are only imperfect J., but in consequence of their presence the pelvis has considerably more elasticity than it would have if it were all one bone. In all

perfect J. (*diarthroses*) the articulating bony surfaces are covered with cartilages, the convexities of the one cartilaginous cap fitting more or less closely into the concavities of the other. In some cases these articular cartilages are separated by interarticular plates of cartilage lying between them, and in this case the opposing faces of the interarticular and of the articular cartilages fit into one another; examples of such interarticular plates are the semi-lunar cartilages of the knee joint. The joint is enclosed by a synovial membrane forming a closed sac and containing a viscid lubricating secretion termed synovial fluid. Outside the synovial membrane is a sleeve of fibrous tissue, the capsular ligament. Sacs known as bursae, formed from synovial membrane, are present where J. are subjected to pressure, e.g. the prepatellar bursa of the knee joint, which becomes inflamed in 'housemaid's knee.' The actual shape of the surfaces forming the J. varies greatly and may be spheroidal, cylindrical, or pulley-shaped, and it is suggested that in some cases the movement to which a joint is subject may determine or modify its shape so as to cause it to present divergencies in different individuals. The following are some of the chief forms of J. of the human frame: (a) Ball and socket, a spheroidal surface furnished by one bone works within a cup furnished by another; this will allow of motion of the former bone in any direction, its extent being dependent on the concavity of the cup. This is deep in the case of the hip joint and the extent of movement is sacrificed to obtain additional strength. The shoulder yields an example of an extended movement, for in this the glenoid cavity is shallow. (b) Gliding, in which the articular surfaces are flat. Examples are given in the tarsal J., the intercarpal J., and in the jaw J. in one of its movements. (c) Hinge, which has a nearly cylindrical head fitting into a corresponding socket, the movement being practically restricted to a direction perpendicular to the axis of the cylinder: examples occur in the case of the elbow, knee, ankle, and interphalangeal J., where suitable attachments or bony processes prevent a backward dislocation. (d) Double hinge or saddle, in which the articular surface of each bone is concave in one direction and convex in a direction at right angles to this, e.g. carpo-metacarpal J. of the thumb. The tarso-metatarsal of the big toe is not a saddle joint. (e) Condylloid; this is similar to the saddle and allows flexion, extension, and lateral movement and no rotation, but it is usually a weaker form of joint; examples, wrist and metacarpophalangeal. (f) Pivot, in which one bone furnishes a pivot on which another turns, or it turns itself on its own axis resting on another bone; an example of the former is given in the case of the atlanto-axial, in which the odontoid peg of the axis passes through a ring-like portion of the atlas; this arrangement allows of the head being turned or shaken through a considerable angle. The occipito-atlantal joint, used in nodding the head, is

of a different type. The case of the rotation of a bone on its own axis is illustrated by the radius, which has a shallow cup adjacent to the humerus and a concave surface at its lower end which articulates with the ulnar. In pronation (i.e. when the hand is turned so that the palm faces downwards), the radius turns on its own axis at its upper end and glides round the ulna at its lower.

**Diseases.** For diseases and injuries to the *J.* see under ARTHRITIS; DISLOCATIONS; RHEUMATISM; SPRAINS; SYNOVITIS. See H. Gray, *Anatomy* (31st ed.), 1954.

**Joints**, in geology, are divisional planes in rocks. They never extend beyond the outermost crust, i.e. beyond the 'zone of fracture' as described by Van Hise, and vary in visible width from that of a hair to well-marked fissures, which in certain rocks may be widened by the solvent action of rain water, e.g. the grykes of the limestone regions of Yorks and the Lake Dist. They are most abundant in coherent rocks and absent in loosely packed material. The *J.* not only give passages for the circulation of underground water but also for highly concentrated mineral solutions; on occasion the minerals are deposited and many mineral veins, e.g. calcite barites, ores of lead, etc., follow joint planes. Regular joint systems in sedimentary rocks are generally the products of crustal stresses, and are often perpendicular to the bedding. *J.* in igneous rocks are frequently developed during cooling after solidification. In lava flows and in dikes and sills *J.* form at right angles to the cooling surfaces and may, as in the Giant's Causeway, have a hexagonal arrangement. In large igneous bodies, jointing tends to produce rectangular blocks of rock, a fact which is of importance in quarrying operations. See GEOLOGY.

**Jointure**, in law, is a term denoting the provision made for a wife out of her husband's property in the event of his predecease. Unlike dower, it is not limited to real estate, but now includes any provision made by a settlement for the support of the wife in the event of her surviving her husband. The doctrine of *J.* originated in the equity courts by way of substitution for dower in cases in which the latter had no application. The Statute of Uses originated the modern *J.*, which usually takes the form of a yearly rent-charge or annuity created by a marriage settlement specifying the mode and time of its payment.

**Joinville**, or **Joinville** (formerly called **Dona Francisca**), city of Santa Catarina prov., S. Brazil, about 80 m. NNW. of Florianopolis. An industrial centre, founded by Ger. immigrants, it has textile, brewing, and distilling industries, and ships goods through the port São Francisco do Sul. Pop. 21,100.

**Joinville**, François Ferdinand Philippe Louis Marie d'Orléans, Prince de (1818-1900), Fr. sailor, third son of Louis Philippe, King of France, b. Neuilly. He entered the navy and became a lieutenant in 1836, first distinguishing himself at

the bombardment of San Juan de Ulloa (1838). In 1845 he successfully bombarded Tangier and occupied Mogador in Morocco. At the revolution of 1848 he sought refuge with the rest of his family in England. In 1870 he returned incognito to France, and fought at Orléans, but when his identity became known he was expelled by Gambetta. From 1871 to 1876 he was allowed to sit as member for Haute-Marne in the National Assembly.

**Joinville**, Jean, Sire de (1224-1317), Fr. historian, seneschal of Champagne. He accompanied Louis IX (St Louis) in his crusade of 1248-54, and while at Acre composed his *Credo* or confession of faith (1250). He began his *Vie de St Louis* in about 1280 (completed 1309). It is one of the finest medieval biographies, and a chief source of information about St Louis. There is an Eng. trans. by J. Hutten, 1868. See A. F. Delahorde, *Jean de Joinville*, 1894.

**Joinville**, Fr. tn in the dept of Haute-Marne, on the Marne. It has a château built by Claude de Guise (see under GUISE) in 1546, and here, in 1584, was signed an agreement between the League (q.v.) and the King of Spain. *J.* was the bp. of Jean de *J.*, and of Mary of Guise (qq.v.). The tn has metallurgical industries. Pop. 3200.

**Joinville-le-Pont**, Fr. tn in the dept of Seine, on the Marne, a SE. suburb of Paris. It has a well-known school of physical culture, and film studios. Pop. 13,300.

**Jókai**, Mór (1825-1904), Hungarian novelist, b. Rév-Komárom. He qualified as an advocate, but, encouraged by the praise of the Hungarian Academy for his play *Zsidó fiú* (Jew Boy), went to Pest and embarked on a literary career. The pub. of his romance *Ilékönnapok*, 1845, marked an epoch in Hungarian literature, and firmly estab. its author's reputation. For his part in the revolution of 1848-9, and his support of Kossuth, he was proscribed by the gov., and his life was only saved by a stratagem of his wife, Róza Láborfalvy, the tragic actress. Among his romances, nearly all of which have been trans. into English, are *The Golden Age of Transylvania*, and its sequel, *The Turks in Hungary*, 1903, *Timar's Two Worlds*, 1888, perhaps his masterpiece, *Eyes like the Sea*, which won the Academy's prize in 1890, *Midst the Wild Carpathians*, 1894, with its sequel, *The Slaves of the Padishah*, 1903, *Pretty Michal*, 1897, *The Lion of Janina*, 1897, *A Christian, but a Roman*, 1900, *The Baur's Sons*, 1902, and *Tales from Jókai*, 1904, with a biography by R. N. Bain. See 'Maurice Jókai and the Historical Novel' in *Contemporary Review*, July 1904, and life by F. Zsigmond, Budapest, 1934.

**Joke**, see HUMOUR and JEST-BOOKS.

**Jokjokarta**, see JOGJAKARTA.

**Joliba River**, see NIGER.

**Joliet**, Louis (1645-1700), Fr.-Canadian explorer, b. Quebec. He was commissioned 1672 to explore the Mississippi, which he did, as also the Fox, Wisconsin, and Illinois R.s.

**Joliet**, city, co. seat of Will co., Illinois, U.S.A., on the Des Plaines R. and the Illinois Waterway, 37 m. SW. of Chicago. It is a railway and industrial centre, with coal mines and limestone quarries near by, and manufs. of wallpaper, steel products, chemicals, etc. It is the site of the state penitentiary. Pop. 51,600.

**Joliette**, or **Industry Village**, city in Quebec, Canada, 35 m. N. of Montreal. It is an agric. centre, and the industries include dyeing and finishing of textiles, iron goods, flour, and lumber. Pop. 16,870.

**Joliot-Curie, Irène** (1897- ), b. Paris, daughter of Marie and Pierre Curie (q.v.). Worked at the Institut de Radium until 1934. Awarded Nobel prize together with her husband, Jean Frédéric J.-C., in 1935 for the discovery of artificial radioactivity.

**Joliot-Curie, Jean Frédéric** (1900- ), Fr. physicist, b. Paris and studied there. He shared the Nobel prize for chem. in 1935 with his wife, Irène, for their discovery of artificial radioactivity. In 1937 he became prof. at the Collège de France. During the Second World War he was a leader of the Fr. resistance movement, but in 1950 he was dismissed from his post as director of the Fr. Commission of Atomic Energy on political grounds. His most important work has been in nuclear physics, with contributions to the discovery of the neutron, studies of the positron, and demonstration of the fact that more than one neutron is liberated in the fission of uranium 235.

**Jolly-boat**, small clinker-built boat, not so large as a cutter; it is usually hoisted at the stern of a vessel, and used for miscellaneous services. It has a bluff bow, and a wide transom, and is about 4 ft in beam and 12 ft in length.

**Jolo Archipelago**, see **SULU**.

**Jolson, Al** (real name Asa Yoelson) (1886-1950), Amer. actor and singer; his third wife was Ruby Keeler, the actress. B. in St Petersburg, he was the son of a rabbi, and emigrated to the U.S.A. with his family in 1893. His first legitimate theatre appearance was in 1899 at the Herald Square Theatre, New York, as one of the mob in *The Children of the Ghetto*; for sev. years he toured with a circus company and minstrel shows. He made his first big success in 1909, singing 'Mammy' in blackface. After a series of theatrical successes he began his film career by appearing in the first talking film, *The Jazz Singer*; other well-known films were *Wonder Bar* and *The Singing Fool*, in which he sang another famous song, 'Sonny Boy.' He appeared as a voice only in 2 films of his life, *The Jolson Story* and *Jolson Sings Again*.

**Jom Kippur**, see **DAY OF ATONEMENT**.

**Jomada I and II**, see **JUMADA**.

**Jomini, Antoine Henri, Baron** (1779-1869), general in the Fr. and afterwards in the Russian service, b. Payerne, Switzerland. He served in the campaign of Austerlitz, and became prin. aide-de-camp to Marshal Ney in 1805. His *Traité des grandes opérations militaires*,

1804-5, brought him to the notice of Napoleon, under whom he served at Jena and Eylau. He served through the Peninsular campaign (1808), but after the retreat from Moscow entered the Russian service, in which he took part in the Russo-Turkish war, especially at the siege of Varna (1828). Besides the *Traité*, he wrote *Principes de la stratégie*, 1818, *Précis de l'art de la guerre*, 1830, *Histoire de la Révolution*, 1806, and *Vie de Napoléon*, 1827. See F. Locmte, *Le Général Jomini*, 1861, and C. A. Sainte-Bouve, *Vie*, 1869.

**Jommelli, Niccolò** (1714-74), It. composer, b. Aversa, near Naples. In 1737 his first opera, *L'errore amoroso*, was successfully produced at Naples. In 1747 one of his finest operas, *Didone*, was produced at Naples and a revised version came out in 1749 at Vienna. In 1753 he was appointed chapel-master to the Duke of Württemberg at Stuttgart. His best-known works were the operas *Ifigenia in Aulide*, 1751, and *Armida abbandonata*, 1770, a *Miserere*, and a *Requiem*. See life by H. Abert, 1908.

Warner Bros.

AL JOLSON IN 'THE JAZZ SINGER'

**Jonah** (Gk *Jonas*), son of Amittai of Gath-hopher, lived under Jeroboam II (q.v.) and predicted his victories over the Syrians (2 Kings xiv. 25). All we know of him apart from this comes from the Book of J., which is now generally regarded (even by many Catholic scholars) as a prophetic parable, or didactic fiction. It is written in the form of historical narrative but placed among the prophetic books. The teachings of the book are: (1) the care of God for all mankind, not for Israelites only; (2) the mercy of God

towards those who repent. Incidentally the book contains one of the few references in scripture to God's loving solicitude for animals (Jonah iv. 11, cf. Matt. x. 29). J.'s sojourn for part of 3 days in the belly of a great fish (not specifically a whale) was used by Christ as a sign or type of His death and resurrection: no proof that He regarded the book as historical. He perhaps referred to a type present in scripture as we might refer to something said or done by Hamlet. Matt. xii. 40-2 is more difficult to explain away. If the Ninevites did not in fact repent at J.'s preaching, how can they rise up on the day of judgment to condemn those who have not repented at the Gospel of Christ!

**Jonas, Justus** (1493-1555), Ger. Protestant reformer, b. Nordhausen in Thuringia; was canon of St Severus and prof. of law at Erfurt (1518) and prof. of theology at Wittenberg (1521). An intimate friend of Luther, he accompanied him to the Diet of Worms and helped his trans. of the Bible. See T. I. Pressel, *Monograph*, 1863, and Meyer, *Festschrift des 400 Jährigen Geburtstages des Dr Justus Jonas*, 1893.

**Jónasson, Jóhannes** (úr Kötium) (1899-), Icelandic poet who has written many poems of austere beauty. As a rule he drops his patronymic (Jónasson) and instead writes as 'úr Kötium,' the name of the farm where he was b.

**Jonathan:** 1. Son of Gershom and descendant of Moses, chief of the priests at Dan (Judges xviii. 30). He provides an interesting hint at a priesthood derived from Moses, usually regarded as a prophet and not a priest. See under LEVITES. See also G. Buchanan Gray, *Sacrifice and Priesthood*.

2. Eldest son of Saul, a great and generous-hearted warrior whose devotion to David is the great classic of friendship (1 Sam. xviii-xx.). He was slain at Gilboa, where Saul also met his death. David's lament over Saul and J. (2 Sam. i. 17 ff.) is one of the great poems of all time.

3. Son of Mattathias and brother of Judas, whom he succeeded as leader of the Maccabean party. His statesmanship was greater than his ability as a warrior, and to it he owed the favourable terms which he made for the insurgents with Bacchides, the Syrian governor. He became high-priest in 153 BC, but was slain in captivity 11 years later.

**Jonathan, Brother**, personification of the U.S.A., corresponding to the Eng. 'John Bull'; the phrase has now been largely superseded by 'Uncle Sam.' The name is supposed to have come from Jonathan Trumbull (1710-85), governor of Connecticut and friend of Washington.

**Jones, Daniel** (1881-), Eng. phonetician, educ. at Radley, Univ. College School, and King's College, Cambridge. He studied law, and was called to the Bar in 1907, in which year he also became lecturer in phonetics at Univ. College, London. In 1921 he was appointed prof. of that subject in the Univ. of London. He has lectured at Paris, Geneva, Zürich,

Berlin, Göttingen, Marburg, Bonn, Cologne, Hamburg, Copenhagen, Stockholm, Upsala, Gothenburg, Rotterdam, and in the U.S.A. and India. He was secretary of the International Phonetic Association from 1928 to 1949, and assistant editor of its organ, *Le Maître phonétique*, 1907-40, and editor 1940-8; president of the Simplified Spelling Society, 1946, and of the International Phonetic Association. His works include *Cantonese Phonetic Reader*, with H. K. Woo, 1912, *Sechuana Reader*, with S. T. Platje, 1916, *English Pronouncing Dictionary*, 1917 (revised eds. 1924, 1939, 1945, 1956), *Colloquial Sinhalese Reader*, with H. S. Perera, 1919, *The Problem of a National Script for India*, 1942, *The Phoneme, its Nature and Use*, 1950, *The Pronunciation of English* (4th ed.), 1956, *Outline of English Phonetics* (8th ed.), 1956, *Phonetic Readings in English*, 1956, and *Cardinal Vowels*, 1956.

**Jones, Ebenezer** (1820-60), poet, b. Islington, London. The early death of his father cut short his education, and compelled him to become a clerk in a tea-merchant's office. His defective education is very apparent in his first vol. of poetry, *Studies of Sensation and Event*, 1843, which was very unfavourably received, although admired by Browning and Rossetti. His 3 remarkable poems, 'Winter Hymn to the Snow,' 'When the World is Burning,' and 'To Death,' were written when he was dying. See the ed. of *Studies of Sensation* by R. H. Shepherd, 1879, with a memoir by Sumner Jones; also T. M. Rees, *The Neglected Poet*, 1909.

**Jones, Sir Edward Burne**, see BURNE-JONES, SIR EDWARD.

**Jones, Emily Elizabeth Constance** (1848-1922), lecturer and schoolmistress; daughter of Dr J. Jones, of Langstone Court, Herefordshire. At Cambridge she took a first in the Moral Sciences Tripos, 1880. She lectured on moral science at Girton from 1884, becoming mistress 1905. Her works include trans. and ed. of Lotze's *Microcosmus* with E. Hamilton, 1885, *General Logic*, 1890, *Primer of Logic*, 1905, *Primer of Ethics*, 1911.

**Jones, Ernest** (1879-1958), psychoanalyst, b. Gowerston, Glamorgan, educ. at Cardiff and London, graduating M.B., 1901, and M.D., 1903. He soon began to specialise in neurology and psychiatry. After studying the Ger. literature on psychoanalysis he became a confirmed Freudian. J. was pro. of psychiatry at Toronto, 1909-11. He returned to London and became the leading psychoanalyst in the Eng.-speaking world. He founded the Brit. Analytical Society and the Institute of Psycho-analysis, and was director of the London Clinic for Psychoanalysis. In 1920 he founded the *International Journal of Psychoanalysis*, which he ed. until 1939. His prolific literary output included *Papers on Psychoanalysis* (5th ed.), 1948, and *Sigmund Freud: Life and Work* (3 vols.), 1953-6.

**Jones, Ernest Charles** (1819-69), Chartist, b. Berlin of Eng. parentage, and educ.

at Göttingen. In 1844 he was called to the Bar at the Middle Temple, but in 1845 joined the Chartist movement, and speedily became one of its most noted orators. His open advocacy of physical violence led to his imprisonment for sedition (1848-50). In prison he wrote *The Revolt of Hindustan*, an epic poem.

Jones, Sir Harold Spencer (1890- ), b. London, Astronomer Royal, 1933-55. From 1913 to 1923 he was chief assistant at the Royal Greenwich Observatory, and from 1923 to 1933 H.M. Astronomer at the Cape of Good Hope. He has pub. *General Astronomy*, 1922, *Worlds Without End*, 1935, *The Earth as a Clock*, 1939, *Life on Other Worlds*, 1939 (2nd ed., 1952), *The Royal Observatory, Greenwich*, 1943, and *John Couch Adams and the Discovery of Neptune*, 1947.

Jones, Henry (1831-99), author, b. London. He practised as a physician in London from 1852 to 1869. In 1862 under the pseudonym of 'Cavendish' he pub. *The Laws and Principles of Whist Explained by Cavendish*. He was a member of sev. whist clubs, including the 'Cavendish.' His work became the standard authority on the game. See W. P. Courtney, *English Whist and Whist Players*, 1894.

Jones, Sir Henry (1852-1922), philosopher; b. Llangernyw, N. Wales. First worked as a shoemaker. Graduated at Glasgow Univ. with first-class honours, 1878. Held the chairs of philosophy and political economy at Bangor Univ. College, 1884-91; and of logic and metaphysics at St Andrews Univ., 1891-4. From 1894 he was prof. of moral philosophy at Glasgow Univ. He was LL.D. of St Andrews, and D.Litt. of Wales. Works include *Browning as a Philosopher and Religious Teacher*, 1891, *The Philosophy of Lotze*, 1895, *Idealism as a Practical Creed*, 1909, and *The Working Faith of the Social Reformer*, 1910—the first and last of which gained him considerable popularity and influence. Elected fellow of Brit. Academy, 1904. Knighted, 1912.

Jones, Henry Arthur (1851-1929), playwright, b. Grandborough, Bucks, son of Silvanus J., tenant-farmer. He attended a grammar school at Winslow till he was 13. He was obliged to adopt a commercial career, but gained his first hearing as a dramatist with *Only Round the Corner*, produced at the Exeter Theatre in 1879, and *A Clerical Error*, 1879, produced in London. His melodrama, *The Silver King*, written with H. Herman, 1882, scored a great success. His *Saints and Sinners*, 1884, was the subject of controversy on account of its religious element. *The Middleman*, 1889, and *Judah*, 1890, mark an advance in technical skill. *The Dancing Girl*, 1891 (revised as *The Dancing Mistress* in 1913), *The Crusaders*, 1891, *The Bauble Shop*, 1893, *The Templer*, 1893, *The Masqueraders*, 1894, *The Case of Rebellious Susan*, 1895, *Michael and his Lost Angel*, 1896, *The Rogue's Comedy*, 1896, *The Physician*, 1897—all these for the most part deal more nearly with the problems of everyday life. His poetical

drama, *The Templer*, 1893, was not a success; but with *The Triumph of the Philistines*, 1895, he began a series of successful plays which include *The Liars*, 1897, and *The Heroic Stubbs*, 1906. Later 'serious' plays are *Carnac Sahib* and *The Manoeuvres of Jane*, 1899, *The Lackey's Carnival*, 1900, *Mrs Dane's Defence*, 1900, *Chance, the Idol and the Princess's Nose*, 1902, *Whitewashing Julia*, 1903, *Joseph Entangled and The Chevalier*, 1904, *The Hypocrites*, 1906, *Dolly Reforming Herself*, 1908, *The Knife*, 1909, and *The Ogre*, 1911. A uniform ed. of his plays began to be issued in 1891 and his views on dramatic art are given in *The Resurgence of the English Drama*, 1895. See his *Life and Letters*, by J. D. Jones, 1930, and R. A. Cordell, *Henry Arthur Jones and the Modern Drama*, 1932.

Jones, Inigo (1573-1652), architect, b. London. Sometimes called the 'English Palladio,' for J. was the first to introduce pure Renaissance architecture, adapting it. Ideas, especially those of Palladio, to

INIGO JONES

Eng. requirements. Little is known of his life, beyond the fact that he appears to have travelled a great deal, particularly in Italy. It is possible that he was sent to Italy to study, by Wm Herbert, 3rd Earl of Pembroke. At any rate, he was in Venice c. 1603 when he was sent for by the King of Denmark. A quite unfounded legend suggests that he designed the palaces of Rosenborg and Frederiksborg. He accompanied Anne of Denmark to the Eng. court in 1604, and there designed the scenery for Ben Jonson's *Masque of Blackness*, given at Whitehall in 1605. In 1615, after another visit to Italy, J. became surveyor-general of the royal buildings, and in 1617 he began the Queen's House at Greenwich. In 1619 he was commissioned to design additions to Whitehall, including the banquetting-house. He held the same offices under Charles I. The Civil war interfered with his activities, and his loyalty to the Stuarts caused him to be fined twice, so that other examples of his work are not numerous. Besides the 2 mentioned, his only buildings still surviving are the

chapel of Marlborough House, London (1623-6), and part of Wilton House, Wilts, including the 'Double Cube Room' (1649-52); but a good example of his work is to be found in St Paul's, Covent Garden, burnt down in 1795, but re-erected in the same style; and he may have designed Lindsey House in Lincoln's Inn Fields, c. 1640. See biography by J. A. Gutch, 1928.

**Jones, John** (c. 1765-1827), Unitarian minister, b. Carmarthenshire. In 1795 he was appointed pastor at Plymouth Dock, and subsequently at Halifax, Yorks, and in London. The introduction of Gk-Eng. lexicons is due to him, Greek having hitherto been studied only through Lat. books. His *Greek and English Lexicon* was pub. in 1823. He pub. *Illustrations of the Four Gospels*, 1808.

**Jones, John Paul** (1747-92), commander and the first great hero in the Amer. Navy, b. Kirkbean, Kirkcudbright, Scotland. In 1764 he shipped as mate on a slaver and made sev. voyages to America. He assumed the name of J. when he settled in Virginia. When war broke out between England and America in 1775, J. was given a commission in the Amer. Navy. In 1778 he was sent on a mission to Brest, and during a cruise round the Brit. coasts succeeded in capturing the *Drake*, and surprising the garrison of Whitehaven. In 1779 he took command in one of the most famous sea-fights in hist. He had command of 3 ships led by the *Bonhomme Richard* off Flamborough Head, England. The *Serapis* surrendered when sinking. J.'s ship sank the next day. In 1788 he joined the Russian Navy, taking part in the battle of Liman (1788), but left in 1789. He d. in Paris. His body was then escorted by a fleet of Amer. warships to Annapolis. See J. Sherburn, *Life of Paul Jones*, 1825; Janette Taylor, *Collections*, 1830; life by C. Townshend Brady in Great Commanders Series, 1900; Winston Churchill's novel, *Richard Carvel*, 1903.

**Jones, Thomas Gwynne** (1871-1949), Welsh poet, b. Gwyndy Uchaf, Denbighshire, son of a farmer. He was on the staff of a Welsh newspaper *Genedl Gymreig* in Caernarvon when he was appointed to the staff of the newly estab. National Library of Wales. In 1913 he was appointed lecturer in Welsh literature at the Univ. College of Wales, Aberystwyth, and in 1918 became prof. His first book of verse was pub. when he was little more than a boy. His second vol., *Gwlad y Gan*, appeared in 1902, after he had already pub. 2 Welsh novels, and it was in that year that he won the National Eisteddfod chair at Bangor with his *Ymadawiad Arthur*, a poem which heralded a new era in Welsh literature. He won the national chair again in 1909, with his *Gwlad y Bryniau*, and from then his place in Welsh literature was assured. In 1912 he wrote a biography of Emrys ap Iwan, the preacher and linguist, and a life of Thomas Gee, his first editor (1913); this book is in effect a hist. of Welsh politics. In his verse J. was a constant experimenter and

innovator, working, however, on the foundation of the classical tradition. He also wrote some vols. of essays, sev. plays, and a book in English on Welsh folklore. Among his other works are a critical ed. of the poems of Tudor Aled, 1926, trans. of *Faust* and *Macbeth*, an anthology of Irish poems trans. into Welsh, and a version of *Y Bardd Cwsc* in English.

**Jones, William** (1675-1749), Brit. mathematician to whom is attributed the first use of the symbol  $\pi$  (see  $\pi$ ) to denote the circumference/diameter ratio. He was a friend of Isaac Newton (q.v.), and ed. Newton's mathematical papers, 1711. F.R.S., 1712. For many years he was employed as tutor by the earls of Macclesfield at Shirlburn Castle.

**Jones, Sir William** (1746-94), orientalist, b. London. He was that rare combination, a great scholar both in oriental fields (Hindu, Arabic, and Persian languages and literatures) and in legal studies. In 1783 he was appointed to a judgeship in Bengal, which he held till his death; he devoted his leisure to the study of Hindu law, the results of which were pub. under the title *Digest of Hindu Laws*, 1800. His numerous works include *Traité sur la poésie orientale*, 1770, *Dissertation sur la Littérature orientale*, 1771, *Grammar of the Persian Language*, 1774, *Mohammedan Law of Inheritance*, 1792; he ed. *Mānavadharmaśāstra* on the codex of Manu, 1794, dealing with the 'Institutes of Hindu Law on the Ordinances of Manu'. He also ed. *Sakuntalā* (with a celebrated introduction on the Indian theatre), 1789, as well as *Rhusamhara*, 1792, and sev. other works. His collected works were pub. in 1799 (6 vols.) and 1807 (13 vols.).

**Jonesboro**, co. seat of Craighead co., Arkansas, U.S.A., 60 m. NNW. of Memphis; it has manufs. of leather, cotton-oil, wood products, shoes, flour, hosiery, and bricks. It is a distribution centre for a farm area (cotton, corn, rice, fruit, livestock, poultry). Pop. 16,310.

**Jongkind, Johann Barthold** (1819-91), Dutch landscape painter and engraver, b. Lattrop. A pupil of Isabey, he worked much in France, and in his study of atmospheric effects was one of the pioneers of Impressionism (q.v.).

**Jongleurs, Jugglers, or Joculatores** (Lat. *joculator*, a jester) were the descendants in medieval times of the Rom. mimes, the strolling players who were all that remained in the 4th cent. of the once great Rom. theatre. They appeared at festivals, gave their entertainment, and vanished again into obscurity; but they alone carried down such traditions as remained of the anct pagan drama, and ultimately combined them with the new religious drama. In N. France they very early adapted the religious drama for secular purposes, and came to be confused with the *trouvères*, who corresponded with the 'minstrels' of Saxon times. But the *trouvères* or minstrels were a superior class of entertainers; they were generally attached to great households to sing of war and noble deeds, whereas the J. were vagabonds

strolling from vil. to vil. to exhibit their juggling and pantomimic tricks. The requirements of a jongleur are quoted by Sismond: 'He must know how to compose and rhyme well, and how to compose a *jeu parti*. He must be able to play on the tambourine and cymbals; to throw and catch little balls on the point of a knife; to imitate the songs of birds; to play tricks with the baskets; to exhibit attacks of castles, and leaps through four hoops; to play on the citole and the mandore; to handle the clavichord and the guitar; to string the wheel with seventeen chords; to play on the harp; and to adapt a gigue so as to enliven a psaltery'—a combination, in fact, of the anacrostic and the modern conjuror (q.v.) and variety entertainer. They lived and travelled after the manner of present-day gipsies in companies, and, according to Lacroix, under 'kings' of their own, but whether they were largely composed of the gipsy element is uncertain. See L. Sismond, *Historical View of the Literature of the South of Europe* (trans. P. Roscoe, 2nd ed.), 1846; P. Lacroix, *Manners, etc., of the Middle Ages*, 1876.

Jönköping, tn of Sweden, the cap. of the prov. (län) of the same name, 170 m. SW. of Stockholm and 80 m. E. of Gothenburg, at the S. end of Lake Vättern. It has a large safety-match factory, a good shipping trade, and manufs. of snuff and cigars, paper, carpets and damask, dye and asphalt. It has played an important part in Scandinavian hist., and was the scene of the conclusion of peace between Sweden and Denmark in 1809. Area of prov. 4447 sq. m. Pop. (prov.) 277,949; (tn) 48,488.

Jouquièr, adjoining tn to Kénogami, 8 m. E. of Chicoutimi, in Quebec, Canada. Prin. industry, pulp and paper. Pop. 25,400.

Jonquill, popular name for *Narcissus jonquilla*, a well-known and beautiful species of Amaryllidaceae largely cultivated in Britain. Sev. of the flowers are borne on one stem; in colour they are yellow and the corona is well developed.

Jonson, Ben (c. 1573-1637), poet and dramatist, b. Westminster, posthumous son of a clergyman of Scottish descent. He was educ. at Westminster School under Wm Camden. After working for some time for his stepfather, a bricklayer, he went abroad to join the Eng. Army in Flanders. He returned in 1592, and soon afterwards took to the stage. He joined the Admiral's Company, and not only took part in the performances, but also acted as hack-dramatist. Killing his challenger in a duel in 1593 all but cost him his life; he was branded on the thumb, imprisoned, and his goods confiscated. In prison he became a Catholic, but 12 years later reverted to Protestantism. A quarrel with the manager, Henslowe, in the same year resulted in his offering his first known comedy, *Every Man in His Humour*, to the rival company, the Lord Chamberlain's Servants, by whom it was produced at the Globe Theatre, with Shakespeare in the cast. The play was successful, and J. was at once enrolled

among the list of the leading dramatists. His next most important plays were *Every Man out of his Humour*, 1599, *Cynthia's Revels*, 1600, *The Poetaster*, 1601, and *Sejanus* (a tragedy), 1603. These were followed by *Volpone*, or *The Foote*, 1605, *Epicoene*, or *The Silent Woman*, 1609, and *The Alchemist*, 1610, his most elaborate and masterly play. In all he is credited with 18 plays, although there were probably many more of which he was author or part-author. In addition to these he wrote sev. masques, numerous poems, and some works in prose. In 1619 he received the laureateship and a small pension from the king. J. acquired a position to which scarcely any man of letters before him had attained. 'His conversation,' Clarendon has recorded, 'was very good and with men of most note.' He was on friendly terms with Bacon, Selden, Camden, Donne, and Fletcher, and certainly he knew Shakespeare. With Suckling, Herrick, and others he founded the Apollo Club at the Devil Tavern. He was also a frequenter of the famous Mermaid Tavern (q.v.). He d. in poverty, but was buried in Westminster Abbey, his tombstone being inscribed with the words 'O rare Ben Jonson.' As a dramatist, he is second only to Shakespeare, with the possible exception of Marlowe. As a satirist he was magnificent, as a humorist unrivalled except by the master-dramatist himself. His poetry was exquisite, and he gave to everything he wrote the hall-mark of his vivid personality. He wrote some 35 masques in the production of which Inigo Jones provided the mechanisms. His best work was his lyrics, notably 'Drink to me only with thine eyes.'

His collected works were ed. by W. Gifford, 1816, reissued in 1875 with corrections by F. Cunningham, and by C. N. Herford and P. Simpson, 1925-52. See lives by W. Gifford, 1816; J. A. Symonds, 1886; G. Smith, 1919; J. Palmer, 1934. See also A. C. Swinburne, *Study of Ben Jonson*, 1889; M. Castelain, *Ben Jonson: l'homme et l'œuvre*, 1907; G. B. Johnston, *Ben Jonson, Poet*, 1945.

Jonsong, pass in the Himalaya, at an altitude of over 21,000 ft in the ridge connecting Kangchenjunga with Nepal.

Jönsson, Agnar K. (1909- ), scholar and diplomatist, Icelandic minister in London. He has pub. a biographical dictionary of Icelandic lawyers.

Jönsson, Arngrímur (1568-1648), Icelandic scholar and church magnate whose works, mostly in Latin, on Icelandic and N. hist. are still of fundamental importance, as he had access to sources that no longer exist. Chief among his works pub. in his lifetime are *Brevis Commentarius de Islandia*, 1593, *Crymogaea*, 1609, and *Specimen Islandiae*, 1643, while others have been preserved in MS. only; but the entire corpus is now being pub. in the *Bibliotheca Arnarnaganae*, vols. ix-xli, ed. by J. Benediktsson.

Jönsson, Björn (1846-1912), Icelandic newspaper editor and a national leader in Iceland's struggle for political independence; a man of great endowments,

immense strength of character, and high ideals, he had a profound influence on the affairs and the progress of his country.

**Jónsson, Einar** (1874-1954), Icelandic sculptor of great originality and force. His sculpture gallery in Reykjavík was erected by the Icelandic Gov., and a vol. of reproductions of all his major works was pub. in 1954.

**Jónsson, Finnur** (1704-80), Icelandic bishop and church historian. His *Historia ecclesiastica Islandiæ* (4 vols.) is a standard work. See P. E. Ólason, *Íslenskar æviskrár*.

**Jónsson, Finnur** (1858-1934), Icelandic philologist, prof. of Old Icelandic in the univ. of Copenhagen and author of the standard hist. of Old Norwegian and Old Icelandic literature (in Danish, 3 vols.) and many other learned works. See his autobiography (in Danish and Icelandic) and H. Hermannsson's *Catalogues of the Fiske Icelandic Collection*.

**Jónsson, Hjalmar** (1796-1875), Icelandic poet whose poetry reflects a lifelong struggle with poverty. He was by nature a proud man and fully cognisant of his vast intellectual superiority. After his death he became a national hero and a monument has been erected to his memory. He is commonly referred to as Bólu-Hjalmar (Hjalmar of Bóla, the farm where he lived).

**Jónsson, Kristján** (1842-89), Icelandic poet of great ability but whose philosophy of life was exceptionally pessimistic. This does not appear to have affected his daily behaviour, for he won the hearts of all who came into contact with him. Though he d. at the age of 26 he holds an unassailable position as one of the leading poets of the greatest poetic age in the literature of Iceland.

**Jónsson, Thorsteinn** (1885- ), Icelandic short story writer, by many regarded as the foremost living author in that field. He writes under the pseudonym of Thórir Bergsson.

**Jonzac**, Fr. tn. cap. of an arron., in the dept. of Charente-Maritime, on the Seugne. Brandy and wines are made. Pop. 3800.

**Joplin**, city in Missouri, U.S.A., 140 m. S. of Kansas City, at W. of Ozark plateau and near N.E. corner of Oklahoma. It is a railway centre in an agric., zinc and lead mining, and limestone quarrying area, with stockyards and meat-packing and mineral-processing plants. It manufs. leather goods, metal and food products, sewer pipe, and explosives. Pop. 38,700.

**Joppa**, auct name of Jaffa (q.v.).

**Jordaens, Jakob** (1593-1678), Flem. painter, b. Antwerp. He studied under Van Oort and Rubens, being indebted to the latter for most of his artistic knowledge, and subsequently being employed by him. After Rubens's death, J. was recognised as leader of the Antwerp school. His colouring was rich and harmonious, and he excelled especially in depicting humorous scenes. He also painted allegorical subjects and religious pictures, the best known among the latter being 'The Last Supper,' 'The Martyrdom

of St Apollonia,' 'The Adoration of the Shepherds,' and 'Christ in the Midst of the Doctors.' See P. Buschmann, *Jordaens et son Œuvre*, 1905, and a life by E. Herdies, 1920.

**Jordan, Dorothea** (1762-1816), actress, made her theatrical début at Dublin in 1777 as Phoebe in *As You Like It*. She acquired much experience in the provs., and in 1785 she first appeared at Drury Lane, where she acted until her retirement from the stage 21 years later. As a comedienne she won many laurels. She had more than one intrigue before 1790, when she became mistress of the Duke of Clarence (afterwards William IV). She bore him many children, who took the name Fitzclarence, and became well known in society; the liaison lasted until 1811. Four years later she went abroad, where she d. in 1816 at St Cloud. See biography by J. Roaden, 1831.

**Jordan, Sir Joseph** (1603-85), Eng. admiral, who fought in the Dutch wars and was in command at the victory of Solobay in 1672, serving as vice-admiral of the Blue.

**Jordan, Thomas** (c. 1612-85), poet and pamphleteer, b. London. He began life as an actor at the Red Bull Theatre, Clerkenwell, publishing his first vol. of poems, *Poetical Varieties*, in 1637. In 1671 he was appointed laureate to the corporation of London, and composed every year a panegyric on the Lord Mayor, and arranged the pageants, celebrating them in verse. He wrote many works, some of which are in the Brit. Museum.

**Jordan**, most important riv. of Palestine; it runs from N. to S., through a great valley some 160 m. long, and at times as much as 15 m. broad. The highest source is 1700 ft above sea level on the W. of Mt Hermon, near to the vil. of Hasbeya; under the name of the Hasbany it flows to join the Leddán and the Bānīasi, which have already united into one stream. Thence the J. flows S. into Lake Huleh and the Lake of Tiberias (Sea of Galilee), where it is already more than 600 ft below sea level. The most important feature in its course between the Sea of Galilee and the Dead Sea is the rocky cleft known as the Ghor, some 65 m. long and from 3 to 12 m. in breadth, through which it passes. It then falls into the Dead Sea at a point 1292 ft below the level of the Mediterranean. The course of the J. is extremely tortuous, its total length being about 160 m. Processions to the J. take place from Jericho at the Orthodox Epiphany and Easter, when white-shrouded pilgrims bathe in the riv.—the bathing-place of the pilgrim is supposed to be the scene of the baptism of Christ, the miraculous div. of the waters by the cloak of Elijah, and the legend of St Christopher, who carried the Infant Christ across the river. Owing to differences between Israel and the Arab states, schemes to utilise the J. waters for power and irrigation have not, as yet, been put into operation. See also DEAD SEA; GALILEE; PALESTINE. (See illustration, p. 366.)

**Jordan, Kingdom of** (the Hashemite

Kingdom of Jordan), Arab state, bounded by Israel on the W., Saudi Arabia on the S., Iraq on the E., and Syria on the N. Area c. 37,000 sq. m.; pop (1955) 1,400,000, including c. 400,000 displaced Palestinians and c. 50,000 Christians. The cap. is Amman (pop. 175,000), and other tns include Jerusalem (Arab sector), Nablus, Petra, Jerash, and Akaba (the only port). Of the 7 provs. 2 are W. of the R. J. By the 1952 constitution, J. is a constitutional monarchy with a Parliament consisting of an upper chamber of 20 members nominated by the king and an elected lower house of 40 members, the representatives

2 months later the kingdom of J. was proclaimed. The annexation of the occupied Palestine ter. followed in April 1950, and Abdullah refused to allow the internationalisation of the Jerusalem sector held by him. This drew him closer to Israel. The annexed part of Palestine includes the dists. of Jonin, Tulkarm, Nablus, Ramallah, Jericho, Arab Jerusalem, Bethlehem, and Hebron. On the assassination of Abdullah on 20 July 1951 he was succeeded by his eldest son Talal, who was deposed on 11 Aug. 1952 on account of mental ill health, in favour of his son Hussein.

E.N.A.

THE VALLEY OF THE JORDAN

being divided equally between Arab Palestine and Transjordan. J. is a member of the U.N. and of the Arab League (q.v.). Most of the land is desert, unsuitable for agriculture, but there is generally an exportable surplus of vegetables and fruit. There is no large-scale industry. The heavy adverse trading balance is covered by foreign subsidies (see below), and the U.N. contributes towards the relief of Palestinian refugees. (For earlier hist. see TRANSJORDAN.)

The kingdom of J. is an enlargement of the kingdom of Transjordan, resulting from the conquest of part of Arab Palestine (c. 2000 sq. m.) by King Abdullah (q.v.) in 1948. This completely changed the character of the country, the nomadic Bedouin element of Transjordan being now dominated by the more cultured Palestinians, who consist of c. 500,000 settled inhab. and c. 400,000 displaced from Israel. In April 1949 Abdullah admitted 3 Palestinians to his Cabinet and

After the death of Abdullah, J. policy fell mainly into the hands of the Palestinian element. Brit. influence was drastically reduced and closer ties estab. with Egypt and Syria. In 1955 J. refused to agree to the revision of the 1948 treaty with Great Britain or to join the Brit.-inspired Bagdad Pact (q.v.). Glubb (q.v.), the Brit. commander of the Arab Legion, was dismissed in Mar. 1956, together with other Brit. officers. The anti-Brit. gov. elected in 1956 considerably strengthened J.'s ties with Egypt, and after the Suez crisis of 1956 (see SUEZ CANAL) such Brit. influence as still remained had virtually disappeared. On 25 Oct., 4 days before the Israeli attack on Egypt which precipitated the Suez crisis, J., Egypt, and Syria signed an agreement establishing a joint military command under Egyptian leadership to meet any emergency. In Jan. 1957 Egypt, Syria, and Saudi Arabia agreed to pay J. the equivalent of the ann. Brit. subsidy received under the 1948

Anglo-J. treaty, which was officially terminated on 4 Feb. 1957. In April King Hussein asked for the resignation of the J. Gov. and a coalition was formed. Following a general strike in Amman and anti-Amer. demonstrations the J. Cabinet resigned, and a new Cabinet was appointed by King Hussein, who dissolved the political parties in J. and imposed martial law. Under the Anglo-J. treaty Brit. Army units had been stationed in J., and there were also sev. R.A.F. bases, at

of the Arab Federation is King Feisal of Iraq; King Hussein of J. is his deputy and both retain constitutional authority in their respective kingdoms.

Jordanes (fl. AD 550), historian and ecclesiastic of the 6th cent. Originally a notary at the Ostrogoth court in Italy, he became a monk, and finally Bishop of Croton, though the last appointment has been denied by some. His prin. work is *De Getarum Origine et Rebus Gestis*, the only source of information of the hist. of

Jordan Tourist Department  
PETRA: THE TREASURY

Amman, Mafrok, and Akaba: all military and air bases had been handed back to J. by the end of May. After the death of Abdullah, relations between J. and Israel deteriorated, and many border incidents have taken place, Jordanian infiltrations into Israel being countered by occasional savage reprisal raids into J. Following on the creation of the United Arab Rep. (q.v.) on 14 Feb. 1958 the kings of J. and Iraq (q.v.) signed an agreement uniting their kingdoms in the 'Arab Federation.' The agreement laid down that the federation was to be open to other Arab states, and foreign policy, finance, education, diplomatic representation, and the 2 armies were to be unified within 3 months. Executive and legislative bodies were to be set up with members from each partner-country. A single flag was to be the flag both of the federation and of the participants. The cap. of the federation was to alternate between Bagdad and Amman every 6 months. The first head

FEET

Held on Maundy Thursday in the  
Armenian cathedral of St James.

the Goths. He also wrote *Summa temporum*, a hist. of Rome to 552. There is an ed. of both works by T. Mommsen, 1822. J. was a good compiler, but displayed little original thought.

Jorga, Nicolas, see IORGA, NECULAI.  
Jørgensen, Jens Johannes (1886- ), Dan. author, b. Svendborg. In 1896 he became converted to Rom. Catholicism, and later settled in Assisi. His philosophical and religious works are of high literary merit. He is well known also for his travel descriptions: *Reisebogen*, 1895; *Romersk Mosaik*, 1901; *Pilgrimsbogen*, 1903; and for his biographical studies: *Den hellige Frans af Assisi*, 1907; *Den hellige Katharina af Siena*, 1915; *Goethebogen*, 1913. In Denmark he has gained great fame as a lyric poet. His autobiography was pub. in English, 1928-9. See E. Frederiksen, *J. Jørgensens Ungdom*, 1943.

Jortin, John (1698-1770), Eng. church historian and critic, b. London of Huguenot parentage. He was educ. at Charter-

house and Jesus College, Cambridge, graduating in 1719. After sev. preferments, in 1749 he was appointed Boyle lecturer. Subsequently he became vicar of Kensington, a prebendary of St Paul's, and archdeacon of London. Amongst his prin. works are *Miscellaneous Observations upon Authors, Ancient and Modern*, 1731-2, *Remarks on Ecclesiastical History*, 1767-1773, *The Life of Erasmus*, 1758-60, *Lusus Poetici* (an early vol. of Lat. verse), *Sermons and Charges*, 1781, etc. See J. Disney, *Memoirs of the Life and Writings of John Jortin*, 1792.

**Jorullo**, or **Xorullo**, volcano of Michoacán, central Mexico, which came into existence in Sept. 1759, when a great eruption occurred. Height 4315 ft.

**Josephat**, see **BARLAAM** and **JOSAPHAT**. **Josefov** (Ger. **Josefstadt**), Czechoslovak tn in the region of Hradec Králové (q.v.). It was once a strong fortress. Pop. 3700. **Josefstadt**, see **JOSEFOV**.

**Joseph**: 1. Eldest son of Jacob and Rachel, and brother of Benjamin, was sold into Egypt by his jealous brethren, sons of other wives. Here he rose to supreme power, saved Egypt from famine, and settled his father and brethren after a painful trial and reconciliation. He was buried in Shechem. His sons Ephraim and Manasse produced the two J. tribes. No trace of J. and of the Israelite sojourn in Egypt has yet been found in Egyptian records; but it seems likely that it took place under the Hyksos, Asiatics who conquered Palestine and Egypt c. 1730-1380 BC. Of the historical fact of the sojourn in Egypt and subsequent exodus, there can be no question; and the J. story (Gen. xli-l) is full of authentic and contemporary Egyptian colouring. See A. S. E. Yahuda, *Accuracy of the Bible*, 1934, and *Language of the Pentateuch*, 1933.

2. St, husband of the Virgin Mary, carpenter of Nazareth, and legal foster-father of Jesus. It is made clear in the Gospels that he was not the father of Jesus in the physical sense, but his foster-father and guardian. The Church has, moreover, always held that he was never more than a guardian to Mary, who remained over-virgin. He last appears in the Gospel hist. in connection with the going up of Jesus to the Temple at the age of 12. From the fact that he is not mentioned in connection with our Lord's ministry, it has been gathered that he had d. before this began. The ant. tradition is that J. was an old man (i.e. over 40) when he married Mary. Besides the feast of his *Transitus* on 19 Mar. he is honoured on the third Wednesday after Easter (Solemnity of St J.).

3. St J. of Arimathea, a rich Israelite of high rank, and possibly a member of the Sanhedrin or Great Council, who was in secret a disciple of Jesus. After the Crucifixion, he went boldly to Pilate and obtained leave to take down the sacred body which he interred in his own tomb, Feast, 17 Mar.

4. St J. called Barsabas, surnamed Justus, chosen as one of 2 candidates for the place in the apostolic band left vacant by Judas

Iscaiot. His name does not recur in the N.T. His feast day is 20 July.

**Joseph**, King of Spain and Naples, see **BONAPARTE**, *Joseph Bonaparte*.

**Joseph I** (1678-1711), Holy Rom. emperor, son of Leopold I, b. Vienna. In 1687 he was crowned King of Hungary; in 1690 King of the Romans, succeeding his father as emperor and ruler of the Hapsburg dominions in 1705. Supported by England, Holland, and Savoy, he warred successfully against Louis XIV (Sp. Succession War).

**Joseph II** (1741-90), Holy Rom. emperor, son of Francis I and Maria Theresa, b. Vienna. He became King of the Romans in 1764, succeeding his father as emperor in 1765. In 1772 he signed a treaty with Russia and Prussia dividing Poland among the three. On his mother's death (1780) he came into possession of Hungary and all the hereditary dominions of Austria. In the Turkish war (1788-9) his general, Loudon, won sev. victories, but the result was unsuccessful. J. made many reforms, regulating the taxes and allowing a considerable measure of religious toleration, but he proved over-zealous and over-anxious to centralise. His reign ended with serious revolts in Belgium and Hungary. See life by E. Benedict, 1936.

**Joseph of Exeter** (d. c. 1210), Eng. Lat. poet, author of a lost epic on the deeds of Richard I. His *magnum opus* is the *De Bello Troiano*, in which the influence of Lucan is apparent. J. accompanied Archbishop Baldwin of Canterbury on the third crusade.

**Josephine**, **Marie Rose** (1763-1814), empress of the French and first wife of Napoleon I, b. Trois Islets, Martinique, her father being captain of the port of St Pierre. Her maiden name was Tascher de la Pagerie, and she first married the Vicomte de Beauharnais (1777), to whom she bore Eugène, later Viceroy of Italy, and a daughter Hortense, afterwards Queen of Holland and mother of the Emperor Napoleon III. Beauharnais was guillotined during the Reign of Terror (1794), and 2 years later his widow married Napoleon. She at first exercised great influence over the emperor, and at the Luxembourg and the Tuilleries attracted around her the most brilliant society of France; but the union proved childless and increasingly unhappy, and in 1810 the marriage was dissolved. Soon afterwards Napoleon married Marie Louise of Austria. The divorce has gained J. a good deal of sympathy, but there were considerable faults on both sides. She later lived in retirement at Malmaison until her death. See lives by C. S. Forrester, 1925, and R. M. Wilson, 1930. See also W. Geer, *Napoleon and Josephine*, 1925, and D. Creston, *In Search of Two Characters*, 1945, 1947.

**Josephus Flavius** (AD 38 to after 100), celebrated Jewish historian (the 'Greco-Latin Livy') and general, of both royal and sacerdotal lineage. He appears to have joined the sect of the Essenes, and spent 3 years with a hermit, Banos, in the desert, but in 56 he became a Pharisee.

In 64 he visited Rome as deputy to Nero to procure the release of some Jewish priests, and succeeded through the influence of Poppaea. On his return he opposed the revolutionary spirit of his countrymen, but became Governor of the 2 Galilees at the outbreak of war with Rome. In 67 he bravely defended Jotapata against the Romans under Vespasian, but the latter was finally victorious. J. was saved for predicting that Vespasian would soon wear the imperial purple. He was kept for a time in honourable confinement, and then accompanied the Rom. Army at the destruction of Jerusalem by Titus (70). His influence saved the lives of many of his friends. Vespasian made him a full Rom. citizen, and he adopted the name 'Flavius' as a compliment to the emperor. His chief works are *History of the Jewish War* (from 170 BC to his own times), *Ioudaïkē Archaiologia* (from the creation to AD 66); autobiography (Eng. trans. by Trall, 1862), and a treatise, *Against Apion of Alexandria*. See ed. of H. St. J. Thackeray and R. Marcus (1928—in progress). See M. Friedländer, *Geschichte der jüdischen Apologetik*, 1903; R. Laqueur, *Der jüdische Historiker Josephus*, 1920; H. St. John Thackeray, *Josephus*, 1929; F. Jackson, *Josephus and the Jews*, 1930.

Joshkar-Ola, see YOSHKAR-OLA.

Joshua, son of Nun, in youth an attendant on Moses, became leader of the Israelites in the conquest of Canaan. Evidence supporting the biblical account of his taking of Jericho has been found by excavation: the walls fell outwards, probably by a providential earthquake. He was of the tribe of Ephraim, and at first was called Hosea (Num. xiii. 8 and 16). He d. at the age of 110, and was buried at Timnath Serah. See *Book of Joshua*; C. F. Burney, *Israel's Settlement in Canaan*, 1921; John and J. B. E. Garstang, *Story of Jericho*, 1940; *Catholic Commentary on Holy Scripture*, 1953.

Joshua, The Book of, first of the books of the 'Former' Prophets. It tells of the invasion and conquest of Canaan (chs. i.-xii.) and the div. of the land among the tribes (chs. xiii.-xv.). The book ends with 2 addresses delivered by Joshua a little before his death. See also HEXATEUCH.

Joshua Tree, *Yucca brevifolia*, which attains to a height of 35 ft., one of a genus containing about 30 species, occurring most often in Mexico and Central America. It is fertilised entirely through the agency of the yucca-moth. This moth, called the Pronuba moth, was first observed 60 years ago to scrape the pollen off a yucca flower, roll it up into a ball, and fly off to another yucca plant, which she impregnates with 4 or 5 eggs, placing the ball of food firmly in the pistil. Her larvae feed on the seeds of the yucca plant, 20 seeds to 1 larva; so that there remain of the plant's 200 seeds about 100, from which the plant can be perpetuated. Only by this means can a yucca be sure of getting its seed. The J. T. is not much known in Great Britain, but other species of yucca, the *Y. glori-*

*osa*, for example, are hardy enough to grow out of doors in the Brit. winter, and flower at rare intervals, with blossoms of singular beauty, white, creamy, tinged with green, and bell-shaped.

Josiah (c. 639-609 BC), son of Amon, King of Judah, came to the throne at the age of 8; but nothing is told us until the eighteenth year of his reign, when occurred the finding of the Book of the Law (see DEUTERONOMY) which started a radical reform of the religious system. J. ruled in peace and prosperity, until in 609 Pharaoh Necho II came N. to help the Assyrians, whose cap. Nineveh had fallen to the Babylonians and Medes in 612. J. tried to halt his advance and was defeated and killed at Megiddo.

Jósika, Baron Miklós (1796-1865), Hungarian novelist, b. Torda, Transylvania. He wrote a series of popular romances after the style of Sir Walter Scott. J. became involved in the revolution of 1848, and was forced to live in exile at Brussels and Dresden, where he d. His chief novels are *Abafi*, 1836, *The Last Bátori*, 1837, *The Bohemians in Hungary*, 1840, *Fishier*, 1853, *A Hungarian Family during the Revolution*, 1852, etc. In English there are 'Neath the Hoof of the Tartar, 1904, and *King Matthias and the Beggar Boy*, 1896, 1902, both trans. by S. Gaye.

Josquin des Prés (c. 1450-1521), Flem. composer, b. probably at Condé-sur-Escaut, Hainaut, one of the greatest masters of the Netherland school. For some time he was chapel-master at St Quentin, and from 1486 to 1494 he was musician at the papal chapel in Rome. He was regarded as the greatest composer of his day, and gave a great impetus to music in Italy. His printed compositions consist of 17 masses, numerous polyphonic chansons, and upwards of 150 motets.

Joss, Chinese idol. A joss-house is a Chinese temple; a joss-stick is a thin stick of fragrant tinder mixed with clay, used by the Chinese as incense and burned before the statue of an ancestor or holy personage.

Jost, Isaac Markus (1793-1860), Jewish historian, b. Bernberg, Anhalt, Germany. From 1826 to 1835 he was a schoolmaster at Berlin, and from 1835 to 1860 held a similar position at Frankfurt-on-Main. His chief works were 3 hist. of the Israelites pub. between 1820 and 1859, including *Geschichte des Judentums und seiner Sekten* (1857-9). He also ed. a Ger. trans. of the Mishnah (1832-6). See H. Zirndorf, *Isaac Markus Jost*, 1886.

Jostedal, valley in Norway, about 110 m. NE. of Bergen, at the E. base of the plateau of Jostedalbreen, the largest glacier-field of Europe.

Jötuns, the name of certain mythical N. giants' or 'devourers' hostile to men, to Thor, and to the beneficent Oeuvr, types of the untamable, destructive forces of nature, Loki being father of the mightiest and most dreaded of them. Their abode was Jötunheim or Utgard, desert regions in the far N., and they figure largely in the Eddas. See C. Keyser, *Religion of the*

*Northmen*, 1841, and B. Thorpe, *Northern Mythology*, vol. 1, 1852.

**Joubert, Joseph** (1754-1824), Fr. moralist and critic, b. Montignac, pupil and later prof. at the Jesu College at Toulouse, till about 1776. Going to Paris (1778) he became a member of the brilliant literary circles there, and was an intimate of Chateaubriand who pub. his *Pensées, essais, maximes, et correspondance*, 1838 (now ed. by V. Giraud, 1909). See M. Arnold, *Essays in Criticism*, 1865; A. Beaunier, *La Jeunesse de Joseph Joubert*, 1918, and *Le Roman d'une amitié, Joseph Joubert et Mme de Beaumont*, 1924; R. Tessonneau, *J. Joubert, éducateur*, 1764-1824, 1944.

**Joubert, Petrus Jacobus** ('Slim Piet') (c. 1831-1900), Boer general and politician, b. Cango, Natal, of Dutch-Huguenot parentage; commandant-general of the S. African Rep. 1880-1900. After serving with the U.S. forces in the civil war he became a successful farmer and a prominent citizen of the Transvaal, being acting president (1874) during Burger's visit to Europe. J. went to England with Kruger (1878) to protest against the proposed annexation of the Transvaal, proclaiming its independence (1880) with Kruger and Pretorius. He won the victories of Laing's Nek, Ingogo, and Majuba Hill (1881) in the war with England. In 1893 J. contested the presidency with Kruger, losing by only about 665 votes. In 1896 he defeated Jameson at the time of his great raid. He devoted much time to the military organisation of his country, and on the outbreak of the Boer War (1899) commanded the army in Natal. He besieged Gen. White in Ladysmith, after which his health failed, and he retired to Pretoria. He was a brave and upright man, commanding the respect of his foes.

**Jouffroy, Théodore Simon** (1796-1842), Fr. philosopher, b. Les Pontets Doubs, entered the Ecole Normale (1813), studying under Royer-Collard and Cousin, and became teacher there from 1817 to 1822. He was prof. at the Collège de France (1832), leaving through ill-health to become librarian at Paris Univ. (1838). J. made Scottish philosophy known in France. His works include trans. of Dugald Stewart, 1826, and Reid, 1828-1830, *Cours de droit naturel*, 1834-42, *Mélanges Philosophiques*, 1833, *Nouveaux Mélanges*, 1842. See 'Notice' by F. A. M. Mignet, 1853, and life by C. J. Tisserot, 1876.

**Jouffroy d'Abbas, Claude François Dorothee, Marquis de** (1751-1832), Fr. engineer and inventor of steam navigation, b. Rochers-sur-Rognon, Haute-Marne, a captain of infantry before the revolution. He conceived the idea of applying steam to navigation on seeing a fire-engine at Chailloit (1775). His first attempt was on the Doubs (1776), a more successful one being on the Saône (1783). Through lack of means and influence he lost the fame which Fulton won (1803). His *Charles-Philippe* was launched on the Seine (1816), and he pub. *Les Bateaux à*

*Vapeur* (1816). The Academy recognised his rights (1840), and Fulton proclaimed them in U.S.A. See monograph by A. Prost.

**Jougs, Juggs, or Joggs** (Lat. *jugum*, yoke), form of pillory used in Scotland and the Low Countries as a punishment for eccles. and minor civil offences from the 15th to the 18th cents. It consisted of a hinged iron ring or collar for the delinquent's neck, and was chained to a pillar or wall in some public place. An example remains at the churchyard gate of Duddingston near Edinburgh. See also BRANK; PILLORY; STOCKS.

**Jouhandeau, Marcel** (1888- ), Fr. novelist, b. Guéret; his real name is Marcel Provence. He was for some time teacher in the Collège de Passy, Paris. His work reveals a strong sense of the cruelty of life and the forces of evil in man; and he writes about himself and his surroundings with bitter irony and disenchantment. Among his best works are his self-analytical novels *Monsieur Godeau intime*, 1926, *Monsieur Godeau marié*, 1933, and *Chroniques maritales*, 1938. He describes life in his native tin under the name of Chaminadour. He also wrote a series of short stories: *Les Pincengrain*, 1924; *Le Journal du Coiffeur*, 1931; *Images de Paris*, 1934. See C. Mauriac, *Introduction à une mystique de l'enfer*, 1938.

**Joule, James Prescott** (1818-89), physicist, b. Salford. A pupil of Dalton, but largely self-taught. His first discoveries were made in electro-magnetism, and in *Annals of Electricity*, 1837, he pub. a description of an electro-magnetic engine which he had invented. He adopted a convenient and scientific unit of work in practical electricity, called after him 'Joule' (see METROLOGY). It is the work done in 1 sec. by the 'ampère', or unit current flowing through the 'ohm', or unit resistance, equal to 10,000,000 ergs (see ELECTRICITY and HEAT). J. is considered one of the founders of the theory of the correlation of forces, and in 1847 stated the doctrine of the 'Conservation of Energy.' Much of his time after 1843 was spent in determining by different methods with the greatest possible accuracy the mechanical equivalent of heat. He was awarded the Copley medal of the Royal Society in 1860. Amongst his pubs. may be noticed *A New Theory of Heat*, 1850, and his scientific papers were pub. by the Physical Society of London, 1884-7. See O. Reynolds's memoir, 1892.

**Jourdan, Jean Baptiste, Comte** (1762-1833), Fr. general, b. Limoges, served in America, and rose to be head of the army of the N. (1793), defeating the Austrians at Wattignies. In 1794 he won the victory of Fleurus, driving the Austrians beyond the Rhine, and besieging Mainz (1795). After this he was less successful, being defeated by the Archduke Charles in 1796 at Amberg and Würzburg, and again in 1799, whereupon he resigned his command to Masséna. He defended himself in *Opérations de l'armée du Danube*, 1799, and became famous as framer of the conscription law (1798). Under Napoleon he

became director of affairs in Piedmont in 1800, marshal in 1804, and governor of Naples in 1806. He accompanied King Joseph to Spain in 1808. Though created a peer by Louis XVIII in 1819, he heartily supported the revolution of 1830. His last years were spent as governor of the Invalides. See J. de Courcelles, *Dictionnaire des généraux français*, 1820-2, and K. Gachot, *Les Campagnes de 1799: Jourdan en Allemagne et Brune en Hollande*, 1906.

**Journalism.** The evolution of J., and especially Eng. J., is one of the romantic episodes of human hist. Names crowd upon the memory, from Dr Johnson and Fielding at one pole to Archibald Forbes and G. W. Stevens at the other, or from the *Letters of Junius* and the polemics of Addison and Steele to the humblest 'story' of a modern reporter-journalist. In its accidental development lies the strange part of the hist. of Eng. J. To modern minds it is incredible that it was not earlier realised what a weapon against political tyranny publicity would prove. Hence the germ of J. in pure and quasi-literary efforts, redolent of opinion and often guiltless of fact. Its fortuitous development is seen in the very anomaly of the genesis of the freedom of the press. No formal assertion of such freedom is to be found, except in the stately lines of the *Areopagitica* of Milton. Its institution was the result of the refusal of the Commons in 1695 to renew the Licensing Act, which, in its turn, was an autocratic device consequent on the development of the art of printing. The newspaper proper begins with the development of the news letter, often in MS., which purveyed the 'chit-chat' of tn much in the manner of the modern London or Paris letters, in a single printed sheet, posted on a fixed day in the week, and circulated in the provs. under the name of the *Weekly News*. This paper was pub. before 1695 and before the necessity for the permission of the Star Chamber to publish a newspaper was a thing of the past. It was by the sufrage of the Whig partisans actually in the gov. that other papers were allowed to appear, like the *London Mercury*, *True News*, and the *Protestant Intelligence*. After the political controversies over the Exclusion Bill (q.v.), the motive for collusion with news publishers was gone, and there was a reversion to censorship with a consequent monopoly to the *London Gazette*. But it was not for long, and the appearance of the *Intelligencer* under the editorship of the remarkable Sir Roger l'Estrange (q.v.), in the reigns of Charles II and James II, inaugurated an era of discussion of public questions in the newspaper press, which ultimately resulted in that press attaining the virtual position of the Fourth Estate of the Realm (see ESTATES OF THE REALM).

The age of Anne has been well described as the classic or Augustan age of Eng. literature, and its influence on the newspaper press was no less marked than in purely literary circles. Papers like the *Tatler* and the *Spectator*, filled with the

pub. wit of Addison, Pope, Steele, and Swift, burked politics altogether, in favour of satires on the transient, social foibles of the age. But there were a few other papers, like the Whig *Examiner* and Defoe's *Review of the Affairs of State*, which drew their breath of life from the atmosphere of politics. Fearless and scurrilous criticism of public men was inspired and even written by some of the foremost men in the state like Bolingbroke, and it began to change the character of newspapers. Henceforth they were a power to be reckoned with, which no bureaucratic action could repress, which constituted itself the guardian of public liberty, and which was courted directly or indirectly by ministers themselves. It was the practice of reporting the speeches of the opposition of the day that paved the way for publicist articles in the press, for the reports were the material upon which they were necessarily founded. In constitutional theory it was a gross breach of parl. privilege to publish debates or discuss political questions in the press, but by surreptitious means, reports, meagre it is true, crept into the papers, and before the middle of the 18th cent. the press had become firmly estab. as the backbone of ministerial or anti-ministerial support.

The triumph of John Wilkes (q.v.) and the *North Briton* marks a well-known epoch in the annals of press criticism and vindicated the right of the press to extend its criticism to the acts and words of the sovereign himself. The *Morning Chronicle* is generally credited with being the first paper to employ a regular staff of parliamentary reporters who actually took their places in relays in the gallery of the House, and James Perry, its editor, practically created the profession of J., though certainly not as we know that profession to-day. Developments in J. proceeded apace with the founding of the *Morning Post* in 1772, the *Morning Herald*, *The Courier*, *The Sun*, and the *Anti-Jacobin* before the end of the 18th cent. The proprietors of the *Morning Herald* estab. correspondents in all the chief caps. of Europe and big tns of Great Britain. Probably the rivalry between the *Morning Chronicle* and *The Times*, under the proprietorship of the famous John Walter (q.v.), did more for the progress of Eng. newspaper J. than any other event. Each paper was constantly striving to surpass the other by the introduction of some novel feature. The 'leading article' became a work of art and no less a powerful influence in the interpretation of public opinion than a source of lively interest to readers in general. Coleridge, Peter Fraser, and John Sterling were among the most notable writers who set the earlier style of 'leaders,' and though the daily newspaper press has not been remarkable for attracting the most distinguished writers, it has been the Mecca of many a leader-writer of astonishing powers of pungent criticism. John Walter's adoption of printing by steam machinery in place of the slow system of printing by hand set

*The Times* on the high road of its successful commercial and journalistic career. The enterprise of the *Daily Telegraph* in fitting out exploration parties in the early seventies, and in using to the utmost the brilliant critiques and articles on social life, literature, and art of George Augustus Sala, may almost be said to constitute the breaking-point with the early and mid-Victorian methods of newspaper J. The trenchant, vituperative, and slashing style, long becoming obsolescent, received its death-blow, not only from the keener public interest felt in matters outside mere politics, but from the reflection in the papers themselves of the greater culture and intellectual range of the people.

But modern J. also has its personal note, and that personal note is its outstanding characteristic. It is a different form of intimacy to that of the letters of Junius, or the fulminations of John Sterling of the 'Thunderer' (*The Times*). This is essentially the age of what is known as the 'human document.' With all its precision of diction and close adherence to classical models, there was in the J. of 50 (or even less) years ago a marked conventionality of tone. To us that tone seems to have been stilted and even 'priggish.' People generally, and writers no less, did not so much give free play to individual ideas as present everything in the form of independent or external phenomena, having no relation to human sympathies. It required the free play of democratic thought, not only to make art generally, and the art of J. in particular, conscious of itself, but to make criticism, which in its wider sense is the rock-bottom of J., really sincere. The progress of modern J. is a reflection of the restless and searching inquisitiveness of the age. The ramifications of the newspaper press into every dept of life are bounded by nothing but the discretion of its personnel and the law of libel. Perhaps, even in the later Victorian era, when monopoly and censorship were long-forgotten relics of the past, nothing existed to foreshadow the methods of the later J. which has been identified with the name of W. T. Stead. Big London dailies, which in that era were marked by a pompous dignity of style, succumbed to the influence of sensationalism. The modern craving for a paper that shall be readable in a limited space of time by a public pressed for time, necessitates the presentation of news in attractive form with headlines, and a précis, in leaded type arranged in paragraphs.

Different classes of readers must be catered for in different fashions. *The Times* circulates essentially among the influential elements, whence something of old conventionality and austerity still permeates its tone and make-up. The same qualities mark the *Manchester Guardian*. C. P. Scott, the editor from 1872 to 1929, became one of the greatest figures in Brit. J.

One result of the progress of modern J. is the assignment to definite and separate spheres of J. proper and literature. The

latter, no doubt, is present in the shape of book reviews and 'specials' (i.e. topical articles) on the 'literary page.' But these articles generally relate to matters of current public interest, and literary form in them is subordinate to the purpose of the article, which is primarily to persuade. The term 'journalism' is admittedly a wide one, and in a manner of speaking is almost one of degree. Anything that is written germane to some event or incident in a periodical that belongs to the class of so-called 'public

Topical Press

C. P. SCOTT

journals' is an effort of J. But the main-spring of J. proper is news, and periodicals like the *Spectator* and *New Statesman* occupy a position midway between J. proper and literature. The duties of a journalist have become extraordinarily exacting. The greater his knowledge and experience of the world and of men the more successful is he likely to be. The most liberal education is useless without the knack of getting news and presenting that news in accurate, graphic, and convincing form. The goal of a journalist is, above all, to bring off a 'scoop' for his paper, i.e. the pub. of a particular item of news before its appearance in the columns of any other paper. Opportunities occur in time of war and the war correspondent's life is a hazardous one, as has recently been exemplified in the Sino-Jap. War, the Sp. Civil War, and the campaigns of the Second World War and in other theatres of operations, where journalists have lost their lives or been taken prisoner. In

regard to the training of a journalist England was long behind America, in that she had no schools of J. like the school of J. of the Univ. of Missouri, where a range of subjects is taught embracing sociology, economics, political science, Eng. hist., together with the arts of reporting, editorial writing, magazine J., and newspaper administration. For information on training in J. in England see *Journalism and Publishing* (careers for Men and Women series, No. 26, H.M.S.O.).

It is said by a competent authority that Amer. J. has exercised considerable influence on Eng. J. The hunt for men with 'live' ideas and methods is essentially an Amer. habit. It is not far from the truth to say that America is the home of modern J. In France the influence of Amer. methods has been no less felt than in England. But the fine literary tradition of Fr. J. still lives in the signed article, and although the transition from literature to J., or in other words from opinion to news, has resulted, as in England, in the mere co-ordination of politics with other items of intelligence, yet the frequent appearance of signed *articles de fond* by some of the most remarkable literary men of the age indicates not only the vitality of the national literary character, but the greater importance attributed by the Fr. people to the individuality of the journalist himself. This remains as true to-day as before the Second World War. Recent years have witnessed the development in Great Britain, as in America, of enormously powerful combinations of newspapers and periodicals, dominated by strong personalities. So far as J. as a calling is concerned, the danger of the combine lies in the stereotyping of opinion to the detriment of the individual outlook. The journalist becomes only the mouthpiece of his newspaper, uttering the views which the policy of his paper demands. On a free vote (29 Oct. 1946) the House of Commons, by 270 to 157 votes, adopted the motion of a Labour M.P. asking for a Royal Commission to inquire into the finance, control, management, and ownership of the press. A somewhat similar inquiry was instituted in the U.S.A. with special emphasis on the preservation of the freedom of the press, but it was not an official inquiry instituted by the gov. (See further under NEWSPAPERS.) See also ADVERTISEMENT and articles on various newspapers.

*Journalism in the U.S.A.* From feeble, almost timid beginnings, J. in the U.S.A. has grown not only as a great power in the land, but numerically and financially into a business far exceeding in extent and resources anything known anywhere else in the world. In 1689 and 1690 2 issues of the *Boston Public Occurrences* were suppressed. The *Boston News Letter* was started in 1704 by John Campbell, who was the postmaster of Boston. Other papers were started in Boston and Philadelphia in 1719. New York, to-day the undisputed metropolis of J., singularly enough had no regular newspaper of its

own until the *New York Gazette* was founded in 1725. New York began to take its dominating position in Amer. J. in the early thirties and forties of the last cent. As a result of the enterprise of 3 or 4 strong men, James Gordon Bennett, senior, started the *New York Herald* in 1835 with very slender resources. The *New York Tribune* was founded in 1841, with Horace Greeley as editor and part owner. The Civil war gave a great impetus to the newspapers of the N., with a public avid for news of the great conflict. The *New York Herald* began to do spectacular things, such as sending Stanley to find Livingstone in the heart of Africa and equipping an expedition to the Arctic. Later Bennett made an innovation which was much derided at the time, but has since been copied by newspapers all over the U.S.A. and Great Britain—the society column.

A new development in retail business gave a fresh impetus to the newspapers. This was the foundation of what are known in the U.S.A. as 'department stores,' which embrace under one roof a multitude of shops under one ownership, seeking to serve every need of the customer. To bring more trade to these shops the proprietors availed themselves of the medium of extensive advertisements in effective 'journallese.' Instead of small cards, they began to buy space to the extent of half a page, then of full pages. This enterprise on the part of advertisers brought vastly increased revenue to the papers. The era of building rich and powerful papers had begun. It was the editor, and not the newspaper, which was famous. The quotations were from what Henry Watterson said in the *Louisville Courier Journal*, Charles A. Dana in the *New York Sun*, Murat Halstead in the *Cincinnati Commercial Gazette*, W. R. Nelson in the *Kansas City Star*. With the death or resignation of these men came the new era, when the paper itself was pushed forward and the editor's name and personality were not so well known. In 1878 E. W. Scripps (q.v.) founded with slender capital the *Penny Press*, afterwards the *Cleveland Press*, in Cleveland, Ohio. It was independent in politics. It aspired ardently to help the 'under dog' in life. The paper prospered and Scripps proceeded to found other evening papers along the same lines, until to-day his successors control a chain of papers from coast to coast. In 1883, inspired by somewhat similar ideas, Joseph Pulitzer (q.v.) bought the then weak *New York World*, and made of it the most liberal organ in the metropolis. Pulitzer was an aggressive opponent, and he brought to Amer. J. a touch of sensationalism which was then new. In 1898 Adolph S. Ochs (q.v.) bought the semi-moribund *New York Times*, and Wm Randolph Hearst (q.v.) the *New York Journal*. They began to fight Pulitzer for circulation. Hearst conducted his papers even more sensationally than Pulitzer, and gave rise to the term 'yellow journalism.' Ochs proceeded on more sober lines, tried to print all the

news, and gradually made of his paper one of the wealthiest in the world.

The fight for circulation and advertising brought in its train the very large papers the people of the U.S.A. know to-day. The daily papers, both morning and evening, in New York range from 40 to 60 pages. The Sunday ed. of the *New York Herald-Tribune* before the Second World War often had from 100 to 140 pages. Issuing big papers, the editors have a great deal of space at their disposal, and are therefore in the market for good news feature stories. This demand gave rise to

*Topical Press*

RANDOLPH HEARST

another peculiar development in Amer. J. The Newspaper Enterprise Association—one of the earliest in the field—and other similar concerns, started out to supply news features to one paper in each city. This developed even beyond the dream of its founders, and before long the Newspaper Enterprise Association, for instance, was distributing to its clients not only news features, but also editorials, the contents of a sports page, a woman's page, a religious column, book reviews, news of the cinema world and the dramatic field, news photos, and many strip cartoons. A later development in Amer. J. was the imitation in New York and a few other cities of the picture papers long familiar to Londoners in the *Daily Mirror* and *Daily Sketch*. Whereas the latter had before the Second World War from 16 to 32 pages daily, those in New York had about 60 pages. In popular language these papers are known as 'Tabloids.'

The trend in recent years in the U.S.A. has steadily been the reverse of that in Great Britain. Whereas in the latter the morning papers have the largest circulation and popularity, in the U.S.A. it is the evening papers which have the primacy.

Another marked tendency is for the estab. under one ownership, editorial direction, and management of chains of papers. The most notable of these are the Scripps-Howard chain, with papers in 18 cities and total circulation of over 3,600,000, and the Hearst chain, with papers in 18 cities with 5,384,700 daily and 9,975,900 Sunday circulation.

Finally there is one feature of Amer. J. unmatched anywhere else in the world. This is the number of papers printed in foreign languages. The reason for it is the polyglot pop. of the U.S.A. It has been estimated that the average circulation of the foreign language press in the U.S.A. is about 2,300,000, divided as follows: Bohemian, 145,780; Chinese, 31,000; Finnish, 34,000; French, 44,000; German, 335,000; Greek, 35,000; Hungarian, 70,000; Italian, 315,000; Japanese, 65,000; Lithuanian, 55,000; Polish, 382,000; Russian, 33,000; Slovak, 30,000; Slovenian, 20,000; Spanish, 55,000; Yiddish, 536,000; and other languages about 109,000. See also MAGAZINES and NEWSPAPERS. See L. N. Flint, *The Conscience of the Newspaper*, New York, 1925; G. F. Carr and F. E. Stevens, *Modern Journalism*, 1931; C. Bourdon, *Le Journalisme d'aujourd'hui*, 1931; R. Christingen, *Le Développement de la Presse*, 1944; I. Rothenberg, *The Newspaper*, 1947; A. Aspinall, *Politics and the Press, 1780-1850*, 1949; International Press Institute, *The Flow of the News*, 1953; A. P. Robbins, *Newspapers To-day*, 1950.

See also MAGAZINES and NEWSPAPERS. **Journalists**, Institute of, senior organisation of the profession, incorporated by royal charter in 1890. It had its origin in the National Association of J., which was founded in 1883 and converted into the Institute in 1889. It is an independent body, its object, as set forth in the charter, being 'the promotion of the interests of journalists and journalism.' In addition to being a corporate professional society, the Institute is a certificated trade union and as such is fully recognised as a negotiating body on salaries and working conditions of J. There are 2 professional classes of membership, called fellows and members, and a class of junior members undergoing preparation for professional membership: fellows are J. of recognised professional standing or of special experience or distinction. Two small non-professional classes consist of associates and honorary members. There is an Overseas List, consisting of members of Brit. nationality resident overseas, and a Foreign List, comprising members of foreign nationality resident abroad. Women are eligible for the sev. classes of membership on the same terms as men. An employment register is maintained, with a section for freelances; legal advice is also provided on any question affecting professional right or privilege; there are sev. benevolent funds. The Institute has its own hall at 2-4 Tudor Street, E.C. 4. **Journalists, National Union of, Brit.**

trade union of working J., is the largest association of its kind in the world. It includes members of newspaper and periodical staffs, freelance correspondents, television J., press photographers, and editorial artists. It has done much to raise the status of professional J. Its offices are at 22 Great Windmill Street, London, W.1.

**Joust**, see **TOURNAMENT**.

**Jove**, see **JUPITER**.

**Jovellanos** (or **Jove Llanos**), Don Gaspar Melchior de (1744–1810), Sp. author and statesman, magistrate at Seville and Madrid. In 1790 he shared in the disgrace of Cabarrus, but Charles III made him minister of justice in 1797. Imprisoned in Majorca from 1801 to 1808 through the intrigues of Godoy (q.v.), on the latter's fall he returned and became a member of the Central Junta. He wrote the tragedy *El Pelajo*, 1769, the comedy *El Delincuente Honrado*, 1773, *Memorias Políticas*, 1801, and *A Mis Compatriotas*, 1811, a defence of the Junta and himself against suspicions of treason. He also trans. the first book of *Paradise Lost*. See lives by E. González Blanco, 1911, J. Juderías, 1913, and C. Artiñano y de Galdecano, 1913.

**Jovianus** (or **Jovinianus**), **Flavius Claudius**, Rom. emperor (AD 363–4), b. c. 331. He was captain of the praetorian guards under Julian, accompanying him against the Persians. J. escaped with the army to the Tigris on the death of Julian (363), and was soon chosen as his successor. He was obliged to conclude a humiliating peace with the Persian king, Sapor (or Shapur), ceding various dists. and fortresses, including Nisibis. He proclaimed Christianity at Antioch, upheld the Nicene Creed against the Arians, and restored Athanasius to the see of Alexandria. The manner of his death at Dadastana 7 months after his accession is uncertain. See Gibbon, *Decline and Fall of the Roman Empire* (chs. xxiv, xxv).

**Jovinus**, one of the generals of Honorius, who, in AD 411, assumed the imperial title and won part of Gaul. In the following year he was defeated at Valence by the Franks and Visigoths under Ataulphus, and put to death by order of the Rom. prefect Dardanus.

**Jowett**, **Benjamin** (1817–93), scholar and theologian, educ. at St Paul's and Oxford, becoming fellow of Balliol (1838), tutor (1842–70), and finally master (1870). He was Regius Prof. of Greek at Oxford (1855). One of the greatest moral teachers of his age, he became intimate with Stanley, joining him and Tait in advocating certain univ. reforms (1846). His personal influence at the univ. was very great, and although his views met with no little hostility he had numerous supporters, his pupils being especially enthusiastic in their support. Among his pupils at Balliol were Curzon, Asquith, Grey (of Fallodon), Bowen, Loreburn, Gore, Lang (the archbishop), Morier, Tout, Caird, Swinburne, and Walter Morrison. The flow of Balliol successes bred envy and some malice outside the

college, and even in the college itself maintenance of the flow tended to become an objective in itself. Sir Robert Morier, J.'s best-loved pupil, certainly owed his ambassadorial career to J.; not indeed because J. exercised any influence in official quarters but solely because he converted a lax, imperfectly educ. but able young man into a worker. In J.'s own mind the desire to see his young men succeed sprang from hatred of failure. His own father had been a failure and his boyhood one of extreme poverty and loneliness; and this gave the spur to his efforts on behalf of his pupils. Beginning from nothing, he ended as a kind of mentor-in-chief to most of the great Victorians, men and women alike. He was incomparably the greatest educator of able young men England has produced. One of the Broad Church school, his *Epistles of St Paul to the Thessalonians, Galatians, Romans, with Critical Notes and Dissertations*, 1855, and a contribution to *Essays and Reviews*, 1860, roused a storm of criticism and hostility. But he undoubtedly led the way to a new understanding of St Paul. He may be said to have rediscovered the Gk philosophers, his outstanding work in this sphere being his trans. of Plato's *Dialogues*, 1871. There followed a trans. of Thucydides, 1881, and of Aristotle's *Politics*, 1885. His *College Sermons* were pub. in 1895. He also played a part in the world of affairs, notably in the reconstruction of the Indian Civil Service and the reform of medieval Oxford. He was convinced that only a small fraction of the men of ability ever came to the univ. in England. He worked to reduce the expense of a career at Oxford, encourage non-collegiate students, and promote physical science and mathematics. In all these endeavours he had some success. He pressed the claims of secondary education and univ. extension. See Evelyn Abbott and L. Campbell, *Life and Letters of Benjamin Jowett*, 1899; Geoffrey Faber, *Jowett: A Portrait with a Background*, 1957.

**Jowitt**, **William Allen**, Earl (1885–1957), lawyer and politician, educ. at Marlborough and New College, Oxford. He was called to the Bar, 1909; K.C., 1922. He was a Liberal M.P., 1922–4, but subsequently joined the Labour party, being a Labour M.P. 1929–31 and 1939–45. From 1929 to 1932 he was attorney-general; solicitor-general, 1940–2; paymaster-general, 1942; minister without portfolio, 1942–4; first minister of national insurance, 1944–5; and, under the post-war Labour Govs., lord chancellor, 1945–51. He was created a baron, 1945; viscount, 1947; and earl, 1951. On J.'s death his titles became extinct.

**Joyce**, **James Augustine Aloysius** (1882–1941), writer, b. Dublin, one of a large and poor family. Educ. at the National Univ. of Ireland, he early showed strong literary tendencies. In 1903–4 he was in Paris engaged first in medical studies and, later, in having his voice trained for the concert platform. Returning to Dublin he pub. a

few stories but could not make a living, and therefore, with his wife, migrated to Trieste where he taught English, having much talent for languages. He again returned to Dublin to start a cinema theatre which, however, failed. Hitherto his only book was one of lyrics called *Chamber Music*, 1917. His only other verse was *Pomes Penyeach*, 1927. In 1914 appeared *Dubliners*, which had been delayed for 9 years through wrangling with publishers over excisions demanded by them. *A Portrait of the Artist as a Young Man* was serialised by Ezra Pound in the *Egoist*, 1914-15. At this time J. was under 'free arrest' in Austria but was allowed to go to Zürich, where he formed a company of Irish players who performed his play *Exiles*, 1918, which was modelled on Ibsen's work. He had in 1914 begun his chief work, *Ulysses*, which appeared serially in the *Little Review* (New York), from 1918 to 1920, at which date it was banned by a prosecution launched by the Society for the Suppression of Vice. At Zürich J.'s sight began to fail, and a few years after the First World War he settled in Paris. *Ulysses* was pub. in book form in Paris and London in 1922, but was not allowed to circulate in England or America. Eds. were printed in Paris and thousands of copies were smuggled into England by individual book collectors. His next work, *Work in Progress*, began to appear in 1927 in parts under various titles. In it the word-coining which was a feature of *Ulysses* was extended to the point of incomprehensibility. *Ulysses* is a bitter and ferocious satire, which was variously hailed as a tremendous libel on humanity and as the *chef-d'œuvre* of a second Tertullian. The book purports to relate the whole mental and physical hist. of Bloom, Jewish advertisement canvasser, and Dedalus, scholar-philosopher, during one single day in Dublin. J. claimed to have discovered his literary device in Edouard Dujardin's forgotten novel, *Les Lauriers sont coupés*, 1888, and certainly it is to be found employed by Proust, Dorothy Richardson, and other writers, and it has had a far-reaching influence on the technique of many other modern writers. J. worked in great poverty for much of his life and had numerous operations for cataract. He d. in Zürich.

J.'s earlier books give scarcely a hint either of the power which went to the making of *Ulysses* or of the perversity which makes his even more ambitious experiment, *Finnegans Wake*, 1939, almost unintelligible. It must be admitted that even *Ulysses* would have been less widely read or carefully studied, and therefore less influential among the younger writers of its day, but for a reputation gratuitously made for it by the Brit. Customs officials, who autocritically took it upon themselves to treat the early eds., printed on the Continent, as unfit for circulation in this country. The Amer. courts, which insisted that his picture of an Irishman's day was morally innocuous, showed greater discernment. That J. was

genuine artist, sincere and profound, is clear from the simplicity of his early short stories, *Dubliners*, 1914, and from the well-defined autobiographical narrative, *Portrait of the Artist as a Young Man*, 1916. In *Ulysses* he essayed the difficult task of presenting a complete picture of the life of the individual in our time, both conscious and subconscious, the simple, sinning, groping man with the hard unrelenting universe around him. In *Finnegans Wake* he seems to be trying to break through the barriers of time, but so complex is the medium that, without commentary, few can follow the meaning. One of the inspirations of this book was the It. Giambattista Vico's *Scienza Nuova*, first pub. in 1725. To Vico in part can be traced J.'s idea of word formations as the key to the human mind and to the various phases of experience. J.'s originality lies in his discovery of a literary form for expressing the inconsequent complexity of the human mind and the shadowy similarity that its migrations bear to the orderliness of grammatical sentences or the appearances of time and space. In a word, he annihilated the ordinary and the normal, and revealed a chaotic world of the mental and emotional reactions which may come over men in a single day. He sought to devise a new form of language, which would not merely convey meanings to the conscious intellect, but would stir the unconscious mind to direct experience of a poetic reality embodied in the sound and rhythm of the words. This new language was fully developed only in his last book, *Finnegans Wake*. Its obscurities, hailed as ultra-modernistic, in fact represented a return to the kind of speech which some philologists believe must have been the common speech of mankind in distant ages before the invention of writing. But for J.'s readers unfortunately it was a language that had to be learnt, and probably it has been thoroughly understood by no one save J. himself. See lives and studies by L. Golding, 1933; H. Gorman, 1941; J. Levin, 1944; H. Kenner, 1956; also R. M. Kain, *Fabulous Voyager, James Joyce's Ulysses*, 1947; J. J. Slocum and H. Cahoon, *A Bibliography of James Joyce*, 1953; M. Magalaner and R. M. Kain, *Joyce: the Man, the Work, the Reputation*, 1950; S. Gilbert (ed.), *Letters of James Joyce*, 1957.

Joyce, William (1906-46), b. New York, his father being a native of Co. Mayo, Ireland, and his mother a native of Crompton, Lancs, England. The father became a naturalised Amer. citizen in Oct. 1894. A citizen of the U.S.A., J. accepted the harbourage of Britain for 18 years, and took an active part in its politics. By declaring himself a Brit. subject he obtained, in 1933, a Brit. passport for holidays abroad and renewed it for a year in Aug. 1939; from Sept. 1940 he was employed by the Germans to broadcast anti-Brit. propaganda. His talks inspired ridicule rather than alarm (he was nicknamed 'Lord Haw-Haw' by a Brit. journalist and this label certainly helped to lessen his propagandist effectiveness),

but their bitterness to a country which had given him hospitality for the greater part of his life disintitiled him to any sympathy when, after the Second World War, he was tried and convicted of treason at the Old Bailey (Sept. 1945). His appeal to the House of Lords was dismissed (1 Feb. 1946) and he was executed. See further under TREASON. See Rebecca West, *The Meaning of Treason*, 1949.

**Joynson-Hicks, Sir William**, see BRENTFORD, 1st VISCOUNT.

**Juan de Fuca**, Strait of, connects Puget Sound with the Pacific Ocean, and separates Vancouver Is. on the N. from the state of Washington on the S. It is about 90 m. long and 13 m. broad, and contains at its E. end the San Juan archipelago, through which the boundary was drawn by an arbitration by the Emperor of Germany in 1872.

**Juan de la Cruz, St.**, see JOHN OF THE CROSS, St.

**Juan Fernández**, group of volcanic is. and an islet, belonging to Chile, prov. Aconcagua, situated about 380 m. W. of Valparaíso; they are named *Más a tierra* (landward), 13 m. long and 4 m. wide, consisting of rugged rock with rich vegetation, *Más a fuera* (outer), Santa Clara or Goat Is., and El Yunque. They were discovered about 1572 by Juan Fernández, who introduced goats and European plants on them. On the N. side of the inner is. is Cumberland Bay, where Alexander Selkirk lived in solitude for 4 years, 1704-9, which incident is supposed to be the basis for Defoe's *Robinson Crusoe*. The is. are now used as penal settlements. Lobster fishing is important. Total area about 70 sq. m.; pop. 450.

**Juan-les-Pins**, Fr. tn in the dept of Alpes-Maritimes, on the Riviera (q.v.) coast, 4 m. SW. of Antibes. It is a noted holiday resort. Pop. 1000.

**Juan Manuel**, see MANUEL, DON JUAN.

**Juárez, Benito Pablo** (1806-72), Mexican statesman, b. San Pueblo Guelato, Oajaca, of Indian parentage. Appointed a judge of the civil court in 1842, he became governor of the state of Oajaca in 1847, greatly improving the prov. conditions during his term. He was exiled from Mexico in 1853, but returned 2 years later and joined Alvarez and the revolutionists. Elected president in 1858. He retained this position till his death, and his vigorous and liberal policy was of great benefit to the nation. See lives by (i. Baz, 1874, U. L. Burke, 1894, and García Jenaro, 1907. There is a drama on J. by F. Werfel, *Juárez und Maximilian*, 1914. See R. Roeder, *Juárez and his Mexico* (2 vols.), New York, 1947.

**Juba**, one of the chief rivs. of E. Africa. It rises in Ethiopia and enters the Indian Ocean 10 m. N. of Kismayu, in Somalia. Length over 1000 m.

**Juba I**, King of Numidia, an ally of Pompey, whom he supported against Caesar. He committed suicide after the battle of Thapsus (46 BC).

**Juba II**, son of the preceding, made King of Numidia about 30 BC, and transferred to Mauretania in 25 BC by the

Emperor Augustus on Numidia being made a Rom. prov. He was noted as an historical and general writer and wrote works on painting, botany, grammar, the theatre, etc., and hist. of Rome, Africa, Assyria, and Arabia, of which only fragments have survived.

**Jubal**, or **Jabal**, son of Lamech and Ada; inventor of the harp or lyre, and so the first instrumental musician according to Gen. iv. 21.

**Jubbulpore**, see JABALPUR.

**Jubilate**, opening words of the 100th Psalm, an alternative second canticle in the morning service of the Church of England.

**Jubilee**, The Year of, peculiar custom among the Hebrews, in which every fiftieth year all land was restored to those original owners who had lost it within that period. All who through poverty had had to hire themselves out were released from their bondage, and all debts were remitted (Lev. xxv). The J. was proclaimed at the close of harvest, on the tenth day of the seventh month, the day of atonement, when the *yôbel* (horn) was sounded. The Rom. Catholics have borrowed this word from the Hebrews in their celebration of ordinary or extraordinary jubilees. The first J. was inaugurated by Pope Boniface VIII in 1300, when he issued a bull granting plenary indulgence to all pilgrim visitors to Rome, should they fulfil certain conditions.

**Jubilees**, The Book of, apocryphal book known also as Little Genesis, The Apocalypse of Moses, The Testament of Moses, and The Life of Adam. The author, a rigid Pharisee of the time of John Hyrcanus (135-105 BC), rewrites Genesis and Exodus, adding a commentary, to further the views of his party. In opposition to the Hellenist party, he draws a sharp line between Jews and Gentiles, and insists upon the eternal nature of the Law. Before the revelation of the Law to man, it had over been observed in heaven by the angels, and so would be throughout eternity. The author in every way glorifies Judaism, and insists on the rigid observance of its ceremonial. The work calculates periods of time in J., periods of 7 times 7 years with 1 year added at the end, and lays stress on the mystical importance of the exact calculation of weeks and J., with the ever-recurring number 7. The work was Hebrew, but early trans. into Greek and thence into Latin and Ethiopic. See C. Albeck, *Das Buch der Jubileen und die Halacha*, 1930.

**Juby**, Cape, on the W. coast of the Sahara, Africa, a low sandy point opposite the is. of Fuerteventura, which is one of the Canary Is.

**Jucar**, or **Jucar**, Sp. riv., rising in the NE. of the prov. of Cuenca, and flowing S. through Cuenca and E. through the provs. of Albacete and Valencia to the Mediterranean at Cullera (q.v.). It irrigates rice and other plantations, and there are hydro-electric installations. Length 314 m. (See illustration, p. 378.)

**Judaea**, region in the S. of Palestine

originally allotted to the tribe of Judah, occupied by the Jews who returned from the Babylonian exile during the periods of Persian, Gk. and Rom. supremacy. Its limits varied at different times. Josephus says (*Bell. Jud.* iii. 5) that it extended from Annath, called also Borecos, on the N. to the vil. of Jordan on the S., from Joppa on the W. to the Jordan in the E. St Luke, however, frequently uses the title to include the whole of W. Palestine. In the time of Herod Idumaea was included in J. The plateau of J. takes the form of a long zigzag central spine which throws out a series of steep spurs to E. and W. Modern J. came under Brit. mandatory administration, and is now

poems survive, 800 being of a secular nature, and 300 religious. His poetry represents both the sufferings and the aspirations of his people. In him the Jewish-Sp. renaissance of poetry reached its loftiest form both as regards subject-matter and nobility of conception, and he may be justly considered the greatest medieval Heb. poet. His poems are still used as prayers by Jewish congregations. According to tradition he met his death on a pilgrimage to Jerusalem. Besides his poems, he wrote an apologetical work in Arabic, entitled *The Book of Argumentation and Demonstration for the Defence of the Oppressed Religion*, known as *Chozari*. Selections of his poems were trans. by I.

CUENCA, ABOVE THE VALLEY OF THE JUCAR

divided between Israel and Jordan. J. is an agric. country, wheat, barley, olives, etc., being produced. See also ISRAEL and PALESTINE.

Judah, according to the Genesis narrative, was the fourth son of Jacob and Leah, b. Haran in Mesopotamia. The tribe which bears his name was the most important of the 12, and from it sprang the house of David. The cap. of J. was Hebron, and its ters. stretched from Jerusalem on the N. to the ter. of the Amalekites on the S., and from the Dead Sea on the E. to the Mediterranean on the W. Jerusalem was taken by David, and formed a new cap. Under David the kingdom of J. attained its greatest extent. On the death of Solomon this kingdom fell into 2 parts: J. to the S. and Israel to the N. The kingdom of J. survived until 586 when it was destroyed by the Babylonians. See ISRAEL.

Judah ben Samuel ha-Levi (c. 1085-1140), Sp.-Jewish poet, philosopher, and physician, b. Toledo. Over 1100 of his

Heinemann, 1948. See J. M. Millás Vallcrosa, *Yehudá ha-Levi como poeta y apologista*, 1947, and R. Kayser, *The Life and Times of Jehudah Halevi*, 1949. See also Heine's poem 'Jehuda ben Halovi'.

Judaizers, see EBIONITES.

Judaism, faith and ceremonies of the Jews, as revealed by God to Moses (the *Torah*) and interpreted by rabbinical authority. J. is the oldest monotheistic faith, the forebear of Christianity and Islam. In the O.T. it is recorded how Abraham attained to the worship of one God and adopted the rite of circumcision, the outward sign of the covenant between God and his people. Subsequently his descendants were led out of Egypt by Moses to Mt Sinai, where the Ten Commandments and other laws were revealed. These included the estab. of the priestly and Levitical orders, the institution of sacrifices, a civil and criminal code, a code of sexual morality and personal hygiene, and the dietary laws. The whole is based on the fatherhood of God, His choice of

Israel, and divine revelation. After the destruction of the Temple in 586 BC there arise the further developments of the synagogue, the ancestor of the church and mosque, Messianism, and eschatology. Inspired prophecy came to an end, and the custody of the *Torah* passed into the hands of the scribes, later rabbis (q.v.). They eventually produced the *Talmud* (q.v.), an authoritative compendium of J., which helped J. to surmount the difficulties occasioned by the loss of national independence and the rise of Christianity and later Islam. In the Middle Ages more interest was shown in dogma. Maimonides (q.v.) laid down 13 principles of J. These comprise the existence, unity, incorporeality, omniscience, and eternity of God and His exclusive worship, the truth of prophecy and the superiority of Moses, the truth of the revealed *Torah* and its immutability, reward, and punishment, the coming of the Messiah, and the resurrection of the dead. At the same time revised codes of Jewish practice were being drawn up, culminating in the *Shulchan Aruch* of Joseph Caro (1555), which is current to-day. There is no world rabbinical authority, problems which arise being dealt with by individual rabbis or courts (*Beth Din*). There have always been dissenting sects, notably Karaim (8th cent.), which rejected the *Talmud*, and contemporary Reform and Liberal J., which claim the right of abandoning dogmas and practices which they believe to be outdated. See M. Friedlander, *The Jewish Religion*, 1891, and I. Epstein, *The Faith of Judaism*, 1954.

**Judas, St.** not Iscariot (John xiv. 22), spoken of in the Lucan list as *Ioudas Iakobou*, which may mean either 'brother' or 'son of James.' He is generally identified with the Thaddeus of Matthew and Mark, and is known as St Jude. He is the writer of the Epistle of Jude. His feast is on 28 Oct., and he is the patron of the hopeless.

**Judas Iscariot**, son of Simon (John vi. 71), betrayer of Jesus, the only one of the Twelve who did not come from Galilee. His name tells us that he was a Judean of the tn of Kerioth. The gospels associate his action with avarice, but widely divergent views have been held; some, such as the Gnostics in ant times and Noack in modern, have tried to make his action in hastening the Atonement a praiseworthy one. Others hold that he desired to test Jesus, to see whether he were indeed the Christ. It is more probable that his early love had cooled with his continued avarice and peculation, and that, turning to hate, his hasty temper led him to an act followed by all the terrors of remorse.

**Judas Maccabaeus**, 'the Hammer,' son of the priest Mattathias, the first to resist actively the persecution of the Jews by Antiochus Epiphanes. Mattathias d. in 166 BC, and Judas took command of the insurgent forces. A great warrior, he gained a series of successes over the Syrian generals, Apollonius, Seron, and Gorgias, and finally over the viceroy Lysias him-

self. Judas made Jerusalem his centre of operations and also reorganised the religious system. He restored and fortified the Temple, procured new priests, and revived the observance of the Law. The Temple was solemnly rededicated at the end of the year 165 BC, 3 years after its profanation by Antiochus. This was the origin of the Feast of the Dedication (John x. 22). Religious freedom was granted in 162, and the main object of the war was thus achieved, but Judas and his friends now strove for political independence. Judas, however, was defeated and slain by Bacchides at Eleasa (161 BC). The command was then taken by his brother Jonathan. See ISRAEL, *From the Exile to the Revolt of the Maccabees*; also *The Books of Maccabees*; J. W. Hunkin in *New Commentary on Holy Scripture*, 1928; T. Corbishley in *Catholic Commentary on Holy Scripture*, 1953; A. M. Hyamson, *Judas Maccabaeus, the Hammer of God*, 1935.

**Judas of Galilee**, mentioned in Acts v. 37, was, with Sadduk the Pharisee, leader of an insurrection in AD 6 or 7, on the occasion of Judaea coming under direct Rom. administration. See also GALILAEANS.

**Judas Tree**, name applied popularly to sev. trees, on one of which Judas is said to have hanged himself. It is given most commonly to *Cercis siliquastrum*, a leguminous tree found in S. Europe and cultivated as a hardy plant in Britain. The purple flowers are papilionaceous, and show before the leaves. See also JEW'S EAR.

**Judd, John Wesley** (1840-1916), geologist, b. Portsmouth, entered the Royal School of Mines, joining the Geological Survey staff in 1867. In 1876 he became prof. in geology at the School of Mines, and in 1881 held the same position at the Royal College of Science. C.B., 1895. His chief publs. are *Volcanoes*, 1881, *The Student's Lyell*, 1896, and *Geology of Rutland*, 1875.

**Jude, St.** see JUDAS, ST, not Iscariot.

**Jude, The Epistle of St.** smallest of the general epistles, a canonical book which attained to its position only after much disputation. It does not appear in the Peshito, or Syrian version of the N.T., nor is it quoted by the majority of Early Christian writers. Eusebius classes it among the Antilegomena, and later St Jerome says that its use of the Apocryphal Book of Enoch was the reason of its rejection by many. The author speaks of himself as 'Jude, a servant of Jesus Christ and brother of James,' i.e. Judas ('not Iscariot'), the apostle. There is a close literary connection between J. and 2 Pet. cf. 3-18 and 2 Pet. i. 5; ii. 1-18). J. is probably the earlier. The epistle is directed against a kind of false teaching closely allied to Gnosticism (q.v.), though there is no means of deciding against which particular sect he wrote. This 'gnosticism' had led to immoral and licentious practices, and against these the writer also warns his readers. His main object is to urge them to do this by

contending 'earnestly for the faith once delivered to the saints.' See J. Moffatt, *The General Epistles*, 1928; Little (in Gore's *New Commentary*), 1928; J. W. Ward, *St Peter and St Jude*, 1934; Wilmering (in *A Catholic Commentary*), 1953.

**Judge.** A J. is one who is invested with the power to hear and determine civil and criminal causes, and generally to administer justice by making such orders, decrees, and judgments as to him seem best fitted to subserve that purpose. The status of the highest J.s. at any given time, in any given community, has always been one of great dignity; but the functions have differed to a remarkable degree, varying from those above noted to those of a mere juror or J. of fact; and again, judgments have varied from the ancient conception of divinely uttered awards of the Homeric poems to the prosaic though admirable models of scientific precision of the modern High Court J. In ancient codes, as Maine has suggested, the *themistes* (Gk *Themis*, goddess of justice), or judgments pronounced, whether by a king or priest, in a dispute between individuals, were of so exalted a nature in the vulgar mind that they were not only deemed to be due to divine dictation but took the place of all law-making, and indeed laid the foundation of customary law. In Rome, during the era of the kings, the supreme J. in all cases was the king himself, and civil causes were decided by him in his capacity of *pontifex maximus* (high priest), *jus* and *sacra* (law and sacred law) being for the most part inextricably involved in one another. In the developed Roman legal system the *judex* or J., who was generally a senator or, later, a knight, was a person with a very clearly defined duty of judging an issue submitted to him by the praetor or magistrate in a document called the *formula*. But it was the high status and delegated sovereign authority of the magistrate that invested legal proceedings with weight and solemnity; the *judex* had long since sunk to the condition of a mere arbiter, who could not exert the force of the state unless empowered so to do by the magistrate, with whom also it lay to declare what the law was in particular cases. In all developed modern systems the highest J.s. combine both of the following functions: they not only declare the law, even altering or improving it on occasion (Bentham's 'judge-made law'), but they set in motion the machinery for enforcing their judgments. In England the term 'judge' is confined to J.s. of the Courts of Appeal, High Court J.s., and Co. Court J.s.; J.s. of Bor. Courts are called 'recorders'; of Metropolitan Magistrates' Courts 'stipendiary magistrates'; and of Petty Sessions 'justices of the peace.' The Lord High Chancellor, the head of the Eng. judicial system, appoints the puisne (i.e. junior. from Fr. *puisne*, meaning literally 'later born') J.s., of whom there are 6 in the Chancery Div. (of which Div. the Lord Chancellor is titular president), 17 in the Queen's Bench Div., excluding the Lord Chief Justice (who,

besides being president of the Queen's Bench Div., is also a member of the body of Lords of Appeal in Ordinary), and 5 in the Probate, Divorce, and Admiralty Div. The J.s. of the highest Court of Appeal, the House of Lords, regarded as a tribunal, are the Lord High Chancellor, ex-Lord High Chancellors, 7 Lords of Appeal in Ordinary, the Lord Chief Justice, the Master of the Rolls, and the President of the Probate, Divorce, and Admiralty Div. There are 8 Lords Justices, who form the penultimate Court of Appeal. All puisne J.s. are knighted on appointment, but are addressed as 'My Lord' or styled 'Mr Justice —'. The Lord Chief Justice is merely the titular head of the Queen's Bench Div., but, since the institution in 1908 of the Court of Criminal Appeal, he presides over the Court. The lord mayor and aldermen are titular J.s. of the Central Criminal Court (Old Bailey), but its regular J.s. are the Recorder of London, the Common Serjeant, and the 2 J.s. of the City of London Court. The number of Co. Court J.s. varies but is usually about 60. See also *CIRCUITS* and *INFERIOR COURTS*. See R. C. Ensor, *Courts and Judges in France, Germany, and England*, 1933, and E. Jenks, *The Book of English Law*, 1936.

**Judges in the U.S.A.** Each of the 48 states of the U.S.A. has its own judiciary enforcing and construing its own state laws. Compared with the Brit. system the judiciary is rather complicated, and one outstanding difference is that all judicial offices are filled by election by the people. In many states candidates for judicial positions are nominated by political parties and their names placed on the political ballots. In a few, like New York, for the higher judiciary an endeavour is made to take the J.s. out of politics by nominating an agreed 'ticket' of eminent men. Each of any size elects a police J. to try cases of minor infractions of the municipal laws. Each co. elects a co. J. to try cases of a higher degree. Then there are elective J.s. who hear the more important criminal cases or the bigger civil suits. Most of the states have a set of appellate J.s. who hear appeals from these courts. Finally, most states have each a supreme court, which is the last tribunal of resort in the commonwealth. The terms of office for which J.s. are elected vary in different states from 4 to 17 years.

The U.S. J.s. deal only with the Federal laws of the nation as a whole. They are named by the president of the U.S.A., hold their positions for life, and have to be confirmed by the U.S. Senate. The lowest order of these J.s. is known as the Federal Dist. Court J.s. Next above them are the U.S. Circuit J.s. The whole country is divided into 10 circuits, and there are 39 of these J.s. The U.S. Circuit Courts of Appeal consist of the Dist. and Circuit J.s. in the respective circuits, together with a Justice of the U.S. Supreme Court who is assigned to each circuit. Finally, at the apex of the entire judicial system of

the country, the court of absolute last resort is the U.S. Supreme Court composed of a Chief Justice and 8 Associate Justices. This court is so powerful that it can even abrogate a law enacted by the Congress, if it finds the statute in contravention of, or conflict with, the U.S. constitution.

**Judge Advocate-General**, army official appointed on the recommendation of the Lord Chancellor and responsible to that authority, but prior to 1948 appointed by the Crown and responsible to the secretaries of state for war and air. He enjoys a status and remuneration not less than those of a puisne judge of the High Court. The responsibility for acting or not acting on his advice in particular cases still remains with the secretary of state concerned.

Formerly the duty of the J. A.-G. was to advise on the legality of proceedings at courts-martial, with power to revise sentences passed by such courts, and upon other matters relating to the army. He was also at one time responsible for prosecutions, but ceased to be so after the Crawley trial of 1868. The former J. A.-G.'s dept, conformably to the Lewis Committee's recommendations, has been reconstituted so as to separate the functions of pre-trial advice and of prosecution from functions of a judicial character. The former functions are no longer the responsibility of the J. A.-G., but have been transferred to directorates of legal services in the War Office and Air Ministry. The office of J. A.-G. dates back to the 16th cent. For long the holder of the office also acted as secretary of the Board of General Officers. After this board was abolished in 1855 his functions became purely legal. During the 19th cent. the office was held by a privy councillor, who was also a member of the gov., but the functions of the office were in 1892 assigned to a judge of the High Court. That arrangement not proving satisfactory, the duties were by 1905 assigned to a barrister at a salary of £2000 a year. The changes of 1948 as recommended by the Lewis Committee (which endorsed similar recommendations of the Oliver Committee of 1938) are in effect a reversion to the arrangement of 1892. There is an analogous official to the J. A.-G. at the Admiralty—styled the Judge Advocate of the Fleet (q.v.)—to advise on matters of naval law.

See also COURTS-MARTIAL.

**Judge Advocate of the Fleet.** Appointment usually given to a practising barrister. Under the Naval Discipline Act of 1866, amended by the Act of 1884, courts-martial consist of from 5 to 9 officers of defined ranks who try the cases and make their judgments. In theory the Judge Advocate sits with them, not as an equal judge or with any right to interfere with their decisions, but rather as a legal adviser and as a representative of the queen empowered to delay action in certain cases. In practice he is usually represented by an appointed barrister, who is in attendance and acts for him.

The Judge Advocate's position becomes important when a death sentence is passed during peace time, as, though he does not constitute a Court of Appeal, and may not himself override the decision, he can, if the case warrants it, advise the queen to grant a royal pardon.

**Judges**, The Book of (Heb. *sophetim*, cf. Carthaginian *sufetes*), second book of the 'Former' Prophets, continuing the hist. of the Israelites from the death of Joshua to the death of Samson. The book may be divided into 3 parts: (1) chs. i.-ii. 5 is a synopsis of the conquest of Canaan earlier in date than the Book of Joshua, from which it varies, making the action of the various tribes more independent. (2) The main body, chs. ii. 6-xvi. 31, presents an apparently consecutive and chronological account of the gov. of Israel under 6 major and 6 minor judges. The scheme of the cycles is explained in ch. ii. 11-19, which shows the recurring events as they occur in the case of each judge: 'The children of Israel did that which was evil in the sight of the Lord . . . and they forsook the Lord . . . and the anger of the Lord was kindled against Israel and he delivered them into the hands of spoilers . . . and they were sore distressed. . . . And the Lord raised them up judges . . . and saved them out of the hands of their enemies all the days of the judge. . . . And it came to pass when the judge was dead that they returned and corrupted themselves more than their fathers.' The final redaction of this section is due to a Deuteronomistic editor, who provided the setting but did not alter the text. (3) The last 5 chapters, xvii.-xxi., consist of various incidents of the same period, but in no way connected with the earlier narratives. See W. O. Oesterley and T. H. Robinson, *A History of Israel*, 1932, and C. F. Burney, *Judges*, 1922.

**Judgment**, in law, the decision of a court of law in any cause heard therein. Final J. disposes of the case, subject to any right of appeal; an interlocutory or interim J., such as the grant of an injunction (q.v.) in the Chancery Div., disposes only of a particular issue, leaving the merits to be adjudicated at some other time or, as in the grant of a mandamus (q.v.), in another and inferior court (q.v.). A J. binds only the parties to the particular case. A J. summons is one which follows non-compliance with a default summons by a debtor who, in the court's opinion, can but will not pay his debt; it asks the court to make an order for payment subject, on further default, to commitment to prison.

**Judgment**, in philosophy, broadly the faculty which enables a person to arrive at the truth or at what any particular school of philosophy may consider to be the truth. In ethics it denotes the faculty of distinguishing between right and wrong conduct. In metaphysics a proposition which, by its mere suggestion, is conceived as *necessary* is an *a priori* J., and if derived from nothing else than another necessary proposition it is called an absolutely *a priori* J. These terms are

used in the Kantian philosophy in the differentiation between knowledge gained by experience and *a priori* knowledge. In Kant's philosophy the J.s of experience are never truly and strictly universal, but possess only the comparative universality of induction; i.e. experience can only tell us that, so far as our observation goes, a particular result will follow from a particular combination of circumstances. But necessity and strict universality are sure criteria of *a priori* knowledge. Hume, arguing from this position, had asserted that necessary and universal J.s could not exist as valid knowledge by reason of their very necessity and universality, but were rather the effect of an association of ideas. Kant, however, accepting the validity of

on (1) many parables and other statements of Christ; (2) 2 Cor. v. 10; (3) Rev. xx. 12 ff. Belief in a F. J. formed a part of Jewish teaching developed from prophetic teaching about the Day of the Lord. Originally a judgment in the course of earthly hist., it was connected with the Messianic hope of the coming of the Kingdom, and developed by the apocalyptists into a real eschatology. Zoroaster (q.v.) also taught a remarkable doctrine of the F. J. See also HEAVEN; HELL; PURGATORY.

**Judicature Acts.** These comprise the J. A. 1873, 1874, 1875, 1877, 1878, 1879, 1881, 1883, 1884, and the Appellate Jurisdiction Act, 1876. The main purpose of these Acts may be summarised as follows: (1) the abolition of archaic forms of

D. McLeish

## THE LAST JUDGMENT

One of many similar representations of the Last Judgment in France. This appears over the main portal of Bourges Cathedral.

universal J.s. contends that they do in fact supersadd something to our sum total of knowledge, and, after arguing the possibility of passing J.s going beyond the range of experience from the otherwise very impossibility of experience itself, goes on to show the bearing of such *intellectual* J.s upon the supersensible world or the ultimate problems of metaphysics—God, freedom, and universality.

**Judgment, The Final.** According to Rom. Catholic theology every soul individually, at the instant of death, is committed by God to its final destiny, in what is called a *private judgment*. The term F. J., however, is more commonly applied to the *general judgment*, a public vindication of God's justice which is to take place at the end of the world. At that moment the dead will rise again with bodies transformed like Christ's at His Resurrection, a transformation which will affect the living also. Then all alike will behold the everlasting fate of each and every one. The doctrine is found in the Nicene Creed, which states that Christ 'shall come again with glory to judge both the quick and the dead.' This belief is founded upon Scripture, and in particular

pleading (q.v.) which often defeated valid claims for absurd technical reasons; (2) the fusion of administration of common law and equity; (3) the setting up of the Supreme Court of Judicature comprising the Court of Appeal and the Queen's Bench, Chancery, and Probate, Divorce, and Admiralty Divs. of the High Court. See CHANCERY and EQUITY.

**Judicial Committee of the Privy Council.** Like the ultimate Court of Appeal in civil causes—the House of Lords or Lords of Appeal in Ordinary—the J. C. of the P. C. has really nothing to do with the body of which it is in theory a committee. In its present form it dates from 1833, when its constitution was strengthened by the addition of colonial and Indian judges, in order to meet the difficulty arising from the difference between Eng. laws and those of the colonies. As long ago as 1580 the right of appeal to the Queen in Council was recognised in the case of the Channel Is. The Lord President of the Council is technically the head of the J. C., and there are a number of judges holding other offices who, as privy councillors, are technically members. In practice a panel is usually drawn from the following: the

Lord Chancellor, the 7 Lords of Appeal in Ordinary, and, prior to the Indian Independence Act, 1947, certain judges of Indian experience who sat for the hearing of Indian appeals only. There are also a number of judges of the courts of the dominions overseas who are members, though they do not often sit. In theory the J. C. does not pronounce judgment, but merely advises the sovereign to give judgment in a particular way, a harmless fiction that finds its parallel in the conventional duty of the members not to disclose their differences of opinion in submitting their 'advice' to the Crown. Appeals in criminal cases can only be brought to the J. C. by special leave of the committee itself. The committee also hears appeals from the eccles. courts and from the prize courts, and in this connection provision is made for the attendance of prelates and naval experts, respectively, as assessors. The J. C. of the P. C. hears appeals from Australia, New Zealand, and the colonies.

**Judicial Factor**, see FACTOR, JUDICIAL.

**Judicial Separation**. Decree for J. S. or divorce *a mensa et thoro* is a remedy for certain matrimonial offences which, unlike a decree of dissolution of marriage (divorce *a matrimonii vinculo*), does not leave the parties at liberty to marry again. A J. S. may be obtained by either spouse on these grounds: (1) adultery; (2) cruelty; (3) under section 16 of the Matrimonial Causes Act, 1857, for desertion without cause for 2 years or upwards; (4) for statutory desertion under section 5 of the Matrimonial Causes Act, 1884, that is, where the respondent to the petition for J. S. has failed to obey a previous order of the court for restitution of conjugal rights. Against a husband J. S. may also be obtained on the ground of sodomy or an attempt to commit that offence. Acts of cruelty to children may amount to cruelty to the wife, when committed by the husband in the presence of the wife and for the purpose of giving her pain (*F. v. F.*, 38, T. L. R., decided in 1922). Desertion has only been a ground of petition for divorce or J. S. since the Matrimonial Causes Act, 1857, for in the eccles. courts it was only recognised as a ground for restitution of conjugal rights.

Where a decree is pronounced against a wife for adultery, and she has property in possession or reversion, the court may compel a settlement of as much of the property as it deems reasonable for the benefit of the husband or the children of the marriage. The petitioner for J. S. must, as in the case of a suit for dissolution, file together with the petition an affidavit stating that there is no collusion (q.v.) or connivance between the 2 spouses. Where a wife gets a J. S. she may apply for petition for permanent alimony (financial support from the husband) provided she gives the husband 8 days' notice prior to her application. The court, even before the decree for J. S. has been made final, may make such orders as it thinks fit for the custody, maintenance, access,

and education of the children of the marriage, together with provision for their support when the final decree is pronounced. Incidentally to these purposes the court has power to vary the terms of settlements of property on the respondent. The defences to a suit for J. S. are as in a suit for dissolution: (a) connivance at adultery; (b) condonation of adultery; (c) collusion; (d) adultery, desertion, etc., not proven. Connivance, generally speaking, means acquiescence in adulterous intercourse by wilful abstention from taking any steps to prevent it. Cruelty and desertion, however much they may induce a wife to become unfaithful, do not amount to connivance in law. Condonation implies a conditional forgiveness with a full knowledge of all antecedent guilt, the condition being that the offence shall not be repeated, or, as it has been expressed, a complete blotting out of conjugal offence followed by cohabitation with full knowledge of all the circumstances. There is no narrow definition of collusion, but it exists where the originating of the petition is founded on an agreement between the parties or their agents. A suit for J. S. may be compromised by agreement, and neither party is at liberty to repudiate the agreement, except on the ground of fraud, or of such an error in its terms that they ought not to be bound by it. This principle was confirmed in the Court of Appeal in 1922. (*See Brown and Watts on Divorce*, 10th ed., 1924.) Where the court grants the decree, it is of course no longer obligatory for petitioner to cohabit with respondent. The grant of the decree does not bar presentation of a petition for divorce upon substantially the same facts.

'Judith,' O.E. poem of about AD 900, found in the same MS. as *Beowulf* (q.v.). Only about 350 lines remain, and the author is unknown. Its theme is taken from the story of J. in the Apocrypha, and the treatment is vivid in the extreme, the story being told as if it were contemporary. The metre is the usual O.E. alliterative verse, but is varied towards the end by lines of extra length. *See* ed. by B. J. Timmer, 1952.

**Judo**, see JU-JITSU.

**Judson, Adoniram** (1788-1850), Amer. missionary, b. Malden, Massachusetts. After graduating at Brown Univ. (1807) he studied at the Andover Theological Seminary and became a Congregational minister. He sailed for Burma in 1812, and on the voyage joined the Baptist Church. He and his wife settled in Rangoon, but subsequently moved to Ava, where J. was imprisoned during the Burmese war. His trans. of the Bible into Burmese was completed in 1833, and was followed by a *Burmese-English Dictionary*. *See* lives by F. Wayland, 1853; R. Middleditch, 1859, and his son E. Judson, 1883; also Honoré Morrow, *The Splendour of God*, 1929.

**Juel, Niels** (1629-97), Dan. admiral, b. Christiania. He served under Tromp and de Ruyter fighting in the war with England (1652-4). He subsequently took

part in the Swedo-Dan. wars (1658-60), and in the Scanian war (the Scania were a Swedish political party) when he was appointed to the supreme command in 1673. He was victorious at Jasmund (1676) and at the Bay of Kjöge (1677), when he distinguished himself by his brilliant tactics.

**Jugdalak**, or **Jagdalk**, vil. and pass situated between Kabul and Jalalabad, Afghanistan.

**Jugerum**, Rom. land unit, = 2 actus quadrati = 28,800 Rom. sq. ft = 100 Eng. sq. poles =  $\frac{1}{4}$  ac. The side of a square J., therefore, measured 10 poles = 100 Sumerian cubits = 96 royal cubits. See A. E. Herriman, *Historical Metrology*, 1953. See also METROLOGY.

**Juggernaut**, or **Puri**, tn situated on the Orissa coast, India. It is one of the holy places of India, and in addition to its having for a number of cents. preserved the Golden Tooth of Buddha, it is famous for a temple built in honour of Vishnu, and in which was his idol. The name given to this idol was Jagannath or J. ('lord of the world'), and it was the representation of a god of the people. Sev. festivals are celebrated in his honour each year, the chief one being that of the car. The ceremony consists in drawing the god on a huge car to a place near by, the journey extending over sev. days. Large numbers of pilgrims assemble in the tn for this purpose, and as some are killed during the journey the belief has become current that it is customary for them to throw themselves under the car. This, however, has been contradicted.

**Juggling** is very much the same as conjuring, prestidigitation, and legerdemain. 'Jugler' is the Eng. form of the Lat. *joculator* (jester), whilst *jongleur* (q.v.), which was used in the Middle Ages of a strolling singer or minstrel, is the Fr. equivalent. J. can be traced back to the days of the anct Chaldees and Egyptians. The magicians of Pharaoh, Jannes and Jambres, tried to outdo the miracle of Moses; and Zoroaster, who reformed the Magi, was famous for his marvellous feats. Equally so was Paracelsus of a later day (1493-1541). The Greeks and Romans were no strangers to sleight of hand, and among the latter the so-called *acclabularii* performed wonderful tricks with tiny pebbles, whilst *ventilatores* (knife-throwers) and *pilarti* (ball-players) were professional entertainers in the imperial days. Musset's pathetic opera, *Le Jongleur de Notre Dame*, gives an idyllic picture of a wandering juggler in the great monastic days, and in olden times no country fair was complete without its conjurers and tricksters, and no vil. was for long without its afternoon's entertainment in the form of the knife-swallowings and ball-tossings of some needy and itinerant merry-andrew. In Hocus Pocus' *Anatomy of Legerdemaine*, 1634, there is mention of 'the greatest juggler in England,' who 'used the assistance of a familiar; he lived,' we are told, 'a tinker by trade, and used his feats as a trade by the by; he lived . . . always botattered, and died, for ought I

could hear, in the same estate.' Jonas, Androletti, and Carloti enjoyed high reputations as conjurers in Paris during the 18th cent., and about 1783 the Italian Pinetti began to give his sensational exhibitions of legerdemain. In modern times the Indians and Chinese have surpassed W. peoples in the ingenuity of their impostures and in the marvellous skill with which they juggle with fire, rings, knives, balls, and swords—conjuring properties which seem more especially to form the stock-in-trade of the professional juggler. See CONJURING and DEVANT, DAVID.

**Juggs**, see JOUGS.

**Juglans**, family Juglandaceae, genus of about 16 deciduous trees of N. lands. *J. regia*, the common walnut of E. Europe, provides fine timber for cabinet-making, and edible nuts, yielding oil. *J. nigra*, black walnut of E. America, is a valuable timber species; *J. cathayensis* is the Chinese walnut, *J. mandshurica* the Manchurian walnut, and *J. cinerea* the Butternut of N. America, yielding sweet nuts.

**Jugoslavia**, see YUGOSLAVIA.

**Jugular Veins**, **The**. Their number varies in different individuals, but the 4 chief ones are: (a) the *external jugular*, which can usually be seen through the skin and muscle on the side of the neck. It runs in a line drawn from the angle of the jaw and eventually pierces the deep fascia above the middle of the clavicle and joins the *subclavian*. It receives its blood from the scalp and deeper parts of the face. (b) *Anterior jugular*, smaller, runs about half an inch from the middle line of the neck. (c) *Posterior jugular*, collecting from the neck. (d) *Internal jugular*, uniting at the root of the neck with the subclavian to form the *vena innominata*; its blood is obtained from the superficial parts of the face and the deeper parts of the cranium. 'Cutting the throat' usually results in injuries to one or more of these veins. A severance of the *internal* is critical, and in the case of div. of any of the J. V. death may follow from the admission of air to the cardiac cavities.

In the development of the embryo the *primitive jugular* represents the *anterior cardinal* of the 2 longitudinal vein trunks formed by the junction of veins from body segments. It receives fewer segmental veins than the *posterior cardinal* as the first site of the heart is in that portion which later becomes the neck of the embryo.

**Jugurtha** (d. 104 BC), Numidian king, natural son of Mastanabal and grandson of Masinissa (q.v.). He was brought up by his uncle, Micipsa (q.v.), who left his kingdom (118) to J. and his 2 sons, Hiempsal and Adherbal. J., greedy for supreme authority, determined to get rid of his cousins, and assassinated Hiempsal. The Rom. Senate decreed that the kingdom should be equally divided between J. and Adherbal, but in 112 the former had Adherbal put to death. War was now declared between Rome and Numidia, J.

having attacked the It. inhab. of Cirta. J. drove the Rom. troops out of his kingdom (110), and in the following year fresh troops were sent from Rome, under Q. Caecilius Metellus, who was victorious at Nuthul. Metellus was superseded by Marius in 107; J. now made an alliance with his father-in-law, Bocchus, and on their united forces being defeated withdrew into the deserts of the interior. Bocchus made his peace with Rome by betraying his relative, and delivered J. up in chains to Sulla, the quaestor (106). Marius led his prisoner in triumph through Rome (104), and afterwards had him strangled in prison. The hist. of the Jugurthian war was written by Sallust.

Ju-Jitsu, Jiu-jitsu, or Ju-jutsu are various ways of spelling the Eng. form of a Jap. word signifying the national art of self-defence without weapons. The word means 'gentle art' or is sometimes trans. as 'to conquer by yielding,' from the Jap. word *ju* (pliant); the latter interpretation is certainly a good description of the art whatever its etymological verity. J. was introduced into Japan in the middle of the 17th cent. by Ching Gem Ping, a naturalised Chinese. Until the break-up of the feudal system in Japan, J., or as it was also called, Taijutsu or *yawara*, was a secret art practised only by the *samurai*, the warriors of Japan. By means of this acquired skill they were not only able to assert their authority over the common people without the use of the swords which they alone were allowed to carry, but they were doubly equipped for mortal combat. Since the sweeping constitutional and social changes in Japan, however, it has been possible to teach the art to all who wish to learn. After the Meiji Restoration in 1868, J. was somewhat neglected for a time though many training schools continued in existence. It was revived by Jigoro Kano, who introduced it in a new form to which he gave the name judo and which was based on modifications of the traditional techniques. He rendered the sport less dangerous by eliminating techniques devised to kill or seriously to cripple an opponent and he also laid great emphasis on the spiritual value of judo training. Kano was later the principal of Tokyo Higher Normal School, a member of the Olympic Committee, and eventually a member of the House of Lords. He also founded the Kodokan in Tokyo in 1882, a famous judo school which is now the centre of the judo world. The art of judo like J. lies in an ability to utilise the power of an opponent to one's own advantage so that size and strength are not necessarily a prerequisite of victory. Judo techniques are divided into 3 groups: *nage-waza*, throwing an opponent to the ground, *katame-waza*, getting a grip on an opponent so that he cannot move or resist, and *ate-waza*, temporarily incapacitating for action by a blow or kick at an important nerve point. A knowledge of first-aid forms part of the training. Judo experts are divided into 10 *dan* or grades, for which diplomas and belts are awarded. Mr Kyuzo Mifune, the leading

judoman at the Kodokan in Tokyo is the sole holder of the tenth grade. Judo has achieved world-wide popularity and judo schools are now to be found in most countries in Europe and the Amer. continent; it is especially popular in France. There are about 150 trainees in Britain. See H. H. Skinner, *Jiu-jitsu*, 1904; H. J. Hancock, *Complete Kano Ju-jitsu* (Judo), 1905; K. Saito, *Ju-jitsu Tricks*, 1905; Mrs R. Walts, *Ju-jitsu*, 1906; S. K. Uyenishi, *Ju-jitsu*, 1906; J. Kano, *Judo*, 1937; E. N. Dornay, *The Art of Judo*, 1954.

Ju-Ju, word used by Africans of the Guinea Coast for a fetish (q.v.), perhaps adopted from Fr. *joujou*, a toy, or corrupted from Mandingo *grugru*, a charm. J., besides denoting the shrine, idol, or charm in which a spirit is supposed to dwell, was applied to the spirit itself, and so loosely to witchcraft, rites, and customs characteristic of the Negroes. The 'Long Ju-Ju' of the Aro clan of the Nigerian Ibo was a sacred shrine where human beings were sacrificed until the Brit. interfered (1901-2). See P. A. Talbot, *Peoples of Southern Nigeria*, 1926, and K. O. Dike, *Trade and Politics in the Niger Delta*, 1956.

Jujube, name of sev. plants of the genus *Zizyphus* in the family Rhamnaceae, which consists of shrubs and small trees found in the tropics. Many of the species bear edible fruits, and these are sometimes dried and used as sweetmeats. *Z. jujuba*, the common or Fr. J., flourishes in the E. and produces a small red or yellow fruit; *Z. lotus*, the lotus, bears a small, sweet fruit said to be the lotus fruit known to antiquity; *Z. spina-Christi*, Christ's Thorn, is fabled to have yielded the crown of thorns; the thorns are modified stipules. The confection known as J. is made of gum arabic or gelatine, glycerine, and pure sugar, and is flavoured like the J. fruit.

Jujuy: 1. Prov. of Argentina, situated in the NW., and having Bolivia on its N. and W. sides. Its area is 22,962 sq. m. Part of the surface is mountainous, rising to a height of over 15,000 ft. The prin. riv. is the San Francisco with its tribs. The state is rich in mineral wealth, and is a valuable source of revenue. Gold, petroleum, lime, gypsum, lead, iron, china-clay, and useful salts are worked. Agriculture is largely carried on and sugarcane is grown. Fruit grows prolifically and there is a large export trade in oranges. Pop. 225,130.

2. Cap. of the above prov., on the railway from Buenos Aires to Bolivia; possesses a national college and a school for girls. An old colonial city of strong Indian attachments. Pop. 31,000. See H. J. Muir, *Hoo Hooey*, 1947.

Jukes, Joseph Beets (1811-69), geologist, b. Summer Hill, near Birmingham, and educ. at St John's College, Cambridge. Was appointed geological surveyor of Newfoundland (1839-40). In 1842 he joined an expedition to Torres Strait, New Guinea, and the E. coast of Australia, and on his return to England in 1846 took part in the work of the Geological Survey in N. Wales, becoming local Director of

the Survey in Ireland in 1850. He lectured on his subject at Dublin, and pub. a valuable text-book, *The Student's Manual*, 1857. His other writings include *Excursions in and about Newfoundland*, 1842, and *A Sketch of the Physical Structure of Australia*, 1850. His writings throw light on cleavage, the Devonian system, elvans, Silurian granite, trough-faults, and numerous other subjects of geological interest. His *Letters* were ed. by his sister, C. A. Browne, in 1871.

**Jukun**, Negro people of E. Nigeria, famed for their belief in divine kingship. The king is equated or associated with the moon, and is supposed to have a personal influence over the course of nature. By J. tradition he is allowed to rule for only 7 years; then, or previously if he has become weak and so liable to influence the crops badly, he is strangled. To-day the royal practices are largely in desuetude. See C. K. Meek, *A Sudanese Kingdom*, 1931.

**Julfa**, Armenian suburb of Isfahan (q.v.) in Persia.

**Julia**, name of sev. Rom. women of rank, belonging to the gens Julia: (1) Sister of Julius Caesar, wife of M. Atilius Balbus and grandmother of Augustus. (2) (d. 54 BC) Daughter of Julius Caesar by Cornelia. She married Pompey in 59. (3) (39 BC-AD 14) Daughter of Augustus by Scribonia. In 25 she married her cousin, M. Marcellus, who died 2 years later. She then married M. Agrippa, by whom she had 5 children, Caius and Lucius Caesar, Agrippa Postumus, Julia, and Agrippina. Her third marriage, in 12 BC, was to Tiberius Nero, who was afterwards emperor. In 2 BC Augustus banished her to Pandataria, an is. off Campania, on account of her adulteries, and she was subsequently removed to Rhegium, where she died. (4) (d. AD 28) Daughter of the above, and wife of L. Aemilius Paulus. Like her mother she was notoriously immoral, and was banished by Augustus to Tremerus, an is. off Apulia, in AD 9. (5) The youngest daughter of Germanicus and Agrippina, murdered by Claudius at the instigation of Messalina. (6) (d. AD 59) Daughter of Drusus and Livia, sister of Germanicus, also killed by Claudius at Messalina's instigation.

**Julia Concordia**, see PORTOGRUARO.

**Julia Gens**, famous patrician clan of ant. Rome of which the most notable family was that of Caesar. It claimed descent from Julius (sometimes called Ascanius), the son of Aeneas and grandson of Venus and Anchises. Julius is supposed to have founded Alba Longa, so that the family came of Alban stock. On the destruction of that city the J. G. was removed to Rome by Tullus Hostilius.

**Julia Joza**, or **Transducta**, see TARIFA.

**Julia Obsequens**, see PISA.

**Julia Pisana**, see PISA.

**Julia Romula**, see SEVILLA.

**Julia Septimana Biterrea**, see BÉZIERS.

**Julia Transducta**, see TARIFA.

**Juliabona**, see LILLEBONNE.

**Juliaum**, see JÜLICH.

**Julian**, or **Juliana**, of Norwich (c. 1342-c. 1413), anchoress and mystic. She was probably a Benedictine nun, living as a recluse in Norwich. Her *Revelations of Divine Love* are the most perfect fruit of medieval mysticism in England. See ed. by G. Warrack, 1949, and modernised ed. by R. Huddleston, 1952. See studies by P. F. Chambers, 1955, and P. Molinari, 1958.

**Julian (Flavius Claudius Julianus)**, surnamed the **Apostate** (331-63), Rom. emperor, b. Constantinople, being the youngest son of Julius Constantius and Basilina, and the nephew of Constantine the Great. On the death of Constantine in 337, at the instigation of his 3 sons, a terrible massacre took place in which J. and his elder half-brother, Gallus, alone escaped the fate of their kinsfolk. Educated under strict supervision at Nicomedia, until 344, he and his brother were removed to Macellum in Cappadocia. In early life he became greatly attached to Gk culture, and secretly abandoned Christianity. In 355 J. was created Caesar at Milan by the Emperor Constantius II, whose sister Helena (q.v.) he married. Thereupon J. was entrusted with the government of Gaul, and in 357 won a great battle against the Alemanni at Strasburg. He took up his residence in Lutetia (Paris), wisely administered the laws, and relieved the people of some of the heavy taxes. The emperor, becoming jealous of his increasing popularity, bade him lead his troops against the Persians, whereupon his soldiers proclaimed him Augustus (360). Constantius opportunely died in 361, and J. was universally acknowledged his successor. He now openly declared his apostasy, and proclaimed universal toleration within his realms; but he deprived the Church of its former privileges, forbade Christians to teach rhetoric, and in the offices of state gave preference to pagans. Before long, he made great preparations for an invasion of Persia, and marched through Antioch into Mesopotamia and Assyria, until he reached the walls of Ctesiphon (363). He was misled by the treachery of a Persian nobleman who advised him to march inland to meet the forces of Shapur II. His men suffered terribly from thirst and were overcome by the heat. During the battle, J. fell, and as he died, is supposed to have cried out, 'Thou hast conquered, O Galilean.' His extant writings are *The Caesars* (a satire in Senecan vein on the Caesars), *Misopogon*, 8 *Orations* (being panegyrics on Constantius and the Empress Eusebia, and comments on the philosophy of the Cynics) and a series of letters numbering upwards of 70, though the authenticity of some is disputed. His treatise *Against the Christians* is lost. See Gibbon, *Decline and Fall*, xix, xxi-xxiv, and J. Bidez, *Vie de Julien*, 1930.

**Julian Calendar**, epoch, see CALENDAR.

**Juliana** (1909- ), Queen of the Netherlands. Juliana Louisa Emma Maria Wilhelmina is the only child of Queen Wilhelmina and Prince Heinrich of Mecklenburg-Schwerin. She married

Prince Bernhard von Lippe-Biesterfeld, Jan. 1937. In 1948 she succeeded to the throne on the abdication of her mother. The heir-presumptive is her eldest daughter, Princess Beatrix Wilhelmina Amélie (1938- ); her other daughters are Princess Irene (1939- ); Princess Margriet (1943- ), b. in Canada; and Princess Maria (Marijke) (1947- ). Queen J. and her family came to England in 1940, going later to Canada, but returned to the Netherlands after the liberation in 1945.

**Julianus, Salvius** (b. c. AD 100), Rom. jurist, who lived during the reigns of Hadrian and the Antonines. By order of Hadrian, he was entrusted with the work of drawing up the *edictum perpetuum* from the immense mass of laws and praetors' edicts which existed at the time. His other works include *Digestorum Libri XC*, *Ad Minucium*, and *De Ambiguitatibus Libris Singularis*. He held the position of praefectus urbi, and was twice consul.

**Jüllöh** (ancient Juliaeum), Ger. tn in the Land of N. Rhine-Westphalia (q.v.), on the r. b. of the Roer, 27 m. SW. of Düsseldorf (q.v.). It was once the seat of the dukes of Aix-la-Chapelle (see AACHEN). J. was a strong fortress in the 17th cent., but was taken by Maurice of Orange (q.v.) in 1610, and by the Sp. a few years later. Its fortifications were demolished in 1860. During the Second World War it was the scene of heavy fighting in Feb. 1945, when the Amer. 9th Army was ordered to hold a front on the Roer from J. to Roermond (q.v.). The riv. was swollen, and it was not until 23 Feb. that the floods subsided sufficiently for 2 corps of the army to cross. A corps of the Amer. 1st Army simultaneously attacked over the Roer S. of Düren (q.v.). J. was taken on 24 Feb., and it was then (due to bombing, as well as ground fighting) almost completely in ruins. It has since been rebuilt, but of its ancient monuments only the ruins of the vast citadel, and a 13th-cent. tower, the *Hezenturm*, remain. It has paper, sugar, and leather manufs. Pop. 12,000. See WESTERN FRONT IN SECOND WORLD WAR.

**Julien, Stanislas-Aignan** (1799-1873), Fr. sinologist. He was a pupil of Abel Remusat and in 1832 became his successor in the chair of Chinese (which he held 40 years) at the Collège de France. Later he became keeper of the Royal Library (1839) and head of the Collège Impériale (1854). He trans. into Fr. sev. Chinese romances and novels as well as Taoist texts, his trans. being a model of accuracy. He also wrote a *Syntaxe nouvelle de la langue Chinoise* (1869), and various important pubs. on Chinese contributions to technology.

**Julier Pass**, Alpine pass in the canton of Grisons, Switzerland. It connects the Rhine Valley with the Upper Engadine, and has an altitude of 7500 ft.

**Jullibriga**, see BRAGANÇA.

**Julius**, name of 3 popes:

**Julius I, Saint** (337-52). In the Arian controversy he gave unwavering support to Athanasius.

**Julius II (Giuliano della Rovere)** (1503-1513), nephew of Sixtus IV, b. Albissola, near Savona, in 1443. During his uncle's pontificate he received many honours, and was sent as legate to France (1480), where he acquired great political influence. On his election to the pontificate he recovered Romagna from the Borgias, and devoted all his energies to suppressing nepotism and extending the temporal possessions of the Church. In 1508 he joined the League of Cambrai with Maximilian, Ferdinand, and Louis XII against Venice; but on the submission of that rep. he joined the Holy League directed against Louis (1510). J. condemned duelling (1509) and simony (1513), sent missionaries to India, Africa, and America, and was a liberal patron of the fine arts. See lives by A. Dumesnil, 1873, and M. Brosch, 1878, also L. Pastor, *History of the Popes* (trans.), 1898, and C. Stange, *Erasmus und Julius II: eine Legende*, 1937.

**Julius III (Giovanni Maria del Monte)** (1550-5), b. Rome in 1487. He was one of the 3 legates under whom the Council of Trent (1545) was opened. He sent Cardinal Pole to England to negotiate with Mary for the reconciliation of her kingdom with Rome. He was by nature pleasure-loving, and was guilty of the charge of nepotism. See L. von Ranke, *History of the Popes* (trans.), 1840-83, and L. Pastor, *History of the Popes* (Eng. trans.), 1898.

**Julian, Camille** (1859-1933), Fr. historian, b. Marseilles. His most notable work was *Histoire de la Gaule* (8 vols.), 1907-28. Other works include *Histoire de Bordeaux*, 1895, *Vercingetorix*, 1901, *De la Gaule à la France*, 1922, and *Au Seuil de notre histoire* (I.-III.), 1930 ff. See life by A. Creulor, 1945.

**Julien, Louis Antoine** (1812-60), Fr. musical conductor, originally Julien, b. Sisteron, Basses Alpes. He became a conductor of concerts in Paris (1836), came to London (1839), where he estab. promenade concerts, and travelled in the Brit. Isles and America. His light attractive promenade concerts drew large audiences, and his 'Monster Quadrilles' were very popular. But his sensational success was due to his eccentric behaviour and superficial musical gifts. He became bankrupt (1857) and ultimately returned to Paris, where he was arrested for debt (1859) and d. insane.

**Jullundur, or Jalandhar**, large city of E. Punjab, State, India, some 50 m. E. of Amritsar. There was an ancient city here, mentioned in the 7th cent. AD, but practically nothing of it remains.

**Julus**, or Iulus, genus of myriapods of the order Chilognatha, and the species are often known as galle-worms. The number of body segments varies between 40 and 50, many of which have 2 pairs of legs.

**July**, seventh month by our modern reckoning. In the old calendar, when the year began either with the vernal equinox or on 1 Mar., it was, of course, the fifth month, and therefore called *Quintilis* by the Romans. In honour of Julius Caesar,

whose birthday fell on the 12th, it was named *Julius* in the last year of his life. Dog days (q.v.) begin on the 3rd.

**Jumada I and II**, months of the Mohammedan calendar following Rabi'a II.

**Jumet**, tn in the prov. of Hainaut, Belgium, 3 m. N. of Charleroi. There are coal mines and sandstone quarries. Its chief industries are iron and copper foundries, glass-works, breweries, and distilleries. Pop. (1955) 29,000.

**Jumièges**, Robert of (fl. 1037-52), Archbishop of Canterbury. He was b. in Normandy and came to England with Edward the Confessor, 1043. In 1044 he became Bishop of London, and in 1051 was appointed Archbishop of Canterbury. He led the opposition to Godwin and was instrumental in obtaining Godwin's banishment, but on the latter's return from exile in 1052, Robert had to flee to Jumièges, where he d.

**Jumièges**, William of, Norman monk, remembered for his compilation of a list of the dukes of Normandy down to 1071. This book, written in Latin, is in J. P. Migne's *Patrologiae Cursus Completus*.

**Jumièges**, Fr. vii. in the dept of Seine-Inférieure, between the forest of J. and the r. b. of the Seine. It is famous for the ruins of its great Benedictine abbey, founded in 654. The adjoining church of St Pierre is a continuation of a church of Charlemagne's time. Pop. 880.

**Jumilla**, Sp. tn in the prov. of Murcia. It has a fortress, and a trade in wine, brandy, oil, and esparto. Pop. 22,000.

**Jumna**, one of the great rivs. of N. India, and a prin. trib. of the R. Ganges. It rises near Jammu in the Himalaya and debouches into the plain N. of Dehra Dun. It then flows S. gradually nearing the Ganges, which it joins 3 m. S. of Allahabad. It is about 860 m. in length and feeds large irrigation canals. Among the important tns on its banks are Delhi, Agra, and Allahabad.

**Jumping**, see **ATHLETICS**.

**Jumping Beans**, seeds of *Sebastiania* species of plants, infested by the grubs of a small moth, *Cydia salitans*, which move within and cause the seeds to jump.

**Jumping Hare**, or *Pedetes cafer*, called by the Dutch Spring Haas, rodent of S. Africa and a member of the family *Pedetidae*, being the only species of the genus *Pedetes*. The head of the animal resembles that of a hare, but its general appearance and movements are like those of a jerboa, though it is larger. Its chief characteristics are its long tail, 5 toes to the fore feet and 4 on the hind, and hind limbs much longer than the fore limbs, thus enabling it to make immense leaps. It is a nocturnal animal, feeding on roots, grass, etc.

**Jumping Mouse**, or *Zapus hudsonius*, member of the jerboa family (*Dipodidae*) and a native of N. America. It resembles a mouse, having a long tail and its hind limbs longer than the fore limbs, enabling it to leap in the same way as the other species of *Dipodidae*.

**Junagadh**, former princely state of India, in Kathiawar Peninsula. At partition

the Nawab, a Muslim, declared that the state would join Pakistan, but the great majority of the inhab. being Hindus, the Indian Gov. refused to recognise the accession, and ultimately the state was incorporated in Saurashtra. The tn of J. is an anct one, the present port having been built about 1475. The state contains remarkable monastic caves, some of them dating from the time of Asoka (c. 250 bc). The outstanding feature is Girnar (q.v.), a mt of 3600 ft which is studded with temples and shrines of great antiquity. Here also is an Asoka Stone, bearing the Fourteen Edicts of Asoka.

**Junca**, Etienne du, see **IRON MASK**.

**Juncaceae**, family of monocotyledons, about 300 species of perennial herbs, which contains the rushes; natives of cold, damp parts of temperate and arctic regions. The inflorescence is cymose (see **INFLORESCENCE**) and consists of hermaphrodite flowers; the perianth is sepaloid and in 2 whorls of 3, the stamens are also in 2 whorls of 3, or only the outer whorl may be present; the ovary is superior and consists of 3 united carpels usually containing numerous ovules; the fruit is a loculicidal capsule. The genera include *Prionium*, *Juncus*, *Kingia*, and *Luzula*.

**Juncaginaceae**, family of small and unimportant monocotyledonous plants, is found in temperate lands, and consists of 4 genera of marsh-herbs. The chief genus is *Triglochin* (arrow-grass) (q.v.).

**Juncus**, chief genus of Juncaceae, contains over 220 species, 18 of which occur in Britain. These rushes are cosmopolitan in distribution and frequent damp, cold localities; in habit they are rigid, with slender stems which may contain pith or may be hollow; the flowers are small, green or brown in colour, and are borne in dense heads or panicles; pollination is effected by means of the wind. The economic importance of J. is slight; *J. squarrosus* forms a pasturage for sheep in hilly dists. of Britain; other species are used to fix the soil on riv.-banks; chair-bottoms, matting, and baskets are made from the long, flat leaves, and the pith forms the wick of rush-lights still used in Europe and in China.

**June**, sixth month by our modern reckoning. In the old calendar it was the fourth month. According to Ovid it was named after Juno (q.v.), the guardian of women, her month being regarded as favourable for marriage. In the Rom. calendar it was the fourth month and originally had 26 days, but later 29; to these Julius Caesar added one at the time of his reform of the calendar. Midsummer day falls on the 24th.

**Juneau**, cap. of Alaska, U.S.A., situated opposite Douglas Is. on Gastineau Channel. It has salmon canneries and lumber mills, and is the supply centre for a gold-mining, fur-farming region. It has an airport, seaplane base, and territorial and federal offices. J. is a sea- and fishing-port, ice-free all the year round. There are a public library, public schools, and 2 daily newspapers. Pop. about 6000.

**June**, tn in New S. Wales, Australia,

300 m. SW. of Sydney, in a fertile agric. and pastoral dist. It is an important railway junction. Pop. 4070.

**Jung, Carl Gustav** (1875- ), Swiss psychologist and psychiatrist, b. Kesswil. He studied medicine at Basel, where he graduated M.D. 1900. Deciding to specialise in mental disease, he spent the next 8 years working with Eugen Bleuler (q.v.) at the Burghölzli Hospital in Zürich. Here he made intensive physiological and psychological studies of patients with mental disorders, 'to detect the intruders of the mind.' In 1906 he pub. *Psychology of Dementia Praecox*, a study of schizophrenia which estab. his reputation as a pioneer. For many years he lectured on psychiatry at Zürich Univ. and was prof. of psychology there, 1933-41. He was among the first to support Freud's views on psycho-analysis and for a time they worked on parallel lines, but later J.'s opinions diverged considerably and thereafter the two worked apart. J.'s most notable contribution has been his study of the unconscious mind, in which he recognizes 2 divs.—the personal unconscious and the collective unconscious. He founded a school of analytical psychology in which the aim of therapy is to bring about a state of mind where the patient begins to experiment with his own nature. Hence J.'s emphasis on dreams as an indication of the direction in which the unconscious is moving, and on art therapy; but his greatness lies less in devising therapeutic tools than in the light he has thrown upon the hinterland of the mind. He ranks with Freud and Adler as a pioneer of psychiatry. His most important work is probably *The Psychology of the Unconscious*, 1916; other valuable contributions include *The Theory of Psycho-analysis*, 1912, *Collected Papers on Analytical Psychology*, 1917, *Psychological Types*, 1923, *Contributions to Analytical Psychology*, 1928, *Modern Man in Search of a Soul*, 1933, and *The Integration of the Personality*, 1939. His *Collected Works* (18 vols.), trans. into Eng. by R. F. C. Hull, are in course of pub. For a summary of his work see D. C. Daking, *Jungian Psychology and Modern Spiritual Thought*, 1933, and J. Jacobi, *Psychology of C. G. Jung*, 1942.

**Jünger, Ernst** (1895- ), Ger. novelist and essayist, b. Heidelberg. After a distinguished military career in the First World War, he devoted himself to writing, using his former experiences as material. He is essentially an individualist, however, and although the substance of his writing is largely drawn from his military experience (e.g., *Feuer und Blut*, 1925), he is not guilty of Ger. militaristic thinking. Indeed he believes that a constant exercise of human virtues is the only means of retaining a civilisation threatened by the forces of inhumanity and barbarism. Among his works are *Das abenteuerliche Herz*, 'Figures and Capricious,' 1929, a contemplative essay; *Der Arbeiter*, 1932, in which he describes the contemporary worker; and *Gärten und Strassen*, 1942, which is a diary of some

time he spent in France during the Second World War. Other works include *In Stahlgewittern*, 1920 (trans. 1929), *Afrikanische Spiele*, 1936, *Auf den Marmor-Klippen*, 1939, *Gehetmisse der Sprache*, 1934 (revised 1939), *Atlantische Fahrt*, 1947, and *Das Sanduhrbuch*, 1954. See L. P. Stern, *Ernst Jünger*, 1953.

**Jungermannia**, genus of liverworts which received its name in honour of the Ger. botanist, Jungermann. The species are moss-like and are known popularly as scale-mosses; sev. fossils have been found.

**Jungfrau** (Ger. for maiden), one of 3 linked peaks (Eiger, Mönch) in the Bernese Oberland, Switzerland; height 13,670 ft. It was first climbed in 1811 by the brothers Meyer, from the E., and since then has been climbed on every side. There is a railway to the Jungfrauoch (11,300 ft.), passing through a tunnel 5 m. long. A hotel was built in 1925 near the upper terminus of the railway.

**Jungle-fowl**, name applied to birds of the family Phasianidae, to which belong 4 species, *Gallus gallus*, the Red J., is generally considered to be the origin of domesticated poultry. Its back is purplish-red and orange, while the under surface, wings, and tail are greenish-black tinged with yellow. It is a native of India, Sumatra, the Philippine Is., and the Celebes, and is pugnacious towards its own kind, while the noise of both cock and hen is said to resemble that of ordinary domestic varieties. The other species of the genus are *G. sonnerati*, the Grey J., a native of S., central, and W. India; *G. varius*, found in Java; and *G. lafayetii*, a native of Ceylon.

**Jungle Warfare**. With the possible exception of the E. African campaign of the 1914-18 war, J. W. before 1939 consisted in the main of punitive operations by European and European-trained troops against native tribes fighting in their own habitat. Special training in this type of warfare was largely confined to units such as the King's African Rifles and the Royal W. African Frontier Force. The entry of the Japanese into the war in 1941 brought home the need for much closer attention to the problems of J. W. on the part of the Brit. and other allied forces. The Japanese had made a close study of the subject, and used their knowledge to full effect in their earlier operations. The basic pattern of J. W. consists of a series of small combat actions in which platoons armed with light weapons, including manpack flame throwers and rocket launchers, strive to eject the enemy from their positions. These actions are largely independent because lack of observation, and difficulties of movement and intercommunication, preclude direct control by battalion and higher level commanders. The allied troops learned this new type of warfare the hard way, but soon overcame their initial disadvantage. The later operations in Burma were an unbroken record of success. The lessons learned in Burma were later used with good effect in the operations against the Communists in Malayan jungles. See

Sir C. E. Callwell, *Small Wars*, 1906; H. Rowan-Robinson, *Jungle Warfare*, 1944; B. E. Fergusson, *The Wild Green Earth*, 1946, and *Beyond the Chindwin*, 1946; F. Spencer Chapman, *The Jungle is Neutral*, 1949.

**Junia Gens**, anct Rom. clan, to which belonged the families of Brutus and Silanus.

**Junin**: 1. Dept of Peru, traversed by the Andes Mts. In this dept is the Lake of Junin or Chínchaicocha, situated at an elevation of 13,560 ft and drained by the R. Montaro. The lake is 14 m. long and close to Cerro de Pasco. The dept is rich in minerals, including silver. Area 11,166 sq. m. (Pasco dist. was separated in 1944); pop. about 385,000. Cap. Huancayo.

2. Tn situated in the dept of Junin, central Peru, 100 m. N.E. of Lima, standing at an elevation of 14,000 ft. It is a nitrate riv. port, and has good road and rail connections.

3. City and rail junction of Argentina, 150 m. W. of Buenos Aires, on Río Salado. It is a centre for technical education, and a general commerce and agric. market. Pop. 37,000.

**Junin, Lake** (or Chínchaicocha, or Reyes), in Peru, lying to the S. of Cerro de Pasco. Altitude 13,560 ft; length 14 m.; breadth 6 m. It discharges its surplus waters at the NW. corner by the Mantaro or La Oroya R.

**Juniperus**, genus of coniferous plants containing 30 species, all of which are evergreen trees or shrubs and flourish in

besides the Scots pine and the yew) as well as in other parts of N. Europe and Asia; the stem and leaves contain an aromatic principle; the blue-black fruit is used medicinally and in the flavouring of gin. *J. virginiana*, the red cedar, of N. America, furnishes a valuable wood used by turners and cabinet-makers, and also employed in making lead pencils and cigar boxes; *J. bermudiana* serves like purposes. *J. sabina*, the savin, grows in S. Europe, and the topmost twigs of the plant are used in pharmacy. See FORESTRY.

**Junius, Franciscus** (1545-1602), b. Bourges, France. He is best known for his own ed. of the Lat. O.T., see his *Opera Theologica*, 1613.

**Junius, Franciscus** (1589-1678), son of the above, b. Heidelberg. He was brought up in Holland, but in 1620 went to England, where he became librarian to the Earl of Arundel. He was a student of Anglo-Saxon, Gothic, etc., and pub. the Gothic version of the Gospels, *De Pictura Veterum*, and *Etymologicum Anglicanum*, a valuable work.

**Junius, Letters of**, literary curiosity of the 18th cent.—a curiosity because, in spite of ingenious surmises and the most thorough and persistent perusal of contemporary documents, the identity of the author is still doubtful, and it is as true to-day as at the hour of their pub. that—to quote his own words—‘the mystery of Junius increases his importance.’ The letters, 70 in number, appeared in the London *Public Advertiser* between 21 Jan. 1769 and 21 Jan. 1772. During this period the writer invariably used the pseudonym of J., though he had at different times availed himself of others: ‘Lucius,’ ‘Brutus,’ and possibly of ‘Nemesis.’ His object was clearly to ruin the Duke of Grafton’s ministry, and in fulfilment of that purpose he used the weapon which nature had given him, namely satire of the most brilliant and deadly description. The Marquess of Granby, the Duke of Bedford, and Lord Chief Justice Mansfield were each in turn the victims of his powerful and vilifying invective, but the most violent of J.’s onslaughts were naturally reserved for their leader, the ineffectual Grafton. Moreover the author profited by his disguise, or rather invisibility, to speak some frank abuse of the king; indeed it was the impudent epistle he addressed to George III which excited a veritable storm of indignation, and at the same time sealed the writer’s fame. But J. was defeated in his aims; for the fall of Grafton (1770) was only the signal for the advent of Lord North and his tedious administration. Perhaps J. deserved no better; for although he was a loyal and active supporter of Chatham he showed no political acumen in the steps he took towards restoring him to power. A modern reader of the ‘Junius’ polemics will be struck with their scurrility and venom; let him remember that these were fashionable qualities in similar writings of the day. But he will be more permanently and sincerely impressed by the

JUNIPER

the N. hemisphere. The leaves are small, needle-shaped, and occur either as opposite leaves or in whorls of 3 or 4; occasionally they are imbricated in 4 rows. The flowers are dioecious; the males form a scaly catkin and the females a small rounded cone which later develops into a fleshy fruit, known as a *galbule*, in appearance greatly resembling a true berry. *J. communis*, the common juniper, is a shrub which flourishes in Great Britain (where it is a native conifer

vigour and dignity of their style. The careful rounding off of the lengthy periods, and a certain typically 18th-cent. pomposity, prove the author to have been an earnest admirer of the Ciceronian tirades; yet, in spite of his indebtedness to classical models, J., whoever he was, had a command over language which was original as well as splendid. There are cogent arguments in favour of regarding Sir Philip Francis as the unfathomable J., but the claims of a host of far more distinguished men, including Burke, Lord Chatham himself, Wilkes, Barré, and Horace Walpole, have one and all found eager partisans. See *The Francis Letters*, 1894; G. H. R. Francis, *Junius, Revealed by his Surviving Grandson*, 1894; J. Smith, *Junius Unveiled*, 1909; C. W. Everett, *The Letters of Junius*, 1927.

A CHINESE JUNK

**Junk**, flat-bottomed, sea-going vessel, peculiar to China, which is employed on the coasts and seas of China and Japan. It carries large masts with square sails of matting, and has a very high fore-castle and poop. Its progress is slow, and it is awkward to handle.

**Junker, Wilhelm** (1840-92), Ger. explorer of Africa, b. Moscow. He studied medicine in Göttingen, Berlin, and Prague, but going to Africa in 1874 began the work of his life, exploration. He visited Tunis and Egypt, and explored the Upper Nile and the Wellé. In 1883 he was prevented from returning to Europe owing to the Mahdist rising, but succeeded in reaching Zanzibar in 1886, and received the gold medal of the Royal Geographical Society in 1887. His *Reisen in Afrika* (3 vols.), Vienna, 1889-91, contains an account of his travels and is a work of high merit. An Eng. trans. by A. H. Keane was pub. in 1890-2.

**Junkers, Hugo** (1850-1935), Ger. aircraft designer, b. Rheydt. From 1897 to

1912 he was prof. of mechanical engineering at the technical high school at Aachen. In 1919 he founded the J.-Werke at Dessau for the manuf. of aeroplanes, and built up his business until by 1939 it was the largest of its kind in Germany, employing 5000 workers. His machines, including transport planes, fighters, and bombers, were used by the Germans in the Second World War. His *Ju 52* was one of the great transport aircraft of all time. J.'s vital importance in aviation hist. was due to his revolutionary work in pioneering the cantilever wing and all-metal construction of aeroplanes.

**Junkers**, political party name given in Germany to the class of militaristic young Prussian nobles who supported Bismarck before the Franco-Prussian war. The name in more recent times has been associated with the sword-rattling and reactionary party of pre-1914 Germany, and it is generally considered that the attitude, outlook, and behaviour of the J. had a considerable effect on events leading to the First World War and, though after 1918 their influence was much diminished, on events leading also to the Second World War.

**Juno**, Rom. goddess (Gk. Hera), daughter of Saturn and Rhea, and wife and sister of Jupiter, queen of heaven and earth. She was the protectress of all women, from the moment of birth till death. *Juno Natalis* was invoked by women on their birthdays; at marriage *Juno Iugalis* presided; and *Juno Lucina* was invoked in childbirth. Her festival, the *Matronalia*, was celebrated on 1 Mar.; another festival, the *Nonae Caprotinae*, fell on 7 July. The month of June was called after her, and thought particularly lucky for marriages. She was also the guardian of finance, a temple being dedicated to *Juno Moneta* in 344 bc, and later used as a mint. She was represented with attendant peacocks.

**Juno**, third asteroid (q.v.) to be discovered, was found by Harding in 1804. J., Ceres, Pallas, and Vesta (qq.v.) are the four largest planetoids and present at opposition visible disks about 1 in. in diameter, corresponding to real diameters from about 600 to 120 m.

**Junod's Boot**, see AEROTHERAPEUTICS.  
**Junot, Andoche, Duc d'Abantès** (1771-1813), Fr. soldier, b. Bussy-le-Grand, in Côte-d'Or. He joined the volunteer army at the outbreak of the revolution, and came to know Napoleon at the siege of Toulon. He distinguished himself in many campaigns, and in 1804 was made governor of Paris. In 1807 he commanded the army which invaded Portugal, and was so successful that he was created Duc d'Abantès, and made governor of Portugal; but he was defeated by Wellington at Vimiera and obliged to retire from the country, bitterly mortified that he was not made a marshal of France when he received the Cross of the Légion de Honneur. He afterwards served in Germany and Russia, but being blamed, with others for the disastrous Russian campaign was sent to govern Illyria.

This disgrace increased the mental instability to which he had always been prone, and he committed suicide.

**Junot, Laurette de Sainte-Martin-Permon, Duchess D'Abrantès** (1784-1838), Fr. writer, wife of Andoche J. (q.v.), b. Montpellier. She had considerable wit and intelligence, and her *salon* attracted most of the influential political figures of the Napoleonic era. She is remembered for her *Mémoires*, 1831-5, which deal with the period 1789-1830. She also pub. *Femmes Célèbres*, 1833-5, and *Histoire des salons de Paris*, 1837-8.

**Junta**, Sp. word designating a legislative or other distinguished assembly which meets either for political purposes or for the passing of laws. In 1808 a J. was elected to undertake the defence of Spain against Napoleon. In Eng. hist. the word is used as a term of contempt for a legislative party, etc., e.g. the Whig J. in the reigns of King William III and Queen Anne.

**Jupille**, tn in Belgium, 3 m. NNE. of Liège. It stands on the Meuse and has coal mines and important ironworks, producing boilers and nails. Pop. 9700.

**Jupiter**, later identified by the Romans with Zeus (q.v.), was originally an elemental deity. His name signifies father, or lord, of heaven, being a contraction of *Diouis pater*. He was first worshipped as the god of rain, thunder, and lightning; whence he had appropriate titles (*Pluvius*, *Fulgurator*, etc.). To these, in course of time, were added others corresponding to the various aspects of his power and patronage. As the special protector of Rome he was worshipped by the consuls when they took office; and the triumph of a victorious general was a solemn procession to the temple of J. Capitolinus. J. was supposed to determine the course of human affairs. He foresaw the future; and the events happening therein proceeded from his will. He revealed the future to man through signs and the flight of birds. For the same reason he was invoked at the beginning of every undertaking, together with Janus (q.v.). J. was also regarded as the guardian of law, and as the protector of justice and virtue. As he was the lord of heaven, and consequently of light, white was sacred to him. White animals were offered to him; his chariot was described as drawn by 4 white horses; his priests wore white caps (see FLAMEN); and the consuls were attired in white when they sacrificed in the Capitol on the day of their inauguration.

**Jupiter**, largest of the planets, and (if the sun, moon, and comets be excluded) the second brightest object in the sky when it is nearest to the earth (having about 2 times more lustre than Sirius, the brightest star), is one of the outer planets, and its orbit lies between those of the minor planets and that of Saturn. J.'s mean distance from the sun is 5 times that of the earth (483,000,000 m.), and its period is 11.86 years. Other data of the planet are as follows: Diameter, 11 times that of the earth (equatorial, 88,700 m.; polar, 82,800 m.); mass, less

than one-thousandth of the sun; density, one-third denser than water, the earth being more than 4 times as dense as J.; rotation about axis, about 10 hrs; and gravitational pull at surface, 2.65 times that on the earth.

J. is attended by 12 satellites, 4 of which are just beyond the range of naked-eye vision, but can easily be seen with the aid of a pair of field-glasses. These 4 moons were discovered by Galileo in Jan. 1610, being one of the first-fruits of the newly invented telescope. It was not till Sept. 1892 that Prof. Barnard, at the Lick Observatory, found a fifth satellite revolving between these 4 and J. Three more moons were discovered as follows: 2 by Perrine at the Lick Observatory, 1904-5, and 1 by Melotte at Greenwich, 1908. These recently discovered satellites can only be seen by high-power instruments, but quite a small telescope will show the transits in front of J. of Galileo's moons and their eclipses in his shadow. The smallest of Galileo's satellites is nearly as large as the moon, and the largest has a diameter nearly half that of the earth. The surface of J. presents the appearance of a number of belts, and they can be detected with the aid of a small telescope. The surface of the planet is continually changing, but since 1878 the equatorial belt has had a large red spot. The spot has varied in brightness, and was just visible in 1907. It has been found that the belts or currents rotate at different velocities, depending on their latitudes. These differences go to prove that J. is not a solid body, and the permanence of the red spot also favours the conclusion. The red spot would appear to be something in the nature of a floating is., an is. having its base in the more solid regions.

**Jura** (Scandinavian *deor-oe*, deer is.), is. of the Inner Hebrides, off the coast of Argyll, Scotland, separated from Scarba on the N. by the whirlpool of Corrievreckan, from Islay on the S. by the Sound of Islay, and from the mainland on the E. by the Sound of J. Its greatest length is 27 m., the width varying from 1 m. to 8½ m. It has a range of mts. culminating in the conical Paps of J. (2751 ft and 2412 ft). The inhab. are engaged in fishing, agriculture, and the raising of livestock. Area 160 sq. m.; pop. 260.

**Jura**, dept. of E. France, formed of part of the anct. prov. of Franche-Comté. It is bordered on the E. by Switzerland. The greater part of the dept. is occupied by the J. Mts, but there is a plain in the W. The chief rvs. are the Doubs and the Ain. Some cereals and beet are grown, and sheep and horses are raised; some excellent wines are produced. There are metallurgical, paper, furniture, foodstuff, and watchmaking industries, and hydro-electric schemes. The prin. tns are Lons-le-Saunier (the cap.), Dole, and St-Claude (qq.v.). Area 1951 sq. m.; pop. 220,200.

**Jura Mountains**. This range of mts extends for about 190 m. from the dept. of Ain in France in a N-easterly direction through Switzerland, traversing the cantons of Vaud, Neuchâtel, and Bern to the

R. Rhine. They are made up of parallel ranges, the chief heights in which are Cret de la Neige (5655 ft), situated W. of Geneva, the Dôle (5005 ft), Columbier de Gex (5548 ft), and Mont Tendre (5519 ft). These consist chiefly of limestone, known as Jurassic, a term applied to the whole system in this div. of geology owing to the preponderance of this limestone in these particular mts. The mts are covered with forests and intersected with fissures.

**Jurassic System.** The geological name

through the sea as 'massifs' separating basins or straits. The latter do not appear to have been very deep nor were the massifs very high and as a result the Jurassic sediments are those typical of shallow seas receiving comparatively little material from land. Argillaceous muds, clays, marls, and limestones are characteristic. In detail the Jurassic succession is very variable, but may be summed up thus. The Lower Lias consists of dark clay-bearing limestones; the Middle and Upper Lias of dark marls and

DINOSAURS (DIPLODOCUS CARNEGII) OF THE UPPER JURASSIC

An artist's impression, based on reconstructions of remains in the Upper Jurassic of Wyoming.

(from Jura Mts) for the second Mesozoic System of strata. The Jurassic follows the Triassic and is succeeded by the Cretaceous System (q.v.).

The J. S. is extremely fossiliferous and has been subdivided on the fauna which it contains into a number of divs. The main subdivs. are as follows:

	Purbeckian
	Portlandian
Upper Jurassic	Kimmeridgian
	Corallian
	Oxfordian
Middle Jurassic	Bathonian
	Bajocian
Lower Jurassic	Lias

The J. S. of Europe records the spread of a sea which in Lower Jurassic times advanced from the Mediterranean and S. Europe northwards over the continent which occupied much of what is now N. Europe. Parts of the land projected

limestone. The Middle Jurassic is made up of hard limestones, sometimes oolitic and occasionally iron bearing. The Oxfordian is predominantly a clay bearing div., usually dark in colour; the Corallian very variable but often, as its name suggests, containing coral. The Kimmeridgian consists of clays in Britain, though limestones occur on the Continent, while the Portlandian is rich in limestones. In Middle Jurassic time the seas appear to have retreated slightly, and in Upper Jurassic Purbeckian brackish or fresh-water deposits predominate and indicate that the sea had retreated once again to the S. of Europe.

The J. S. fauna is notable for the following: siliceous and calcareous sponges; corals; echinoids, now far more important in the Jurassic than in the Palaeozoic, whereas the related crinoids have become less abundant; lamellibranchs; gastropods, and cephalopods, the last including

the ammonites, which become most strikingly widespread in the Jurassic and which have been employed to divide the system into zones recognisable all over the world. Among plants, cycads were particularly abundant, and among vertebrates the reptiles predominate as marine forms (Ichthyopteria, Sauropterygia), as land animals (Dinosauria), and in the air (Pterosauria). The earliest birds are known from the Jurassic, where Archaeopteryx appears (see SOLENNHOFFEN STONE, in which the only 2 skeletons of Archaeopteryx yet discovered were preserved).

The rock members of the J. S. are widely distributed, e.g. a large tract surrounds the Paris basin; a big area exists in Silesia, Franconia, and NW. Germany; the Jura Mts give their name to the system; more or less isolated patches occur in central and N. Russia, in the Crimea, Caucasus, Carpathians, etc.; though the development is less complete in N. America, yet there is an important dist. in Colorado rich in reptilian remains; and portions of the system occur throughout India, S. Africa, S. America, and Australia. In S. Britain the J. S. lies to the N. and NW. of the Cretaceous deposits, running in a curving line from the N. of Yorks (valuable ironstone in Cleveland) through W. Lincs, widening out near Northants, thence to S. Glos. and to Dorset (with the useful Bath and Portland 'freestone'). Only very small areas occur in the rest of the Brit. Is., as in Sutherland and the Is. of Skye in Scotland, and near Lough Foyle in Ireland.

**Jurat**, one of a body of magistrates in Jersey and Guernsey (the Channel Is. group). J.s are chosen for life and, together with the bailiff, constitute the Royal Court of Justice. The office of J. dates from 1537.

**Jurien de la Gravière, Jean Pierre Edmond** (1812-92), Fr. admiral, b. Brest. He entered the navy in 1828, and was in command of the Fr. Mediterranean fleet during the Franco-Prussian war of 1870, becoming director of charts in 1871; but he is chiefly famous as a writer on naval hist., and among his works are *Guerres maritimes sous la République et l'Empire*, 1864, *La Marine d'Autrefois*, 1865, *La Marine d'Aujourd'hui*, 1872, and *Les Origines de la Marine et la Tactique navale*, 1891.

**Jurieu, Pierre** (1637-1713), Fr. Protestant theologian, b. Mer, Loir-et-Cher. Studied in England under his uncle Pierre de Moulins, and in 1674 was made prof. of Heb. at Sedan; but when that univ. was taken from the Protestants he settled at Rotterdam. He defended Protestantism with great ability, and in his *Accomplissement des Prophéties*, 1686, foretold the overthrow of the papacy in 1689. Besides this he wrote *La Politique du Clergé*, 1680, *Histoire du Calvinisme et du Papisme mis en Parallèle*, 1683, *Histoire des Dogmes et des Cuites*, 1704, and *Lettres Pastorales Adressées aux Fidèles de France*, 1688.

**Jurisdiction** means the authority by which the law courts are entitled to decide matters litigated, or questions tried before

them. The High Court has plenary J. all over England and Wales; but the J. of inferior courts (q.v.) is limited by being confined to certain limits of area and to certain kinds of causes or matters in dispute. Where the civil courts of inferior J. purport to act in a matter in excess of their J. the aggrieved party may get the cause removed to the High Court by order of prohibition; and where a party is convicted in a criminal court that has no J. in the matter the proceedings may be moved into the Queen's Bench Div. by order of *certiorari*. Brit. subjects who commit murders or manslaughters on land in foreign countries are triable in the Brit. courts. As to eccles. J., see ECCLESIASTICAL COURTS. States which belong to the family of nations (see INTERNATIONAL LAW) claim exclusive J. on the sea to a distance of one marine league from the shore, though the U.S.A. claim a greater extent of J. than this. In 1922 the U.S. Gov., in order to have a freer hand in dealing with liquor smuggling, which, in consequence of prohibition, soon became extensive, proposed a treaty with Great Britain giving the U.S. Gov. a right of search to a limit of 12 m. Great Britain would not assent, but a compromise was reached by treaty which left intact the principle that 3 marine miles extending from the coastline outwards and measured from low-water mark constitute the proper limits of territorial waters. By the Territorial Waters Jurisdiction Act, 1878, 'territorial waters of Her Majesty's dominions' means any part of the open sea within one marine league of the coast measured from low-water mark. The J. of the Admiralty Div. in the case of Brit. ships and all those on board extends not only over the high seas but also in foreign rivs. 'as far as great ships go'; but not to any cinque port, haven, or pier, nor to any creek, riv., or port within the body of a country. In the canon law of the Rom. Catholic Church J. may be broadly defined as the territorial or other limits within which a cleric is entitled to exercise the functions appropriate to his order.

**Jurisprudence**, study of the philosophy and principles underlying systems of law: its exponents, who are known as jurists, are concerned with the theories and concepts of law, whereas practitioners deal with the practical application of legal systems to everyday problems. The content of J. may be broadly classified under the heads of concepts of law, legal theory, and sources of law.

(a) *Concepts*. This branch of J. endeavours to work out the principles on which the subject matter of a system of law is based. It includes the study of such topics as rights of property, status of persons, contracts, crime, and legal rights and obligations generally. These 'concepts' are common to most legal systems but will be treated differently by each of them to meet the social needs of the communities they serve.

(b) *Legal theory*. Legal theory is concerned with the underlying purpose of

systems of law. The jurists of ancient Rome and Greece sought to distinguish between law as it really existed (positive law) and an ideal state of law which was termed 'natural law.' This latter more liberal system of law was developed by the Romans as a *jus gentium*. Many of the continental legal systems owe their origin to Rom. J. The Soviet Union legal theories are inspired by Marxist philosophy. Nineteenth-cent. continental jurists sought to find a theory of law which would be ideal and of universal application. The historical school of J. headed by Savigny believed that law had its origins in the spirit of the people (*Volksgeist*). Stammler suggested that 'natural law' was not immutable but had a changing content.

Eng. jurists took a more practical approach. Austin was concerned with 'positive law' and was influenced by a utilitarian philosophy of which Bentham (q.v.) was the prin. exponent.

Modern J. owes much to Amer. juridical thought. Dean Roscoe Pound regards legal theory as 'social engineering' which works out practical solutions to meet the competing interests in society. It may be said that contemporary legal theories are concerned with the evolution of systems of law designed to meet the needs of a given community, whereas their predecessors strove to find abstract eternal truths.

(c) *Sources of law.* The jurist is concerned with the source of law. Custom, particularly in England, has played an important part in the origins of legal systems. There has been engrafted on to customary law a system of judicial precedent based on decided cases. A study of source of law is relevant in considering the development of such concepts as property rights and liability for negligence.

See J. Austin, *Analysis of Jurisprudence*, 1905; Sir P. Vinogradoff, *Outlines of Historical Jurisprudence*, 1920 ff.; Sir F. Pollock, *First Book of Jurisprudence*, 1929; G. W. Keeton, *Elementary Principles of Jurisprudence*, 1930; H. J. S. Maine, *Ancient Law*, 1931; B. N. Cardozo, *The Judicial Process* (11th printing), 1941; J. W. Salmond, *Jurisprudence* (10th ed. by G. L. Williams), 1947; W. Friedmann, *Legal Theory* (2nd ed.), 1949.

*Jurisprudence, Medical, see MEDICAL.*

**Jury.** Trial by J. signifies the determination of facts in the administration of civil or criminal justice by 12 men sworn (*Lat. jurati*) to decide facts truly according to the evidence produced before them. The institution is one of the most cherished guarantees of Brit. liberties, and historians in their enthusiasm have often seen its origin in the general statement of the liberty of the subject expressed in Clause 39 of Magna Carta, which declares that no freeman shall be imprisoned or outlawed except by the lawful judgment of his equals (*suorum parium iudicium*). But this clause referred to the trial *per pares* or *per sectatores* in the old co. or shire courts, an institution which has

long been generally admitted to have been of a totally different character. Simple, indeed, as the definition of a modern J. may appear, the evolution of that body has been a subject of keen controversy; though, according to the most widely accepted opinion, its genesis may with some confidence be sought in the Norman custom of inquest by sworn recognitors, the principle of which was adopted as an alternative mode of trial in criminal cases when the Lateran Council of 1215 abolished the ordeal in England as a means of ascertaining the truth of a criminal accusation. The vital fact in the evolution of the petty J. (as opposed to the Grand J.) is that, from being originally witnesses or persons presumed to know the facts of the case and able to come to a decision independently of other evidence, they ultimately became mere judges of fact.

In the form in which it existed for several centuries, after the Conquest, the traces of trial by J. are more distinctly discernible in the ancient Norman customs than in such fragments of A.-S. laws as have come down to us. The canonical institution of trial by 12 compurgators, who merely gave general evidence as to a man's character, resembled the trial by J. in no other respect than the number of persons sworn, and that that institution was no progenitor of the J. is conclusively established by the fact that it continued, under the name of 'wager of law,' side by side with the J. down to 1833. A number of notable writers, including Forsyth (*History of Trial by Jury*), see in trial by J. a purely indigenous growth. Yet others ascribe its origin to the 12 senior thegns of Ethelred's time, who were sworn to accuse none falsely; but that institution is far more probably the ancestor of the modern Grand J.

But whatever view the antiquarian may take of the genesis, the development by Henry II, through the existing machinery of the shire-moot, of the Anglo-Norman system of inquest or inquiry into facts by sworn recognitors on behalf of the crown was not only the undoubted forerunner of the Eng. J., but an exclusively Eng. development. Under Henry II trial by recognitors was mainly used at first as an alternative to trial by battle in disputes concerning the title to land. The actual practice was to select 12 knights from the neighbourhood who were obliged to declare on oath which of the parties had the better right, and if not unanimous the original body was 'aforded,' i.e. others were added until 12 were of one mind. As soon as the 12 became stereotyped into arbiters ignorant of the facts, as distinct from witnesses, we have the true civil J., and probably the same steps are discernible in the evolution of the criminal petty J., whose primary function was to test the truth of a criminal presentment by an accusatory J. (*jurata delatoria*) or, as we call it, a Grand J.

The early hist. of the Eng. criminal J. is uncertain, but it is clear from Bracton and Fleta that at the end of the 13th

cent. it had become the normal mode of trial, having gained ground with advancing civilisation, and superseded the more ancient and barbarous customs of battle, ordeal, and wager of law. The 3 types of J. in modern Eng. courts are grand, special, and petty or common. Grand J.s were abolished by the Administration of Justice Act, 1933, with a few minor exceptions. Special J.s composed of more substantial citizens were abolished by the Jurors Act, 1949, except that commercial actions can be tried by a special J. J.s which hear the great majority of cases were called 'petty' or 'common' J.s until 1949, when the term was abolished.

All natural-born subjects of the sovereign and aliens domiciled for 10 years or more, being men or women between 21 and 60 years of age, are liable to serve as jurors. The sex disqualification was removed in 1919, and women are now liable to serve, but a judge may order that the J. shall be composed of men only, or of women only, or he may, on an application by a woman called on to serve, grant her exemption in respect of any case by reason of the nature of the evidence to be given or of the issues for trial. All jurors are liable to serve on petty or common juries, but special jurors must have certain special qualifications. The following persons—save where exempted or disqualified—are compellable to serve on a J. at the High Court, at the Assizes, and on both the J.s at the co. sessions: a co. or bor. resident who owns £10 a year in real estate or rent charge, or £20 in leaseholds; a co. or bor. householder assessed for rates at not less than £30 a year in Middlesex and the co. of London, or £20 in other cos.; and an occupier of a house with not fewer than 15 windows. Jurors for the City of London must be either householders or occupiers of premises, and, in addition, possess property of some description to the value of £100. Persons above 60 are exempt from J. service. The following are also exempt: peers, judges, Rom. Catholic priests, members of parliament, dissenting ministers following no other secular occupation than that of schoolmaster, barristers, solicitors (if practising), registered medical practitioners, and pharmaceutical chemists actually in practice, clerks in holy orders, solicitors' managing clerks, officers of the law courts, and officials connected with prisons and public lunatic asylums, officers in the navy, army, air and territorial forces on full pay, members and licentiates of the Royal College of Physicians of London or the Royal College of Surgeons (London, Edinburgh, and Dublin), masters, wardens, and brethren of Trinity House, masters of vessels in the buoy and light service, licensed pilots, post office employees, customs and inland revenue officials, metropolitan and country police officials, special constables, councillors of municipal corporations, tn. clerks, bor. treasurers (as to their own cos.), justices of the peace, metropolitan police magistrates and their officials,

sheriffs' officers, and household servants of the sovereign.
